As of MySQL 4.1, the character set indicated by the `character_set_database` system variable is used to interpret the information in the file. `SET NAMES` and the setting of `character_set_client` do not affect interpretation of input.

Note that it is currently not possible to load data files that use the `ucs2` character set.

You can also load data files by using the `mysqlimport` utility; it operates by sending a `LOAD DATA INFILE` statement to the server. The `--local` option causes `mysqlimport` to read data files from the client host. You can specify the `--compress` option to get better performance over slow networks if the client and server support the compressed protocol. See [Section 8.14, “mysqlimport — A Data Import Program”](#).

If you use `LOW_PRIORITY`, execution of the `LOAD DATA` statement is delayed until no other clients are reading from the table.

If you specify `CONCURRENT` with a `MyISAM` table that satisfies the condition for concurrent inserts (that is, it contains no free blocks in the middle), other threads can retrieve data from the table while `LOAD DATA` is executing. Using this option affects the performance of `LOAD DATA` a bit, even if no other thread is using the table at the same time.

The `LOCAL` keyword, if specified, is interpreted with respect to the client end of the connection:

- If `LOCAL` is specified, the file is read by the client program on the client host and sent to the server. The file can be given as a full pathname to specify its exact location. If given as a relative pathname, the name is interpreted relative to the directory in which the client program was started.

`LOCAL` is available in MySQL 3.22.6 or later.

- If `LOCAL` is not specified, the file must be located on the server host and is read directly by the server. The server uses the following rules to locate the file:
  - If the filename is an absolute pathname, the server uses it as given.
  - If the filename is a relative pathname with one or more leading components, the server searches for the file relative to the server's data directory.
  - If a filename with no leading components is given, the server looks for the file in the database directory of the default database.

Note that, in the non-`LOCAL` case, these rules mean that a file named as `./myfile.txt` is read from the server's data directory, whereas the file named as `myfile.txt` is read from the database directory of the default database. For example, if `db1` is the default database, the following `LOAD DATA` statement reads the file `data.txt` from the database directory for `db1`, even though the statement expli-

city loads the file into a table in the `db2` database:

```
LOAD DATA INFILE 'data.txt' INTO TABLE db2.my_table;
```

Windows pathnames are specified using forward slashes rather than backslashes. If you do use backslashes, you must double them.

For security reasons, when reading text files located on the server, the files must either reside in the database directory or be readable by all. Also, to use `LOAD DATA INFILE` on server files, you must have the `FILE` privilege. See [Section 5.7.3, “Privileges Provided by MySQL”](#).

Using `LOCAL` is a bit slower than letting the server access the files directly, because the contents of the file must be sent over the connection by the client to the server. On the other hand, you do not need the `FILE` privilege to load local files.

As of MySQL 3.23.49 and MySQL 4.0.2 (4.0.13 on Windows), `LOCAL` works only if your server and your client both have been enabled to allow it. For example, if `mysqld` was started with `-local-infile=0`, `LOCAL` does not work. See [Section 5.6.4, “Security Issues with LOAD DATA LOCAL”](#).

On Unix, if you need `LOAD DATA` to read from a pipe, you can use the following technique (here we load the listing of the `/` directory into a table):

```
mkfifo /mysql/db/x/x
chmod 666 /mysql/db/x/x
find / -ls > /mysql/db/x/x
mysql -e "LOAD DATA INFILE 'x' INTO TABLE x" x
```

If you are using a version of MySQL older than 3.23.25, you can use this technique only with `LOAD DATA LOCAL INFILE`.

If you are using MySQL before version 3.23.24, you cannot read from a FIFO with `LOAD DATA INFILE`. If you need to read from a FIFO (for example, the output from `gunzip`), use `LOAD DATA LOCAL INFILE` instead.

The `REPLACE` and `IGNORE` keywords control handling of input rows that duplicate existing rows on unique key values:

- If you specify `REPLACE`, input rows replace existing rows. In other words, rows that have the same value for a primary key or unique index as an existing row. See [Section 13.2.6, “REPLACE Syntax”](#).
- If you specify `IGNORE`, input rows that duplicate an existing row on a unique key value are skipped. If you do not specify either option, the behavior depends on whether the `LOCAL` keyword is specified. Without `LOCAL`, an error occurs when a duplicate key value is found, and the rest of the text file is ignored. With `LOCAL`, the default behavior is the same as if `IGNORE` is specified; this is because the server has no way to stop transmission of the file in the middle of the operation.

If you want to ignore foreign key constraints during the load operation, you can issue a `SET FOREIGN_KEY_CHECKS=0` statement before executing `LOAD DATA`.

If you use `LOAD DATA INFILE` on an empty `MyISAM` table, all non-unique indexes are created in a separate batch (as for `REPAIR TABLE`). Normally, this makes `LOAD DATA INFILE` much faster when you have many indexes. In some extreme cases, you can create the indexes even faster by turning them off with `ALTER TABLE ... DISABLE KEYS` before loading the file into the table and using `ALTER TABLE ... ENABLE KEYS` to re-create the indexes after loading the file. See [Section 7.2.13, “Speed of INSERT Statements”](#).

For both the `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE` statements, the syntax of

the `FIELDS` and `LINES` clauses is the same. Both clauses are optional, but `FIELDS` must precede `LINES` if both are specified.

If you specify a `FIELDS` clause, each of its subclauses (`TERMINATED BY`, `[OPTIONALLY] ENCLOSED BY`, and `ESCAPED BY`) is also optional, except that you must specify at least one of them.

If you specify no `FIELDS` clause, the defaults are the same as if you had written this:

```
FIELDS TERMINATED BY '\t' ENCLOSED BY '' ESCAPED BY '\\'
```

If you specify no `LINES` clause, the defaults are the same as if you had written this:

```
LINES TERMINATED BY '\n' STARTING BY ''
```

In other words, the defaults cause `LOAD DATA INFILE` to act as follows when reading input:

- Look for line boundaries at newlines.
- Do not skip over any line prefix.
- Break lines into fields at tabs.
- Do not expect fields to be enclosed within any quoting characters.
- Interpret occurrences of tab, newline, or `'\'` preceded by `'\'` as literal characters that are part of field values.

Conversely, the defaults cause `SELECT ... INTO OUTFILE` to act as follows when writing output:

- Write tabs between fields.
- Do not enclose fields within any quoting characters.
- Use `'\'` to escape instances of tab, newline, or `'\'` that occur within field values.
- Write newlines at the ends of lines.

Backslash is the MySQL escape character within strings, so to write `FIELDS ESCAPED BY '\\'`, you must specify two backslashes for the value to be interpreted as a single backslash.

**Note:** If you have generated the text file on a Windows system, you might have to use `LINES TERMINATED BY '\r\n'` to read the file properly, because Windows programs typically use two characters as a line terminator. Some programs, such as `WordPad`, might use `\r` as a line terminator when writing files. To read such files, use `LINES TERMINATED BY '\r'`.

If all the lines you want to read in have a common prefix that you want to ignore, you can use `LINES STARTING BY 'prefix_string'` to skip over the prefix, *and anything before it*. If a line does not include the prefix, the entire line is skipped. Suppose that you issue the following statement:

```
LOAD DATA INFILE '/tmp/test.txt' INTO TABLE test
FIELDS TERMINATED BY ',' LINES STARTING BY 'xxx';
```

If the data file looks like this:

```
xxx"abc",1
something xxx"def",2
"ghi",3
```

The resulting rows will be ("abc",1) and ("def",2). The third row in the file is skipped because it does not contain the prefix.

The `IGNORE number LINES` option can be used to ignore lines at the start of the file. For example, you can use `IGNORE 1 LINES` to skip over an initial header line containing column names:

```
LOAD DATA INFILE '/tmp/test.txt' INTO TABLE test IGNORE 1 LINES;
```

When you use `SELECT ... INTO OUTFILE` in tandem with `LOAD DATA INFILE` to write data from a database into a file and then read the file back into the database later, the field- and line-handling options for both statements must match. Otherwise, `LOAD DATA INFILE` will not interpret the contents of the file properly. Suppose that you use `SELECT ... INTO OUTFILE` to write a file with fields delimited by commas:

```
SELECT * INTO OUTFILE 'data.txt'
  FIELDS TERMINATED BY ','
FROM table2;
```

To read the comma-delimited file back in, the correct statement would be:

```
LOAD DATA INFILE 'data.txt' INTO TABLE table2
  FIELDS TERMINATED BY ',';
```

If instead you tried to read in the file with the statement shown following, it wouldn't work because it instructs `LOAD DATA INFILE` to look for tabs between fields:

```
LOAD DATA INFILE 'data.txt' INTO TABLE table2
  FIELDS TERMINATED BY '\t';
```

The likely result is that each input line would be interpreted as a single field.

`LOAD DATA INFILE` can be used to read files obtained from external sources. For example, many programs can export data in comma-separated values (CSV) format, such that lines have fields separated by commas and enclosed within double quotes. If lines in such a file are terminated by newlines, the statement shown here illustrates the field- and line-handling options you would use to load the file:

```
LOAD DATA INFILE 'data.txt' INTO TABLE tbl_name
  FIELDS TERMINATED BY ',' ENCLOSED BY '"'
  LINES TERMINATED BY '\n';
```

Any of the field- or line-handling options can specify an empty string (''). If not empty, the `FIELDS [OPTIONALLY] ENCLOSED BY` and `FIELDS ESCAPED BY` values must be a single character. The `FIELDS TERMINATED BY`, `LINES STARTING BY`, and `LINES TERMINATED BY` values can be more than one character. For example, to write lines that are terminated by carriage return/line-feed pairs, or to read a file containing such lines, specify a `LINES TERMINATED BY '\r\n'` clause.

To read a file containing jokes that are separated by lines consisting of `%%`, you can do this

```
CREATE TABLE jokes
  (a INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
  joke TEXT NOT NULL);
LOAD DATA INFILE '/tmp/jokes.txt' INTO TABLE jokes
  FIELDS TERMINATED BY ''
  LINES TERMINATED BY '\n%%\n' (joke);
```

`FIELDS [OPTIONALLY] ENCLOSED BY` controls quoting of fields. For output (`SELECT ... INTO OUTFILE`), if you omit the word `OPTIONALLY`, all fields are enclosed by the `ENCLOSED BY`

character. An example of such output (using a comma as the field delimiter) is shown here:

```
"1","a string","100.20"
"2","a string containing a , comma","102.20"
"3","a string containing a \" quote","102.20"
"4","a string containing a \", quote and comma","102.20"
```

If you specify **OPTIONALLY**, the **ENCLOSED BY** character is used only to enclose values from columns that have a string data type (such as **CHAR**, **BINARY**, **TEXT**, or **ENUM**):

```
1,"a string",100.20
2,"a string containing a , comma",102.20
3,"a string containing a \" quote",102.20
4,"a string containing a \", quote and comma",102.20
```

Note that occurrences of the **ENCLOSED BY** character within a field value are escaped by prefixing them with the **ESCAPED BY** character. Also note that if you specify an empty **ESCAPED BY** value, it is possible to inadvertently generate output that cannot be read properly by **LOAD DATA INFILE**. For example, the preceding output just shown would appear as follows if the escape character is empty. Observe that the second field in the fourth line contains a comma following the quote, which (erroneously) appears to terminate the field:

```
1,"a string",100.20
2,"a string containing a , comma",102.20
3,"a string containing a " quote",102.20
4,"a string containing a ", quote and comma",102.20
```

For input, the **ENCLOSED BY** character, if present, is stripped from the ends of field values. (This is true regardless of whether **OPTIONALLY** is specified; **OPTIONALLY** has no effect on input interpretation.) Occurrences of the **ENCLOSED BY** character preceded by the **ESCAPED BY** character are interpreted as part of the current field value.

If the field begins with the **ENCLOSED BY** character, instances of that character are recognized as terminating a field value only if followed by the field or line **TERMINATED BY** sequence. To avoid ambiguity, occurrences of the **ENCLOSED BY** character within a field value can be doubled and are interpreted as a single instance of the character. For example, if **ENCLOSED BY ' ''** is specified, quotes are handled as shown here:

```
"The "BIG" boss" -> The "BIG" boss
The "BIG" boss  -> The "BIG" boss
The "BIG" boss  -> The "BIG" boss
```

**FIELDS ESCAPED BY** controls how to write or read special characters. If the **FIELDS ESCAPED BY** character is not empty, it is used to prefix the following characters on output:

- The **FIELDS ESCAPED BY** character
- The **FIELDS [OPTIONALLY] ENCLOSED BY** character
- The first character of the **FIELDS TERMINATED BY** and **LINES TERMINATED BY** values
- ASCII 0 (what is actually written following the escape character is ASCII '0', not a zero-valued byte)

If the **FIELDS ESCAPED BY** character is empty, no characters are escaped and **NULL** is output as **NULL**, not **\N**. It is probably not a good idea to specify an empty escape character, particularly if field values in your data contain any of the characters in the list just given.

For input, if the **FIELDS ESCAPED BY** character is not empty, occurrences of that character are

stripped and the following character is taken literally as part of a field value. The exceptions are an escaped '0' or 'N' (for example, \0 or \N if the escape character is '\'). These sequences are interpreted as ASCII NUL (a zero-valued byte) and NULL. The rules for NULL handling are described later in this section.

For more information about '\'-escape syntax, see [Section 9.1, “Literal Values”](#).

In certain cases, field- and line-handling options interact:

- If `LINES TERMINATED BY` is an empty string and `FIELDS TERMINATED BY` is non-empty, lines are also terminated with `FIELDS TERMINATED BY`.
- If the `FIELDS TERMINATED BY` and `FIELDS ENCLOSED BY` values are both empty (' '), a fixed-row (non-delimited) format is used. With fixed-row format, no delimiters are used between fields (but you can still have a line terminator). Instead, column values are read and written using a field width wide enough to hold all values in the field. For `TINYINT`, `SMALLINT`, `MEDIUMINT`, `INT`, and `BIGINT`, the field widths are 4, 6, 8, 11, and 20, respectively, no matter what the declared display width is.

`LINES TERMINATED BY` is still used to separate lines. If a line does not contain all fields, the rest of the columns are set to their default values. If you do not have a line terminator, you should set this to ' '. In this case, the text file must contain all fields for each row.

Fixed-row format also affects handling of NULL values, as described later. Note that fixed-size format does not work if you are using a multi-byte character set.

**Note:** Before MySQL 4.1.12, fixed-row format used the display width of the column. For example, `INT(4)` was read or written using a field with a width of 4. However, if the column contained wider values, they were dumped to their full width, leading to the possibility of a “ragged” field holding values of different widths. Using a field wide enough to hold all values in the field prevents this problem. However, data files written before this change was made might not be reloaded correctly with `LOAD DATA INFILE` for MySQL 4.1.12 and up. This change also affects data files read by `mysqlimport` and written by `mysqldump --tab`, which use `LOAD DATA INFILE` and `SELECT ... INTO outfile`.

Handling of NULL values varies according to the `FIELDS` and `LINES` options in use:

- For the default `FIELDS` and `LINES` values, NULL is written as a field value of \N for output, and a field value of \N is read as NULL for input (assuming that the `ESCAPED BY` character is '\').
- If `FIELDS ENCLOSED BY` is not empty, a field containing the literal word NULL as its value is read as a NULL value. This differs from the word NULL enclosed within `FIELDS ENCLOSED BY` characters, which is read as the string 'NULL'.
- If `FIELDS ESCAPED BY` is empty, NULL is written as the word NULL.
- With fixed-row format (which is used when `FIELDS TERMINATED BY` and `FIELDS ENCLOSED BY` are both empty), NULL is written as an empty string. Note that this causes both NULL values and empty strings in the table to be indistinguishable when written to the file because both are written as empty strings. If you need to be able to tell the two apart when reading the file back in, you should not use fixed-row format.

An attempt to load NULL into a `NOT NULL` column causes assignment of the implicit default value for the column's data type and a warning. Implicit default values are discussed in [Section 11.1.4, “Data Type Default Values”](#).

Some cases are not supported by `LOAD DATA INFILE`:

- Fixed-size rows (`FIELDS TERMINATED BY` and `FIELDS ENCLOSED BY` both empty) and `BLOB` or `TEXT` columns.
- If you specify one separator that is the same as or a prefix of another, `LOAD DATA INFILE` cannot interpret the input properly. For example, the following `FIELDS` clause would cause problems:

```
FIELDS TERMINATED BY '' ENCLOSED BY ''
```

- If `FIELDS ESCAPED BY` is empty, a field value that contains an occurrence of `FIELDS ENCLOSED BY` or `LINES TERMINATED BY` followed by the `FIELDS TERMINATED BY` value causes `LOAD DATA INFILE` to stop reading a field or line too early. This happens because `LOAD DATA INFILE` cannot properly determine where the field or line value ends.

The following example loads all columns of the `persondata` table:

```
LOAD DATA INFILE 'persondata.txt' INTO TABLE persondata;
```

By default, when no column list is provided at the end of the `LOAD DATA INFILE` statement, input lines are expected to contain a field for each table column. If you want to load only some of a table's columns, specify a column list:

```
LOAD DATA INFILE 'persondata.txt' INTO TABLE persondata (col1,col2,...);
```

You must also specify a column list if the order of the fields in the input file differs from the order of the columns in the table. Otherwise, MySQL cannot tell how to match input fields with table columns.

If an input line has too many fields, the extra fields are ignored and the number of warnings is incremented.

If an input line has too few fields, the table columns for which input fields are missing are set to their default values. Default value assignment is described in [Section 11.1.4, “Data Type Default Values”](#).

An empty field value is interpreted differently than if the field value is missing:

- For string types, the column is set to the empty string.
- For numeric types, the column is set to 0.
- For date and time types, the column is set to the appropriate “zero” value for the type. See [Section 11.3, “Date and Time Types”](#).

These are the same values that result if you assign an empty string explicitly to a string, numeric, or date or time type explicitly in an `INSERT` or `UPDATE` statement.

`TIMESTAMP` columns are set to the current date and time only if there is a `NULL` value for the column (that is, `\N`), or if the `TIMESTAMP` column's default value is the current timestamp and it is omitted from the field list when a field list is specified.

`LOAD DATA INFILE` regards all input as strings, so you cannot use numeric values for `ENUM` or `SET` columns the way you can with `INSERT` statements. All `ENUM` and `SET` values must be specified as strings.

When the `LOAD DATA INFILE` statement finishes, it returns an information string in the following format:

```
Records: 1 Deleted: 0 Skipped: 0 Warnings: 0
```

If you are using the C API, you can get information about the statement by calling the `mysql_info()` function. See [Section 17.2.3.33](#), “`mysql_info()`”.

Warnings occur under the same circumstances as when values are inserted via the `INSERT` statement (see [Section 13.2.4](#), “`INSERT Syntax`”), except that `LOAD DATA INFILE` also generates warnings when there are too few or too many fields in the input row. The warnings are not stored anywhere; the number of warnings can be used only as an indication of whether everything went well.

From MySQL 4.1.1 on, you can use `SHOW WARNINGS` to get a list of the first `max_error_count` warnings as information about what went wrong. See [Section 13.5.4.21](#), “`SHOW WARNINGS Syntax`”.

Before MySQL 4.1.1, only a warning count is available to indicate that something went wrong. If you get warnings and want to know exactly why you got them, one way to do this is to dump the table into another file using `SELECT ... INTO OUTFILE` and compare the file to your original input file.

## 13.2.6. REPLACE Syntax

```
REPLACE [LOW_PRIORITY | DELAYED]
  [INTO] tbl_name [(col_name,...)]
  VALUES ({expr | DEFAULT},...),(...),...
```

Or:

```
REPLACE [LOW_PRIORITY | DELAYED]
  [INTO] tbl_name
  SET col_name={expr | DEFAULT}, ...
```

Or:

```
REPLACE [LOW_PRIORITY | DELAYED]
  [INTO] tbl_name [(col_name,...)]
  SELECT ...
```

`REPLACE` works exactly like `INSERT`, except that if an old row in the table has the same value as a new row for a `PRIMARY KEY` or a `UNIQUE` index, the old row is deleted before the new row is inserted. See [Section 13.2.4](#), “`INSERT Syntax`”.

`REPLACE` is a MySQL extension to the SQL standard. It either inserts, or *deletes* and inserts. For another MySQL extension to standard SQL — that either inserts or *updates* — see [Section 13.2.4.3](#), “`INSERT ... ON DUPLICATE KEY UPDATE Syntax`”. `INSERT ... ON DUPLICATE KEY UPDATE` is available as of MySQL 4.1.0.

Note that unless the table has a `PRIMARY KEY` or `UNIQUE` index, using a `REPLACE` statement makes no sense. It becomes equivalent to `INSERT`, because there is no index to be used to determine whether a new row duplicates another.

Values for all columns are taken from the values specified in the `REPLACE` statement. Any missing columns are set to their default values, just as happens for `INSERT`. You cannot refer to values from the current row and use them in the new row. If you use an assignment such as `SET col_name = col_name + 1`, the reference to the column name on the right hand side is treated as `DEFAULT(col_name)`, so the assignment is equivalent to `SET col_name = DEFAULT(col_name) + 1`.

To use `REPLACE`, you must have both the `INSERT` and `DELETE` privileges for the table.

The `REPLACE` statement returns a count to indicate the number of rows affected. This is the sum of the rows deleted and inserted. If the count is 1 for a single-row `REPLACE`, a row was inserted and no rows were deleted. If the count is greater than 1, one or more old rows were deleted before the new row was inserted. It is possible for a single row to replace more than one old row if the table contains multiple unique indexes and the new row duplicates values for different old rows in different unique indexes.

The affected-rows count makes it easy to determine whether `REPLACE` only added a row or whether it also replaced any rows: Check whether the count is 1 (added) or greater (replaced).

If you are using the C API, the affected-rows count can be obtained using the `mysql_affected_rows()` function.

Currently, you cannot replace into a table and select from the same table in a subquery.

MySQL uses the following algorithm for `REPLACE` (and `LOAD DATA . . . REPLACE`):

1. Try to insert the new row into the table
2. While the insertion fails because a duplicate-key error occurs for a primary key or unique index:
  - a. Delete from the table the conflicting row that has the duplicate key value
  - b. Try again to insert the new row into the table

## 13.2.7. `SELECT` Syntax

```
SELECT
  [ALL | DISTINCT | DISTINCTROW ]
  [HIGH_PRIORITY]
  [STRAIGHT_JOIN]
  [SQL_SMALL_RESULT] [SQL_BIG_RESULT] [SQL_BUFFER_RESULT]
  [SQL_CACHE | SQL_NO_CACHE] [SQL_CALC_FOUND_ROWS]
  select_expr, ...
  [FROM table_references]
  [WHERE where_condition]
  [GROUP BY {col_name | expr | position}
  [ASC | DESC], ... [WITH ROLLUP]]
  [HAVING where_condition]
  [ORDER BY {col_name | expr | position}
  [ASC | DESC], ...]
  [LIMIT {[offset,] row_count | row_count OFFSET offset}]
  [PROCEDURE procedure_name(argument_list)]
  [INTO OUTFILE 'file_name' export_options
  | INTO DUMPFILE 'file_name'
  | INTO @var_name [, @var_name]]
  [FOR UPDATE | LOCK IN SHARE MODE]]
```

`SELECT` is used to retrieve rows selected from one or more tables. Support for `UNION` statements and subqueries is available as of MySQL 4.0 and 4.1, respectively. See [Section 13.2.7.2, “UNION Syntax”](#), and [Section 13.2.8, “Subquery Syntax”](#).

The most commonly used clauses of `SELECT` statements are these:

- Each *select\_expr* indicates a column that you want to retrieve. There must be at least one *select\_expr*.
- *table\_references* indicates the table or tables from which to retrieve rows. Its syntax is described in [Section 13.2.7.1, “JOIN Syntax”](#).

- The `WHERE` clause, if given, indicates the condition or conditions that rows must satisfy to be selected. `where_condition` is an expression that evaluates to true for each row to be selected. The statement selects all rows if there is no `WHERE` clause.

In the `WHERE` clause, you can use any of the functions and operators that MySQL supports, except for aggregate (summary) functions. See [Chapter 12, Functions and Operators](#).

`SELECT` can also be used to retrieve rows computed without reference to any table.

For example:

```
mysql> SELECT 1 + 1;
-> 2
```

From MySQL 4.1.0 on, you are allowed to specify `DUAL` as a dummy table name in situations where no tables are referenced:

```
mysql> SELECT 1 + 1 FROM DUAL;
-> 2
```

`DUAL` is purely for the convenience of people who require that all `SELECT` statements should have `FROM` and possibly other clauses. MySQL may ignore the clauses. MySQL does not require `FROM DUAL` if no tables are referenced.

In general, clauses used must be given in exactly the order shown in the syntax description. For example, a `HAVING` clause must come after any `GROUP BY` clause and before any `ORDER BY` clause. The exception is that the `INTO` clause can appear either as shown in the syntax description or immediately preceding the `FROM` clause.

- A `select_expr` can be given an alias using `AS alias_name`. The alias is used as the expression's column name and can be used in `GROUP BY`, `ORDER BY`, or `HAVING` clauses. For example:

```
SELECT CONCAT(last_name,', ',first_name) AS full_name
FROM mytable ORDER BY full_name;
```

The `AS` keyword is optional when aliasing a `select_expr`. The preceding example could have been written like this:

```
SELECT CONCAT(last_name,', ',first_name) full_name
FROM mytable ORDER BY full_name;
```

However, because the `AS` is optional, a subtle problem can occur if you forget the comma between two `select_expr` expressions: MySQL interprets the second as an alias name. For example, in the following statement, `columnb` is treated as an alias name:

```
SELECT columna columnb FROM mytable;
```

For this reason, it is good practice to be in the habit of using `AS` explicitly when specifying column aliases.

- It is not allowable to use a column alias in a `WHERE` clause, because the column value might not yet be determined when the `WHERE` clause is executed. See [Section A.5.4, “Problems with Column Aliases”](#).
- The `FROM table_references` clause indicates the table or tables from which to retrieve rows. If you name more than one table, you are performing a join. For information on join syntax, see [Sec-](#)

tion 13.2.7.1, “JOIN Syntax”. For each table specified, you can optionally specify an alias.

```
tbl_name [[AS] alias]  
[ {USE|IGNORE|FORCE} INDEX (key_list) ]
```

The use of `USE INDEX`, `IGNORE INDEX`, `FORCE INDEX` to give the optimizer hints about how to choose indexes is described in Section 13.2.7.1, “JOIN Syntax”.

In MySQL 4.0.14, you can use `SET max_seeks_for_key=value` as an alternative way to force MySQL to prefer key scans instead of table scans. See Section 5.2.2, “System Variables”.

- You can refer to a table within the default database as *tbl\_name*, or as *db\_name.tbl\_name* to specify a database explicitly. You can refer to a column as *col\_name*, *tbl\_name.col\_name*, or *db\_name.tbl\_name.col\_name*. You need not specify a *tbl\_name* or *db\_name.tbl\_name* prefix for a column reference unless the reference would be ambiguous. See Section 9.2.1, “Identifier Qualifiers”, for examples of ambiguity that require the more explicit column reference forms.
- A table reference can be aliased using *tbl\_name AS alias\_name* or *tbl\_name alias\_name*:

```
SELECT t1.name, t2.salary FROM employee AS t1, info AS t2  
WHERE t1.name = t2.name;  
  
SELECT t1.name, t2.salary FROM employee t1, info t2  
WHERE t1.name = t2.name;
```

- Columns selected for output can be referred to in `ORDER BY` and `GROUP BY` clauses using column names, column aliases, or column positions. Column positions are integers and begin with 1:

```
SELECT college, region, seed FROM tournament  
ORDER BY region, seed;  
  
SELECT college, region AS r, seed AS s FROM tournament  
ORDER BY r, s;  
  
SELECT college, region, seed FROM tournament  
ORDER BY 2, 3;
```

To sort in reverse order, add the `DESC` (descending) keyword to the name of the column in the `ORDER BY` clause that you are sorting by. The default is ascending order; this can be specified explicitly using the `ASC` keyword.

Use of column positions is deprecated because the syntax has been removed from the SQL standard.

- If you use `GROUP BY`, output rows are sorted according to the `GROUP BY` columns as if you had an `ORDER BY` for the same columns. To avoid the overhead of sorting that `GROUP BY` produces, add `ORDER BY NULL`:

```
SELECT a, COUNT(b) FROM test_table GROUP BY a ORDER BY NULL;
```

- MySQL extends the `GROUP BY` clause as of version 3.23.34 so that you can also specify `ASC` and `DESC` after columns named in the clause:

```
SELECT a, COUNT(b) FROM test_table GROUP BY a DESC
```

- MySQL extends the use of `GROUP BY` to allow selecting fields that are not mentioned in the `GROUP BY` clause. If you are not getting the results that you expect from your query, please read the description of `GROUP BY` found in Section 12.10, “Functions and Modifiers for Use with `GROUP BY` Clauses”.

- As of MySQL 4.1.1, `GROUP BY` allows a `WITH ROLLUP` modifier. See [Section 12.10.2, “GROUP BY Modifiers”](#).
- The `HAVING` clause is applied nearly last, just before items are sent to the client, with no optimization. (`LIMIT` is applied after `HAVING`.)

A `HAVING` clause can refer to any column or alias named in a `select_expr` in the `SELECT` list or in outer subqueries, and to aggregate functions. (Standard SQL requires that `HAVING` must reference only columns in the `GROUP BY` clause or columns used in aggregate functions.)

- Do not use `HAVING` for items that should be in the `WHERE` clause. For example, do not write the following:

```
SELECT col_name FROM tbl_name HAVING col_name > 0;
```

Write this instead:

```
SELECT col_name FROM tbl_name WHERE col_name > 0;
```

- The `HAVING` clause can refer to aggregate functions, which the `WHERE` clause cannot:

```
SELECT user, MAX(salary) FROM users
GROUP BY user HAVING MAX(salary) > 10;
```

However, that does not work in older MySQL servers (before version 3.22.5). In those versions, you can use a column alias in the select list and refer to the alias in the `HAVING` clause:

```
SELECT user, MAX(salary) AS max_salary FROM users
GROUP BY user HAVING max_salary>10;
```

- MySQL allows duplicate column names. That is, there can be more than one `select_expr` with the same name. This is an extension to standard SQL. Because MySQL also allows `GROUP BY` and `HAVING` to refer to `select_expr` values, this can result in an ambiguity:

```
SELECT 12 AS a, a FROM t GROUP BY a;
```

In that statement, both columns have the name `a`. To ensure that the correct column is used for grouping, use different names for each `select_expr`.

- When MySQL resolves an unqualified column or alias reference in an `ORDER BY`, `GROUP BY`, or `HAVING` clause, it first searches for the name in the `select_expr` values. If the name is not found, it looks in the columns of the tables named in the `FROM` clause.
- The `LIMIT` clause can be used to constrain the number of rows returned by the `SELECT` statement. `LIMIT` takes one or two numeric arguments, which must both be non-negative integer constants (except when using prepared statements).

With two arguments, the first argument specifies the offset of the first row to return, and the second specifies the maximum number of rows to return. The offset of the initial row is 0 (not 1):

```
SELECT * FROM tbl LIMIT 5,10; # Retrieve rows 6-15
```

To retrieve all rows from a certain offset up to the end of the result set, you can use some large number for the second parameter. This statement retrieves all rows from the 96th row to the last:

```
SELECT * FROM tbl LIMIT 95,18446744073709551615;
```

With one argument, the value specifies the number of rows to return from the beginning of the result set:

```
SELECT * FROM tbl LIMIT 5;      # Retrieve first 5 rows
```

In other words, `LIMIT row_count` is equivalent to `LIMIT 0, row_count`.

For prepared statements, you can use placeholders (supported as of MySQL version 5.0.7). The following statements will return one row from the `tbl` table:

```
SET @a=1;
PREPARE STMT FROM 'SELECT * FROM tbl LIMIT ?';
EXECUTE STMT USING @a;
```

The following statements will return the second to sixth row from the `tbl` table:

```
SET @skip=1; SET @numrows=5;
PREPARE STMT FROM 'SELECT * FROM tbl LIMIT ?, ?';
EXECUTE STMT USING @skip, @numrows;
```

For compatibility with PostgreSQL, MySQL also supports the `LIMIT row_count OFFSET offset` syntax.

- The `SELECT ... INTO OUTFILE 'file_name'` form of `SELECT` writes the selected rows to a file. The file is created on the server host, so you must have the `FILE` privilege to use this syntax. `file_name` cannot be an existing file, which among other things prevents files such as `/etc/passwd` and database tables from being destroyed.

The `SELECT ... INTO OUTFILE` statement is intended primarily to let you very quickly dump a table to a text file on the server machine. If you want to create the resulting file on some client host other than the server host, you cannot use `SELECT ... INTO OUTFILE`. In that case, you should instead use a command such as `mysql -e "SELECT ..." > file_name` to generate the file on the client host.

`SELECT ... INTO OUTFILE` is the complement of `LOAD DATA INFILE`; the syntax for the `export_options` part of the statement consists of the same `FIELDS` and `LINES` clauses that are used with the `LOAD DATA INFILE` statement. See [Section 13.2.5, “LOAD DATA INFILE Syntax”](#).

`FIELDS ESCAPED BY` controls how to write special characters. If the `FIELDS ESCAPED BY` character is not empty, it is used as a prefix that precedes following characters on output:

- The `FIELDS ESCAPED BY` character
- The `FIELDS [OPTIONALLY] ENCLOSED BY` character
- The first character of the `FIELDS TERMINATED BY` and `LINES TERMINATED BY` values
- ASCII `NUL` (the zero-valued byte; what is actually written following the escape character is ASCII `'0'`, not a zero-valued byte)

The `FIELDS TERMINATED BY`, `ENCLOSED BY`, `ESCAPED BY`, or `LINES TERMINATED BY` characters *must* be escaped so that you can read the file back in reliably. ASCII `NUL` is escaped to make it easier to view with some paggers.

The resulting file does not have to conform to SQL syntax, so nothing else need be escaped.

If the `FIELDS ESCAPED BY` character is empty, no characters are escaped and `NULL` is output as

`NULL`, not `\N`. It is probably not a good idea to specify an empty escape character, particularly if field values in your data contain any of the characters in the list just given.

Here is an example that produces a file in the comma-separated values (CSV) format used by many programs:

```
SELECT a,b,a+b INTO OUTFILE '/tmp/result.txt'
  FIELDS TERMINATED BY ',' OPTIONALLY ENCLOSED BY '"'
  LINES TERMINATED BY '\n'
FROM test_table;
```

- If you use `INTO DUMPFILE` instead of `INTO OUTFILE`, MySQL writes only one row into the file, without any column or line termination and without performing any escape processing. This is useful if you want to store a `BLOB` value in a file.
- The `INTO` clause can name a list of one or more user-defined variables. The selected values are assigned to the variables. The number of variables must match the number of columns.
- **Note:** Any file created by `INTO OUTFILE` or `INTO DUMPFILE` is writable by all users on the server host. The reason for this is that the MySQL server cannot create a file that is owned by anyone other than the user under whose account it is running. (You should *never* run `mysqld` as `root` for this and other reasons.) The file thus must be world-writable so that you can manipulate its contents.
- The `SELECT` syntax description at the beginning of this section shows the `INTO` clause near the end of the statement. It is also possible to use `INTO OUTFILE` or `INTO DUMPFILE` immediately preceding the `FROM` clause.
- A `PROCEDURE` clause names a procedure that should process the data in the result set. For an example, see [Section 19.3.1, “Procedure Analyse”](#).
- If you use `FOR UPDATE` with a storage engine that uses page or row locks, rows examined by the query are write-locked until the end of the current transaction. Using `LOCK IN SHARE MODE` sets a shared lock that allows other transactions to read the examined rows but not to update or delete them. See [Section 14.2.11.5, “SELECT ... FOR UPDATE and SELECT ... LOCK IN SHARE MODE Locking Reads”](#).

Following the `SELECT` keyword, you can use a number of options that affect the operation of the statement.

The `ALL`, `DISTINCT`, and `DISTINCTROW` options specify whether duplicate rows should be returned. If none of these options are given, the default is `ALL` (all matching rows are returned). `DISTINCT` and `DISTINCTROW` are synonyms and specify removal of duplicate rows from the result set.

`HIGH_PRIORITY`, `STRAIGHT_JOIN`, and options beginning with `SQL_` are MySQL extensions to standard SQL.

- `HIGH_PRIORITY` gives the `SELECT` higher priority than a statement that updates a table. You should use this only for queries that are very fast and must be done at once. A `SELECT HIGH_PRIORITY` query that is issued while the table is locked for reading runs even if there is an update statement waiting for the table to be free.

`HIGH_PRIORITY` cannot be used with `SELECT` statements that are part of a `UNION`.

- `STRAIGHT_JOIN` forces the optimizer to join the tables in the order in which they are listed in the `FROM` clause. You can use this to speed up a query if the optimizer joins the tables in non-optimal order. See [Section 7.2.1, “Optimizing Queries with EXPLAIN”](#). `STRAIGHT_JOIN` also can be used

in the *table\_references* list. See [Section 13.2.7.1, “JOIN Syntax”](#).

- `SQL_BIG_RESULT` can be used with `GROUP BY` or `DISTINCT` to tell the optimizer that the result set has many rows. In this case, MySQL directly uses disk-based temporary tables if needed, and prefers sorting to using a temporary table with a key on the `GROUP BY` elements.
- `SQL_BUFFER_RESULT` forces the result to be put into a temporary table. This helps MySQL free the table locks early and helps in cases where it takes a long time to send the result set to the client.
- `SQL_SMALL_RESULT` can be used with `GROUP BY` or `DISTINCT` to tell the optimizer that the result set is small. In this case, MySQL uses fast temporary tables to store the resulting table instead of using sorting. In MySQL 3.23 and up, this should not normally be needed.
- `SQL_CALC_FOUND_ROWS` (available in MySQL 4.0.0 and up) tells MySQL to calculate how many rows there would be in the result set, disregarding any `LIMIT` clause. The number of rows can then be retrieved with `SELECT FOUND_ROWS()`. See [Section 12.9.3, “Information Functions”](#).

Before MySQL 4.1.0, this option does not work with `LIMIT 0`, which is optimized to return instantly (resulting in a row count of 0). See [Section 7.2.11, “LIMIT Optimization”](#).

- `SQL_CACHE` tells MySQL to store the query result in the query cache if you are using a `query_cache_type` value of 2 or `DEMAND`. For a query that uses `UNION` or subqueries, this option effects any `SELECT` in the query. See [Section 5.13, “The MySQL Query Cache”](#).
- `SQL_NO_CACHE` tells MySQL not to store the query result in the query cache. See [Section 5.13, “The MySQL Query Cache”](#). For a query that uses `UNION` or subqueries, this option effects any `SELECT` in the query.

### 13.2.7.1. JOIN Syntax

MySQL supports the following `JOIN` syntaxes for the *table\_references* part of `SELECT` statements and multiple-table `DELETE` and `UPDATE` statements:

```
table_reference, table_reference
table_reference [INNER | CROSS] JOIN table_reference [join_condition]
table_reference STRAIGHT_JOIN table_reference
table_reference LEFT [OUTER] JOIN table_reference join_condition
table_reference NATURAL [LEFT [OUTER]] JOIN table_reference
{ ON table_reference LEFT OUTER JOIN table_reference
  ON conditional_expr }
table_reference RIGHT [OUTER] JOIN table_reference join_condition
table_reference NATURAL [RIGHT [OUTER]] JOIN table_reference
```

*table\_reference* is defined as:

```
tbl_name [[AS] alias]
[ {USE | IGNORE | FORCE} INDEX (key_list) ]
```

*join\_condition* is defined as:

```
ON conditional_expr | USING (column_list)
```

Note that several changes in join processing were made in MySQL 5.0.12 to make MySQL more compliant with standard SQL. These changes include the ability to handle nested joins (including outer joins) according to the standard. If a nested join returns results that are not what you expect, please consider upgrading to MySQL 5.0. Further details about the changes in join processing can be found at <http://dev.mysql.com/doc/refman/5.0/en/join.html>.

You should generally not have any conditions in the `ON` part that are used to restrict which rows you

want in the result set, but rather specify these conditions in the `WHERE` clause. There are exceptions to this rule.

Note that `INNER JOIN` syntax allows a `join_condition` only from MySQL 3.23.17 on. The same is true for `JOIN` and `CROSS JOIN` only as of MySQL 4.0.11.

The `{ OJ ... LEFT OUTER JOIN ... }` syntax shown in the preceding list exists only for compatibility with ODBC. The curly braces in the syntax should be written literally; they are not metasyntax as used elsewhere in syntax descriptions.

- A table reference can be aliased using `tbl_name AS alias_name` or `tbl_name alias_name`:

```
SELECT t1.name, t2.salary FROM employee AS t1, info AS t2
WHERE t1.name = t2.name;

SELECT t1.name, t2.salary FROM employee t1, info t2
WHERE t1.name = t2.name;
```

- The `ON` conditional is any conditional expression of the form that can be used in a `WHERE` clause.
- If there is no matching row for the right table in the `ON` or `USING` part in a `LEFT JOIN`, a row with all columns set to `NULL` is used for the right table. You can use this fact to find rows in a table that have no counterpart in another table:

```
SELECT table1.* FROM table1
LEFT JOIN table2 ON table1.id=table2.id
WHERE table2.id IS NULL;
```

This example finds all rows in `table1` with an `id` value that is not present in `table2` (that is, all rows in `table1` with no corresponding row in `table2`). This assumes that `table2.id` is declared `NOT NULL`. See [Section 7.2.8, “LEFT JOIN and RIGHT JOIN Optimization”](#).

- The `USING(column_list)` clause names a list of columns that must exist in both tables. The following two clauses are semantically identical:

```
a LEFT JOIN b USING (c1,c2,c3)
a LEFT JOIN b ON a.c1=b.c1 AND a.c2=b.c2 AND a.c3=b.c3
```

- The `NATURAL [LEFT] JOIN` of two tables is defined to be semantically equivalent to an `INNER JOIN` or a `LEFT JOIN` with a `USING` clause that names all columns that exist in both tables.
- `INNER JOIN` and `,` (comma) are semantically equivalent in the absence of a join condition: both produce a Cartesian product between the specified tables (that is, each and every row in the first table is joined to each and every row in the second table).
- `RIGHT JOIN` works analogously to `LEFT JOIN`. To keep code portable across databases, it is recommended that you use `LEFT JOIN` instead of `RIGHT JOIN`.
- `STRAIGHT_JOIN` is identical to `JOIN`, except that the left table is always read before the right table. This can be used for those (few) cases for which the join optimizer puts the tables in the wrong order.

As of MySQL 3.23.12, you can give hints about which index MySQL should use when retrieving information from a table. By specifying `USE INDEX (key_list)`, you can tell MySQL to use only one of the possible indexes to find rows in the table. The alternative syntax `IGNORE INDEX (key_list)` can be used to tell MySQL to not use some particular index. These hints are useful if `EXPLAIN` shows that MySQL is using the wrong index from the list of possible indexes.

From MySQL 4.0.9 on, you can also use `FORCE INDEX`, which acts like `USE INDEX (key_list)` but with the addition that a table scan is assumed to be *very* expensive. In other words, a table scan is used only if there is no way to use one of the given indexes to find rows in the table.

`USE INDEX`, `IGNORE INDEX`, and `FORCE INDEX` affect only which indexes are used when MySQL decides how to find rows in the table and how to do the join. They do not affect whether an index is used when resolving an `ORDER BY` or `GROUP BY`.

`USE KEY`, `IGNORE KEY`, and `FORCE KEY` are synonyms for `USE INDEX`, `IGNORE INDEX`, and `FORCE INDEX`.

Some join examples:

```
SELECT * FROM table1,table2 WHERE table1.id=table2.id;
SELECT * FROM table1 LEFT JOIN table2 ON table1.id=table2.id;
SELECT * FROM table1 LEFT JOIN table2 USING (id);
SELECT * FROM table1 LEFT JOIN table2 ON table1.id=table2.id
LEFT JOIN table3 ON table2.id=table3.id;
SELECT * FROM table1 USE INDEX (key1,key2)
WHERE key1=1 AND key2=2 AND key3=3;
SELECT * FROM table1 IGNORE INDEX (key3)
WHERE key1=1 AND key2=2 AND key3=3;
```

### 13.2.7.2. UNION Syntax

```
SELECT ...
UNION [ALL | DISTINCT] SELECT ...
[UNION [ALL | DISTINCT] SELECT ...]
```

`UNION` is used to combine the result from multiple `SELECT` statements into a single result set. `UNION` is available from MySQL 4.0.0 on.

The column names from the first `SELECT` statement are used as the column names for the results returned. Selected columns listed in corresponding positions of each `SELECT` statement should have the same data type. (For example, the first column selected by the first statement should have the same type as the first column selected by the other statements.)

As of MySQL 4.1.1, if the data types of corresponding `SELECT` columns do not match, the types and lengths of the columns in the `UNION` result take into account the values retrieved by all of the `SELECT` statements. For example, consider the following:

```
mysql> SELECT REPEAT('a',1) UNION SELECT REPEAT('b',10);
+-----+
| REPEAT('a',1) |
+-----+
| a              |
| bbbbbbbbbbb   |
+-----+
```

Before MySQL 4.1.1, only the type and length from the first `SELECT` would have been used and the second row would have been truncated to a length of 1:

```
mysql> SELECT REPEAT('a',1) UNION SELECT REPEAT('b',10);
+-----+
| REPEAT('a',1) |
+-----+
| a              |
| b              |
+-----+
```

The `SELECT` statements are normal select statements, but with the following restrictions:

- Only the last `SELECT` statement can use `INTO OUTFILE`.
- `HIGH_PRIORITY` cannot be used with `SELECT` statements that are part of a `UNION`. If you specify it for the first `SELECT`, it has no effect. If you specify it for any subsequent `SELECT` statements, a syntax error results.

The default behavior for `UNION` is that duplicate rows are removed from the result. The optional `DISTINCT` keyword (introduced in MySQL 4.0.17) has no effect other than the default because it also specifies duplicate-row removal. With the optional `ALL` keyword, duplicate-row removal does not occur and the result includes all matching rows from all the `SELECT` statements.

Before MySQL 4.1.2, you cannot mix `UNION ALL` and `UNION DISTINCT` in the same query. If you use `ALL` for one `UNION`, it is used for all of them. As of MySQL 4.1.2, mixed `UNION` types are treated such that a `DISTINCT` union overrides any `ALL` union to its left. A `DISTINCT` union can be produced explicitly by using `UNION DISTINCT` or implicitly by using `UNION` with no following `DISTINCT` or `ALL` keyword.

To use an `ORDER BY` or `LIMIT` clause to sort or limit the entire `UNION` result, parenthesize the individual `SELECT` statements and place the `ORDER BY` or `LIMIT` after the last one. The following example uses both clauses:

```
(SELECT a FROM t1 WHERE a=10 AND B=1)
UNION
(SELECT a FROM t2 WHERE a=11 AND B=2)
ORDER BY a LIMIT 10;
```

This kind of `ORDER BY` cannot use column references that include a table name (that is, names in `tbl_name.col_name` format). Instead, provide a column alias in the first `SELECT` statement and refer to the alias in the `ORDER BY`. (Alternatively, refer to the column in the `ORDER BY` using its column position. However, use of column positions is deprecated.)

Also, if a column to be sorted is aliased, the `ORDER BY` clause *must* refer to the alias, not the column name. The first of the following statements will work, but the second will fail with an `Unknown column 'a' in 'order clause'` error:

```
(SELECT a AS b FROM t) UNION (SELECT ...) ORDER BY b;
(SELECT a AS b FROM t) UNION (SELECT ...) ORDER BY a;
```

To apply `ORDER BY` or `LIMIT` to an individual `SELECT`, place the clause inside the parentheses that enclose the `SELECT`:

```
(SELECT a FROM t1 WHERE a=10 AND B=1 ORDER BY a LIMIT 10)
UNION
(SELECT a FROM t2 WHERE a=11 AND B=2 ORDER BY a LIMIT 10);
```

Use of `ORDER BY` for individual `SELECT` statements implies nothing about the order in which the rows appear in the final result because `UNION` by default produces an unordered set of rows. If `ORDER BY` appears with `LIMIT`, it is used to determine the subset of the selected rows to retrieve for the `SELECT`, but does not necessarily affect the order of those rows in the final `UNION` result. If `ORDER BY` appears without `LIMIT` in a `SELECT`, it is optimized away because it will have no effect anyway.

To cause rows in a `UNION` result to consist of the sets of rows retrieved by each `SELECT` one after the other, select an additional column in each `SELECT` to use as a sort column and add an `ORDER BY` following the last `SELECT`:

```
(SELECT 1 AS sort_col, colla, collb, ... FROM t1)
```

```
UNION
(SELECT 2, col2a, col2b, ... FROM t2) ORDER BY sort_col;
```

To additionally maintain sort order within individual `SELECT` results, add a secondary column to the `ORDER BY` clause:

```
(SELECT 1 AS sort_col, col1a, col1b, ... FROM t1)
UNION
(SELECT 2, col2a, col2b, ... FROM t2) ORDER BY sort_col, col1a;
```

## 13.2.8. Subquery Syntax

A subquery is a `SELECT` statement within another statement.

Starting with MySQL 4.1, all subquery forms and operations that the SQL standard requires are supported, as well as a few features that are MySQL-specific.

With MySQL versions prior to 4.1, it was necessary to work around or avoid the use of subqueries. In many cases, subqueries can successfully be rewritten using joins and other methods. See [Section 13.2.8.11, “Rewriting Subqueries as Joins for Earlier MySQL Versions”](#).

Here is an example of a subquery:

```
SELECT * FROM t1 WHERE column1 = (SELECT column1 FROM t2);
```

In this example, `SELECT * FROM t1 ...` is the *outer query* (or *outer statement*), and `(SELECT column1 FROM t2)` is the *subquery*. We say that the subquery is *nested* within the outer query, and in fact it is possible to nest subqueries within other subqueries, to a considerable depth. A subquery must always appear within parentheses.

The main advantages of subqueries are:

- They allow queries that are *structured* so that it is possible to isolate each part of a statement.
- They provide alternative ways to perform operations that would otherwise require complex joins and unions.
- They are, in many people's opinion, readable. Indeed, it was the innovation of subqueries that gave people the original idea of calling the early SQL “Structured Query Language.”

Here is an example statement that shows the major points about subquery syntax as specified by the SQL standard and supported in MySQL:

```
DELETE FROM t1
WHERE s11 > ANY
  (SELECT COUNT(*) /* no hint */ FROM t2
  WHERE NOT EXISTS
   (SELECT * FROM t3
    WHERE ROW(5*t2.s1,77)=
     (SELECT 50,11*s1 FROM t4 UNION SELECT 50,77 FROM
      (SELECT * FROM t5) AS t5)));
```

A subquery can return a scalar (a single value), a single row, a single column, or a table (one or more rows of one or more columns). These are called scalar, column, row, and table subqueries. Subqueries that return a particular kind of result often can be used only in certain contexts, as described in the following sections.

There are few restrictions on the type of statements in which subqueries can be used. A subquery can

contain any of the keywords or clauses that an ordinary `SELECT` can contain: `DISTINCT`, `GROUP BY`, `ORDER BY`, `LIMIT`, joins, index hints, `UNION` constructs, comments, functions, and so on.

One restriction is that a subquery's outer statement must be one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`. Another restriction is that currently you cannot modify a table and select from the same table in a subquery. This applies to statements such as `DELETE`, `INSERT`, `REPLACE`, and `UPDATE`.

A more comprehensive discussion of restrictions on subquery use, including performance issues for certain forms of subquery syntax, is given in [Section I.1, “Restrictions on Subqueries”](#).

### 13.2.8.1. The Subquery as Scalar Operand

In its simplest form, a subquery is a scalar subquery that returns a single value. A scalar subquery is a simple operand, and you can use it almost anywhere a single column value or literal is legal, and you can expect it to have those characteristics that all operands have: a data type, a length, an indication whether it can be `NULL`, and so on. For example:

```
CREATE TABLE t1 (s1 INT, s2 CHAR(5) NOT NULL);
INSERT INTO t1 VALUES(100, 'abcde');
SELECT (SELECT s2 FROM t1);
```

The subquery in this `SELECT` returns a single value ('abcde') that has a data type of `CHAR`, a length of 5, a character set and collation equal to the defaults in effect at `CREATE TABLE` time, and an indication that the value in the column can be `NULL`. In fact, almost all subqueries can be `NULL`. If the table used in the example were empty, the value of the subquery would be `NULL`.

There are a few contexts in which a scalar subquery cannot be used. If a statement allows only a literal value, you cannot use a subquery. For example, `LIMIT` requires literal integer arguments, and `LOAD DATA INFILE` requires a literal string filename. You cannot use subqueries to supply these values.

When you see examples in the following sections that contain the rather spartan construct (`SELECT column1 FROM t1`), imagine that your own code contains much more diverse and complex constructions.

Suppose that we make two tables:

```
CREATE TABLE t1 (s1 INT);
INSERT INTO t1 VALUES (1);
CREATE TABLE t2 (s1 INT);
INSERT INTO t2 VALUES (2);
```

Then perform a `SELECT`:

```
SELECT (SELECT s1 FROM t2) FROM t1;
```

The result is 2 because there is a row in `t2` containing a column `s1` that has a value of 2.

A scalar subquery can be part of an expression, but remember the parentheses, even if the subquery is an operand that provides an argument for a function. For example:

```
SELECT UPPER((SELECT s1 FROM t1)) FROM t2;
```

### 13.2.8.2. Comparisons Using Subqueries

The most common use of a subquery is in the form:

```
non_subquery_operand comparison_operator (subquery)
```

Where *comparison\_operator* is one of these operators:

```
= > < >= <= <>
```

For example:

```
... 'a' = (SELECT column1 FROM t1)
```

At one time the only legal place for a subquery was on the right side of a comparison, and you might still find some old DBMSs that insist on this.

Here is an example of a common-form subquery comparison that you cannot do with a join. It finds all the values in table *t1* that are equal to a maximum value in table *t2*:

```
SELECT column1 FROM t1
WHERE column1 = (SELECT MAX(column2) FROM t2);
```

Here is another example, which again is impossible with a join because it involves aggregating for one of the tables. It finds all rows in table *t1* containing a value that occurs twice in a given column:

```
SELECT * FROM t1 AS t
WHERE 2 = (SELECT COUNT(*) FROM t1 WHERE t1.id = t.id);
```

For a comparison performed with one of these operators, the subquery must return a scalar, with the exception that = can be used with row subqueries. See [Section 13.2.8.5, “Row Subqueries”](#).

### 13.2.8.3. Subqueries with **ANY**, **IN**, and **SOME**

Syntax:

```
operand comparison_operator ANY (subquery)
operand IN (subquery)
operand comparison_operator SOME (subquery)
```

The **ANY** keyword, which must follow a comparison operator, means “return **TRUE** if the comparison is **TRUE** for **ANY** of the values in the column that the subquery returns.” For example:

```
SELECT s1 FROM t1 WHERE s1 > ANY (SELECT s1 FROM t2);
```

Suppose that there is a row in table *t1* containing (10). The expression is **TRUE** if table *t2* contains (21, 14, 7) because there is a value 7 in *t2* that is less than 10. The expression is **FALSE** if table *t2* contains (20, 10), or if table *t2* is empty. The expression is **UNKNOWN** if table *t2* contains (NULL, NULL, NULL).

The word **IN** is an alias for = **ANY**. Thus, these two statements are the same:

```
SELECT s1 FROM t1 WHERE s1 = ANY (SELECT s1 FROM t2);
SELECT s1 FROM t1 WHERE s1 IN (SELECT s1 FROM t2);
```

However, **NOT IN** is not an alias for <> **ANY**, but for <> **ALL**. See [Section 13.2.8.4, “Subqueries with ALL”](#).

The word **SOME** is an alias for **ANY**. Thus, these two statements are the same:

```
SELECT s1 FROM t1 WHERE s1 <> ANY (SELECT s1 FROM t2);
SELECT s1 FROM t1 WHERE s1 <> SOME (SELECT s1 FROM t2);
```

Use of the word **SOME** is rare, but this example shows why it might be useful. To most people's ears, the English phrase “a is not equal to any b” means “there is no b which is equal to a,” but that is not what is meant by the SQL syntax. The syntax means “there is some b to which a is not equal.” Using **<> SOME** instead helps ensure that everyone understands the true meaning of the query.

### 13.2.8.4. Subqueries with **ALL**

Syntax:

```
operand comparison_operator ALL (subquery)
```

The word **ALL**, which must follow a comparison operator, means “return **TRUE** if the comparison is **TRUE** for **ALL** of the values in the column that the subquery returns.” For example:

```
SELECT s1 FROM t1 WHERE s1 > ALL (SELECT s1 FROM t2);
```

Suppose that there is a row in table **t1** containing **(10)**. The expression is **TRUE** if table **t2** contains **(-5, 0, +5)** because **10** is greater than all three values in **t2**. The expression is **FALSE** if table **t2** contains **(12, 6, NULL, -100)** because there is a single value **12** in table **t2** that is greater than **10**. The expression is *unknown* (that is, **NULL**) if table **t2** contains **(0, NULL, 1)**.

Finally, if table **t2** is empty, the result is **TRUE**. So, the following statement is **TRUE** when table **t2** is empty:

```
SELECT * FROM t1 WHERE 1 > ALL (SELECT s1 FROM t2);
```

But this statement is **NULL** when table **t2** is empty:

```
SELECT * FROM t1 WHERE 1 > (SELECT s1 FROM t2);
```

In addition, the following statement is **NULL** when table **t2** is empty:

```
SELECT * FROM t1 WHERE 1 > ALL (SELECT MAX(s1) FROM t2);
```

In general, *tables containing NULL values* and *empty tables* are “edge cases.” When writing subquery code, always consider whether you have taken those two possibilities into account.

**NOT IN** is an alias for **<> ALL**. Thus, these two statements are the same:

```
SELECT s1 FROM t1 WHERE s1 <> ALL (SELECT s1 FROM t2);
SELECT s1 FROM t1 WHERE s1 NOT IN (SELECT s1 FROM t2);
```

### 13.2.8.5. Row Subqueries

The discussion to this point has been of scalar or column subqueries; that is, subqueries that return a single value or a column of values. A *row subquery* is a subquery variant that returns a single row and can thus return more than one column value. Here are two examples:

```
SELECT * FROM t1 WHERE (1,2) = (SELECT column1, column2 FROM t2);
SELECT * FROM t1 WHERE ROW(1,2) = (SELECT column1, column2 FROM t2);
```

The queries here are both **TRUE** if table **t2** has a row where **column1 = 1** and **column2 = 2**.

The expressions **(1, 2)** and **ROW(1, 2)** are sometimes called *row constructors*. The two are equivalent. They are legal in other contexts as well. For example, the following two statements are semantically equivalent (although in MySQL 4.1 only the second one can be optimized):

```
SELECT * FROM t1 WHERE (column1,column2) = (1,1);
SELECT * FROM t1 WHERE column1 = 1 AND column2 = 1;
```

The normal use of row constructors is for comparisons with subqueries that return two or more columns. For example, the following query answers the request, “find all rows in table `t1` that also exist in table `t2`”:

```
SELECT column1,column2,column3
FROM t1
WHERE (column1,column2,column3) IN
      (SELECT column1,column2,column3 FROM t2);
```

### 13.2.8.6. EXISTS and NOT EXISTS

If a subquery returns any rows at all, `EXISTS subquery` is `TRUE`, and `NOT EXISTS subquery` is `FALSE`. For example:

```
SELECT column1 FROM t1 WHERE EXISTS (SELECT * FROM t2);
```

Traditionally, an `EXISTS` subquery starts with `SELECT *`, but it could begin with `SELECT 5` or `SELECT column1` or anything at all. MySQL ignores the `SELECT` list in such a subquery, so it makes no difference.

For the preceding example, if `t2` contains any rows, even rows with nothing but `NULL` values, the `EXISTS` condition is `TRUE`. This is actually an unlikely example because a `[NOT] EXISTS` subquery almost always contains correlations. Here are some more realistic examples:

- What kind of store is present in one or more cities?

```
SELECT DISTINCT store_type FROM stores
WHERE EXISTS (SELECT * FROM cities_stores
              WHERE cities_stores.store_type = stores.store_type);
```

- What kind of store is present in no cities?

```
SELECT DISTINCT store_type FROM stores
WHERE NOT EXISTS (SELECT * FROM cities_stores
                  WHERE cities_stores.store_type = stores.store_type);
```

- What kind of store is present in all cities?

```
SELECT DISTINCT store_type FROM stores s1
WHERE NOT EXISTS (
  SELECT * FROM cities WHERE NOT EXISTS (
    SELECT * FROM cities_stores
    WHERE cities_stores.city = cities.city
    AND cities_stores.store_type = stores.store_type));
```

The last example is a double-nested `NOT EXISTS` query. That is, it has a `NOT EXISTS` clause within a `NOT EXISTS` clause. Formally, it answers the question “does a city exist with a store that is not in `Stores`”? But it is easier to say that a nested `NOT EXISTS` answers the question “is `x TRUE` for all `y`?”

### 13.2.8.7. Correlated Subqueries

A *correlated subquery* is a subquery that contains a reference to a table that also appears in the outer query. For example:

```
SELECT * FROM t1 WHERE column1 = ANY
      (SELECT column1 FROM t2 WHERE t2.column2 = t1.column2);
```

Notice that the subquery contains a reference to a column of `t1`, even though the subquery's `FROM` clause does not mention a table `t1`. So, MySQL looks outside the subquery, and finds `t1` in the outer query.

Suppose that table `t1` contains a row where `column1 = 5` and `column2 = 6`; meanwhile, table `t2` contains a row where `column1 = 5` and `column2 = 7`. The simple expression `... WHERE column1 = ANY (SELECT column1 FROM t2)` would be `TRUE`, but in this example, the `WHERE` clause within the subquery is `FALSE` (because `(5, 6)` is not equal to `(5, 7)`), so the subquery as a whole is `FALSE`.

**Scoping rule:** MySQL evaluates from inside to outside. For example:

```
SELECT column1 FROM t1 AS x
      WHERE x.column1 = (SELECT column1 FROM t2 AS x
                        WHERE x.column1 = (SELECT column1 FROM t3
                                          WHERE x.column2 = t3.column1));
```

In this statement, `x.column2` must be a column in table `t2` because `SELECT column1 FROM t2 AS x ...` renames `t2`. It is not a column in table `t1` because `SELECT column1 FROM t1 ...` is an outer query that is *farther out*.

For subqueries in `HAVING` or `ORDER BY` clauses, MySQL also looks for column names in the outer select list.

For certain cases, a correlated subquery is optimized. For example:

```
val IN (SELECT key_val FROM tbl_name WHERE correlated_condition)
```

Otherwise, they are inefficient and likely to be slow. Rewriting the query as a join might improve performance.

Correlated subqueries cannot refer to the results of aggregate functions from the outer query.

### 13.2.8.8. Subqueries in the `FROM` clause

Subqueries are legal in a `SELECT` statement's `FROM` clause. The actual syntax is:

```
SELECT ... FROM (subquery) [AS] name ...
```

The `[AS] name` clause is mandatory, because every table in a `FROM` clause must have a name. Any columns in the `subquery` select list must have unique names. You can find this syntax described elsewhere in this manual, where the term used is “derived tables.”

For the sake of illustration, assume that you have this table:

```
CREATE TABLE t1 (s1 INT, s2 CHAR(5), s3 FLOAT);
```

Here is how to use a subquery in the `FROM` clause, using the example table:

```
INSERT INTO t1 VALUES (1, '1', 1.0);
INSERT INTO t1 VALUES (2, '2', 2.0);
SELECT sb1, sb2, sb3
      FROM (SELECT s1 AS sb1, s2 AS sb2, s3*2 AS sb3 FROM t1) AS sb
      WHERE sb1 > 1;
```

Result: 2, '2', 4.0.

Here is another example: Suppose that you want to know the average of a set of sums for a grouped table. This does not work:

```
SELECT AVG(SUM(column1)) FROM t1 GROUP BY column1;
```

However, this query provides the desired information:

```
SELECT AVG(sum_column1)
       FROM (SELECT SUM(column1) AS sum_column1
             FROM t1 GROUP BY column1) AS t1;
```

Notice that the column name used within the subquery (`sum_column1`) is recognized in the outer query.

Subqueries in the `FROM` clause can return a scalar, column, row, or table. Subqueries in the `FROM` clause cannot be correlated subqueries.

Subqueries in the `FROM` clause are executed even for the `EXPLAIN` statement (that is, derived temporary tables are built). This occurs because upper level queries need information about all tables during optimization phase.

### 13.2.8.9. Subquery Errors

There are some errors that apply only to subqueries. This section describes them.

- Unsupported subquery syntax:

```
ERROR 1235 (ER_NOT_SUPPORTED_YET)
SQLSTATE = 42000
Message = "This version of MySQL does not yet support
'LIMIT & IN/ALL/ANY/SOME subquery'"
```

This means that statements of the following form do not work yet:

```
SELECT * FROM t1 WHERE s1 IN (SELECT s2 FROM t2 ORDER BY s1 LIMIT 1)
```

- Incorrect number of columns from subquery:

```
ERROR 1241 (ER_OPERAND_COL)
SQLSTATE = 21000
Message = "Operand should contain 1 column(s)"
```

This error occurs in cases like this:

```
SELECT (SELECT column1, column2 FROM t2) FROM t1;
```

You may use a subquery that returns multiple columns, if the purpose is comparison. See [Section 13.2.8.5, “Row Subqueries”](#). However, in other contexts, the subquery must be a scalar operand.

- Incorrect number of rows from subquery:

```
ERROR 1242 (ER_SUBSELECT_NO_1_ROW)
SQLSTATE = 21000
Message = "Subquery returns more than 1 row"
```

This error occurs for statements where the subquery returns more than one row. Consider the following example:

```
SELECT * FROM t1 WHERE column1 = (SELECT column1 FROM t2);
```

If `SELECT column1 FROM t2` returns just one row, the previous query will work. If the subquery returns more than one row, error 1242 will occur. In that case, the query should be rewritten as:

```
SELECT * FROM t1 WHERE column1 = ANY (SELECT column1 FROM t2);
```

- Incorrectly used table in subquery:

```
Error 1093 (ER_UPDATE_TABLE_USED)
SQLSTATE = HY000
Message = "You can't specify target table 'x'
for update in FROM clause"
```

This error occurs in cases such as the following:

```
UPDATE t1 SET column2 = (SELECT MAX(column1) FROM t1);
```

You can use a subquery for assignment within an `UPDATE` statement because subqueries are legal in `UPDATE` and `DELETE` statements as well as in `SELECT` statements. However, you cannot use the same table (in this case, table `t1`) for both the subquery's `FROM` clause and the update target.

For transactional storage engines, the failure of a subquery causes the entire statement to fail. For non-transactional storage engines, data modifications made before the error was encountered are preserved.

### 13.2.8.10. Optimizing Subqueries

Development is ongoing, so no optimization tip is reliable for the long term. The following list provides some interesting tricks that you might want to play with:

- Use subquery clauses that affect the number or order of the rows in the subquery. For example:

```
SELECT * FROM t1 WHERE t1.column1 IN
  (SELECT column1 FROM t2 ORDER BY column1);
SELECT * FROM t1 WHERE t1.column1 IN
  (SELECT DISTINCT column1 FROM t2);
SELECT * FROM t1 WHERE EXISTS
  (SELECT * FROM t2 LIMIT 1);
```

- Replace a join with a subquery. For example, try this:

```
SELECT DISTINCT column1 FROM t1 WHERE t1.column1 IN (
  SELECT column1 FROM t2);
```

Instead of this:

```
SELECT DISTINCT t1.column1 FROM t1, t2
WHERE t1.column1 = t2.column1;
```

- Some subqueries can be transformed to joins for compatibility with older versions of MySQL before 4.1 that do not support subqueries. However, in some cases, converting a subquery to a join may also improve performance. See [Section 13.2.8.11, “Rewriting Subqueries as Joins for Earlier MySQL](#)

**Versions”.**

- Move clauses from outside to inside the subquery. For example, use this query:

```
SELECT * FROM t1
WHERE s1 IN (SELECT s1 FROM t1 UNION ALL SELECT s1 FROM t2);
```

Instead of this query:

```
SELECT * FROM t1
WHERE s1 IN (SELECT s1 FROM t1) OR s1 IN (SELECT s1 FROM t2);
```

For another example, use this query:

```
SELECT (SELECT column1 + 5 FROM t1) FROM t2;
```

Instead of this query:

```
SELECT (SELECT column1 FROM t1) + 5 FROM t2;
```

- Use a row subquery instead of a correlated subquery. For example, use this query:

```
SELECT * FROM t1
WHERE (column1,column2) IN (SELECT column1,column2 FROM t2);
```

Instead of this query:

```
SELECT * FROM t1
WHERE EXISTS (SELECT * FROM t2 WHERE t2.column1=t1.column1
AND t2.column2=t1.column2);
```

- Use `NOT (a = ANY (...))` rather than `a <> ALL (...)`.
- Use `x = ANY (table containing (1,2))` rather than `x=1 OR x=2`.
- Use `= ANY` rather than `EXISTS`.
- For uncorrelated subqueries that always return one row, `IN` is always slower than `=`. For example, use this query:

```
SELECT * FROM t1 WHERE t1.col_name
= (SELECT a FROM t2 WHERE b = some_const);
```

Instead of this query:

```
SELECT * FROM t1 WHERE t1.col_name
IN (SELECT a FROM t2 WHERE b = some_const);
```

These tricks might cause programs to go faster or slower. Using MySQL facilities like the `BENCHMARK()` function, you can get an idea about what helps in your own situation. See [Section 12.9.3, “Information Functions”](#).

Some optimizations that MySQL itself makes are:

- MySQL executes non-correlated subqueries only once. Use `EXPLAIN` to make sure that a given subquery really is non-correlated.

- MySQL rewrites `IN`, `ALL`, `ANY`, and `SOME` subqueries in an attempt to take advantage of the possibility that the select-list columns in the subquery are indexed.
- MySQL replaces subqueries of the following form with an index-lookup function, which `EXPLAIN` describes as a special join type (`unique_subquery` or `index_subquery`):

```
... IN (SELECT indexed_column FROM single_table ...)
```

- MySQL enhances expressions of the following form with an expression involving `MIN()` or `MAX()`, unless `NULL` values or empty sets are involved:

```
value {ALL|ANY|SOME} {> | < | >= | <=} (non-correlated subquery)
```

For example, this `WHERE` clause:

```
WHERE 5 > ALL (SELECT x FROM t)
```

might be treated by the optimizer like this:

```
WHERE 5 > (SELECT MAX(x) FROM t)
```

There is a chapter titled “How MySQL Transforms Subqueries” in the MySQL Internals Manual, available at <http://dev.mysql.com/doc/>.

### 13.2.8.11. Rewriting Subqueries as Joins for Earlier MySQL Versions

Before MySQL 4.1, only nested queries of the form `INSERT ... SELECT ...` and `REPLACE ... SELECT ...` are supported. The `IN()` construct can be used in other contexts to test membership in a set of values.

It is often possible to rewrite a query without a subquery:

```
SELECT * FROM t1 WHERE id IN (SELECT id FROM t2);
```

This can be rewritten as:

```
SELECT DISTINCT t1.* FROM t1, t2 WHERE t1.id=t2.id;
```

The queries:

```
SELECT * FROM t1 WHERE id NOT IN (SELECT id FROM t2);
SELECT * FROM t1 WHERE NOT EXISTS (SELECT id FROM t2 WHERE t1.id=t2.id);
```

Can be be rewritten using `IN()`:

```
SELECT table1.* FROM table1
LEFT JOIN table2 ON table1.id=table2.id
WHERE table2.id IS NULL;
```

A `LEFT [OUTER] JOIN` can be faster than an equivalent subquery because the server might be able to optimize it better — a fact that is not specific to MySQL Server alone. Prior to SQL-92, outer joins did not exist, so subqueries were the only way to do certain things. Today, MySQL Server and many other modern database systems offer a wide range of outer join types.

For more complicated subqueries, you can often create temporary tables to hold the subquery. In some

cases, however, this option does not work. The most frequently encountered of these cases arises with `DELETE` statements, for which standard SQL does not support joins (except in subqueries). For this situation, there are three options available:

- The first option is to upgrade to MySQL 4.1, which does support subqueries in `DELETE` statements.
- The second option is to use a procedural programming language (such as Perl or PHP) to submit a `SELECT` query which obtains the primary keys for the rows to be deleted, and then use these values to construct the appropriate `DELETE` statement (`DELETE FROM ... WHERE key_col IN (key1, key2, ...)`).
- The third option is to use interactive SQL to construct a set of `DELETE` statements automatically, using the MySQL extension `CONCAT()` (in lieu of the standard `||` operator). For example:

```
SELECT
  CONCAT('DELETE FROM tabl WHERE pkid = ', "", tabl.pkid, "", ';')
  FROM tabl, tab2
  WHERE tabl.col1 = tab2.col2;
```

You can place this query in a script file, use the file as input to one instance of the `mysql` program, and use the program output as input to a second instance of `mysql`:

```
shell> mysql --skip-column-names mydb < myscript.sql | mysql mydb
```

MySQL Server 4.0 supports multiple-table `DELETE` statements that can be used to efficiently delete rows based on information from one table or even from many tables at the same time. Multiple-table `UPDATE` statements are also supported as of MySQL 4.0.

## 13.2.9. TRUNCATE Syntax

```
TRUNCATE [TABLE] tbl_name
```

`TRUNCATE TABLE` empties a table completely. Logically, this is equivalent to a `DELETE` statement that deletes all rows, but there are practical differences under some circumstances.

For `InnoDB`, `TRUNCATE TABLE` is mapped to `DELETE`, so there is no difference.

For other storage engines, `TRUNCATE TABLE` differs from `DELETE` in the following ways from MySQL 4.0 onward:

- Truncate operations drop and re-create the table, which is much faster than deleting rows one by one.
- Truncate operations are not transaction-safe; an error occurs when attempting one in the course of an active transaction or active table lock.
- The number of deleted rows is not returned.
- As long as the table format file `tbl_name.frm` is valid, the table can be re-created as an empty table with `TRUNCATE TABLE`, even if the data or index files have become corrupted.
- The table handler does not remember the last used `AUTO_INCREMENT` value, but starts counting from the beginning. This is true even for `MyISAM` and `InnoDB`, which normally do not reuse sequence values.

In MySQL 3.23, `TRUNCATE TABLE` is mapped to `COMMIT; DELETE FROM tbl_name`, so it behaves like `DELETE`. See [Section 13.2.1, “DELETE Syntax”](#).

`TRUNCATE TABLE` is an Oracle SQL extension. This statement was added in MySQL 3.23.28, although from 3.23.28 to 3.23.32, the keyword `TABLE` must be omitted.

## 13.2.10. UPDATE Syntax

Single-table syntax:

```
UPDATE [LOW_PRIORITY] [IGNORE] tbl_name
SET col_name1=expr1 [, col_name2=expr2 ...]
[WHERE where_condition]
[ORDER BY ...]
[LIMIT row_count]
```

Multiple-table syntax:

```
UPDATE [LOW_PRIORITY] [IGNORE] table_references
SET col_name1=expr1 [, col_name2=expr2 ...]
[WHERE where_condition]
```

For the single-table syntax, the `UPDATE` statement updates columns of existing rows in `tbl_name` with new values. The `SET` clause indicates which columns to modify and the values they should be given. The `WHERE` clause, if given, specifies the conditions that identify which rows to update. With no `WHERE` clause, all rows are updated. If the `ORDER BY` clause is specified, the rows are updated in the order that is specified. The `LIMIT` clause places a limit on the number of rows that can be updated.

For the multiple-table syntax, `UPDATE` updates rows in each table named in `table_references` that satisfy the conditions. In this case, `ORDER BY` and `LIMIT` cannot be used.

`where_condition` is an expression that evaluates to true for each row to be updated. It is specified as described in [Section 13.2.7, “SELECT Syntax”](#).

The `UPDATE` statement supports the following modifiers:

- If you use the `LOW_PRIORITY` keyword, execution of the `UPDATE` is delayed until no other clients are reading from the table.
- If you use the `IGNORE` keyword, the update statement does not abort even if errors occur during the update. Rows for which duplicate-key conflicts occur are not updated. Rows for which columns are updated to values that would cause data conversion errors are updated to the closest valid values instead.

If you access a column from `tbl_name` in an expression, `UPDATE` uses the current value of the column. For example, the following statement sets the `age` column to one more than its current value:

```
UPDATE persondata SET age=age+1;
```

Single-table `UPDATE` assignments are generally evaluated from left to right. For multiple-table updates, there is no guarantee that assignments are carried out in any particular order.

If you set a column to the value it currently has, MySQL notices this and does not update it.

If you update a column that has been declared `NOT NULL` by setting to `NULL`, the column is set to the default value appropriate for the data type and the warning count is incremented. The default value is 0 for numeric types, the empty string ( ' ' ) for string types, and the “zero” value for date and time types.

`UPDATE` returns the number of rows that were actually changed. In MySQL 3.22 or later, the `mysql_info()` C API function returns the number of rows that were matched and updated and the number of warnings that occurred during the `UPDATE`.

Starting from MySQL 3.23, you can use `LIMIT row_count` to restrict the scope of the `UPDATE`. A `LIMIT` clause works as follows:

- Before MySQL 4.0.13, `LIMIT` is a rows-affected restriction. The statement stops as soon as it has changed `row_count` rows that satisfy the `WHERE` clause.
- From 4.0.13 on, `LIMIT` is a rows-matched restriction. The statement stops as soon as it has found `row_count` rows that satisfy the `WHERE` clause, whether or not they actually were changed.

If an `UPDATE` statement includes an `ORDER BY` clause, the rows are updated in the order specified by the clause. `ORDER BY` can be used from MySQL 4.0.0. This can be useful in certain situations that might otherwise result in an error. Suppose that a table `t` contains a column `id` that has a unique index. The following statement could fail with a duplicate-key error, depending on the order in which rows are updated:

```
UPDATE t SET id = id + 1;
```

For example, if the table contains 1 and 2 in the `id` column and 1 is updated to 2 before 2 is updated to 3, an error occurs. To avoid this problem, add an `ORDER BY` clause to cause the rows with larger `id` values to be updated before those with smaller values:

```
UPDATE t SET id = id + 1 ORDER BY id DESC;
```

Starting with MySQL 4.0.4, you can also perform `UPDATE` operations covering multiple tables. However, you cannot use `ORDER BY` or `LIMIT` with a multiple-table `UPDATE`. The `table_references` clause lists the tables involved in the join. Its syntax is described in [Section 13.2.7.1, “JOIN Syntax”](#). Here is an example:

```
UPDATE items,month SET items.price=month.price
WHERE items.id=month.id;
```

The preceding example shows an inner join that uses the comma operator, but multiple-table `UPDATE` statements can use any type of join allowed in `SELECT` statements, such as `LEFT JOIN`.

Before MySQL 4.0.18, you need the `UPDATE` privilege for all tables used in a multiple-table `UPDATE`, even if they were not updated. As of MySQL 4.0.18, you need only the `SELECT` privilege for any columns that are read but not modified.

If you use a multiple-table `UPDATE` statement involving `InnoDB` tables for which there are foreign key constraints, the MySQL optimizer might process tables in an order that differs from that of their parent/child relationship. In this case, the statement fails and rolls back. Instead, update a single table and rely on the `ON UPDATE` capabilities that `InnoDB` provides to cause the other tables to be modified accordingly. See [Section 14.2.7.4, “FOREIGN KEY Constraints”](#).

Currently, you cannot update a table and select from the same table in a subquery.

## 13.3. MySQL Utility Statements

### 13.3.1. DESCRIBE Syntax

```
{DESCRIBE | DESC} tbl_name [col_name | wild]
```

`DESCRIBE` provides information about the columns in a table. It is a shortcut for `SHOW COLUMNS FROM`. (See [Section 13.5.4.3](#), “`SHOW COLUMNS Syntax`”.)

`col_name` can be a column name, or a string containing the SQL ‘%’ and ‘\_’ wildcard characters to obtain output only for the columns with names matching the string. There is no need to enclose the string within quotes unless it contains spaces or other special characters.

```
mysql> DESCRIBE city;
+-----+-----+-----+-----+-----+-----+
| Field      | Type      | Null | Key | Default | Extra      |
+-----+-----+-----+-----+-----+-----+
| Id         | int(11)   |      | PRI | NULL    | auto_increment |
| Name      | char(35)  |      |     |         |              |
| Country   | char(3)   |      |     |         |              |
| District  | char(20)  | YES  | UNI |         |              |
| Population| int(11)   |      | MUL | 0       |              |
+-----+-----+-----+-----+-----+-----+
5 rows in set (0.00 sec)
```

`Field` indicates the column name.

The `Null` field indicates whether `NULL` values can be stored in the column, with `YES` displayed when `NULL` values are allowed.

The `Key` field indicates whether the column is indexed. A value of `PRI` indicates that the column is part of the table's primary key. `UNI` indicates that the column is part of a `UNIQUE` index. The `MUL` value indicates that multiple occurrences of a given value are allowed within the column.

One reason for `MUL` to be displayed on a `UNIQUE` index is that several columns form a composite `UNIQUE` index; although the combination of the columns is unique, each column can still hold multiple occurrences of a given value. Note that in a composite index, only the leftmost column of the index has an entry in the `Key` field.

If the column allows `NULL` values, the `Key` value can be `MUL` even when a `UNIQUE` index is used. The rationale is that multiple rows in a `UNIQUE` index can hold a `NULL` value if the column is not declared `NOT NULL`. (This behavior changes in MySQL 5.0.)

The `Default` field indicates the default value that is assigned to the column.

The `Extra` field contains any additional information that is available about a given column. In the example shown, the `Extra` field indicates that the `Id` column was created with the `AUTO_INCREMENT` keyword.

If the data types are different from what you expect them to be based on a `CREATE TABLE` statement, note that MySQL sometimes changes data types. See [Section 13.1.5.1](#), “`Silent Column Specification Changes`”.

The `DESCRIBE` statement is provided for compatibility with Oracle.

The `SHOW CREATE TABLE` and `SHOW TABLE STATUS` statements also provide information about tables. See [Section 13.5.4](#), “`SHOW Syntax`”.

## 13.3.2. `HELP Syntax`

```
HELP 'search_string'
```

The `HELP` statement returns online information from the MySQL Reference manual. Its proper operation requires that the help tables in the `mysql` database be initialized with help topic information (see [Section 5.2.7](#), “`Server-Side Help`”).

The `HELP` statement searches the help tables for the given search string and displays the result of the search. The search string is not case sensitive.

The `HELP` statement understands several types of search strings:

- At the most general level, use `contents` to retrieve a list of the top-level help categories:

```
HELP 'contents'
```

- For a list of topics in a given help category, such as `Data Types`, use the category name:

```
HELP 'data types'
```

- For help on a specific help topic, such as as the `ASCII ( )` function or the `CREATE TABLE` statement, use the associated keyword or keywords:

```
HELP 'ascii'
HELP 'create table'
```

In other words, the search string matches a category, many topics, or a single topic. You cannot necessarily tell in advance whether a given search string will return a list of items or the help information for a single help topic. However, you can tell what kind of response `HELP` returned by examining the number of rows and columns in the result set.

The following descriptions indicate the forms that the result set can take. Output for the example statements is shown using the familiar “tabular” or “vertical” format that you see when using the `mysql` client, but note that `mysql` itself reformats `HELP` result sets in a different way.

- Empty result set

No match could be found for the search string.

- Result set containing a single row with three columns

This means that the search string yielded a hit for the help topic. The result has three columns:

- `name`: The topic name.
- `description`: Descriptive help text for the topic.
- `example`: Usage example or examples. This column might be blank.

Example: `HELP 'replace'`

Yields:

```
name: REPLACE
description: Syntax:
REPLACE(str,from_str,to_str)

Returns the string str with all occurrences of the string from_str
replaced by the string to_str. REPLACE() performs a case-sensitive
match when searching for from_str.
example: mysql> SELECT REPLACE('www.mysql.com', 'w', 'Ww');
-> 'WwWwWw.mysql.com'
```

- Result set containing multiple rows with two columns

This means that the search string matched many help topics. The result set indicates the help topic names:

- `name`: The help topic name.
- `is_it_category`: `Y` if the name represents a help category, `N` if it does not. If it does not, the `name` value when specified as the argument to the `HELP` statement should yield a single-row result set containing a description for the named item.

Example: `HELP 'status'`

Yields:

name	is_it_category
SHOW	N
SHOW ENGINE	N
SHOW INNODB STATUS	N
SHOW MASTER STATUS	N
SHOW SLAVE STATUS	N
SHOW STATUS	N
SHOW TABLE STATUS	N

- Result set containing multiple rows with three columns

This means the search string matches a category. The result set contains category entries:

- `source_category_name`: The help category name.
- `name`: The category or topic name
- `is_it_category`: `Y` if the name represents a help category, `N` if it does not. If it does not, the `name` value when specified as the argument to the `HELP` statement should yield a single-row result set containing a description for the named item.

Example: `HELP 'functions'`

Yields:

source_category_name	name	is_it_category
Functions	CREATE FUNCTION	N
Functions	DROP FUNCTION	N
Functions	Bit Functions	Y
Functions	Comparison operators	Y
Functions	Control flow functions	Y
Functions	Date and Time Functions	Y
Functions	Encryption Functions	Y
Functions	Information Functions	Y
Functions	Logical operators	Y
Functions	Miscellaneous Functions	Y
Functions	Numeric Functions	Y
Functions	String Functions	Y

The `HELP` statement was added in MySQL 4.1.

### 13.3.3. USE Syntax

USE `db_name`

The `USE db_name` statement tells MySQL to use the `db_name` database as the default (current) database for subsequent statements. The database remains the default until the end of the session or another `USE` statement is issued:

```
USE db1;
SELECT COUNT(*) FROM mytable;    # selects from db1.mytable
USE db2;
SELECT COUNT(*) FROM mytable;    # selects from db2.mytable
```

Making a particular database the default by means of the `USE` statement does not preclude you from accessing tables in other databases. The following example accesses the `author` table from the `db1` database and the `editor` table from the `db2` database:

```
USE db1;
SELECT author_name,editor_name FROM author,db2.editor
WHERE author.editor_id = db2.editor.editor_id;
```

The `USE` statement is provided for compatibility with Sybase.

## 13.4. MySQL Transactional and Locking Statements

### 13.4.1. `START TRANSACTION`, `COMMIT`, and `ROLLBACK` Syntax

```
START TRANSACTION | BEGIN [WORK]
COMMIT
ROLLBACK
SET AUTOCOMMIT = {0 | 1}
```

The `START TRANSACTION` and `BEGIN` statement begin a new transaction. `COMMIT` commits the current transaction, making its changes permanent. `ROLLBACK` rolls back the current transaction, canceling its changes. The `SET AUTOCOMMIT` statement disables or enables the default autocommit mode for the current connection.

By default, MySQL runs with autocommit mode enabled. This means that as soon as you execute a statement that updates (modifies) a table, MySQL stores the update on disk.

If you are using a transaction-safe storage engine (such as `InnoDB`, `BDB`, or `NDB Cluster`), you can disable autocommit mode with the following statement:

```
SET AUTOCOMMIT=0;
```

After disabling autocommit mode by setting the `AUTOCOMMIT` variable to zero, you must use `COMMIT` to store your changes to disk or `ROLLBACK` if you want to ignore the changes you have made since the beginning of your transaction.

To disable autocommit mode for a single series of statements, use the `START TRANSACTION` statement:

```
START TRANSACTION;
SELECT @A:=SUM(salary) FROM table1 WHERE type=1;
UPDATE table2 SET summary=@A WHERE type=1;
COMMIT;
```

With `START TRANSACTION`, autocommit remains disabled until you end the transaction with `COMMIT` or `ROLLBACK`. The autocommit mode then reverts to its previous state.

`BEGIN` and `BEGIN WORK` are supported as aliases of `START TRANSACTION` for initiating a transac-

tion. `START TRANSACTION` was added in MySQL 4.0.11. This is standard SQL syntax and is the recommended way to start an ad-hoc transaction. `BEGIN` and `BEGIN WORK` are available from MySQL 3.23.17 and 3.23.19, respectively.

As of MySQL 4.1.8, you can begin a transaction like this:

```
START TRANSACTION WITH CONSISTENT SNAPSHOT;
```

The `WITH CONSISTENT SNAPSHOT` clause starts a consistent read for storage engines that are capable of it. Currently, this applies only to `InnoDB`. The effect is the same as issuing a `START TRANSACTION` followed by a `SELECT` from any `InnoDB` table. See [Section 14.2.11.4, “Consistent Non-Locking Read”](#).

The `WITH CONSISTENT SNAPSHOT` clause does not change the current transaction isolation level, so it provides a consistent snapshot only if the current isolation level is one that allows consistent read (`REPEATABLE READ` or `SERIALIZABLE`).

Beginning a transaction causes an implicit `UNLOCK TABLES` to be performed.

For best results, transactions should be performed using only tables managed by a single transactional storage engine. Otherwise, the following problems can occur:

- If you use tables from more than one transaction-safe storage engine (such as `InnoDB` and `BDB`), and the transaction isolation level is not `SERIALIZABLE`, it is possible that when one transaction commits, another ongoing transaction that uses the same tables will see only some of the changes made by the first transaction. That is, the atomicity of transactions is not guaranteed with mixed engines and inconsistencies can result. (If mixed-engine transactions are infrequent, you can use `SET TRANSACTION ISOLATION LEVEL` to set the isolation level to `SERIALIZABLE` on a per-transaction basis as necessary.)
- If you use non-transaction-safe tables within a transaction, any changes to those tables are stored at once, regardless of the status of autocommit mode.

If you issue a `ROLLBACK` statement after updating a non-transactional table within a transaction, an `ER_WARNING_NOT_COMPLETE_ROLLBACK` warning occurs. Changes to transaction-safe tables are rolled back, but not changes to non-transaction-safe tables.

If you are using `START TRANSACTION` or `SET AUTOCOMMIT=0`, you should use the MySQL binary log for backups instead of the older update log. Transactions are stored in the binary log in one chunk, upon `COMMIT`. Transactions that are rolled back are not logged. (**Exception:** Modifications to non-transactional tables cannot be rolled back. If a transaction that is rolled back includes modifications to non-transactional tables, the entire transaction is logged with a `ROLLBACK` statement at the end to ensure that the modifications to those tables are replicated. This is true as of MySQL 4.0.15.) See [Section 5.11.4, “The Binary Log”](#).

You can change the isolation level for transactions with `SET TRANSACTION ISOLATION LEVEL`. See [Section 13.4.6, “SET TRANSACTION Syntax”](#).

Rolling back can be a slow operation that may occur without the user having explicitly asked for it (for example, when an error occurs). Because of this, `SHOW PROCESSLIST` displays `Rolling back` in the `State` column for the connection during implicit and explicit (`ROLLBACK` SQL statement) roll-backs, starting from MySQL 4.1.8.

## 13.4.2. Statements That Cannot Be Rolled Back

Some statements cannot be rolled back. In general, these include data definition language (DDL) statements, such as those that create or drop databases or those that create, drop, or alter tables.

You should design your transactions not to include such statements. If you issue a statement early in a transaction that cannot be rolled back, and then another statement later fails, the full effect of the transaction cannot be rolled back in such cases by issuing a `ROLLBACK` statement.

### 13.4.3. Statements That Cause an Implicit Commit

Each of the following statements (and any synonyms for them) implicitly end a transaction, as if you had done a `COMMIT` before executing the statement:

- `ALTER TABLE`, `BEGIN`, `CREATE DATABASE`, `CREATE INDEX`, `CREATE TABLE`, `DROP DATABASE`, `DROP INDEX`, `DROP TABLE`, `LOAD MASTER DATA`, `LOCK TABLES`, `RENAME TABLE`, `SET AUTOCOMMIT=1`, `START TRANSACTION`, `TRUNCATE TABLE`, `UNLOCK TABLES`.
- `UNLOCK TABLES` commits a transaction only if any tables currently are locked.
- Prior to MySQL 4.0.13, `CREATE TABLE` commits a transaction if the binary update log is enabled. The `CREATE TABLE`, `CREATE DATABASE DROP DATABASE`, and `TRUNCATE TABLE` statements cause an implicit commit beginning with MySQL 4.1.13.
- The `CREATE TABLE` statement in `InnoDB` is processed as a single transaction. This means that a `ROLLBACK` from the user does not undo `CREATE TABLE` statements the user made during that transaction.

Transactions cannot be nested. This is a consequence of the implicit `COMMIT` performed for any current transaction when you issue a `START TRANSACTION` statement or one of its synonyms.

### 13.4.4. `SAVEPOINT` and `ROLLBACK TO SAVEPOINT` Syntax

```
SAVEPOINT identifier
ROLLBACK TO SAVEPOINT identifier
```

Starting from MySQL 4.0.14 and 4.1.1, `InnoDB` supports the SQL statements `SAVEPOINT` and `ROLLBACK TO SAVEPOINT`.

The `SAVEPOINT` statement sets a named transaction save point with a name of *identifier*. If the current transaction has a save point with the same name, the old save point is deleted and a new one is set.

The `ROLLBACK TO SAVEPOINT` statement rolls back a transaction to the named save point. Modifications that the current transaction made to rows after the save point was set are undone in the rollback, but `InnoDB` does *not* release the row locks that were stored in memory after the save point. (Note that for a new inserted row, the lock information is carried by the transaction ID stored in the row; the lock is not separately stored in memory. In this case, the row lock is released in the undo.) Savepoints that were set at a later time than the named save point are deleted.

If the `ROLLBACK TO SAVEPOINT` statement returns the following error, it means that no savepoint with the specified name exists:

```
ERROR 1181: Got error 153 during ROLLBACK
```

All save points of the current transaction are deleted if you execute a `COMMIT`, or a `ROLLBACK` that does not name a save point.

### 13.4.5. `LOCK TABLES` and `UNLOCK TABLES` Syntax

```
LOCK TABLES
  tbl_name [AS alias] {READ [LOCAL] | [LOW_PRIORITY] WRITE}
  [, tbl_name [AS alias] {READ [LOCAL] | [LOW_PRIORITY] WRITE}] ...
UNLOCK TABLES
```

`LOCK TABLES` locks tables for the current thread. If any of the tables are locked by other threads, it blocks until all locks can be acquired. `UNLOCK TABLES` releases any locks held by the current thread. All tables that are locked by the current thread are implicitly unlocked when the thread issues another `LOCK TABLES`, or when the connection to the server is closed.

A table lock protects only against inappropriate reads or writes by other clients. The client holding the lock, even a read lock, can perform table-level operations such as `DROP TABLE`. Truncate operations are not transaction-safe, so an error occurs if the client attempts one during an active transaction or while holding a table lock.

Note the following regarding the use of `LOCK TABLES` with transactional tables:

- `LOCK TABLES` is not transaction-safe and implicitly commits any active transactions before attempting to lock the tables. Also, beginning a transaction (for example, with `START TRANSACTION`) implicitly performs an `UNLOCK TABLES`. (See [Section 13.4.3, “Statements That Cause an Implicit Commit”](#).)
- The correct way to use `LOCK TABLES` with transactional tables, such as `InnoDB` tables, is to set `AUTOCOMMIT = 0` and not to call `UNLOCK TABLES` until you commit the transaction explicitly. When you call `LOCK TABLES`, `InnoDB` internally takes its own table lock, and MySQL takes its own table lock. `InnoDB` releases its table lock at the next commit, but for MySQL to release its table lock, you have to call `UNLOCK TABLES`. You should not have `AUTOCOMMIT = 1`, because then `InnoDB` releases its table lock immediately after the call of `LOCK TABLES`, and deadlocks can very easily happen. Starting from 4.1.9, we do not acquire the `InnoDB` table lock at all if `AUTOCOMMIT=1`, to help old applications avoid unnecessary deadlocks.
- `ROLLBACK` does not release MySQL's non-transactional table locks.

As of MySQL 4.0.2, to use `LOCK TABLES` you must have the `LOCK TABLES` privilege and a `SELECT` privilege for the involved tables. In MySQL 3.23, you must have `SELECT`, `INSERT`, `DELETE`, and `UPDATE` privileges for the tables.

The main reasons to use `LOCK TABLES` are to emulate transactions or to get more speed when updating tables. This is explained in more detail later.

If a thread obtains a `READ` lock on a table, that thread (and all other threads) can only read from the table. If a thread obtains a `WRITE` lock on a table, only the thread holding the lock can write to the table. Other threads are blocked from reading or writing the table until the lock has been released.

The difference between `READ LOCAL` and `READ` is that `READ LOCAL` allows non-conflicting `INSERT` statements (concurrent inserts) to execute while the lock is held. However, this cannot be used if you are going to manipulate the database files outside MySQL while you hold the lock. For `InnoDB` tables, `READ LOCAL` is the same as `READ` as of MySQL 4.1.15. (Before that, `READ LOCAL` essentially does nothing: It does not lock the table at all, so for `InnoDB` tables, the use of `READ LOCAL` is deprecated because a plain consistent-read `SELECT` does the same thing, and no locks are needed.)

When you use `LOCK TABLES`, you must lock all tables that you are going to use in your queries. While the locks obtained with a `LOCK TABLES` statement are in effect, you cannot access any tables that were not locked by the statement. Also, you cannot use a locked table multiple times in a single query. Use aliases instead, in which case you must obtain a lock for each alias separately.

```
mysql> LOCK TABLE t WRITE, t AS t1 WRITE;
mysql> INSERT INTO t SELECT * FROM t;
```

```
ERROR 1100: Table 't' was not locked with LOCK TABLES
mysql> INSERT INTO t SELECT * FROM t AS t1;
```

If your queries refer to a table by means of an alias, you must lock the table using that same alias. It does not work to lock the table without specifying the alias:

```
mysql> LOCK TABLE t READ;
mysql> SELECT * FROM t AS myalias;
ERROR 1100: Table 'myalias' was not locked with LOCK TABLES
```

Conversely, if you lock a table using an alias, you must refer to it in your queries using that alias:

```
mysql> LOCK TABLE t AS myalias READ;
mysql> SELECT * FROM t;
ERROR 1100: Table 't' was not locked with LOCK TABLES
mysql> SELECT * FROM t AS myalias;
```

**WRITE** locks normally have higher priority than **READ** locks to ensure that updates are processed as soon as possible. This means that if one thread obtains a **READ** lock and then another thread requests a **WRITE** lock, subsequent **READ** lock requests wait until the **WRITE** thread has gotten the lock and released it. You can use **LOW\_PRIORITY WRITE** locks to allow other threads to obtain **READ** locks while the thread is waiting for the **WRITE** lock. You should use **LOW\_PRIORITY WRITE** locks only if you are sure that eventually there will be a time when no threads have a **READ** lock.

**LOCK TABLES** works as follows:

1. Sort all tables to be locked in an internally defined order. From the user standpoint, this order is undefined.
2. If a table is locked with a read and a write lock, put the write lock before the read lock.
3. Lock one table at a time until the thread gets all locks.

This policy ensures that table locking is deadlock free. There are, however, other things you need to be aware of about this policy: If you are using a **LOW\_PRIORITY WRITE** lock for a table, it means only that MySQL waits for this particular lock until there are no threads that want a **READ** lock. When the thread has gotten the **WRITE** lock and is waiting to get the lock for the next table in the lock table list, all other threads wait for the **WRITE** lock to be released. If this becomes a serious problem with your application, you should consider converting some of your tables to transaction-safe tables.

You can safely use **KILL** to terminate a thread that is waiting for a table lock. See [Section 13.5.5.3, “KILL Syntax”](#).

Note that you should *not* lock any tables that you are using with **INSERT DELAYED** because in that case the **INSERT** is performed by a separate thread.

Normally, you do not need to lock tables, because all single **UPDATE** statements are atomic; no other thread can interfere with any other currently executing SQL statement. However, there are a few cases when locking tables may provide an advantage:

- If you are going to run many operations on a set of **MyISAM** tables, it is much faster to lock the tables you are going to use. Locking **MyISAM** tables speeds up inserting, updating, or deleting on them. The downside is that no thread can update a **READ**-locked table (including the one holding the lock) and no thread can access a **WRITE**-locked table other than the one holding the lock.

The reason some **MyISAM** operations are faster under **LOCK TABLES** is that MySQL does not flush the key cache for the locked tables until **UNLOCK TABLES** is called. Normally, the key cache is

flushed after each SQL statement.

- If you are using a storage engine in MySQL that does not support transactions, you must use `LOCK TABLES` if you want to ensure that no other thread comes between a `SELECT` and an `UPDATE`. The example shown here requires `LOCK TABLES` to execute safely:

```
LOCK TABLES trans READ, customer WRITE;
SELECT SUM(value) FROM trans WHERE customer_id=some_id;
UPDATE customer
  SET total_value=sum_from_previous_statement
  WHERE customer_id=some_id;
UNLOCK TABLES;
```

Without `LOCK TABLES`, it is possible that another thread might insert a new row in the `trans` table between execution of the `SELECT` and `UPDATE` statements.

You can avoid using `LOCK TABLES` in many cases by using relative updates (`UPDATE customer SET value=value+new_value`) or the `LAST_INSERT_ID()` function. See [Section 1.9.5.3, “Transactions and Atomic Operations”](#).

You can also avoid locking tables in some cases by using the user-level advisory lock functions `GET_LOCK()` and `RELEASE_LOCK()`. These locks are saved in a hash table in the server and implemented with `pthread_mutex_lock()` and `pthread_mutex_unlock()` for high speed. See [Section 12.9.4, “Miscellaneous Functions”](#).

See [Section 7.3.1, “Locking Methods”](#), for more information on locking policy.

You can lock all tables in all databases with read locks with the `FLUSH TABLES WITH READ LOCK` statement. See [Section 13.5.5.2, “FLUSH Syntax”](#). This is a very convenient way to get backups if you have a filesystem such as Veritas that can take snapshots in time.

**Note:** If you use `ALTER TABLE` on a locked table, it may become unlocked. See [Section A.7.1, “Problems with ALTER TABLE”](#).

## 13.4.6. SET TRANSACTION Syntax

```
SET [GLOBAL | SESSION] TRANSACTION ISOLATION LEVEL
{ READ UNCOMMITTED | READ COMMITTED | REPEATABLE READ | SERIALIZABLE }
```

This statement sets the transaction isolation level for the next transaction, globally, or for the current session.

The default behavior of `SET TRANSACTION` is to set the isolation level for the next (not yet started) transaction. If you use the `GLOBAL` keyword, the statement sets the default transaction level globally for all new connections created from that point on. Existing connections are unaffected. You need the `SUPER` privilege to do this. Using the `SESSION` keyword sets the default transaction level for all future transactions performed on the current connection.

For descriptions of each InnoDB transaction isolation level, see [Section 14.2.11.3, “InnoDB and TRANSACTION ISOLATION LEVEL”](#). InnoDB supports each of these levels from MySQL 4.0.5 on. The default level is `REPEATABLE READ`.

To set the initial default global isolation level for `mysqld`, use the `--transaction-isolation` option. See [Section 5.2.1, “Command Options”](#).

## 13.5. Database Administration Statements

## 13.5.1. Account Management Statements

MySQL account information is stored in the tables of the `mysql` database. This database and the access control system are discussed extensively in [Chapter 5, Database Administration](#), which you should consult for additional details.

**Important:** Some releases of MySQL introduce changes to the structure of the grant tables to add new privileges or features. Whenever you update to a new version of MySQL, you should update your grant tables to make sure that they have the current structure so that you can take advantage of any new capabilities. See [Section 5.5.1, “mysql\\_fix\\_privilege\\_tables — Upgrade MySQL System Tables”](#).

### 13.5.1.1. DROP USER Syntax

```
DROP USER user [, user] ...
```

The `DROP USER` statement removes one or more MySQL accounts. To use it, you must have the `DELETE` privilege for the `mysql` database. Each account is named using the same format as for the `GRANT` statement; for example, `'jeffrey'@'localhost'`. The user and host parts of the account name correspond to the `User` and `Host` column values of the `user` table row for the account.

`DROP USER` was added in MySQL 4.1.1. In MySQL 4.1, it removes only accounts that have no privileges. This means that the procedure for removing an account depends on your version of MySQL.

From 4.1.1 onward in the MySQL 4.1 release series, `DROP USER` serves only to remove each account record from the `user` table. To remove a MySQL account completely, you should use the following procedure, performing the steps in the order shown:

1. Use `SHOW GRANTS` to determine what privileges the account has. See [Section 13.5.4.10, “SHOW GRANTS Syntax”](#).
2. Use `REVOKE` to revoke the privileges displayed by `SHOW GRANTS`. This removes rows for the account from all the grant tables except the `user` table, and revokes any global privileges listed in the `user` table. See [Section 13.5.1.2, “GRANT Syntax”](#).
3. Delete the account by using `DROP USER` to remove the `user` table record.

**Note:** `DROP USER` does not automatically close any open user sessions. Rather, in the event that a user with an open session is dropped, the statement does not take effect until that user's session is closed. Once the session is closed, the user is dropped, and that user's next attempt to log in will fail. *This is by design.*

Before MySQL 4.1.1, `DROP USER` is not available. You should first revoke the account privileges as just described. Then delete the `user` table record and flush the grant tables as shown here:

```
mysql> DELETE FROM mysql.user
-> WHERE User='user_name' and Host='host_name';
mysql> FLUSH PRIVILEGES;
```

### 13.5.1.2. GRANT Syntax

```
GRANT priv_type [(column_list)] [, priv_type [(column_list))] ...
ON {tbl_name | * | *.* | db_name.*}
TO user [IDENTIFIED BY [PASSWORD] 'password']
    [, user [IDENTIFIED BY [PASSWORD] 'password']] ...
[REQUIRE
    NONE |
    [{SSL | X509}]
    [CIPHER 'cipher' [AND]]
    [ISSUER 'issuer' [AND]]
```

```

    [SUBJECT 'subject']]
    [WITH with_option [with_option] ...]

with_option =
GRANT OPTION
| MAX_QUERIES_PER_HOUR count
| MAX_UPDATES_PER_HOUR count
| MAX_CONNECTIONS_PER_HOUR count

```

The **GRANT** statement enables system administrators to create MySQL user accounts and to grant rights to accounts. To use **GRANT**, you must have the **GRANT OPTION** privilege, and you must have the privileges that you are granting. **GRANT** is implemented in MySQL 3.22.11 or later. For earlier MySQL versions, it does nothing. The **REVOKE** statement is related and enables administrators to remove account privileges. See [Section 13.5.1.3, “REVOKE Syntax”](#).

MySQL account information is stored in the tables of the `mysql` database. This database and the access control system are discussed extensively in [Chapter 5, Database Administration](#), which you should consult for additional details.

**Important:** Some releases of MySQL introduce changes to the structure of the grant tables to add new privileges or features. Whenever you update to a new version of MySQL, you should update your grant tables to make sure that they have the current structure so that you can take advantage of any new capabilities. See [Section 5.5.1, “mysql\\_fix\\_privilege\\_tables — Upgrade MySQL System Tables”](#).

If the grant tables hold privilege rows that contain mixed-case database or table names and the `lower_case_table_names` system variable is set to a non-zero value, **REVOKE** cannot be used to revoke these privileges. It will be necessary to manipulate the grant tables directly. (**GRANT** will not create such rows when `lower_case_table_names` is set, but such rows might have been created prior to setting the variable.)

Privileges can be granted at several levels:

- **Global level**

Global privileges apply to all databases on a given server. These privileges are stored in the `mysql.user` table. **GRANT ALL ON \*.\*** and **REVOKE ALL ON \*.\*** grant and revoke only global privileges.

- **Database level**

Database privileges apply to all tables in a given database. These privileges are stored in the `mysql.db` and `mysql.host` tables. **GRANT ALL ON db\_name.\*** and **REVOKE ALL ON db\_name.\*** grant and revoke only database privileges.

- **Table level**

Table privileges apply to all columns in a given table. These privileges are stored in the `mysql.tables_priv` table. **GRANT ALL ON db\_name.tbl\_name** and **REVOKE ALL ON db\_name.tbl\_name** grant and revoke only table privileges.

- **Column level**

Column privileges apply to single columns in a given table. These privileges are stored in the `mysql.columns_priv` table. When using **REVOKE**, you must specify the same columns that were granted.

For the **GRANT** and **REVOKE** statements, `priv_type` can be specified as any of the following:

Privilege	Meaning
-----------	---------

ALL [ PRIVILEGES ]	Sets all simple privileges except GRANT OPTION
ALTER	Enables use of ALTER TABLE
CREATE	Enables use of CREATE TABLE
CREATE TEMPORARY TABLES	Enables use of CREATE TEMPORARY TABLE
DELETE	Enables use of DELETE
DROP	Enables use of DROP TABLE
EXECUTE	Not implemented
FILE	Enables use of SELECT ... INTO OUTFILE and LOAD DATA INFILE
INDEX	Enables use of CREATE INDEX and DROP INDEX
INSERT	Enables use of INSERT
LOCK TABLES	Enables use of LOCK TABLES on tables for which you have the SELECT privilege
PROCESS	Enables use of SHOW FULL PROCESSLIST
REFERENCES	Not implemented
RELOAD	Enables use of FLUSH
REPLICATION CLIENT	Enables the user to ask where slave or master servers are
REPLICATION SLAVE	Needed for replication slaves (to read binary log events from the master)
SELECT	Enables use of SELECT
SHOW DATABASES	SHOW DATABASES shows all databases
SHUTDOWN	Enables use of mysqladmin shutdown
SUPER	Enables use of CHANGE MASTER, KILL, PURGE MASTER LOGS, and SET GLOBAL statements, the mysqladmin debug command; allows you to connect (once) even if max_connections is reached
UPDATE	Enables use of UPDATE
USAGE	Synonym for “no privileges”
GRANT OPTION	Enables privileges to be granted

The CREATE TEMPORARY TABLES, EXECUTE, LOCK TABLES, REPLICATION CLIENT, REPLICATION SLAVE, SHOW DATABASES, and SUPER privileges were added in MySQL 4.0.2. To use these privileges when upgrading from an earlier version of MySQL that does not have them, you must first upgrade the grant tables. See [Section 5.5.1, “mysql\\_fix\\_privilege\\_tables — Upgrade MySQL System Tables”](#).

The REFERENCES and EXECUTE privileges are unused in MySQL versions up to and including the 4.1 release series.

In older MySQL versions that do not have the SUPER privilege, specify the PROCESS privilege instead.

USAGE can be specified when you want to create a user that has no privileges.

Use SHOW GRANTS to determine what privileges an account has. See [Section 13.5.4.10, “SHOW GRANTS Syntax”](#).

You can assign global privileges by using ON \*.\* syntax or database-level privileges by using ON db\_name.\* syntax. If you specify ON \* and you have selected a default database, the privileges are

granted in that database. (**Warning:** If you specify `ON *` and you have *not* selected a default database, the privileges granted are global.)

The `FILE`, `PROCESS`, `RELOAD`, `REPLICATION CLIENT`, `REPLICATION SLAVE`, `SHOW DATABASES`, `SHUTDOWN`, and `SUPER` privileges are administrative privileges that can only be granted globally (using `ON *.*` syntax).

Other privileges can be granted globally or at more specific levels.

The *priv\_type* values that you can specify for a table are `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `CREATE`, `DROP`, `GRANT OPTION`, `INDEX`, and `ALTER`.

The *priv\_type* values that you can specify for a column (that is, when you use a *column\_list* clause) are `SELECT`, `INSERT`, and `UPDATE`.

For the global, database, and table levels, `GRANT ALL` assigns only the privileges that exist at the level you are granting. For example, if you use `GRANT ALL ON db_name.*`, that is a database-level statement, so none of the global-only privileges such as `FILE` are granted.

MySQL allows you to grant privileges even on databases and tables that do not exist. In such cases, the privileges to be granted must include the `CREATE` privilege. *This behavior is by design*, and is intended to enable the database administrator to prepare user accounts and privileges for databases and tables that are to be created at a later time.

**Important:** *MySQL does not automatically revoke any privileges when you drop a table or database.*

**Note:** the `'_'` and `'%'` wildcards are allowed when specifying database names in `GRANT` statements that grant privileges at the global or database levels. This means, for example, that if you want to use a `'_'` character as part of a database name, you should specify it as `'\_'` in the `GRANT` statement, to prevent the user from being able to access additional databases matching the wildcard pattern; for example, `GRANT ... ON `foo\_bar`.* TO ...`

To accommodate granting rights to users from arbitrary hosts, MySQL supports specifying the *user* value in the form `user_name@host_name`. If a *user\_name* or *host\_name* value is legal as an unquoted identifier, you need not quote it. However, quotes are necessary to specify a *user\_name* string containing special characters (such as `'-'`), or a *host\_name* string containing special characters or wildcard characters (such as `'%'`); for example, `'test-user'@'test-hostname'`. Quote the username and hostname separately.

You can specify wildcards in the hostname. For example, `user_name@'%.loc.gov'` applies to *user\_name* for any host in the `loc.gov` domain, and `user_name@'144.155.166.%'` applies to *user\_name* for any host in the `144.155.166` class C subnet.

The simple form *user\_name* is a synonym for `user_name@'%'`.

*MySQL does not support wildcards in usernames.* Anonymous users are defined by inserting entries with `User=''` into the `mysql.user` table or by creating a user with an empty name with the `GRANT` statement:

```
GRANT ALL ON test.* TO ''@'localhost' ...
```

When specifying quoted values, quote database, table, and column names as identifiers, using backticks (```). Quote hostnames, usernames, and passwords as strings, using single quotes (`'`).

**Warning:** If you allow anonymous users to connect to the MySQL server, you should also grant privileges to all local users as `user_name@localhost`. Otherwise, the anonymous user account for `localhost` in the `mysql.user` table (created during MySQL installation) is used when named users try to log in to the MySQL server from the local machine. For details, see [Section 5.7.5, “Access Control, Stage 1: Connection Verification”](#).

You can determine whether this applies to you by executing the following query, which lists any anonymous users:

```
SELECT Host, User FROM mysql.user WHERE User='';
```

If you want to delete the local anonymous user account to avoid the problem just described, use these statements:

```
DELETE FROM mysql.user WHERE Host='localhost' AND User='';
FLUSH PRIVILEGES;
```

**GRANT** supports hostnames up to 60 characters long. Database, table, and column names can be up to 64 characters. Usernames can be up to 16 characters. **Note:** *The allowable length for usernames cannot be changed by altering the `mysql.user` table, and attempting to do so results in unpredictable behavior which may even make it impossible for users to log in to the MySQL server.* You should never alter any of the tables in the `mysql` database in any manner whatsoever except by means of the procedure prescribed by MySQL AB that is described in [Section 5.5.1, “mysql\\_fix\\_privilege\\_tables — Upgrade MySQL System Tables”](#).

The privileges for a table or column are formed additively as the logical **OR** of the privileges at each of the privilege levels. For example, if the `mysql.user` table specifies that a user has a global **SELECT** privilege, the privilege cannot be denied by an entry at the database, table, or column level.

The privileges for a column can be calculated as follows:

```
global privileges
OR (database privileges AND host privileges)
OR table privileges
OR column privileges
```

In most cases, you grant rights to a user at only one of the privilege levels, so life is not normally this complicated. The details of the privilege-checking procedure are presented in [Section 5.7, “The MySQL Access Privilege System”](#).

If you grant privileges for a username/hostname combination that does not exist in the `mysql.user` table, an entry is added and remains there until deleted with a **DELETE** statement. In other words, **GRANT** may create `user` table entries, but **REVOKE** does not remove them; you must do that explicitly using **DROP USER** or **DELETE**.

**Warning:** If you create a new user but do not specify an **IDENTIFIED BY** clause, the user has no password. This is very insecure. As of MySQL 5.0.2, you can enable the `NO_AUTO_CREATE_USER` SQL mode to keep **GRANT** from creating a new user if it would otherwise do so, unless **IDENTIFIED BY** is given to provide the new user a non-empty password.

In MySQL 3.22.12 or later, if a new user is created or if you have global grant privileges, the user's password is set to the password specified by the **IDENTIFIED BY** clause, if one is given. If the user already had a password, this is replaced by the new one.

**Warning:** If you create a new user but do not specify an **IDENTIFIED BY** clause, the user has no password. This is very insecure.

Passwords can also be set with the **SET PASSWORD** statement. See [Section 13.5.1.4, “SET PASSWORD Syntax”](#).

In the **IDENTIFIED BY** clause, the password should be given as the literal password value. It is unnecessary to use the `PASSWORD()` function as it is for the **SET PASSWORD** statement. For example:

```
GRANT ... IDENTIFIED BY 'mypass';
```

If you do not want to send the password in clear text and you know the hashed value that `PASSWORD()` would return for the password, you can specify the hashed value preceded by the keyword `PASSWORD`:

```
GRANT ...
IDENTIFIED BY PASSWORD '*6C8989366EAF75BB670AD8EA7A7FC1176A95CEF4';
```

In a C program, you can get the hashed value by using the `make_scrambled_password()` C API function.

If you grant privileges for a database, an entry in the `mysql.db` table is created if needed. If all privileges for the database are removed with `REVOKE`, this entry is deleted.

The `SHOW DATABASES` privilege enables the account to see database names by issuing the `SHOW DATABASE` statement. Accounts that do not have this privilege see only databases for which they have some privileges, and cannot use the statement at all if the server was started with the `-skip-show-database` option.

If a user has no privileges for a table, the table name is not displayed when the user requests a list of tables (for example, with a `SHOW TABLES` statement).

The `WITH GRANT OPTION` clause gives the user the ability to give to other users any privileges the user has at the specified privilege level. You should be careful to whom you give the `GRANT OPTION` privilege, because two users with different privileges may be able to join privileges!

You cannot grant another user a privilege which you yourself do not have; the `GRANT OPTION` privilege enables you to assign only those privileges which you yourself possess.

Be aware that when you grant a user the `GRANT OPTION` privilege at a particular privilege level, any privileges the user possesses (or may be given in the future) at that level can also be granted by that user to other users. Suppose that you grant a user the `INSERT` privilege on a database. If you then grant the `SELECT` privilege on the database and specify `WITH GRANT OPTION`, that user can give to other users not only the `SELECT` privilege, but also `INSERT`. If you then grant the `UPDATE` privilege to the user on the database, the user can grant `INSERT`, `SELECT`, and `UPDATE`.

For a non-administrative user, you should not grant the `ALTER` privilege globally or for the `mysql` database. If you do that, the user can try to subvert the privilege system by renaming tables!

The `MAX_QUERIES_PER_HOUR count`, `MAX_UPDATES_PER_HOUR count`, and `MAX_CONNECTIONS_PER_HOUR count` options are implemented in MySQL 4.0.2. They limit the number of queries, updates, and logins a user can perform during one hour. If `count` is 0 (the default), this means that there is no limitation for that user.

Note: To specify any of these resource-limit options for an existing user without affecting existing privileges, use `GRANT USAGE ON *.* ... WITH MAX_...`

See [Section 5.8.4, “Limiting Account Resources”](#).

MySQL can check X509 certificate attributes in addition to the usual authentication that is based on the username and password. To specify SSL-related options for a MySQL account, use the `REQUIRE` clause of the `GRANT` statement. (For background information on the use of SSL with MySQL, see [Section 5.8.7, “Using Secure Connections”](#).)

There are a number of different possibilities for limiting connection types for a given account:

- If the account has no SSL or X509 requirements, unencrypted connections are allowed if the username and password are valid. However, encrypted connections can also be used, at the client's option, if the client has the proper certificate and key files.

- The `REQUIRE SSL` option tells the server to allow only SSL-encrypted connections for the account. Note that this option can be omitted if there are any access-control rows that allow non-SSL connections.

```
GRANT ALL PRIVILEGES ON test.* TO 'root'@'localhost'
  IDENTIFIED BY 'goodsecret' REQUIRE SSL;
```

- `REQUIRE X509` means that the client must have a valid certificate but that the exact certificate, issuer, and subject do not matter. The only requirement is that it should be possible to verify its signature with one of the CA certificates.

```
GRANT ALL PRIVILEGES ON test.* TO 'root'@'localhost'
  IDENTIFIED BY 'goodsecret' REQUIRE X509;
```

- `REQUIRE ISSUER 'issuer'` places the restriction on connection attempts that the client must present a valid X509 certificate issued by CA `'issuer'`. If the client presents a certificate that is valid but has a different issuer, the server rejects the connection. Use of X509 certificates always implies encryption, so the `SSL` option is unnecessary in this case.

```
GRANT ALL PRIVILEGES ON test.* TO 'root'@'localhost'
  IDENTIFIED BY 'goodsecret'
  REQUIRE ISSUER '/C=FI/ST=Some-State/L=Helsinki/
  O=MySQL Finland AB/CN=Tonu Samuel/Email=tonu@example.com';
```

Note that the `'issuer'` value should be entered as a single string.

- `REQUIRE SUBJECT 'subject'` places the restriction on connection attempts that the client must present a valid X509 certificate containing the subject `subject`. If the client presents a certificate that is valid but has a different subject, the server rejects the connection.

```
GRANT ALL PRIVILEGES ON test.* TO 'root'@'localhost'
  IDENTIFIED BY 'goodsecret'
  REQUIRE SUBJECT '/C=EE/ST=Some-State/L=Tallinn/
  O=MySQL demo client certificate/
  CN=Tonu Samuel/Email=tonu@example.com';
```

Note that the `'subject'` value should be entered as a single string.

- `REQUIRE CIPHER 'cipher'` is needed to ensure that ciphers and key lengths of sufficient strength are used. SSL itself can be weak if old algorithms using short encryption keys are used. Using this option, you can ask that a specific cipher method is used to allow a connection.

```
GRANT ALL PRIVILEGES ON test.* TO 'root'@'localhost'
  IDENTIFIED BY 'goodsecret'
  REQUIRE CIPHER 'EDH-RSA-DES-CBC3-SHA';
```

The `SUBJECT`, `ISSUER`, and `CIPHER` options can be combined in the `REQUIRE` clause like this:

```
GRANT ALL PRIVILEGES ON test.* TO 'root'@'localhost'
  IDENTIFIED BY 'goodsecret'
  REQUIRE SUBJECT '/C=EE/ST=Some-State/L=Tallinn/
  O=MySQL demo client certificate/
  CN=Tonu Samuel/Email=tonu@example.com'
  AND ISSUER '/C=FI/ST=Some-State/L=Helsinki/
  O=MySQL Finland AB/CN=Tonu Samuel/Email=tonu@example.com'
  AND CIPHER 'EDH-RSA-DES-CBC3-SHA';
```

Starting from MySQL 4.0.4, the `AND` keyword is optional between `REQUIRE` options.

The order of the options does not matter, but no option can be specified twice.

When `mysqld` starts, all privileges are read into memory. For details, see [Section 5.7.7, “When Privilege Changes Take Effect”](#).

Note that if you are using table or column privileges for even one user, the server examines table and column privileges for all users and this slows down MySQL a bit. Similarly, if you limit the number of queries, updates, or connections for any users, the server must monitor these values.

The biggest differences between the standard SQL and MySQL versions of `GRANT` are:

- In MySQL, privileges are associated with the combination of a hostname and username and not with only a username.
- Standard SQL does not have global or database-level privileges, nor does it support all the privilege types that MySQL supports.
- MySQL does not support the standard SQL `TRIGGER` or `UNDER` privileges.
- Standard SQL privileges are structured in a hierarchical manner, which means that if you remove a user, all privileges the user has been granted are revoked. This is not the case in MySQL 4.1 and earlier versions, where the granted privileges are not automatically revoked and you must revoke them explicitly. See [Section 13.5.1.1, “DROP USER Syntax”](#).
- In standard SQL, when you drop a table, all privileges for the table are revoked. In standard SQL, when you revoke a privilege, all privileges that were granted based on that privilege are also revoked. In MySQL, privileges can be dropped only with explicit `REVOKE` statements or by manipulating values stored in the MySQL grant tables.
- In MySQL, it is possible to have the `INSERT` privilege for only some of the columns in a table. In this case, you can still execute `INSERT` statements on the table, provided that you omit those columns for which you do not have the `INSERT` privilege. The omitted columns are set to their implicit default values. (Standard SQL requires you to have the `INSERT` privilege on all columns.) [Section 11.1.4, “Data Type Default Values”](#), discusses implicit default values.

### 13.5.1.3. REVOKE Syntax

```
REVOKE priv_type [(column_list)] [, priv_type [(column_list)]] ...
ON {tbl_name | * | *.* | db_name.*}
FROM user [, user] ...

REVOKE ALL PRIVILEGES, GRANT OPTION FROM user [, user] ...
```

The `REVOKE` statement enables system administrators to revoke privileges from MySQL accounts. To use `REVOKE`, you must have the `GRANT OPTION` privilege, and you must have the privileges that you are revoking. `REVOKE` is implemented in MySQL 3.22.11 or later. For earlier MySQL versions, it does nothing.

For details on the levels at which privileges exist, the allowable *priv\_type* values, and the syntax for specifying users and passwords, see [Section 13.5.1.2, “GRANT Syntax”](#)

If the grant tables hold privilege rows that contain mixed-case database or table names and the `lower_case_table_names` system variable is set to a non-zero value, `REVOKE` cannot be used to revoke these privileges. It will be necessary to manipulate the grant tables directly. (`GRANT` will not create such rows when `lower_case_table_names` is set, but such rows might have been created prior to setting the variable.)

To make it easy to revoke all privileges, MySQL 4.1.2 has added the following syntax, which drops all global, database-, table-, and column-level privileges for the named users:

```
REVOKE ALL PRIVILEGES, GRANT OPTION FROM user [, user] ...
```

To use this `REVOKE` syntax, you must have the `UPDATE` privilege for the `mysql` database.

Before MySQL 4.1.2, all privileges cannot be dropped at once. Two statements are necessary:

```
REVOKE ALL PRIVILEGES ON *.* FROM user [, user] ...
REVOKE GRANT OPTION ON *.* FROM user [, user] ...
```

### 13.5.1.4. SET PASSWORD Syntax

```
SET PASSWORD [FOR user] = PASSWORD('some password')
```

The `SET PASSWORD` statement assigns a password to an existing MySQL user account.

With no `FOR` clause, this statement sets the password for the current user. Any client that has connected to the server using a non-anonymous account can change the password for that account.

With a `FOR` clause, this statement sets the password for a specific account on the current server host. Only clients that have the `UPDATE` privilege for the `mysql` database can do this. The `user` value should be given in `user_name@host_name` format, where `user_name` and `host_name` are exactly as they are listed in the `User` and `Host` columns of the `mysql.user` table entry. For example, if you had an entry with `User` and `Host` column values of `'bob'` and `'%.loc.gov'`, you would write the statement like this:

```
SET PASSWORD FOR 'bob'@'%.loc.gov' = PASSWORD('newpass');
```

That is equivalent to the following statements:

```
UPDATE mysql.user SET Password=PASSWORD('newpass')
  WHERE User='bob' AND Host='%.loc.gov';
FLUSH PRIVILEGES;
```

**Note:** If you are connecting to a MySQL 4.1 or later server using a pre-4.1 client program, do not use the preceding `SET PASSWORD` or `UPDATE` statement without reading [Section 5.7.9, “Password Hashing as of MySQL 4.1”](#), first. The password format changed in MySQL 4.1, and under certain circumstances it is possible that if you change your password, you might not be able to connect to the server afterward.

Starting from MySQL 4.1, you can see which account the server authenticated you as by executing `SELECT CURRENT_USER()`.

## 13.5.2. Table Maintenance Statements

### 13.5.2.1. ANALYZE TABLE Syntax

```
ANALYZE [LOCAL | NO_WRITE_TO_BINLOG] TABLE tbl_name [, tbl_name] ...
```

`ANALYZE TABLE` analyzes and stores the key distribution for a table. During the analysis, the table is locked with a read lock for `MyISAM` and `BDB`. For `InnoDB` the table is locked with a write lock. This statement works with `MyISAM`, `BDB`, and (as of MySQL 4.0.13) `InnoDB` tables. For `MyISAM` tables, this statement is equivalent to using `myisamchk --analyze`.

For more information on how the analysis works within `InnoDB`, see [Section 14.2.17, “Restrictions on InnoDB Tables”](#).

MySQL uses the stored key distribution to decide the order in which tables should be joined when you perform a join on something other than a constant.

This statement requires `SELECT` and `INSERT` privileges for the table.

`ANALYZE TABLE` returns a result set with the following columns:

Column	Value
Table	The table name
Op	Always <code>analyze</code>
Msg_type	One of <code>status</code> , <code>error</code> , <code>info</code> , or <code>warning</code>
Msg_text	The message

You can check the stored key distribution with the `SHOW INDEX` statement. See [Section 13.5.4.11, “SHOW INDEX Syntax”](#).

If the table has not changed since the last `ANALYZE TABLE` statement, the table is not analyzed again.

Before MySQL 4.1.1, `ANALYZE TABLE` statements are not written to the binary log. As of MySQL 4.1.1, they are written to the binary log unless the optional `NO_WRITE_TO_BINLOG` keyword (or its alias `LOCAL`) is used. This is done so that `ANALYZE TABLE` statements used on a MySQL server acting as a replication master will be replicated by default to the replication slave.

### 13.5.2.2. BACKUP TABLE Syntax

```
BACKUP TABLE tbl_name [, tbl_name] ... TO '/path/to/backup/directory'
```

**Note:** This statement is deprecated. We are working on a better replacement for it that will provide on-line backup capabilities. In the meantime, the `mysqlhotcopy` script can be used instead.

`BACKUP TABLE` copies to the backup directory the minimum number of table files needed to restore the table, after flushing any buffered changes to disk. The statement works only for `MyISAM` tables. It copies the `.frm` definition and `.MYD` data files. The `.MYI` index file can be rebuilt from those two files. The directory should be specified as a full pathname. To restore the table, use `RESTORE TABLE`.

During the backup, a read lock is held for each table, one at a time, as they are being backed up. If you want to back up several tables as a snapshot (preventing any of them from being changed during the backup operation), issue a `LOCK TABLES` statement first, to obtain a read lock for all tables in the group.

`BACKUP TABLE` returns a result set with the following columns:

Column	Value
Table	The table name
Op	Always <code>backup</code>
Msg_type	One of <code>status</code> , <code>error</code> , <code>info</code> , or <code>warning</code>
Msg_text	The message

`BACKUP TABLE` is available in MySQL 3.23.25 and later.

### 13.5.2.3. CHECK TABLE Syntax

```
CHECK TABLE tbl_name [, tbl_name] ... [option] ...
option = {QUICK | FAST | MEDIUM | EXTENDED | CHANGED}
```

**CHECK TABLE** checks a table or tables for errors. **CHECK TABLE** works for **MyISAM** and **InnoDB** tables. For **MyISAM** tables, the key statistics are updated as well.

**CHECK TABLE** returns a result set with the following columns:

Column	Value
Table	The table name
Op	Always <code>check</code>
Msg_type	One of <code>status</code> , <code>error</code> , <code>info</code> , or <code>warning</code>
Msg_text	The message

Note that the statement might produce many rows of information for each checked table. The last row has a `Msg_type` value of `status` and the `Msg_text` normally should be `OK`. If you don't get `OK`, or `Table is already up to date` you should normally run a repair of the table. See [Section 5.9.4, “Table Maintenance and Crash Recovery”](#). `Table is already up to date` means that the storage engine for the table indicated that there was no need to check the table.

The different check options that can be given are shown in the following table. These options apply only to checking **MyISAM** tables and are ignored for **InnoDB** tables.

Type	Meaning
<code>QUICK</code>	Do not scan the rows to check for incorrect links.
<code>FAST</code>	Check only tables that have not been closed properly.
<code>CHANGED</code>	Check only tables that have been changed since the last check or that have not been closed properly.
<code>MEDIUM</code>	Scan rows to verify that deleted links are valid. This also calculates a key checksum for the rows and verifies this with a calculated checksum for the keys.
<code>EXTENDED</code>	Do a full key lookup for all keys for each row. This ensures that the table is 100% consistent, but takes a long time.

If none of the options `QUICK`, `MEDIUM`, or `EXTENDED` are specified, the default check type for dynamic-format **MyISAM** tables is `MEDIUM`. This has the same result as running `myisamchk -medium-check tbl_name` on the table. The default check type also is `MEDIUM` for static-format **MyISAM** tables, unless `CHANGED` or `FAST` is specified. In that case, the default is `QUICK`. The row scan is skipped for `CHANGED` and `FAST` because the rows are very seldom corrupted.

You can combine check options, as in the following example that does a quick check on the table to determine whether it was closed properly:

```
CHECK TABLE test_table FAST QUICK;
```

**Note:** In some cases, **CHECK TABLE** changes the table. This happens if the table is marked as “corrupted” or “not closed properly” but **CHECK TABLE** does not find any problems in the table. In this case, **CHECK TABLE** marks the table as okay.

If a table is corrupted, it is most likely that the problem is in the indexes and not in the data part. All of the preceding check types check the indexes thoroughly and should thus find most errors.

If you just want to check a table that you assume is okay, you should use no check options or the `QUICK` option. The latter should be used when you are in a hurry and can take the very small risk that `QUICK` does not find an error in the data file. (In most cases, under normal usage, MySQL should find any error in the data file. If this happens, the table is marked as “corrupted” and cannot be used until it is repaired.)

`FAST` and `CHANGED` are mostly intended to be used from a script (for example, to be executed from `cron`) if you want to check tables from time to time. In most cases, `FAST` is to be preferred over `CHANGED`. (The only case when it is not preferred is when you suspect that you have found a bug in the `MyISAM` code.)

`EXTENDED` is to be used only after you have run a normal check but still get strange errors from a table when MySQL tries to update a row or find a row by key. This is very unlikely if a normal check has succeeded.

Some problems reported by `CHECK TABLE` cannot be corrected automatically:

- Found row where the `auto_increment` column has the value 0.

This means that you have a row in the table where the `AUTO_INCREMENT` index column contains the value 0. (It is possible to create a row where the `AUTO_INCREMENT` column is 0 by explicitly setting the column to 0 with an `UPDATE` statement.)

This is not an error in itself, but could cause trouble if you decide to dump the table and restore it or do an `ALTER TABLE` on the table. In this case, the `AUTO_INCREMENT` column changes value according to the rules of `AUTO_INCREMENT` columns, which could cause problems such as a duplicate-key error.

To get rid of the warning, simply execute an `UPDATE` statement to set the column to some value other than 0.

### 13.5.2.4. CHECKSUM TABLE Syntax

```
CHECKSUM TABLE tbl_name [, tbl_name] ... [ QUICK | EXTENDED ]
```

`CHECKSUM TABLE` reports a table checksum.

With `QUICK`, the live table checksum is reported if it is available, or `NULL` otherwise. This is very fast. A live checksum is enabled by specifying the `CHECKSUM=1` table option when you create the table; currently, this is supported only for `MyISAM` tables. See [Section 13.1.5, “CREATE TABLE Syntax”](#).

With `EXTENDED`, the entire table is read row by row and the checksum is calculated. This can be very slow for large tables.

If neither `QUICK` nor `EXTENDED` is specified, MySQL returns a live checksum if the table storage engine supports it and scans the table otherwise.

For a non-existent table, `CHECKSUM TABLE` returns `NULL`.

This statement is implemented in MySQL 4.1.1.

### 13.5.2.5. OPTIMIZE TABLE Syntax

```
OPTIMIZE [LOCAL | NO_WRITE_TO_BINLOG] TABLE tbl_name [, tbl_name] ...
```

`OPTIMIZE TABLE` should be used if you have deleted a large part of a table or if you have made many changes to a table with variable-length rows (tables that have `VARCHAR`, `VARBINARY`, `BLOB`, or `TEXT` columns). Deleted rows are maintained in a linked list and subsequent `INSERT` operations reuse old row positions. You can use `OPTIMIZE TABLE` to reclaim the unused space and to defragment the data file.

This statement requires `SELECT` and `INSERT` privileges for the table.

In most setups, you need not run `OPTIMIZE TABLE` at all. Even if you do a lot of updates to variable-length rows, it is not likely that you need to do this more than once a week or month and only on certain tables.

`OPTIMIZE TABLE` works only for `MyISAM`, `BDB`, and `InnoDB` tables.

For `MyISAM` tables, `OPTIMIZE TABLE` works as follows:

1. If the table has deleted or split rows, repair the table.
2. If the index pages are not sorted, sort them.
3. If the table's statistics are not up to date (and the repair could not be accomplished by sorting the index), update them.

For `BDB` tables, `OPTIMIZE TABLE` currently is mapped to `ANALYZE TABLE`. See [Section 13.5.2.1, “ANALYZE TABLE Syntax”](#).

That was also the case for `InnoDB` tables before MySQL 4.1.3. As of 4.1.3, `OPTIMIZE TABLE` is mapped to `ALTER TABLE`, which rebuilds the table to update index statistics and free unused space in the clustered index.

You can make `OPTIMIZE TABLE` work on other storage engines by starting `mysqld` with the `-skip-new` or `--safe-mode` option. In this case, `OPTIMIZE TABLE` is just mapped to `ALTER TABLE`.

`OPTIMIZE TABLE` returns a result set with the following columns:

Column	Value
<code>Table</code>	The table name
<code>Op</code>	Always <code>optimize</code>
<code>Msg_type</code>	One of <code>status</code> , <code>error</code> , <code>info</code> , or <code>warning</code>
<code>Msg_text</code>	The message

Note that MySQL locks the table during the time `OPTIMIZE TABLE` is running.

Before MySQL 4.1.1, `OPTIMIZE TABLE` statements are not written to the binary log. As of MySQL 4.1.1, they are written to the binary log unless the optional `NO_WRITE_TO_BINLOG` keyword (or its alias `LOCAL`) is used. This is done so that `OPTIMIZE TABLE` statements used on a MySQL server acting as a replication master will be replicated by default to the replication slave.

### 13.5.2.6. REPAIR TABLE Syntax

```
REPAIR [LOCAL | NO_WRITE_TO_BINLOG] TABLE
      tbl_name [, tbl_name] ... [QUICK] [EXTENDED] [USE_FRM]
```

`REPAIR TABLE` repairs a possibly corrupted table. By default, it has the same effect as `myisamchk`

`--recover tbl_name`. `REPAIR TABLE` works for `MyISAM` and for `ARCHIVE` tables. See [Section 14.1](#), “The `MyISAM` Storage Engine”, and [Section 14.7](#), “The `ARCHIVE` Storage Engine”.

This statement requires `SELECT` and `INSERT` privileges for the table.

Normally, you should never have to run this statement. However, if disaster strikes, `REPAIR TABLE` is very likely to get back all your data from a `MyISAM` table. If tables become corrupted often, you should try to find the reason for it and so to eliminate the need to use `REPAIR TABLE`. See [Section A.4.2](#), “What to Do If MySQL Keeps Crashing”, and [Section 14.1.4](#), “`MyISAM` Table Problems”.

**Warning:** If the server dies during a `REPAIR TABLE` operation, it is essential after restarting it that you immediately execute another `REPAIR TABLE` statement for the table before performing any other operations on it. (It is always a good idea to start by making a backup.) In the worst case, you might have a new clean index file without information about the data file, and then the next operation you perform could overwrite the data file. This is an unlikely but possible scenario.

`REPAIR TABLE` returns a result set with the following columns:

Column	Value
Table	The table name
Op	Always <code>repair</code>
Msg_type	One of <code>status</code> , <code>error</code> , <code>info</code> , or <code>warning</code>
Msg_text	The message

The `REPAIR TABLE` statement might produce many rows of information for each repaired table. The last row has a `Msg_type` value of `status` and `Msg_text` normally should be `OK`. If you do not get `OK`, you should try repairing the table with `myisamchk --safe-recover`. (`REPAIR TABLE` does not yet implement all the options of `myisamchk`.) With `myisamchk --safe-recover`, you can also use options that `REPAIR TABLE` does not support, such as `--max-record-length`.

If `QUICK` is given, `REPAIR TABLE` tries to repair only the index tree. This type of repair is like that done by `myisamchk --recover --quick`.

If you use `EXTENDED`, MySQL creates the index row by row instead of creating one index at a time with sorting. (Before MySQL 4.1, this might be better than sorting on fixed-length keys if you have long `CHAR` keys that compress very well.) This type of repair is like that done by `myisamchk --safe-recover`.

As of MySQL 4.0.2, there is a `USE_FRM` mode for `REPAIR TABLE`. Use this if the `.MYI` index file is missing or if its header is corrupted. In this mode, MySQL re-creates the `.MYI` file using information from the `.frm` file. This kind of repair cannot be done with `myisamchk`. **Note:** Use this mode *only* if you cannot use regular `REPAIR` modes. The `.MYI` header contains important table metadata (in particular, current `AUTO_INCREMENT` value and `Delete link`) that are lost in `REPAIR ... USE_FRM`. Don't use `USE_FRM` if the table is compressed because this information is also stored in the `.MYI` file.

Before MySQL 4.1.1, `REPAIR TABLE` statements are not written to the binary log. As of MySQL 4.1.1, they are written to the binary log unless the optional `NO_WRITE_TO_BINLOG` keyword (or its alias `LOCAL`) is used. This is done so that `REPAIR TABLE` statements used on a MySQL server acting as a replication master will be replicated by default to the replication slave.

### 13.5.2.7. `RESTORE TABLE` Syntax

```
RESTORE TABLE tbl_name [, tbl_name] ... FROM '/path/to/backup/directory'
```

`RESTORE TABLE` restores the table or tables from a backup that was made with `BACKUP TABLE`. The directory should be specified as a full pathname.

Existing tables are not overwritten; if you try to restore over an existing table, an error occurs. Just as for `BACKUP TABLE`, `RESTORE TABLE` currently works only for `MyISAM` tables. Restored tables are not replicated from master to slave.

The backup for each table consists of its `.frm` format file and `.MYD` data file. The restore operation restores those files, and then uses them to rebuild the `.MYI` index file. Restoring takes longer than backing up due to the need to rebuild the indexes. The more indexes the table has, the longer it takes.

`RESTORE TABLE` returns a result set with the following columns:

Column	Value
Table	The table name
Op	Always <code>restore</code>
Msg_type	One of <code>status</code> , <code>error</code> , <code>info</code> , or <code>warning</code>
Msg_text	The message

### 13.5.3. SET Syntax

```
SET variable_assignment [, variable_assignment] ...
variable_assignment:
  user_var_name = expr
  | [GLOBAL | SESSION] system_var_name = expr
  | [@@global. | @@session. | @@]system_var_name = expr
```

The `SET` statement assigns values to different types of variables that affect the operation of the server or your client. Older versions of MySQL employed `SET OPTION`, but this syntax is deprecated in favor of `SET` without `OPTION`.

This section describes use of `SET` for assigning values to system variables or user variables. For general information about these types of variables, see [Section 9.3, “User-Defined Variables”](#). System variables also can be set at server startup, as described in [Section 5.2.3, “Using System Variables”](#).

Some variants of `SET` syntax are used in other contexts:

- `SET PASSWORD` assigns account passwords. See [Section 13.5.1.4, “SET PASSWORD Syntax”](#).
- `SET TRANSACTION ISOLATION LEVEL` sets the isolation level for transaction processing. See [Section 13.4.6, “SET TRANSACTION Syntax”](#).

The following discussion shows the different `SET` syntaxes that you can use to set variables. The examples use the `=` assignment operator, but the `:=` operator also is allowable.

A user variable is written as `@var_name` and can be set as follows:

```
SET @var_name = expr;
```

As of MySQL 4.0.3, many system variables are dynamic and can be changed while the server runs by using the `SET` statement. For a list, see [Section 5.2.3.2, “Dynamic System Variables”](#). To change a system variable with `SET`, refer to it as `var_name`, optionally preceded by a modifier:

- To indicate explicitly that a variable is a global variable, precede its name by `GLOBAL` or `@@global..` The `SUPER` privilege is required to set global variables.

- To indicate explicitly that a variable is a session variable, precede its name by `SESSION`, `@@session.`, or `@@`. Setting a session variable requires no special privilege, but a client can change only its own session variables, not those of any other client.
- `LOCAL` and `@@local.` are synonyms for `SESSION` and `@@session.`
- If no modifier is present, `SET` changes the session variable.

A `SET` statement can contain multiple variable assignments, separated by commas. If you set several system variables, the most recent `GLOBAL` or `SESSION` modifier in the statement is used for following variables that have no modifier specified.

Examples:

```
SET sort_buffer_size=10000;
SET @@local.sort_buffer_size=10000;
SET GLOBAL sort_buffer_size=1000000, SESSION sort_buffer_size=1000000;
SET @@sort_buffer_size=1000000;
SET @@global.sort_buffer_size=1000000, @@local.sort_buffer_size=1000000;
```

When you assign a value to a system variable with `SET`, you cannot use suffix letters in the value (as can be done with startup options). However, the value can take the form of an expression:

```
SET sort_buffer_size = 10 * 1024 * 1024;
```

The `@@var_name` syntax for system variables is supported for compatibility with some other database systems.

If you change a session system variable, the value remains in effect until your session ends or until you change the variable to a different value. The change is not visible to other clients.

If you change a global system variable, the value is remembered and used for new connections until the server restarts. (To make a global system variable setting permanent, you should set it in an option file.) The change is visible to any client that accesses that global variable. However, the change affects the corresponding session variable only for clients that connect after the change. The global variable change does not affect the session variable for any client that is currently connected (not even that of the client that issues the `SET GLOBAL` statement).

To prevent incorrect usage, MySQL produces an error if you use `SET GLOBAL` with a variable that can only be used with `SET SESSION` or if you do not specify `GLOBAL` (or `@@global.`) when setting a global variable.

To set a `SESSION` variable to the `GLOBAL` value or a `GLOBAL` value to the compiled-in MySQL default value, use the `DEFAULT` keyword. For example, the following two statements are identical in setting the session value of `max_join_size` to the global value:

```
SET max_join_size=DEFAULT;
SET @@session.max_join_size=@@global.max_join_size;
```

Not all system variables can be set to `DEFAULT`. In such cases, use of `DEFAULT` results in an error.

You can refer to the values of specific global or session system variables in expressions by using one of the `@@`-modifiers. For example, you can retrieve values in a `SELECT` statement like this:

```
SELECT @@global.sql_mode, @@session.sql_mode, @@sql_mode;
```

When you refer to a system variable in an expression as `@@var_name` (that is, when you do not specify `@@global.` or `@@session.`), MySQL returns the session value if it exists and the global value oth-

erwise. (This differs from `SET @@var_name = value`, which always refers to the session value.)

To display system variables names and values, use the `SHOW VARIABLES` statement. (See [Section 13.5.4.20](#), “`SHOW VARIABLES Syntax`”.)

The following list describes options that have non-standard syntax or that are not described in the list of system variables found in [Section 5.2.2](#), “`System Variables`”. Although the options described here are not displayed by `SHOW VARIABLES`, you can obtain their values with `SELECT` (with the exception of `CHARACTER SET` and `SET NAMES`). For example:

```
mysql> SELECT @@AUTOCOMMIT;
+-----+
| @@AUTOCOMMIT |
+-----+
|              1 |
+-----+
```

The lettercase of these options does not matter.

- `AUTOCOMMIT = {0 | 1}`

Set the autocommit mode. If set to 1, all changes to a table take effect immediately. If set to 0 you have to use `COMMIT` to accept a transaction or `ROLLBACK` to cancel it. By default, client connections begin with `AUTOCOMMIT` set to 1. If you change `AUTOCOMMIT` mode from 0 to 1, MySQL performs an automatic `COMMIT` of any open transaction. Another way to begin a transaction is to use a `START TRANSACTION` or `BEGIN` statement. See [Section 13.4.1](#), “`START TRANSACTION, COMMIT, and ROLLBACK Syntax`”.

- `BIG_TABLES = {0 | 1}`

If set to 1, all temporary tables are stored on disk rather than in memory. This is a little slower, but the error `The table tbl_name is full` does not occur for `SELECT` operations that require a large temporary table. The default value for a new connection is 0 (use in-memory temporary tables). As of MySQL 4.0, you should normally never need to set this variable, because MySQL automatically converts in-memory tables to disk-based tables as necessary. (*Note:* This variable previously was named `SQL_BIG_TABLES`.)

- `CHARACTER SET {charset_name | DEFAULT}`

This maps all strings from and to the client with the given mapping. Before MySQL 4.1, the only allowable value for `charset_name` is `cp1251_koi8`, but you can add new mappings by editing the `sql/convert.cc` file in the MySQL source distribution. As of MySQL 4.1.1, `SET CHARACTER SET` sets three session system variables: `character_set_client` and `character_set_results` are set to the given character set, and `character_set_connection` to the value of `character_set_database`. See [Section 10.4](#), “`Connection Character Sets and Collations`”.

The default mapping can be restored by using the value `DEFAULT`. The default depends on the server configuration.

Note that the syntax for `SET CHARACTER SET` differs from that for setting most other options.

- `FOREIGN_KEY_CHECKS = {0 | 1}`

If set to 1 (the default), foreign key constraints for `InnoDB` tables are checked. If set to 0, they are ignored. Disabling foreign key checking can be useful for reloading `InnoDB` tables in an order different from that required by their parent/child relationships. This variable was added in MySQL 3.23.52. See [Section 14.2.7.4](#), “`FOREIGN KEY Constraints`”.

- `IDENTITY = value`

This variable is a synonym for the `LAST_INSERT_ID` variable. It exists for compatibility with other database systems. As of MySQL 3.23.25, you can read its value with `SELECT @@IDENTITY`. As of MySQL 4.0.3, you can also set its value with `SET IDENTITY`.

- `INSERT_ID = value`

Set the value to be used by the following `INSERT` or `ALTER TABLE` statement when inserting an `AUTO_INCREMENT` value. This is mainly used with the binary log.

- `LAST_INSERT_ID = value`

Set the value to be returned from `LAST_INSERT_ID()`. This is stored in the binary log when you use `LAST_INSERT_ID()` in a statement that updates a table. Setting this variable does not update the value returned by the `mysql_insert_id()` C API function.

- `NAMES {'charset_name' [COLLATE 'collation_name'] | DEFAULT}`

`SET NAMES` sets the three session system variables `character_set_client`, `character_set_connection`, and `character_set_results` to the given character set. Setting `character_set_connection` to `charset_name` also sets `collation_connection` to the default collation for `charset_name`. The optional `COLLATE` clause may be used to specify a collation explicitly. See [Section 10.4, “Connection Character Sets and Collations”](#).

The default mapping can be restored by using a value of `DEFAULT`. The default depends on the server configuration.

Note that the syntax for `SET NAMES` differs from that for setting most other options. This statement is available as of MySQL 4.1.0.

- `ONE_SHOT`

This option is a modifier, not a variable. It can be used to influence the effect of variables that set the character set, the collation, and the time zone. `ONE_SHOT` is primarily used for replication purposes: `mysqlbinlog` uses `SET ONE_SHOT` to modify temporarily the values of character set, collation, and time zone variables to reflect at rollforward what they were originally. `ONE_SHOT` is available as of MySQL 4.1.3.

You cannot use `ONE_SHOT` with other than the allowed set of variables; if you try, you get an error like this:

```
mysql> SET ONE_SHOT max_allowed_packet = 1;
ERROR 1382 (HY000): The 'SET ONE_SHOT' syntax is reserved for purposes
internal to the MySQL server
```

If `ONE_SHOT` is used with the allowed variables, it changes the variables as requested, but only for the next non-`SET` statement. After that, the server resets all character set, collation, and time zone-related system variables to their previous values. Example:

```
mysql> SET ONE_SHOT character_set_connection = latin5;
mysql> SET ONE_SHOT collation_connection = latin5_turkish_ci;
mysql> SHOW VARIABLES LIKE '%_connection';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| character_set_connection | latin5 |
| collation_connection | latin5_turkish_ci |
+-----+-----+
mysql> SHOW VARIABLES LIKE '%_connection';
+-----+-----+
```

Variable_name	Value
character_set_connection	latin1
collation_connection	latin1_swedish_ci

- `SQL_AUTO_IS_NULL = {0 | 1}`

If set to 1 (the default), you can find the last inserted row for a table that contains an `AUTO_INCREMENT` column by using the following construct:

```
WHERE auto_increment_column IS NULL
```

This behavior is used by some ODBC programs, such as Access.

- `SQL_BIG_SELECTS = {0 | 1}`

If set to 0, MySQL aborts `SELECT` statements that are likely to take a very long time to execute (that is, statements for which the optimizer estimates that the number of examined rows exceeds the value of `max_join_size`). This is useful when an inadvisable `WHERE` statement has been issued. The default value for a new connection is 1, which allows all `SELECT` statements.

If you set the `max_join_size` system variable to a value other than `DEFAULT`, `SQL_BIG_SELECTS` is set to 0.

- `SQL_BUFFER_RESULT = {0 | 1}`

If set to 1, `SQL_BUFFER_RESULT` forces results from `SELECT` statements to be put into temporary tables. This helps MySQL free the table locks early and can be beneficial in cases where it takes a long time to send results to the client. The default value is 0. This variable was added in MySQL 3.23.13.

- `SQL_LOG_BIN = {0 | 1}`

If set to 0, no logging is done to the binary log for the client. The client must have the `SUPER` privilege to set this option. The default value is 1. This variable was added in MySQL 3.23.16.

- `SQL_LOG_OFF = {0 | 1}`

If set to 1, no logging is done to the general query log for this client. The client must have the `SUPER` privilege to set this option. The default value is 0.

- `SQL_LOG_UPDATE = {0 | 1}`

If set to 0, no logging is done to the update log for the client. The client must have the `SUPER` privilege to set this option. The default value is 1. This variable was added in MySQL 3.22.5.

- `SQL_NOTES = {0 | 1}`

If set to 1 (the default), warnings of `Note` level are recorded. If set to 0, `Note` warnings are suppressed. `mysqldump` includes output to set this variable to 0 so that reloading the dump file does not produce warnings for events that do not affect the integrity of the reload operation. `SQL_NOTES` was added in MySQL 4.1.11.

- `SQL_QUOTE_SHOW_CREATE = {0 | 1}`

If set to 1 (the default), the server quotes identifiers for `SHOW CREATE TABLE` and `SHOW CREATE DATABASE` statements. If set to 0, quoting is disabled. This option is enabled by default so that replication works for identifiers that require quoting. See [Section 13.5.4.5, “SHOW CREATE](#)

TABLE Syntax”, and Section 13.5.4.4, “SHOW CREATE DATABASE Syntax”. This variable was added in MySQL 3.23.26.

- `SQL_SAFE_UPDATES = {0 | 1}`

If set to 1, MySQL aborts `UPDATE` or `DELETE` statements that do not use a key in the `WHERE` clause or a `LIMIT` clause. This makes it possible to catch `UPDATE` or `DELETE` statements where keys are not used properly and that would probably change or delete a large number of rows. The default value is 0. This variable was added in MySQL 3.22.32.

- `SQL_SELECT_LIMIT = {value | DEFAULT}`

The maximum number of rows to return from `SELECT` statements. The default value for a new connection is “unlimited.” If you have changed the limit, the default value can be restored by using a `SQL_SELECT_LIMIT` value of `DEFAULT`.

If a `SELECT` has a `LIMIT` clause, the `LIMIT` takes precedence over the value of `SQL_SELECT_LIMIT`.

`SQL_SELECT_LIMIT` does not apply to `SELECT` statements executed within stored routines. It also does not apply to `SELECT` statements that do not produce a result set to be returned to the client. These include `SELECT` statements in subqueries, `CREATE TABLE ... SELECT`, and `INSERT INTO ... SELECT`.

- `SQL_WARNINGS = {0 | 1}`

This variable controls whether single-row `INSERT` statements produce an information string if warnings occur. The default is 0. Set the value to 1 to produce an information string. This variable was added in MySQL 3.22.11.

- `TIMESTAMP = {timestamp_value | DEFAULT}`

Set the time for this client. This is used to get the original timestamp if you use the binary log to restore rows. `timestamp_value` should be a Unix epoch timestamp, not a MySQL timestamp.

- `UNIQUE_CHECKS = {0 | 1}`

If set to 1 (the default), uniqueness checks for secondary indexes in `InnoDB` tables are performed. If set to 0, storage engines are allowed to assume that duplicate keys are not present in input data. If you know for certain that your data does not contain uniqueness violations, you can set this to 0 to speed up large table imports to `InnoDB`. This variable was added in MySQL 3.23.52.

Note that setting this variable to 0 does not *require* storage engines to ignore duplicate keys. An engine is still allowed to check for them and issue duplicate-key errors if it detects them.

## 13.5.4. SHOW Syntax

`SHOW` has many forms that provide information about databases, tables, columns, or status information about the server. This section describes those following:

```
SHOW [FULL] COLUMNS FROM tbl_name [FROM db_name] [LIKE 'pattern']
SHOW CREATE DATABASE db_name
SHOW CREATE TABLE tbl_name
SHOW DATABASES [LIKE 'pattern']
SHOW ENGINE engine_name {LOGS | STATUS }
SHOW [STORAGE] ENGINES
SHOW ERRORS [LIMIT [offset,] row_count]
SHOW GRANTS FOR user
SHOW INDEX FROM tbl_name [FROM db_name]
SHOW INNODB STATUS
SHOW [BDB] LOGS
```

```
SHOW PRIVILEGES
SHOW [FULL] PROCESSLIST
SHOW [GLOBAL | SESSION] STATUS [LIKE 'pattern']
SHOW TABLE STATUS [FROM db_name] [LIKE 'pattern']
SHOW [OPEN] TABLES [FROM db_name] [LIKE 'pattern']
SHOW [GLOBAL | SESSION] VARIABLES [LIKE 'pattern']
SHOW WARNINGS [LIMIT [offset,] row_count]
```

The `SHOW` statement also has forms that provide information about replication master and slave servers and are described in [Section 13.6, “Replication Statements”](#):

```
SHOW BINARY LOGS
SHOW BINLOG EVENTS
SHOW MASTER STATUS
SHOW SLAVE HOSTS
SHOW SLAVE STATUS
```

If the syntax for a given `SHOW` statement includes a `LIKE 'pattern'` part, `pattern` is a string that can contain the SQL `'%'` and `'_'` wildcard characters. The pattern is useful for restricting statement output to matching values.

### 13.5.4.1. SHOW CHARACTER SET Syntax

```
SHOW CHARACTER SET [LIKE 'pattern']
```

The `SHOW CHARACTER SET` statement shows all available character sets. It takes an optional `LIKE` clause that indicates which character set names to match. For example:

```
mysql> SHOW CHARACTER SET LIKE 'latin%';
```

Charset	Description	Default collation	Maxlen
latin1	cp1252 West European	latin1_swedish_ci	1
latin2	ISO 8859-2 Central European	latin2_general_ci	1
latin5	ISO 8859-9 Turkish	latin5_turkish_ci	1
latin7	ISO 8859-13 Baltic	latin7_general_ci	1

The `Maxlen` column shows the maximum number of bytes required to store one character.

`SHOW CHARACTER SET` is available as of MySQL 4.1.0.

### 13.5.4.2. SHOW COLLATION Syntax

```
SHOW COLLATION [LIKE 'pattern']
```

The output from `SHOW COLLATION` includes all available character sets. It takes an optional `LIKE` clause whose `pattern` indicates which collation names to match. For example:

```
mysql> SHOW COLLATION LIKE 'latin1%';
```

Collation	Charset	Id	Default	Compiled	Sortlen
latin1_german1_ci	latin1	5			0
latin1_swedish_ci	latin1	8	Yes	Yes	0
latin1_danish_ci	latin1	15			0
latin1_german2_ci	latin1	31		Yes	2
latin1_bin	latin1	47		Yes	0
latin1_general_ci	latin1	48			0
latin1_general_cs	latin1	49			0
latin1_spanish_ci	latin1	94			0

The `Default` column indicates whether a collation is the default for its character set. `Compiled in-`

icates whether the character set is compiled into the server. `Sortlen` is related to the amount of memory required to sort strings expressed in the character set.

`SHOW COLLATION` is available as of MySQL 4.1.0.

### 13.5.4.3. SHOW COLUMNS Syntax

```
SHOW [FULL] COLUMNS FROM tbl_name [FROM db_name] [LIKE 'pattern']
```

`SHOW COLUMNS` displays information about the columns in a given table.

If the data types differ from what you expect them to be based on your `CREATE TABLE` statement, note that MySQL sometimes changes data types when you create or alter a table. The conditions for which this occurs are described in [Section 13.1.5.1, “Silent Column Specification Changes”](#).

The `FULL` keyword can be used from MySQL 3.23.32 on. It causes the output to include the privileges you have for each column. As of MySQL 4.1, `FULL` also causes any per-column comments to be displayed.

You can use `db_name.tbl_name` as an alternative to the `tbl_name FROM db_name` syntax. In other words, these two statements are equivalent:

```
mysql> SHOW COLUMNS FROM mytable FROM mydb;
mysql> SHOW COLUMNS FROM mydb.mytable;
```

`SHOW FIELDS` is a synonym for `SHOW COLUMNS`. You can also list a table's columns with the `mysqlshow db_name tbl_name` command.

The `DESCRIBE` statement provides information similar to `SHOW COLUMNS`. See [Section 13.3.1, “DESCRIBE Syntax”](#).

### 13.5.4.4. SHOW CREATE DATABASE Syntax

```
SHOW CREATE DATABASE db_name
```

Shows the `CREATE DATABASE` statement that creates the given database. It was added in MySQL 4.1.

```
mysql> SHOW CREATE DATABASE test\G
***** 1. row *****
      Database: test
Create Database: CREATE DATABASE `test`
                  /*!40100 DEFAULT CHARACTER SET latin1 */
```

`SHOW CREATE DATABASE` quotes table and column names according to the value of the `SQL_QUOTE_SHOW_CREATE` option. See [Section 13.5.3, “SET Syntax”](#).

### 13.5.4.5. SHOW CREATE TABLE Syntax

```
SHOW CREATE TABLE tbl_name
```

Shows the `CREATE TABLE` statement that creates the given table. It was added in MySQL 3.23.20.

```
mysql> SHOW CREATE TABLE t\G
***** 1. row *****
      Table: t
Create Table: CREATE TABLE t (
  id INT(11) default NULL auto_increment,
  s char(60) default NULL,
  PRIMARY KEY (id)
) ENGINE=MyISAM
```

`SHOW CREATE TABLE` quotes table and column names according to the value of the `SQL_QUOTE_SHOW_CREATE` option. See [Section 13.5.3, “SET Syntax”](#).

### 13.5.4.6. SHOW DATABASES Syntax

```
SHOW DATABASES [LIKE 'pattern']
```

`SHOW DATABASES` lists the databases on the MySQL server host. As of MySQL 4.0.2, you see only those databases for which you have some kind of privilege, if you do not have the global `SHOW DATABASES` privilege. You can also get this list using the `mysqlshow` command.

If the server was started with the `--skip-show-database` option, you cannot use this statement at all unless you have the `SHOW DATABASES` privilege.

### 13.5.4.7. SHOW ENGINE Syntax

```
SHOW ENGINE engine_name {LOGS | STATUS }
```

`SHOW ENGINE` displays log or status information about a storage engine. The following statements currently are supported:

```
SHOW ENGINE BDB LOGS
SHOW ENGINE INNODB STATUS
```

`SHOW ENGINE BDB LOGS` displays status information about existing `BDB` log files. It returns the following fields:

- `File`  
The full path to the log file.
- `Type`  
The log file type (`BDB` for Berkeley DB log files).
- `Status`  
The status of the log file (`FREE` if the file can be removed, or `IN USE` if the file is needed by the transaction subsystem)

`SHOW ENGINE INNODB STATUS` displays extensive information about the state of the `InnoDB` storage engine.

The `InnoDB` Monitors provide additional information about `InnoDB` processing. See [Section 14.2.12.1, “SHOW ENGINE INNODB STATUS and the InnoDB Monitors”](#).

Older (and now deprecated) synonyms for these statements are `SHOW [BDB] LOGS` and `SHOW INNODB STATUS`.

`SHOW ENGINE` can be used as of MySQL 4.1.2.

### 13.5.4.8. SHOW ENGINES Syntax

```
SHOW [STORAGE] ENGINES
```

**SHOW ENGINES** displays status information about the the server's storage engines. This is particularly useful for checking whether a storage engine is supported, or to see what the default engine is. This statement is implemented in MySQL 4.1.2. **SHOW TABLE TYPES** is a deprecated synonym.

```
mysql> SHOW ENGINES\G
***** 1. row *****
Engine: MyISAM
Support: DEFAULT
Comment: Default engine as of MySQL 3.23 with great performance
***** 2. row *****
Engine: HEAP
Support: YES
Comment: Alias for MEMORY
***** 3. row *****
Engine: MEMORY
Support: YES
Comment: Hash based, stored in memory, useful for temporary tables
***** 4. row *****
Engine: MERGE
Support: YES
Comment: Collection of identical MyISAM tables
***** 5. row *****
Engine: MRG_MYISAM
Support: YES
Comment: Alias for MERGE
***** 6. row *****
Engine: ISAM
Support: NO
Comment: Obsolete storage engine, now replaced by MyISAM
***** 7. row *****
Engine: MRG_ISAM
Support: NO
Comment: Obsolete storage engine, now replaced by MERGE
***** 8. row *****
Engine: InnoDB
Support: YES
Comment: Supports transactions, row-level locking, and foreign keys
***** 9. row *****
Engine: INNODB
Support: YES
Comment: Alias for INNODB
***** 10. row *****
Engine: BDB
Support: YES
Comment: Supports transactions and page-level locking
***** 11. row *****
Engine: BERKELEYDB
Support: YES
Comment: Alias for BDB
***** 12. row *****
Engine: NDBCLUSTER
Support: NO
Comment: Clustered, fault-tolerant, memory-based tables
***** 13. row *****
Engine: NDB
Support: NO
Comment: Alias for NDBCLUSTER
***** 14. row *****
Engine: EXAMPLE
Support: NO
Comment: Example storage engine
***** 15. row *****
Engine: ARCHIVE
Support: NO
Comment: Archive storage engine
***** 16. row *****
Engine: CSV
Support: NO
Comment: CSV storage engine
***** 17. row *****
Engine: BLACKHOLE
Support: NO
Comment: Storage engine designed to act as null storage
```

The **Support** value indicates whether the particular storage engine is supported, and which is the default engine. For example, if the server is started with the `--default-table-type=InnoDB` op-

tion, the `Support` value for the `InnoDB` row has the value `DEFAULT`. See [Chapter 14, Storage Engines and Table Types](#).

All MySQL servers beginning with the 3.23 release series support `MyISAM` tables, because `MyISAM` is the default storage engine.

### 13.5.4.9. SHOW ERRORS Syntax

```
SHOW ERRORS [LIMIT [offset,] row_count]
SHOW COUNT(*) ERRORS
```

This statement is similar to `SHOW WARNINGS`, except that instead of displaying errors, warnings, and notes, it displays only errors. `SHOW ERRORS` is available as of MySQL 4.1.0.

The `LIMIT` clause has the same syntax as for the `SELECT` statement. See [Section 13.2.7, “SELECT Syntax”](#).

The `SHOW COUNT(*) ERRORS` statement displays the number of errors. You can also retrieve this number from the `error_count` variable:

```
SHOW COUNT(*) ERRORS;
SELECT @@error_count;
```

For more information, see [Section 13.5.4.21, “SHOW WARNINGS Syntax”](#).

### 13.5.4.10. SHOW GRANTS Syntax

```
SHOW GRANTS FOR user
```

This statement lists the `GRANT` statement or statements that must be issued to duplicate the privileges that are granted to a MySQL user account. The account is named using the same format as for the `GRANT` statement; for example, `'jeffrey'@'localhost'`. The user and host parts of the account name correspond to the `User` and `Host` column values of the `user` table row for the account.

```
mysql> SHOW GRANTS FOR 'root'@'localhost';
+-----+-----+
| Grants for root@localhost |
+-----+-----+
| GRANT ALL PRIVILEGES ON *.* TO 'root'@'localhost' WITH GRANT OPTION |
+-----+-----+
```

As of MySQL 4.1.2, to list the privileges granted to the account that you are using to connect to the server, you can use any of the following statements:

```
SHOW GRANTS;
SHOW GRANTS FOR CURRENT_USER;
SHOW GRANTS FOR CURRENT_USER();
```

Before MySQL 4.1.2, you can find out what user the session was authenticated as by selecting the value of the `CURRENT_USER()` function (new in MySQL 4.0.6). Then use that value in the `SHOW GRANTS` statement. See [Section 12.9.3, “Information Functions”](#).

`SHOW GRANTS` displays only the privileges granted explicitly to the named account. Other privileges might be available to the account, but they are not displayed. For example, if an anonymous account exists, the named account might be able to use its privileges, but `SHOW GRANTS` will not display them.

`SHOW GRANTS` is available as of MySQL 3.23.4.

### 13.5.4.11. SHOW INDEX Syntax

```
SHOW INDEX FROM tbl_name [FROM db_name]
```

`SHOW INDEX` returns table index information. The format resembles that of the `SQLStatistics` call in ODBC.

`SHOW INDEX` returns the following fields:

- `Table`  
The name of the table.
- `Non_unique`  
0 if the index cannot contain duplicates, 1 if it can.
- `Key_name`  
The name of the index.
- `Seq_in_index`  
The column sequence number in the index, starting with 1.
- `Column_name`  
The column name.
- `Collation`  
How the column is sorted in the index. In MySQL, this can have values 'A' (Ascending) or `NULL` (Not sorted).
- `Cardinality`  
An estimate of the number of unique values in the index. This is updated by running `ANALYZE TABLE` or `myisamchk -a`. `Cardinality` is counted based on statistics stored as integers, so the value is not necessarily exact even for small tables. The higher the cardinality, the greater the chance that MySQL uses the index when doing joins.
- `Sub_part`  
The number of indexed characters if the column is only partly indexed, `NULL` if the entire column is indexed.
- `Packed`  
Indicates how the key is packed. `NULL` if it is not.
- `Null`  
Contains `YES` if the column may contain `NULL`. If not, in MySQL 4.1 and earlier, the column contains an empty string ('').
- `Index_type`  
The index method used (`BTREE`, `FULLTEXT`, `HASH`, `RTREE`).
- `Comment`

Various remarks. Before MySQL 4.0.2 when the `Index_type` column was added, `Comment` indicates whether an index is `FULLTEXT`.

The `Packed` and `Comment` columns were added in MySQL 3.23.0. The `Null` and `Index_type` columns were added in MySQL 4.0.2.

You can use `db_name.tbl_name` as an alternative to the `tbl_name FROM db_name` syntax. These two statements are equivalent:

```
SHOW INDEX FROM mytable FROM mydb;  
SHOW INDEX FROM mydb.mytable;
```

`SHOW KEYS` is a synonym for `SHOW INDEX`. You can also list a table's indexes with the `mysqlshow -k db_name tbl_name` command.

### 13.5.4.12. SHOW INNODB STATUS Syntax

```
SHOW INNODB STATUS
```

This statement shows extensive information about the state of the `InnoDB` storage engine. As of MySQL 4.1.2, it is deprecated and `SHOW ENGINE INNODB STATUS` should be used instead. See [Section 13.5.4.7, “SHOW ENGINE Syntax”](#).

### 13.5.4.13. SHOW LOGS Syntax

```
SHOW [BDB] LOGS
```

`SHOW LOGS` displays status information about existing `BDB` log files. It was implemented in MySQL 3.23.29. An alias for it (available as of MySQL 4.1.1) is `SHOW BDB LOGS`. As of MySQL 4.1.2, this statement is deprecated and `SHOW ENGINE BDB LOGS` should be used instead. See [Section 13.5.4.7, “SHOW ENGINE Syntax”](#).

### 13.5.4.14. SHOW OPEN TABLES Syntax

```
SHOW OPEN TABLES
```

`SHOW OPEN TABLES` lists the non-`TEMPORARY` tables that are currently open in the table cache. See [Section 7.4.8, “How MySQL Opens and Closes Tables”](#).

`SHOW OPEN TABLES` returns the following fields:

- `Database`

The database containing the table.

- `Table`

The table name.

- `In_use`

The number of times the table currently is in use by queries. If the count is zero, the table is open, but not currently being used.

- `Name_locked`

Whether the table name is locked. Name locking is used for operations such as dropping or renaming tables.

`SHOW OPEN TABLES` was added in MySQL 3.23.33.

### 13.5.4.15. `SHOW PRIVILEGES` Syntax

```
SHOW PRIVILEGES
```

`SHOW PRIVILEGES` shows the list of system privileges that the MySQL server supports. This statement is implemented as of MySQL 4.1.0. The exact list of privileges depends on the version of your server.

```
mysql> SHOW PRIVILEGES\G
***** 1. row *****
Privilege: Alter
Context: Tables
Comment: To alter the table
***** 2. row *****
Privilege: Create temporary tables
Context: Databases
Comment: To use CREATE TEMPORARY TABLE
***** 3. row *****
Privilege: Create
Context: Databases,Tables,Indexes
Comment: To create new databases and tables
***** 4. row *****
Privilege: Delete
Context: Tables
Comment: To delete existing rows
***** 5. row *****
Privilege: Drop
Context: Databases,Tables
Comment: To drop databases and tables
...
```

### 13.5.4.16. `SHOW PROCESSLIST` Syntax

```
SHOW [FULL] PROCESSLIST
```

`SHOW PROCESSLIST` shows you which threads are running. You can also get this information using the `mysqladmin processlist` command. If you have the `PROCESS` privilege, you can see all threads. Otherwise, you can see only your own threads (that is, threads associated with the MySQL account that you are using). See [Section 13.5.5.3, “KILL Syntax”](#). If you do not use the `FULL` keyword, only the first 100 characters of each statement are shown in the `Info` field.

This statement is very useful if you get the “too many connections” error message and want to find out what is going on. MySQL reserves one extra connection to be used by accounts that have the `SUPER` privilege, to ensure that administrators should always be able to connect and check the system (assuming that you are not giving this privilege to all your users).

The output of `SHOW PROCESSLIST` may look like this:

```
mysql> SHOW FULL PROCESSLIST\G
***** 1. row *****
Id: 1
User: system user
Host:
db: NULL
Command: Connect
Time: 1030455
State: Waiting for master to send event
```

```

Info: NULL
***** 2. row *****
Id: 2
User: system user
Host:
db: NULL
Command: Connect
Time: 1004
State: Has read all relay log; waiting for the slave I/O thread to update it
Info: NULL
***** 3. row *****
Id: 3112
User: replikator
Host: artemis:2204
db: NULL
Command: Binlog Dump
Time: 2144
State: Has sent all binlog to slave; waiting for binlog to be updated
Info: NULL
***** 4. row *****
Id: 3113
User: replikator
Host: iconnect2:45781
db: NULL
Command: Binlog Dump
Time: 2086
State: Has sent all binlog to slave; waiting for binlog to be updated
Info: NULL
***** 5. row *****
Id: 3123
User: stefan
Host: localhost
db: apollon
Command: Query
Time: 0
State: NULL
Info: SHOW FULL PROCESSLIST
5 rows in set (0.00 sec)

```

The columns have the following meaning:

- **Id**

The connection identifier.

- **User**

The MySQL user who issued the statement. If this is `system user`, it refers to a non-client thread spawned by the server to handle tasks internally. This could be the I/O or SQL thread used on replication slaves or a delayed-row handler. For `system user`, there is no host specified in the `Host` column.

- **Host**

The hostname of the client issuing the statement (except for `system user` where there is no host). As of MySQL 4.0.12, `SHOW PROCESSLIST` reports the hostname for TCP/IP connections in `host_name:client_port` format to make it easier to determine which client is doing what.

- **db**

The default database, if one is selected, otherwise `NULL`.

- **Command**

The value of that column corresponds to the `COM_xxx` commands of the client/server protocol. See [Section 5.2.4, “Status Variables”](#)

The `Command` value may be one of the following: `Binlog Dump`, `Change user`, `Close`

stmt, Connect, Connect Out, Create DB, Daemon, Debug, Delayed insert, Drop DB, Error, Execute, Fetch, Field List, Init DB, Kill, Long Data, Ping, Prepare, Processlist, Query, Quit, Refresh, Register Slave, Reset stmt, Set option, Shutdown, Sleep, Statistics, Table Dump, Time

- Time

The time in seconds between the start of the statement or command and now.

- State

An action, event, or state, which can be one of the following: After create, Analyzing, Changing master, Checking master version, Checking table, Connecting to master, Copying to group table, Copying to tmp table, Creating delayed handler, Creating index, Creating sort index, Creating table from master dump, Creating tmp table, Execution of init\_command, FULLTEXT initialization, Finished reading one binlog; switching to next binlog, Flushing tables, Killed, Killing slave, Locked, Making temp file , Opening master dump table, Opening table, Opening tables, Processing request, Purging old relay logs, Queueing master event to the relay log, Reading event from the relay log, Reading from net, Reading master dump table data, Rebuilding the index on master dump table, Reconnecting after a failed binlog dump request, Reconnecting after a failed master event read, Registering slave on master, Removing duplicates, Reopen tables, Repair by sorting, Repair done, Repair with keycache, Requesting binlog dump, Rolling back, Saving state, Searching rows for update, Sending binlog event to slave, Sending data, Sorting for group, Sorting for order, Sorting index, Sorting result, System lock, Table lock, Thread initialized, Updating, User lock, Waiting for INSERT, Waiting for master to send event, Waiting for master update, Waiting for slave mutex on exit, Waiting for table, Waiting for tables, Waiting for the next event in relay log, Waiting on cond, Waiting to finalize termination, Waiting to reconnect after a failed binlog dump request, Waiting to reconnect after a failed master event read, Writing to net, allocating local table, cleaning up, closing tables, converting HEAP to MyISAM, copy to tmp table, creating table, deleting from main table, deleting from reference tables, discard\_or\_import\_tablespace, end, freeing items, got handler lock, got old table, info, init, insert, logging slow query, login, preparing, purging old relay logs, query end, removing tmp table, rename, rename result table, reschedule, setup, starting slave, statistics, storing row into queue, unauthenticated user, update, updating, updating main table, updating reference tables, upgrading lock, waiting for delay\_list, waiting for handler insert, waiting for handler lock, waiting for handler open, Waiting for event from ndbcluster

The most common `State` values are described in the rest of this section. Most of the other `State` values are useful only for finding bugs in the server. See also [Section 6.3, “Replication Implementation Details”](#), for additional information about process states for replication servers.

For the `SHOW PROCESSLIST` statement, the value of `State` is `NULL`.

- Info

The statement that the thread is executing, or `NULL` if it is not executing any statement.

Some `State` values commonly seen in the output from `SHOW PROCESSLIST`:

- `Checking table`

The thread is performing a table check operation.

- `Closing tables`

Means that the thread is flushing the changed table data to disk and closing the used tables. This should be a fast operation. If not, you should verify that you do not have a full disk and that the disk is not in very heavy use.

- `Connect Out`

A replication slave is connecting to its master.

- `Copying to group table`

If a statement has different `ORDER BY` and `GROUP BY` criteria, the rows are sorted by group and copied to a temporary table.

- `Copying to tmp table`

The server is copying to a temporary table in memory.

- `Copying to tmp table on disk`

The server is copying to a temporary table on disk. The temporary result set was larger than `tmp_table_size` and the thread is changing the temporary table from in-memory to disk-based format to save memory.

- `Creating tmp table`

The thread is creating a temporary table to hold a part of the result for the query.

- `deleting from main table`

The server is executing the first part of a multiple-table delete. It is deleting only from the first table, and saving fields and offsets to be used for deleting from the other (reference) tables.

- `deleting from reference tables`

The server is executing the second part of a multiple-table delete and deleting the matched rows from the other tables.

- `Flushing tables`

The thread is executing `FLUSH TABLES` and is waiting for all threads to close their tables.

- `FULLTEXT initialization`

The server is preparing to perform a natural-language full-text search.

- `Killed`

Someone has sent a `KILL` statement to the thread and it should abort next time it checks the kill flag. The flag is checked in each major loop in MySQL, but in some cases it might still take a short time for the thread to die. If the thread is locked by some other thread, the kill takes effect as soon as the other thread releases its lock.

- `Locked`

The query is locked by another query.

- `Sending data`

The thread is processing rows for a `SELECT` statement and also is sending data to the client.

- `Sorting for group`

The thread is doing a sort to satisfy a `GROUP BY`.

- `Sorting for order`

The thread is doing a sort to satisfy a `ORDER BY`.

- `Opening tables`

The thread is trying to open a table. This should be very fast procedure, unless something prevents opening. For example, an `ALTER TABLE` or a `LOCK TABLE` statement can prevent opening a table until the statement is finished.

- `Reading from net`

The server is reading a packet from the network.

- `Removing duplicates`

The query was using `SELECT DISTINCT` in such a way that MySQL could not optimize away the distinct operation at an early stage. Because of this, MySQL requires an extra stage to remove all duplicated rows before sending the result to the client.

- `Reopen table`

The thread got a lock for the table, but noticed after getting the lock that the underlying table structure changed. It has freed the lock, closed the table, and is trying to reopen it.

- `Repair by sorting`

The repair code is using a sort to create indexes.

- `Repair with keycache`

The repair code is using creating keys one by one through the key cache. This is much slower than `Repair by sorting`.

- `Searching rows for update`

The thread is doing a first phase to find all matching rows before updating them. This has to be done if the `UPDATE` is changing the index that is used to find the involved rows.

- `Sleeping`

The thread is waiting for the client to send a new statement to it.

- `statistics`

The server is calculating statistics to develop a query execution plan.

- `System lock`

The thread is waiting to get an external system lock for the table. If you are not using multiple `mysqld` servers that are accessing the same tables, you can disable system locks with the `-skip-external-locking` option.

- `unauthenticated user`

The state of a thread that has become associated with a client connection but for which authentication of the client user has not yet been done.

- `Upgrading lock`

The `INSERT DELAYED` handler is trying to get a lock for the table to insert rows.

- `Updating`

The thread is searching for rows to update and is updating them.

- `updating main table`

The server is executing the first part of a multiple-table update. It is updating only the first table, and saving fields and offsets to be used for updating the other (reference) tables.

- `updating reference tables`

The server is executing the second part of a multiple-table update and updating the matched rows from the other tables.

- `User Lock`

The thread is waiting on a `GET_LOCK()`.

- `Waiting for event from ndbcluster`

The server is acting as an SQL node in a MySQL Cluster, and is connected to a cluster management node.

- `Waiting for tables`

The thread got a notification that the underlying structure for a table has changed and it needs to reopen the table to get the new structure. However, to reopen the table, it must wait until all other threads have closed the table in question.

This notification takes place if another thread has used `FLUSH TABLES` or one of the following statements on the table in question: `FLUSH TABLES tbl_name`, `ALTER TABLE`, `RENAME TABLE`, `REPAIR TABLE`, `ANALYZE TABLE`, or `OPTIMIZE TABLE`.

- `waiting for handler insert`

The `INSERT DELAYED` handler has processed all pending inserts and is waiting for new ones.

- `Writing to net`

The server is writing a packet to the network.

Most states correspond to very quick operations. If a thread stays in any of these states for many seconds, there might be a problem that needs to be investigated.

### 13.5.4.17. SHOW STATUS Syntax

```
SHOW STATUS [LIKE 'pattern']
```

`SHOW STATUS` provides server status information. This information also can be obtained using the `mysqladmin extended-status` command.

Partial output is shown here. The list of names and values may be different for your server. The meaning of each variable is given in [Section 5.2.4, “Status Variables”](#).

```
mysql> SHOW STATUS;
+-----+-----+
| Variable_name | Value |
+-----+-----+
| Aborted_clients | 0 |
| Aborted_connects | 0 |
| Bytes_received | 155372598 |
| Bytes_sent | 1176560426 |
| Connections | 30023 |
| Created_tmp_disk_tables | 0 |
| Created_tmp_tables | 8340 |
| Created_tmp_files | 60 |
| ... | ... |
| Open_tables | 1 |
| Open_files | 2 |
| Open_streams | 0 |
| Opened_tables | 44600 |
| Questions | 2026873 |
| ... | ... |
| Table_locks_immediate | 1920382 |
| Table_locks_waited | 0 |
| Threads_cached | 0 |
| Threads_created | 30022 |
| Threads_connected | 1 |
| Threads_running | 1 |
| Uptime | 80380 |
+-----+-----+
```

With a `LIKE` clause, the statement displays only rows for those variables with names that match the pattern:

```
mysql> SHOW STATUS LIKE 'Key%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| Key_blocks_used | 14955 |
| Key_read_requests | 96854827 |
| Key_reads | 162040 |
| Key_write_requests | 7589728 |
| Key_writes | 3813196 |
+-----+-----+
```

### 13.5.4.18. SHOW TABLE STATUS Syntax

```
SHOW TABLE STATUS [FROM db_name] [LIKE 'pattern']
```

`SHOW TABLE STATUS` works like `SHOW TABLE`, but provides a lot of information about each table. You can also get this list using the `mysqlshow --status db_name` command. This statement was added in MySQL 3.23.

`SHOW TABLE STATUS` returns the following fields:

- Name

The name of the table.

- `Engine`

The storage engine for the table. See [Chapter 14, Storage Engines and Table Types](#). Before MySQL 4.1.2, this value is labeled as `Type`.
- `Version`

The version number of the table's `.frm` file.
- `Row_format`

The row storage format (`Fixed`, `Dynamic`, `Compressed`, `Redundant`, `Compact`). InnoDB tables are always in the `Redundant` format.
- `Rows`

The number of rows. Some storage engines, such as `MyISAM` and `ISAM`, store the exact count. For other storage engines, such as `InnoDB`, this value is an approximation, and may vary from the actual value by as much as 40 to 50%. In such cases, use `SELECT COUNT(*)` to obtain an accurate count.
- `Avg_row_length`

The average row length.
- `Data_length`

The length of the data file.
- `Max_data_length`

The maximum length of the data file. This is the total number of bytes of data that can be stored in the table, given the data pointer size used.
- `Index_length`

The length of the index file.
- `Data_free`

The number of allocated but unused bytes.
- `Auto_increment`

The next `AUTO_INCREMENT` value.
- `Create_time`

When the table was created.
- `Update_time`

When the data file was last updated. For some storage engines, this value is `NULL`. For example, `InnoDB` stores multiple tables in its tablespace and the data file timestamp does not apply.
- `Check_time`

When the table was last checked. Not all storage engines update this time, in which case the value is always `NULL`.

- `Collation`  
The table's character set and collation. (Implemented in 4.1.1)
- `Checksum`  
The live checksum value (if any). (Implemented in 4.1.1)
- `Create_options`  
Extra options used with `CREATE TABLE`.
- `Comment`  
The comment used when creating the table (or information as to why MySQL could not access the table information).

In the table comment, `InnoDB` tables report the free space of the tablespace to which the table belongs. For a table located in the shared tablespace, this is the free space of the shared tablespace. If you are using multiple tablespaces and the table has its own tablespace, the free space is for only that table.

For `MEMORY` (`HEAP`) tables, the `Data_length`, `Max_data_length`, and `Index_length` values approximate the actual amount of allocated memory. The allocation algorithm reserves memory in large amounts to reduce the number of allocation operations.

For views, all the fields displayed by `SHOW TABLE STATUS` are `NULL` except that `Name` indicates the view name and `Comment` says `view`.

### 13.5.4.19. `SHOW TABLES` Syntax

```
SHOW TABLES [FROM db_name] [LIKE 'pattern']
```

`SHOW TABLES` lists the non-`TEMPORARY` tables in a given database. You can also get this list using the `mysqlshow db_name` command.

The output from `SHOW TABLES` contains a single column of table names.

**Note:** If you have no privileges for a table, the table does not show up in the output from `SHOW TABLES` or `mysqlshow db_name`.

### 13.5.4.20. `SHOW VARIABLES` Syntax

```
SHOW [GLOBAL | SESSION] VARIABLES [LIKE 'pattern']
```

`SHOW VARIABLES` shows the values of MySQL system variables. This information also can be obtained using the `mysqladmin variables` command.

The `GLOBAL` and `SESSION` modifiers are new in MySQL 4.0.3. With the `GLOBAL` modifier, `SHOW VARIABLES` displays the values that are used for new connections to MySQL. With `SESSION`, it displays the values that are in effect for the current connection. If no modifier is present, the default is `SESSION`. `LOCAL` is a synonym for `SESSION`.

If the default system variable values are unsuitable, you can set them using command options when `mysqld` starts, and most can be changed at runtime with the `SET` statement. See [Section 5.2.3, “Using System Variables”](#), and [Section 13.5.3, “SET Syntax”](#).

Partial output is shown here. The list of names and values may be different for your server. [Sec-](#)

tion 5.2.2, “System Variables”, describes the meaning of each variable, and Section 7.5.2, “Tuning Server Parameters”, provides information about tuning them.

```
mysql> SHOW VARIABLES;
```

Variable_name	Value
back_log	50
basedir	/usr/local/mysql
bdb_cache_size	8388572
bdb_log_buffer_size	32768
bdb_home	/usr/local/mysql
...	
max_connections	100
max_connect_errors	10
max_delayed_threads	20
max_error_count	64
max_heap_table_size	16777216
max_join_size	4294967295
max_relay_log_size	0
max_sort_length	1024
...	
timezone	EEST
tmp_table_size	33554432
tmpdir	/tmp/:/mnt/hd2/tmp/
version	4.1.18
wait_timeout	28800

With a `LIKE` clause, the statement displays only rows for those variables with names that match the pattern. To obtain the row for a specific variable, use a `LIKE` clause as shown:

```
SHOW VARIABLES LIKE 'max_join_size';
SHOW SESSION VARIABLES LIKE 'max_join_size';
```

To get a list of variables whose name match a pattern, use the `'%'` wildcard character in a `LIKE` clause:

```
SHOW VARIABLES LIKE '%size%';
SHOW GLOBAL VARIABLES LIKE '%size%';
```

Wildcard characters can be used in any position within the pattern to be matched. Strictly speaking, because `'_'` is a wildcard that matches any single character, you should escape it as `'\_'` to match it literally. In practice, this is rarely necessary.

### 13.5.4.21. SHOW WARNINGS Syntax

```
SHOW WARNINGS [LIMIT [offset,] row_count]
SHOW COUNT(*) WARNINGS
```

`SHOW WARNINGS` shows the error, warning, and note messages that resulted from the last statement that generated messages, or nothing if the last statement that used a table generated no messages. This statement is implemented as of MySQL 4.1.0. A related statement, `SHOW ERRORS`, shows only the errors. See Section 13.5.4.9, “`SHOW ERRORS Syntax`”.

The list of messages is reset for each new statement that uses a table.

The `SHOW COUNT(*) WARNINGS` statement displays the total number of errors, warnings, and notes. You can also retrieve this number from the `warning_count` variable:

```
SHOW COUNT(*) WARNINGS;
SELECT @@warning_count;
```

The value of `warning_count` might be greater than the number of messages displayed by `SHOW WARNINGS` if the `max_error_count` system variable is set so low that not all messages are stored. An example shown later in this section demonstrates how this can happen.

The `LIMIT` clause has the same syntax as for the `SELECT` statement. See [Section 13.2.7, “SELECT Syntax”](#).

The MySQL server sends back the total number of errors, warnings, and notes resulting from the last statement. If you are using the C API, this value can be obtained by calling `mysql_warning_count()`. See [Section 17.2.3.70, “mysql\\_warning\\_count\(\)”](#).

Note that the framework for warnings was added in MySQL 4.1.0, at which point many statements did not generate warnings. In 4.1.1, the situation is much improved, with warnings generated for statements such as `LOAD DATA INFILE` and DML statements such as `INSERT`, `UPDATE`, `CREATE TABLE`, and `ALTER TABLE`.

The following `DROP TABLE` statement results in a note:

```
mysql> DROP TABLE IF EXISTS no_such_table;
mysql> SHOW WARNINGS;
+-----+-----+-----+
| Level | Code | Message                                     |
+-----+-----+-----+
| Note  | 1051 | Unknown table 'no_such_table'            |
+-----+-----+-----+
```

Here is a simple example that shows a syntax warning for `CREATE TABLE` and conversion warnings for `INSERT`:

```
mysql> CREATE TABLE t1 (a TINYINT NOT NULL, b CHAR(4)) TYPE=MyISAM;
Query OK, 0 rows affected, 1 warning (0.00 sec)
mysql> SHOW WARNINGS\G
***** 1. row *****
Level: Warning
Code: 1287
Message: 'TYPE=storage_engine' is deprecated, use
'ENGINE=storage_engine' instead
1 row in set (0.00 sec)

mysql> INSERT INTO t1 VALUES(10,'mysql'),(NULL,'test'),
-> (300,'Open Source');
Query OK, 3 rows affected, 4 warnings (0.01 sec)
Records: 3 Duplicates: 0 Warnings: 4

mysql> SHOW WARNINGS\G
***** 1. row *****
Level: Warning
Code: 1265
Message: Data truncated for column 'b' at row 1
***** 2. row *****
Level: Warning
Code: 1263
Message: Data truncated, NULL supplied to NOT NULL column 'a' at row 2
***** 3. row *****
Level: Warning
Code: 1264
Message: Data truncated, out of range for column 'a' at row 3
***** 4. row *****
Level: Warning
Code: 1265
Message: Data truncated for column 'b' at row 3
4 rows in set (0.00 sec)
```

The maximum number of error, warning, and note messages to store is controlled by the `max_error_count` system variable. By default, its value is 64. To change the number of messages you want stored, change the value of `max_error_count`. In the following example, the `ALTER TABLE` statement produces three warning messages, but only one is stored because `max_error_count` has been set to 1:

```
mysql> SHOW VARIABLES LIKE 'max_error_count';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| max_error_count | 64   |
+-----+-----+
```

```

+-----+
1 row in set (0.00 sec)

mysql> SET max_error_count=1;
Query OK, 0 rows affected (0.00 sec)

mysql> ALTER TABLE t1 MODIFY b CHAR;
Query OK, 3 rows affected, 3 warnings (0.00 sec)
Records: 3 Duplicates: 0 Warnings: 3

mysql> SELECT @@warning_count;
+-----+
| @@warning_count |
+-----+
|                 3 |
+-----+
1 row in set (0.01 sec)

mysql> SHOW WARNINGS;
+-----+-----+-----+
| Level      | Code | Message
+-----+-----+-----+
| Warning    | 1263 | Data truncated for column 'b' at row 1
+-----+-----+-----+
1 row in set (0.00 sec)

```

To disable warnings, set `max_error_count` to 0. In this case, `warning_count` still indicates how many warnings have occurred, but none of the messages are stored.

As of MySQL 4.1.11, you can set the `SQL_NOTES` session variable to 0 to cause `Note`-level warnings not to be recorded.

## 13.5.5. Other Administrative Statements

### 13.5.5.1. CACHE INDEX Syntax

```

CACHE INDEX
tbl_index_list [, tbl_index_list] ...
IN key_cache_name

tbl_index_list:
tbl_name [[INDEX|KEY] (index_name[, index_name] ...)]

```

The `CACHE INDEX` statement assigns table indexes to a specific key cache. It is used only for `MyISAM` tables.

The following statement assigns indexes from the tables `t1`, `t2`, and `t3` to the key cache named `hot_cache`:

```

mysql> CACHE INDEX t1, t2, t3 IN hot_cache;
+-----+-----+-----+-----+
| Table  | Op           | Msg_type | Msg_text
+-----+-----+-----+-----+
| test.t1 | assign_to_keycache | status   | OK
| test.t2 | assign_to_keycache | status   | OK
| test.t3 | assign_to_keycache | status   | OK
+-----+-----+-----+-----+

```

The syntax of `CACHE INDEX` enables you to specify that only particular indexes from a table should be assigned to the cache. The current implementation assigns all the table's indexes to the cache, so there is no reason to specify anything other than the table name.

The key cache referred to in a `CACHE INDEX` statement can be created by setting its size with a parameter setting statement or in the server parameter settings. For example:

```

mysql> SET GLOBAL keycache1.key_buffer_size=128*1024;

```

Key cache parameters can be accessed as members of a structured system variable. See [Section 5.2.3.1, “Structured System Variables”](#).

A key cache must exist before you can assign indexes to it:

```
mysql> CACHE INDEX t1 IN non_existent_cache;
ERROR 1284 (HY000): Unknown key cache 'non_existent_cache'
```

By default, table indexes are assigned to the main (default) key cache created at the server startup. When a key cache is destroyed, all indexes assigned to it become assigned to the default key cache again.

Index assignment affects the server globally: If one client assigns an index to a given cache, this cache is used for all queries involving the index, no matter which client issues the queries.

`CACHE INDEX` was added in MySQL 4.1.1.

### 13.5.5.2. FLUSH Syntax

```
FLUSH [LOCAL | NO_WRITE_TO_BINLOG] flush_option [, flush_option] ...
```

The `FLUSH` statement clears or reloads various internal caches used by MySQL. To execute `FLUSH`, you must have the `RELOAD` privilege.

The `RESET` statement is similar to `FLUSH`. See [Section 13.5.5.5, “RESET Syntax”](#).

*flush\_option* can be any of the following:

- `HOSTS`

Empties the host cache tables. You should flush the host tables if some of your hosts change IP number or if you get the error message `Host 'host_name' is blocked`. When more than `max_connect_errors` errors occur successively for a given host while connecting to the MySQL server, MySQL assumes that something is wrong and blocks the host from further connection requests. Flushing the host tables allows the host to attempt to connect again. See [Section A.2.5, “Host 'host\\_name' is blocked”](#). You can start `mysqld` with `--max_connect_errors=999999999` to avoid this error message.

- `DES_KEY_FILE`

Reloads the DES keys from the file that was specified with the `--des-key-file` option at server startup time.

- `LOGS`

Closes and reopens all log files. If you have specified an update log file or a binary log file without an extension, the extension number of the log file is incremented by one relative to the previous file. If you have used an extension in the file name, MySQL closes and reopens the update log or binary log file. See [Section 5.11.4, “The Binary Log”](#). On Unix, this is the same thing as sending a `SIGHUP` signal to the `mysqld` server (except on some Mac OS X 10.3 versions where `mysqld` ignores `SIGHUP` and `SIGQUIT`).

Beginning with MySQL 4.0.10, if the server was started with the `--log-error` option, `FLUSH LOGS` causes the error log is renamed with a suffix of `-old` and `mysqld` creates a new empty log file. No renaming occurs if the `--log-error` option was not given.

- `MASTER (DEPRECATED)`. Deletes all binary logs, resets the binary log index file and creates a new binary log. Deprecated in favor of `RESET MASTER`, supported for backwards compatibility only

See [Section 13.6.1.2, “RESET MASTER Syntax”](#).

- `PRIVILEGES`

Reloads the privileges from the grant tables in the `mysql` database.

- `QUERY CACHE`

Defragment the query cache to better utilize its memory. `FLUSH QUERY CACHE` does not remove any queries from the cache, unlike `RESET QUERY CACHE`.

- `SLAVE (DEPRECATED)`. Resets all replication slave parameters, including relay log files and replication position in the master's binary logs. Deprecated in favor of `RESET SLAVE`, supported for backwards compatibility only See [Section 13.6.2.5, “RESET SLAVE Syntax”](#).

- `STATUS`

Resets most status variables to zero. This is something you should use only when debugging a query. See [Section 1.8, “How to Report Bugs or Problems”](#).

- `{TABLE | TABLES} [tbl_name [, tbl_name] ...]`

When no tables are named, closes all open tables and forces all tables in use to be closed. This also flushes the query cache. With one or more table names, flushes only the given tables. `FLUSH TABLES` also removes all query results from the query cache, like the `RESET QUERY CACHE` statement.

- `TABLES WITH READ LOCK`

Closes all open tables and locks all tables for all databases with a read lock until you execute `UNLOCK TABLES`. This is very convenient way to get backups if you have a filesystem such as Veritas that can take snapshots in time.

- `USER_RESOURCES`

Resets all per-hour user resources to zero. This enables clients that have reached their hourly connection, query, or update limits to resume activity immediately. `FLUSH USER_RESOURCES` does not apply to the limit on maximum simultaneous connections. See [Section 13.5.1.2, “GRANT Syntax”](#).

Before MySQL 4.1.1, `FLUSH` statements are not written to the binary log. As of MySQL 4.1.1, they are written to the binary log unless the optional `NO_WRITE_TO_BINLOG` keyword (or its alias `LOCAL`) is used. This is done so that `FLUSH` statements used on a MySQL server acting as a replication master will be replicated by default to the replication slave.

**Note:** `FLUSH LOGS`, `FLUSH MASTER`, `FLUSH SLAVE`, and `FLUSH TABLES WITH READ LOCK` are not logged in any case because they would cause problems if replicated to a slave.

You can also access some of these statements with the `mysqladmin` utility, using the `flush-hosts`, `flush-logs`, `flush-privileges`, `flush-status`, or `flush-tables` commands.

See also [Section 13.5.5.5, “RESET Syntax”](#), for information about how the `RESET` statement is used with replication.

### 13.5.5.3. `KILL` Syntax

```
KILL thread_id
```

Each connection to `mysqld` runs in a separate thread. You can see which threads are running with the `SHOW PROCESSLIST` statement and kill a thread with the `KILL thread_id` statement.

If you have the `PROCESS` privilege, you can see all threads. If you have the `SUPER` privilege, you can kill all threads and statements. Otherwise, you can see and kill only your own threads and statements.

You can also use the `mysqladmin processlist` and `mysqladmin kill` commands to examine and kill threads.

**Note:** You cannot use `KILL` with the Embedded MySQL Server library, because the embedded server merely runs inside the threads of the host application. It does not create any connection threads of its own.

When you use `KILL`, a thread-specific kill flag is set for the thread. In most cases, it might take some time for the thread to die, because the kill flag is checked only at specific intervals:

- In `SELECT`, `ORDER BY` and `GROUP BY` loops, the flag is checked after reading a block of rows. If the kill flag is set, the statement is aborted.
- During `ALTER TABLE`, the kill flag is checked before each block of rows are read from the original table. If the kill flag was set, the statement is aborted and the temporary table is deleted.
- During `UPDATE` or `DELETE` operations, the kill flag is checked after each block read and after each updated or deleted row. If the kill flag is set, the statement is aborted. Note that if you are not using transactions, the changes are not rolled back.
- `GET_LOCK()` aborts and returns `NULL`.
- An `INSERT DELAYED` thread quickly flushes (inserts) all rows it has in memory and then terminates.
- If the thread is in the table lock handler (state: `Locked`), the table lock is quickly aborted.
- If the thread is waiting for free disk space in a write call, the write is aborted with a “disk full” error message.
- Some threads might refuse to be killed. For example, `REPAIR TABLE`, `CHECK TABLE`, and `OPTIMIZE TABLE` cannot be killed before MySQL 4.1 and run to completion. This is changed: `REPAIR TABLE` and `OPTIMIZE TABLE` can be killed as of MySQL 4.1.0, as can `CHECK TABLE` as of MySQL 4.1.3. However, killing a `REPAIR TABLE` or `OPTIMIZE TABLE` operation on a `MyISAM` table results in a table that *is* corrupted and is unusable (reads and writes to it fail) until you optimize or repair it again (without interruption).

#### 13.5.5.4. LOAD INDEX INTO CACHE Syntax

```
LOAD INDEX INTO CACHE
  tbl_index_list [, tbl_index_list] ...

tbl_index_list:
  tbl_name
  [[INDEX|KEY] (index_name[, index_name] ...)]
  [IGNORE LEAVES]
```

The `LOAD INDEX INTO CACHE` statement preloads a table index into the key cache to which it has been assigned by an explicit `CACHE INDEX` statement, or into the default key cache otherwise. `LOAD INDEX INTO CACHE` is used only for `MyISAM` tables.

The `IGNORE LEAVES` modifier causes only blocks for the non-leaf nodes of the index to be preloaded.

The following statement preloads nodes (index blocks) of indexes for the tables `t1` and `t2`:

```
mysql> LOAD INDEX INTO CACHE t1, t2 IGNORE LEAVES;
+-----+-----+-----+-----+
| Table | Op      | Msg_type | Msg_text |
+-----+-----+-----+-----+
| test.t1 | preload_keys | status   | OK       |
| test.t2 | preload_keys | status   | OK       |
+-----+-----+-----+-----+
```

This statement preloads all index blocks from `t1`. It preloads only blocks for the non-leaf nodes from `t2`.

The syntax of `LOAD INDEX INTO CACHE` enables you to specify that only particular indexes from a table should be preloaded. The current implementation preloads all the table's indexes into the cache, so there is no reason to specify anything other than the table name.

`LOAD INDEX INTO CACHE` was added in MySQL 4.1.1.

### 13.5.5.5. RESET Syntax

```
RESET reset_option [, reset_option] ...
```

The `RESET` statement is used to clear the state of various server operations. You must have the `RELOAD` privilege to execute `RESET`.

`RESET` acts as a stronger version of the `FLUSH` statement. See [Section 13.5.5.2, “FLUSH Syntax”](#).

*reset\_option* can be any of the following:

- `MASTER`

Deletes all binary logs listed in the index file, resets the binary log index file to be empty, and creates a new binary log file. Previously named `FLUSH MASTER`. See [Section 13.6.1, “SQL Statements for Controlling Master Servers”](#).
- `QUERY CACHE`

Removes all query results from the query cache.
- `SLAVE`

Makes the slave forget its replication position in the master binary logs. Also resets the relay log by deleting any existing relay log files and beginning a new one. Previously named `FLUSH SLAVE`. See [Section 13.6.2, “SQL Statements for Controlling Slave Servers”](#).

## 13.6. Replication Statements

This section describes SQL statements related to replication. One group of statements is used for controlling master servers. The other is used for controlling slave servers.

### 13.6.1. SQL Statements for Controlling Master Servers

Replication can be controlled through the SQL interface. This section discusses statements for managing master replication servers. [Section 13.6.2, “SQL Statements for Controlling Slave Servers”](#), discusses statements for managing slave servers.

### 13.6.1.1. PURGE MASTER LOGS Syntax

```
PURGE {MASTER | BINARY} LOGS TO 'log_name'
PURGE {MASTER | BINARY} LOGS BEFORE 'date'
```

Deletes all the binary logs listed in the log index prior to the specified log or date. The logs also are removed from the list recorded in the log index file, so that the given log becomes the first.

Example:

```
PURGE MASTER LOGS TO 'mysql-bin.010';
PURGE MASTER LOGS BEFORE '2003-04-02 22:46:26';
```

The **BEFORE** variant is available as of MySQL 4.1. Its date argument can be in 'YYYY-MM-DD hh:mm:ss' format. **MASTER** and **BINARY** are synonyms, but **BINARY** can be used only as of MySQL 4.1.1.

This statement is safe to run while slaves are replicating. You do not need to stop them. If you have an active slave that currently is reading one of the logs you are trying to delete, this statement does nothing and fails with an error. However, if a slave is dormant and you happen to purge one of the logs it has yet to read, the slave will be unable to replicate after it comes up.

To safely purge logs, follow this procedure:

1. On each slave server, use **SHOW SLAVE STATUS** to check which log it is reading.
2. Obtain a listing of the binary logs on the master server with **SHOW BINARY LOGS**.
3. Determine the earliest log among all the slaves. This is the target log. If all the slaves are up to date, this is the last log on the list.
4. Make a backup of all the logs you are about to delete. (This step is optional, but always advisable.)
5. Purge all logs up to but not including the target log.

You can also set the `expire_logs_days` system variable to expire binary log files automatically after a given number of days (see [Section 5.2.2, “System Variables”](#)). If you are using replication, you should set the variable no lower than the maximum number of days your slaves might lag behind the master.

### 13.6.1.2. RESET MASTER Syntax

```
RESET MASTER
```

Deletes all binary logs listed in the index file, resets the binary log index file to be empty, and creates a new binary log file.

This statement was named **FLUSH MASTER** before MySQL 3.23.26.

### 13.6.1.3. SET SQL\_LOG\_BIN Syntax

```
SET SQL_LOG_BIN = {0|1}
```

Disables or enables binary logging for the current connection (`SQL_LOG_BIN` is a session variable) if the client that has the **SUPER** privilege. The statement is refused with an error if the client does not have

that privilege. (Before MySQL 4.1.2, the statement was simply ignored in that case.)

### 13.6.1.4. SHOW BINLOG EVENTS Syntax

```
SHOW BINLOG EVENTS
  [IN 'log_name'] [FROM pos] [LIMIT [offset,] row_count]
```

Shows the events in the binary log. If you do not specify 'log\_name', the first binary log is displayed.

The `LIMIT` clause has the same syntax as for the `SELECT` statement. See [Section 13.2.7, “SELECT Syntax”](#).

This statement is available as of MySQL 4.0.

### 13.6.1.5. SHOW BINARY LOGS Syntax

```
SHOW BINARY LOGS
SHOW MASTER LOGS
```

Lists the binary log files on the server. This statement is used as part of the procedure described in [Section 13.6.1.1, “PURGE MASTER LOGS Syntax”](#), that shows how to determine which logs can be purged.

```
mysql> SHOW BINARY LOGS;
+-----+-----+
| Log_name      | File_size |
+-----+-----+
| binlog.000015 | 724935    |
| binlog.000016 | 733481    |
+-----+-----+
```

`SHOW MASTER LOGS` was added in MySQL 3.23.38. As of MySQL 4.1.1, you can also use `SHOW BINARY LOGS`, which is equivalent. The `File_size` column is displayed as of MySQL 5.0.7.

### 13.6.1.6. SHOW MASTER STATUS Syntax

```
SHOW MASTER STATUS
```

Provides status information about the binary log files of the master. Example:

```
mysql > SHOW MASTER STATUS;
+-----+-----+-----+-----+
| File          | Position | Binlog_Do_DB | Binlog_Ignore_DB |
+-----+-----+-----+-----+
| mysql-bin.003 | 73       | test         | manual,mysql      |
+-----+-----+-----+-----+
```

### 13.6.1.7. SHOW SLAVE HOSTS Syntax

```
SHOW SLAVE HOSTS
```

Displays a list of replication slaves currently registered with the master. Only slaves started with the `--report-host=slave_name` option are visible in this list.

The list is displayed on any server (not just the master server). The output looks like this:

```
mysql> SHOW SLAVE HOSTS;
+-----+-----+-----+-----+
| Server_id | Host      | Port | Master_id |
+-----+-----+-----+-----+
```

192168010	iconnect2	3306	192168011
1921680101	athena	3306	192168011

- **Server\_id**: The unique server ID of the slave server, as configured in the server's option file, or on the command line with `--server-id=value`.
- **Host**: The host name of the slave server, as configured in the server's option file, or on the command line with `--report-host=value`. Note that this can differ from the machine name as configured in the operating system.
- **Port**: The port the slave server is listening on.
- **Master\_id**: The unique server ID of the master server that the slave server is replicating from.

Some MySQL versions report another variable, `Rpl_recovery_rank`. This variable was never used, and was eventually removed.

## 13.6.2. SQL Statements for Controlling Slave Servers

Replication can be controlled through the SQL interface. This section discusses statements for managing slave replication servers. [Section 13.6.1, “SQL Statements for Controlling Master Servers”](#), discusses statements for managing master servers.

### 13.6.2.1. CHANGE MASTER TO Syntax

```
CHANGE MASTER TO master_def [, master_def] ...
```

```
master_def:
MASTER_HOST = 'host_name'
MASTER_USER = 'user_name'
MASTER_PASSWORD = 'password'
MASTER_PORT = port_num
MASTER_CONNECT_RETRY = count
MASTER_LOG_FILE = 'master_log_name'
MASTER_LOG_POS = master_log_pos
RELAY_LOG_FILE = 'relay_log_name'
RELAY_LOG_POS = relay_log_pos
MASTER_SSL = {0|1}
MASTER_SSL_CA = 'ca_file_name'
MASTER_SSL_CAPATH = 'ca_directory_name'
MASTER_SSL_CERT = 'cert_file_name'
MASTER_SSL_KEY = 'key_file_name'
MASTER_SSL_CIPHER = 'cipher_list'
```

`CHANGE MASTER TO` changes the parameters that the slave server uses for connecting to and communicating with the master server. It also updates the contents of the `master.info` and `relay-log.info` files.

`MASTER_USER`, `MASTER_PASSWORD`, `MASTER_SSL`, `MASTER_SSL_CA`, `MASTER_SSL_CAPATH`, `MASTER_SSL_CERT`, `MASTER_SSL_KEY`, and `MASTER_SSL_CIPHER` provide information to the slave about how to connect to its master.

The relay log options (`RELAY_LOG_FILE` and `RELAY_LOG_POS`) are available beginning with MySQL 4.0.

The SSL options (`MASTER_SSL`, `MASTER_SSL_CA`, `MASTER_SSL_CAPATH`, `MASTER_SSL_CERT`, `MASTER_SSL_KEY`, and `MASTER_SSL_CIPHER`) are available beginning with MySQL 4.1.1. You can change these options even on slaves that are compiled without SSL support. They are saved to the `master.info` file, but are ignored unless you use a server that has SSL

support enabled.

If you don't specify a given parameter, it keeps its old value, except as indicated in the following discussion. For example, if the password to connect to your MySQL master has changed, you just need to issue these statements to tell the slave about the new password:

```
STOP SLAVE; -- if replication was running
CHANGE MASTER TO MASTER_PASSWORD='new3cret';
START SLAVE; -- if you want to restart replication
```

There is no need to specify the parameters that do not change (host, port, user, and so forth).

`MASTER_HOST` and `MASTER_PORT` are the hostname (or IP address) of the master host and its TCP/IP port. Note that if `MASTER_HOST` is equal to `localhost`, then, like in other parts of MySQL, the port number might be ignored (if Unix socket files can be used, for example).

If you specify `MASTER_HOST` or `MASTER_PORT`, the slave assumes that the master server is different from before (even if you specify a host or port value that is the same as the current value.) In this case, the old values for the master binary log name and position are considered no longer applicable, so if you do not specify `MASTER_LOG_FILE` and `MASTER_LOG_POS` in the statement, `MASTER_LOG_FILE=''` and `MASTER_LOG_POS=4` are silently appended to it.

`MASTER_LOG_FILE` and `MASTER_LOG_POS` are the coordinates at which the slave I/O thread should begin reading from the master the next time the thread starts. If you specify either of them, you cannot specify `RELAY_LOG_FILE` or `RELAY_LOG_POS`. If neither of `MASTER_LOG_FILE` or `MASTER_LOG_POS` are specified, the slave uses the last coordinates of the *slave SQL thread* before `CHANGE MASTER` was issued. This ensures that replication has no discontinuity, even if the slave SQL thread was late compared to the slave I/O thread, when you just want to change, say, the password to use. This safe behavior was introduced starting from MySQL 4.0.17 and 4.1.1. (Before these versions, the coordinates used were the last coordinates of the slave I/O thread before `CHANGE MASTER` was issued. This caused the SQL thread to possibly lose some events from the master, thus breaking replication.)

`CHANGE MASTER` deletes all relay log files and starts a new one, unless you specify `RELAY_LOG_FILE` or `RELAY_LOG_POS`. In that case, relay logs are kept; as of MySQL 4.1.1, the `relay_log_purge` global variable is set silently to 0.

`CHANGE MASTER` is useful for setting up a slave when you have the snapshot of the master and have recorded the log and the offset corresponding to it. After loading the snapshot into the slave, you can run `CHANGE MASTER TO MASTER_LOG_FILE='log_name_on_master', MASTER_LOG_POS=log_offset_on_master` on the slave.

The following example changes the master and master's binary log coordinates. This is used when you want to set up the slave to replicate the master:

```
CHANGE MASTER TO
  MASTER_HOST='master2.mycompany.com',
  MASTER_USER='replication',
  MASTER_PASSWORD='big3cret',
  MASTER_PORT=3306,
  MASTER_LOG_FILE='master2-bin.001',
  MASTER_LOG_POS=4,
  MASTER_CONNECT_RETRY=10;
```

The next example shows an operation that is less frequently employed. It is used when the slave has relay logs that you want it to execute again for some reason. To do this, the master need not be reachable. You need only use `CHANGE MASTER TO` and start the SQL thread (`START SLAVE SQL_THREAD`):

```
CHANGE MASTER TO
  RELAY_LOG_FILE='slave-relay-bin.006',
  RELAY_LOG_POS=4025;
```

You can even use the second operation in a non-replication setup with a standalone, non-slave server for recovery following a crash. Suppose that your server has crashed and you have restored a backup. You want to replay the server's own binary logs (not relay logs, but regular binary logs), named (for example) `myhost-bin.*`. First, make a backup copy of these binary logs in some safe place, in case you don't exactly follow the procedure below and accidentally have the server purge the binary logs. If using MySQL 4.1.1 or newer, use `SET GLOBAL relay_log_purge=0` for additional safety. Then start the server without the `--log-bin` option. Before MySQL 4.0.19, start it with a new server ID; in newer versions there is no need; simply use the `--replicate-same-server-id` option. Start it with `--relay-log=myhost-bin` (to make the server believe that these regular binary logs are relay logs) and `--skip-slave-start` options. After the server starts, issue these statements:

```
CHANGE MASTER TO
  RELAY_LOG_FILE='myhost-bin.153',
  RELAY_LOG_POS=410,
  MASTER_HOST='some_dummy_string';
START SLAVE SQL_THREAD;
```

The server reads and executes its own binary logs, thus achieving crash recovery. Once the recovery is finished, run `STOP SLAVE`, shut down the server, delete the `master.info` and `relay-log.info` files, and restart the server with its original options.

Specifying the `MASTER_HOST` option (even with a dummy value) is required to make the server think it is a slave.

### 13.6.2.2. LOAD DATA FROM MASTER Syntax

```
LOAD DATA FROM MASTER
```

**This feature is deprecated. We recommend not using it anymore. It is subject to removal in a future version of MySQL.**

Since the current implementation of `LOAD DATA FROM MASTER` and `LOAD TABLE FROM MASTER` is very limited, these statements are deprecated in versions 4.1 of MySQL and above. We will introduce a more advanced technique (called “online backup”) in a future version. That technique will have the additional advantage of working with more storage engines.

For MySQL 5.1 and earlier, the recommended alternative solution to using `LOAD DATA FROM MASTER` or `LOAD TABLE FROM MASTER` is using `mysqldump` or `mysqlhotcopy`. The latter requires Perl and two Perl modules (`DBI` and `DBD:mysql`) and works for `MyISAM` and `ARCHIVE` tables only. With `mysqldump`, you can create SQL dumps on the master and pipe (or copy) these to a `mysql` client on the slave. This has the advantage of working for all storage engines, but can be quite slow, since it works using `SELECT`.

This statement takes a snapshot of the master and copies it to the slave. It updates the values of `MASTER_LOG_FILE` and `MASTER_LOG_POS` so that the slave starts replicating from the correct position. Any table and database exclusion rules specified with the `--replicate-*-do-*` and `--replicate-*-ignore-*` options are honored. `--replicate-rewrite-db` is *not* taken into account because a user could use this option to set up a non-unique mapping such as `--replicate-rewrite-db="db1->db3"` and `--replicate-rewrite-db="db2->db3"`, which would confuse the slave when loading tables from the master.

Use of this statement is subject to the following conditions:

- It works only for `MyISAM` tables. Attempting to load a non-`MyISAM` table results in the following error:

```
ERROR 1189 (08S01): Net error reading from master
```

- It acquires a global read lock on the master while taking the snapshot, which prevents updates on the master during the load operation.

If you are loading large tables, you might have to increase the values of `net_read_timeout` and `net_write_timeout` on both the master and slave servers. See [Section 5.2.2, “System Variables”](#).

Note that `LOAD DATA FROM MASTER` does *not* copy any tables from the `mysql` database. This makes it easy to have different users and privileges on the master and the slave.

To use `LOAD DATA FROM MASTER`, the replication account that is used to connect to the master must have the `RELOAD` and `SUPER` privileges on the master and the `SELECT` privilege for all master tables you want to load. All master tables for which the user does not have the `SELECT` privilege are ignored by `LOAD DATA FROM MASTER`. This is because the master hides them from the user: `LOAD DATA FROM MASTER` calls `SHOW DATABASES` to know the master databases to load, but `SHOW DATABASES` returns only databases for which the user has some privilege. See [Section 13.5.4.6, “SHOW DATABASES Syntax”](#). On the slave side, the user that issues `LOAD DATA FROM MASTER` must have privileges for dropping and creating the databases and tables that are copied.

### 13.6.2.3. `LOAD TABLE tbl_name FROM MASTER` Syntax

```
LOAD TABLE tbl_name FROM MASTER
```

**This feature is deprecated. We recommend not using it anymore. It is subject to removal in a future version of MySQL.**

Since the current implementation of `LOAD DATA FROM MASTER` and `LOAD TABLE FROM MASTER` is very limited, these statements are deprecated in versions 4.1 of MySQL and above. We will introduce a more advanced technique (called “online backup”) in a future version. That technique will have the additional advantage of working with more storage engines.

For MySQL 5.1 and earlier, the recommended alternative solution to using `LOAD DATA FROM MASTER` or `LOAD TABLE FROM MASTER` is using `mysqldump` or `mysqlhotcopy`. The latter requires Perl and two Perl modules (`DBI` and `DBD:mysql`) and works for `MyISAM` and `ARCHIVE` tables only. With `mysqldump`, you can create SQL dumps on the master and pipe (or copy) these to a `mysql` client on the slave. This has the advantage of working for all storage engines, but can be quite slow, since it works using `SELECT`.

Transfers a copy of the table from the master to the slave. This statement is implemented mainly debugging `LOAD DATA FROM MASTER` operations. To use `LOAD TABLE`, the account used for connecting to the master server must have the `RELOAD` and `SUPER` privileges on the master and the `SELECT` privilege for the master table to load. On the slave side, the user that issues `LOAD TABLE FROM MASTER` must have privileges for dropping and creating the table.

The conditions for `LOAD DATA FROM MASTER` apply here as well. For example, `LOAD TABLE FROM MASTER` works only for `MyISAM` tables. The timeout notes for `LOAD DATA FROM MASTER` apply as well.

### 13.6.2.4. `MASTER_POS_WAIT( )` Syntax

```
SELECT MASTER_POS_WAIT('master_log_file', master_log_pos)
```

This is actually a function, not a statement. It is used to ensure that the slave has read and executed events up to a given position in the master's binary log. See [Section 12.9.4, “Miscellaneous Functions”](#), for a full description.

### 13.6.2.5. `RESET SLAVE` Syntax

```
RESET SLAVE
```

`RESET SLAVE` makes the slave forget its replication position in the master's binary logs. This statement is meant to be used for a clean start: It deletes the `master.info` and `relay-log.info` files, all the relay logs, and starts a new relay log.

**Note:** All relay logs are deleted, even if they have not been completely executed by the slave SQL thread. (This is a condition likely to exist on a replication slave if you have issued a `STOP SLAVE` statement or if the slave is highly loaded.)

Connection information stored in the `master.info` file is immediately reset using any values specified in the corresponding startup options. This information includes values such as master host, master port, master user, and master password. If the slave SQL thread was in the middle of replicating temporary tables when it was stopped, and `RESET SLAVE` is issued, these replicated temporary tables are deleted on the slave.

This statement was named `FLUSH SLAVE` before MySQL 3.23.26.

### 13.6.2.6. SET GLOBAL SQL\_SLAVE\_SKIP\_COUNTER Syntax

```
SET GLOBAL SQL_SLAVE_SKIP_COUNTER = N
```

This statement skips the next `N` events from the master. This is useful for recovering from replication stops caused by a statement.

This statement is valid only when the slave thread is not running. Otherwise, it produces an error.

Before MySQL 4.0, omit the `GLOBAL` keyword from the statement.

### 13.6.2.7. SHOW SLAVE STATUS Syntax

```
SHOW SLAVE STATUS
```

This statement provides status information on essential parameters of the slave threads. If you issue this statement using the `mysql` client, you can use a `\G` statement terminator rather than a semicolon to obtain a more readable vertical layout:

```
mysql> SHOW SLAVE STATUS\G
***** 1. row *****
      Slave_IO_State: Waiting for master to send event
      Master_Host: localhost
      Master_User: root
      Master_Port: 3306
      Connect_Retry: 3
      Master_Log_File: gbichot-bin.005
      Read_Master_Log_Pos: 79
      Relay_Log_File: gbichot-relay-bin.005
      Relay_Log_Pos: 548
      Relay_Master_Log_File: gbichot-bin.005
      Slave_IO_Running: Yes
      Slave_SQL_Running: Yes
      Replicate_Do_DB:
      Replicate_Ignore_DB:
           Last_Errno: 0
           Last_Error:
           Skip_Counter: 0
      Exec_Master_Log_Pos: 79
      Relay_Log_Space: 552
      Until_Condition: None
      Until_Log_File:
      Until_Log_Pos: 0
      Master_SSL_Allowed: No
      Master_SSL_CA_File:
      Master_SSL_CA_Path:
```

```
Master_SSL_Cert:  
Master_SSL_Cipher:  
Master_SSL_Key:  
Seconds_Behind_Master: 8
```

Depending on your version of MySQL, you may not see all the fields just shown. In particular, several fields are present only as of MySQL 4.1.1.

`SHOW SLAVE STATUS` returns the following fields:

- `Slave_IO_State`

A copy of the `State` field of the output of `SHOW PROCESSLIST` for the slave I/O thread. This tells you what the thread is doing: trying to connect to the master, waiting for events from the master, reconnecting to the master, and so on. Possible states are listed in [Section 6.3, “Replication Implementation Details”](#). It is necessary to check this field for older versions of MySQL (prior to 4.1.14) because in these versions the thread could be running while unsuccessfully trying to connect to the master; only this field makes you aware of the connection problem. The state of the SQL thread is not copied because it is simpler. If it is running, there is no problem; if it is not, you can find the error in the `Last_Error` field (described below).

This field is present beginning with MySQL 4.1.1.

- `Master_Host`

The current master host.

- `Master_User`

The current user used to connect to the master.

- `Master_Port`

The current master port.

- `Connect_Retry`

The current value of the `--master-connect-retry` option.

- `Master_Log_File`

The name of the master binary log file from which the I/O thread is currently reading.

- `Read_Master_Log_Pos`

The position up to which the I/O thread has read in the current master binary log.

- `Relay_Log_File`

The name of the relay log file from which the SQL thread is currently reading and executing.

- `Relay_Log_Pos`

The position up to which the SQL thread has read and executed in the current relay log.

- `Relay_Master_Log_File`

The name of the master binary log file containing the most recent event executed by the SQL thread.

- `Slave_IO_Running`

Whether the I/O thread is started and has connected successfully to the master. For older versions of MySQL (prior to 4.1.14 and 5.0.12) `Slave_IO_Running` is `YES` if the I/O thread is started, even if the slave hasn't connected to the master yet.

- `Slave_SQL_Running`

Whether the SQL thread is started.

- `Replicate_Do_DB`, `Replicate_Ignore_DB`

The lists of databases that were specified with the `--replicate-do-db` and `--replicate-ignore-db` options, if any.

These fields are present beginning with MySQL 4.1.1.

- `Replicate_Do_Table`, `Replicate_Ignore_Table`, `Replicate_Wild_Do_Table`, `Replicate_Wild_Ignore_Table`

The lists of tables that were specified with the `--replicate-do-table`, `--replicate-ignore-table`, `--replicate-wild-do-table`, and `--replicate-wild-ignore-table` options, if any.

These fields are present beginning with MySQL 4.1.1.

- `Last_Errno`, `Last_Error`

The error number and error message returned by the most recently executed query. An error number of 0 and message of the empty string mean “no error.” If the `Last_Error` value is not empty, it also appears as a message in the slave's error log. For example:

```
Last_Errno: 1051
Last_Error: error 'Unknown table 'z'' on query 'drop table z'
```

The message indicates that the table `z` existed on the master and was dropped there, but it did not exist on the slave, so `DROP TABLE` failed on the slave. (This might occur, for example, if you forget to copy the table to the slave when setting up replication.)

- `Skip_Counter`

The most recently used value for `SQL_SLAVE_SKIP_COUNTER`.

- `Exec_Master_Log_Pos`

The position of the last event executed by the SQL thread from the master's binary log (`Relay_Master_Log_File`). (`Relay_Master_Log_File`, `Exec_Master_Log_Pos`) in the master's binary log corresponds to (`Relay_Log_File`, `Relay_Log_Pos`) in the relay log.

- `Relay_Log_Space`

The total combined size of all existing relay logs.

- `Until_Condition`, `Until_Log_File`, `Until_Log_Pos`

The values specified in the `UNTIL` clause of the `START SLAVE` statement.

`Until_Condition` has these values:

- `None` if no `UNTIL` clause was specified

- `Master` if the slave is reading until a given position in the master's binary logs
- `Relay` if the slave is reading until a given position in its relay logs

`Until_Log_File` and `Until_Log_Pos` indicate the log filename and position values that define the point at which the SQL thread stops executing.

These fields are present beginning with MySQL 4.1.1.

- `Master_SSL_Allowed`, `Master_SSL_CA_File`, `Master_SSL_CA_Path`, `Master_SSL_Cert`, `Master_SSL_Cipher`, `Master_SSL_Key`

These fields show the SSL parameters used by the slave to connect to the master, if any.

`Master_SSL_Allowed` has these values:

- `Yes` if an SSL connection to the master is permitted
- `No` if an SSL connection to the master is not permitted
- `Ignored` if an SSL connection is permitted but the slave server does not have SSL support enabled

The values of the other SSL-related fields correspond to the values of the `--master-ca`, `--master-capath`, `--master-cert`, `--master-cipher`, and `--master-key` options.

These fields are present beginning with MySQL 4.1.1.

- `Seconds_Behind_Master`

This field is present beginning with MySQL 4.1.1. It is been experimental and has been changed in MySQL 4.1.9. The following applies to slaves running MySQL 4.1.9 or newer. This field is an indication of how “late” the slave is:

- When the slave SQL thread is actively running (processing updates), this field is the number of seconds that have elapsed since the timestamp of the most recent event on the master executed by that thread.
- When the SQL thread thread has caught up to the slave I/O thread and goes idle waiting for more events from the I/O thread, this field is zero.

In essence, this field measures the time difference in seconds between the slave SQL thread and the slave I/O thread.

If the network connection between master and slave is fast, the slave I/O thread is very close to the master, so this field is a good approximation of how late the slave SQL thread is compared to the master. If the network is slow, this is *not* a good approximation; the slave SQL thread may quite often be caught up with the slow-reading slave I/O thread, so `Seconds_Behind_Master` often shows a value of 0, even if the I/O thread is late compared to the master. In other words, *this column is useful only for fast networks*.

This time difference computation works even though the master and slave do not have identical clocks (the clock difference is computed when the slave I/O thread starts, and assumed to remain constant from then on). `Seconds_Behind_Master` is `NULL` (which means “unknown”) if the slave SQL thread is not running, or if the slave I/O thread is not running or not connected to master. For example if the slave I/O thread is sleeping for the number of seconds given by the `--master-connect-retry` option before reconnecting, `NULL` is shown, as the slave cannot know what the master is doing, and so cannot say reliably how late it is.

This field has one limitation. The timestamp is preserved through replication, which means that, if a master M1 is itself a slave of M0, any event from M1's binlog which originates in replicating an event from M0's binlog has the timestamp of that event. This enables MySQL to replicate `TIMESTAMP` successfully. However, the drawback for `Seconds_Behind_Master` is that if M1 also receives direct updates from clients, the value randomly deviates, because sometimes the last M1's event is from M0 and sometimes it is the most recent timestamp from a direct update.

### 13.6.2.8. `START SLAVE` Syntax

```
START SLAVE [thread_type [, thread_type] ... ]
START SLAVE [SQL_THREAD] UNTIL
  MASTER_LOG_FILE = 'log_name', MASTER_LOG_POS = log_pos
START SLAVE [SQL_THREAD] UNTIL
  RELAY_LOG_FILE = 'log_name', RELAY_LOG_POS = log_pos

thread_type: IO_THREAD | SQL_THREAD
```

`START SLAVE` with no `thread_type` options starts both of the slave threads. The I/O thread reads queries from the master server and stores them in the relay log. The SQL thread reads the relay log and executes the queries. `START SLAVE` requires the `SUPER` privilege.

If `START SLAVE` succeeds in starting the slave threads, it returns without any error. However, even in that case, it might be that the slave threads start and then later stop (for example, because they do not manage to connect to the master or read its binary logs, or some other problem). `START SLAVE` does not warn you about this. You must check the slave's error log for error messages generated by the slave threads, or check that they are running satisfactorily with `SHOW SLAVE STATUS`.

As of MySQL 4.0.2, you can add `IO_THREAD` and `SQL_THREAD` options to the statement to name which of the threads to start.

As of MySQL 4.1.1, an `UNTIL` clause may be added to specify that the slave should start and run until the SQL thread reaches a given point in the master binary logs or in the slave relay logs. When the SQL thread reaches that point, it stops. If the `SQL_THREAD` option is specified in the statement, it starts only the SQL thread. Otherwise, it starts both slave threads. If the SQL thread is running, the `UNTIL` clause is ignored and a warning is issued.

For an `UNTIL` clause, you must specify both a log filename and position. Do not mix master and relay log options.

Any `UNTIL` condition is reset by a subsequent `STOP SLAVE` statement, a `START SLAVE` statement that includes no `UNTIL` clause, or a server restart.

The `UNTIL` clause can be useful for debugging replication, or to cause replication to proceed until just before the point where you want to avoid having the slave replicate a statement. For example, if an unwise `DROP TABLE` statement was executed on the master, you can use `UNTIL` to tell the slave to execute up to that point but no farther. To find what the event is, use `mysqlbinlog` with the master logs or slave relay logs, or by using a `SHOW BINLOG EVENTS` statement.

If you are using `UNTIL` to have the slave process replicated queries in sections, it is recommended that you start the slave with the `--skip-slave-start` option to prevent the SQL thread from running when the slave server starts. It is probably best to use this option in an option file rather than on the command line, so that an unexpected server restart does not cause it to be forgotten.

The `SHOW SLAVE STATUS` statement includes output fields that display the current values of the `UNTIL` condition.

This statement is called `SLAVE START` before MySQL 4.0.5. `SLAVE START` is still accepted for backward compatibility, but is now deprecated.

### 13.6.2.9. STOP SLAVE Syntax

```
STOP SLAVE [thread_type [, thread_type] ... ]  
thread_type: IO_THREAD | SQL_THREAD
```

Stops the slave threads. `STOP SLAVE` requires the `SUPER` privilege.

Like `START SLAVE`, as of MySQL 4.0.2, this statement may be used with the `IO_THREAD` and `SQL_THREAD` options to name the thread or threads to be stopped.

This statement is called `SLAVE STOP` before MySQL 4.0.5. `SLAVE STOP` is still accepted for backward compatibility, but is deprecated.

## 13.7. SQL Syntax for Prepared Statements

Support for server-side prepared statements was added in MySQL 4.1. This support takes advantage of the efficient client/server binary protocol, provided that you use an appropriate client programming interface. Candidate interfaces include the MySQL C API client library (for C programs), MySQL Connector/J (for Java programs), and MySQL Connector/NET. For example, the C API provides a set of function calls that make up its prepared statement API. See [Section 17.2.4, “C API Prepared Statements”](#). Other language interfaces can provide support for prepared statements that use the binary protocol by linking in the C client library, one example being the [mysql\\_i extension](#) [<http://php.net/mysqli>], available in PHP 5.0 and later.

Beginning with MySQL 4.1.3, an alternative SQL interface to prepared statements is available. This interface is not as efficient as using the binary protocol through a prepared statement API, but requires no programming because it is available directly at the SQL level:

- You can use it when no programming interface is available to you.
- You can use it from any program that allows you to send SQL statements to the server to be executed, such as the `mysql` client program.
- You can use it even if the client is using an old version of the client library. The only requirement is that you be able to connect to a server that is recent enough to support SQL syntax for prepared statements.

SQL syntax for prepared statements is intended to be used for situations such as these:

- You want to test how prepared statements work in your application before coding it.
- An application has problems executing prepared statements and you want to determine interactively what the problem is.
- You want to create a test case that describes a problem you are having with prepared statements, so that you can file a bug report.
- You need to use prepared statements but do not have access to a programming API that supports them.

SQL syntax for prepared statements is based on three SQL statements:

- `PREPARE stmt_name FROM preparable_stmt`

The `PREPARE` statement prepares a statement and assigns it a name, `stmt_name`, by which to refer to the statement later. Statement names are not case sensitive. `preparable_stmt` is either a string literal or a user variable that contains the text of the statement. The text must represent a single SQL statement, not multiple statements. Within the statement, ‘?’ characters can be used as parameter markers to indicate where data values are to be bound to the query later when you execute it. The ‘?’ characters should not be enclosed within quotes, even if you intend to bind them to string values. Parameter markers can be used only where data values should appear, not for SQL keywords, identifiers, and so forth.

If a prepared statement with the given name already exists, it is deallocated implicitly before the new statement is prepared. This means that if the new statement contains an error and cannot be prepared, an error is returned and no statement with the given name exists.

The scope of a prepared statement is the client session within which it is created. Other clients cannot see it.

- `EXECUTE stmt_name [USING @var_name [, @var_name] ...]`

After preparing a statement, you execute it with an `EXECUTE` statement that refers to the prepared statement name. If the prepared statement contains any parameter markers, you must supply a `USING` clause that lists user variables containing the values to be bound to the parameters. Parameter values can be supplied only by user variables, and the `USING` clause must name exactly as many variables as the number of parameter markers in the statement.

You can execute a given prepared statement multiple times, passing different variables to it or setting the variables to different values before each execution.

- `{DEALLOCATE | DROP} PREPARE stmt_name`

To deallocate a prepared statement, use the `DEALLOCATE PREPARE` statement. Attempting to execute a prepared statement after deallocating it results in an error.

If you terminate a client session without deallocating a previously prepared statement, the server deallocates it automatically.

The following SQL statements can be used in prepared statements: `CREATE TABLE`, `DELETE`, `DO`, `INSERT`, `REPLACE`, `SELECT`, `SET`, `UPDATE`, and most `SHOW` statements. Other statements are not yet supported.

The following examples show two equivalent ways of preparing a statement that computes the hypotenuse of a triangle given the lengths of the two sides.

The first example shows how to create a prepared statement by using a string literal to supply the text of the statement:

```
mysql> PREPARE stmt1 FROM 'SELECT SQRT(POW(?,2) + POW(?,2)) AS hypotenuse';
mysql> SET @a = 3;
mysql> SET @b = 4;
mysql> EXECUTE stmt1 USING @a, @b;
+-----+
| hypotenuse |
+-----+
|          5 |
+-----+
mysql> DEALLOCATE PREPARE stmt1;
```

The second example is similar, but supplies the text of the statement as a user variable:

```
mysql> SET @s = 'SELECT SQRT(POW(?,2) + POW(?,2)) AS hypotenuse';
mysql> PREPARE stmt2 FROM @s;
mysql> SET @a = 6;
mysql> SET @b = 8;
mysql> EXECUTE stmt2 USING @a, @b;
+-----+
| hypotenuse |
+-----+
|          10 |
+-----+
mysql> DEALLOCATE PREPARE stmt2;
```

SQL syntax for prepared statements cannot be used in nested fashion. That is, a statement passed to `PREPARE` cannot itself be a `PREPARE`, `EXECUTE`, or `DEALLOCATE PREPARE` statement.

SQL syntax for prepared statements is distinct from using prepared statement API calls. For example, you cannot use the `mysql_stmt_prepare()` C API function to prepare a `PREPARE`, `EXECUTE`, or `DEALLOCATE PREPARE` statement.

SQL syntax for prepared statements does not support multi-statements (that is, multiple statements within a single string separated by `;` characters).

---

# Chapter 14. Storage Engines and Table Types

MySQL supports several storage engines that act as handlers for different table types. MySQL storage engines include both those that handle transaction-safe tables and those that handle non-transaction-safe tables:

- The original storage engine was [ISAM](#), which managed non-transactional tables. This engine has been replaced by [MyISAM](#) and should no longer be used. It is deprecated in MySQL 4.1, and is removed in subsequent MySQL release series.
- In MySQL 3.23.0, the [MyISAM](#) and [HEAP](#) storage engines were introduced. [MyISAM](#) is an improved replacement for [ISAM](#). The [HEAP](#) storage engine provides in-memory tables. The [MERGE](#) storage engine was added in MySQL 3.23.25. It allows a collection of identical [MyISAM](#) tables to be handled as a single table. All three of these storage engines handle non-transactional tables, and all are included in MySQL by default. Note that the [HEAP](#) storage engine has been renamed the [MEMORY](#) engine.
- The [InnoDB](#) and [BDB](#) storage engines that handle transaction-safe tables were introduced in later versions of MySQL 3.23. Both are available in source distributions as of MySQL 3.23.34a. [BDB](#) is included in MySQL-Max binary distributions on those operating systems that support it. [InnoDB](#) also is included in MySQL-Max binary distributions for MySQL 3.23. Beginning with MySQL 4.0, [InnoDB](#) is included by default in all MySQL binary distributions. In source distributions, you can enable or disable either engine by configuring MySQL as you like.
- The [EXAMPLE](#) storage engine was added in MySQL 4.1.3. It is a “stub” engine that does nothing. You can create tables with this engine, but no data can be stored in them or retrieved from them. The purpose of this engine is to serve as an example in the MySQL source code that illustrates how to begin writing new storage engines. As such, it is primarily of interest to developers.
- [NDB Cluster](#) is the storage engine used by MySQL Cluster to implement tables that are partitioned over many computers. It is available in source code distributions as of MySQL 4.1.2 and binary distributions as of MySQL-Max 4.1.3.

MySQL Cluster is covered in a separate chapter of this Manual. See [Chapter 15, MySQL Cluster](#), for more information.

- The [ARCHIVE](#) storage engine was added in MySQL 4.1.3. It is used for storing large amounts of data without indexes in a very small footprint.
- The [CSV](#) storage engine was added in MySQL 4.1.4. This engine stores data in text files using comma-separated values format.
- The [BLACKHOLE](#) storage engine was added in MySQL 4.1.11. This engine accepts but does not store data and retrievals always return an empty set.

This chapter describes each of the MySQL storage engines except for [NDB Cluster](#), which is covered in [Chapter 15, MySQL Cluster](#).

When you create a new table, you can specify which storage engine to use by adding an [ENGINE](#) or [TYPE](#) table option to the [CREATE TABLE](#) statement:

```
CREATE TABLE t (i INT) ENGINE = INNODB;  
CREATE TABLE t (i INT) TYPE = MEMORY;
```

[ENGINE](#) is the preferred term, but cannot be used before MySQL 4.0.18. [TYPE](#) is available beginning

with MySQL 3.23.0, the first version of MySQL for which multiple storage engines were available. `TYPE` is supported for backward compatibility but is deprecated.

If you omit the `ENGINE` or `TYPE` option, the default storage engine is used. Normally, this is `MyISAM`, but you can change it by using the `--default-storage-engine` or `--default-table-type` server startup option, or by setting the `default-storage-engine` or `default-table-type` option in the `my.cnf` configuration file.

You can set the default storage engine to be used during the current session by setting the `storage_engine` or `table_type` variable:

```
SET storage_engine=MYISAM;  
SET table_type=BDB;
```

When MySQL is installed on Windows using the MySQL Configuration Wizard, the `InnoDB` storage engine can be selected as the default instead of `MyISAM`. See [Section 2.3.4.6, “The Database Usage Dialog”](#).

To convert a table from one storage engine to another, use an `ALTER TABLE` statement that indicates the new engine:

```
ALTER TABLE t ENGINE = MYISAM;  
ALTER TABLE t TYPE = BDB;
```

See [Section 13.1.5, “CREATE TABLE Syntax”](#), and [Section 13.1.2, “ALTER TABLE Syntax”](#).

If you try to use a storage engine that is not compiled in or that is compiled in but deactivated, MySQL instead creates a table using the default storage engine, usually `MyISAM`. (Before MySQL, `MyISAM` is always used for unavailable storage engines.) type `MyISAM`. This behavior is convenient when you want to copy tables between MySQL servers that support different storage engines. (For example, in a replication setup, perhaps your master server supports transactional storage engines for increased safety, but the slave servers use only non-transactional storage engines for greater speed.)

This automatic substitution of the default storage engine for unavailable engines can be confusing for new MySQL users. In MySQL 4.1, a warning is generated when a storage engine is automatically changed.

For new tables, MySQL always creates an `.frm` file to hold the table and column definitions. The table's index and data may be stored in one or more other files, depending on the storage engine. The server creates the `.frm` file above the storage engine level. Individual storage engines create any additional files required for the tables that they manage.

A database may contain tables of different types. That is, tables need not all be created with the same storage engine.

Transaction-safe tables (TSTs) have several advantages over non-transaction-safe tables (NTSTs):

- They are safer. Even if MySQL crashes or you get hardware problems, you can get your data back, either by automatic recovery or from a backup plus the transaction log.
- You can combine many statements and accept them all at the same time with the `COMMIT` statement (if autocommit is disabled).
- You can execute `ROLLBACK` to ignore your changes (if autocommit is disabled).
- If an update fails, all of your changes are reverted. (With non-transaction-safe tables, all changes that have taken place are permanent.)
- Transaction-safe storage engines can provide better concurrency for tables that get many updates

concurrently with reads.

You can combine transaction-safe and non-transaction-safe tables in the same statements to get the best of both worlds. However, although MySQL supports several transaction-safe storage engines, for best results, you should not mix different storage engines within a transaction with autocommit disabled. For example, if you do this, changes to non-transaction-safe tables still are committed immediately and cannot be rolled back. For information about this and other problems that can occur in transactions that use mixed storage engines, see [Section 13.4.1, “START TRANSACTION, COMMIT, and ROLLBACK Syntax”](#).

Note that to use the `InnoDB` storage engine in MySQL 3.23, you must configure at least the `innodb_data_file_path` startup option. In 4.0 and up, `InnoDB` uses default configuration values if you specify none. See [Section 14.2.4, “InnoDB Configuration”](#).

Non-transaction-safe tables have several advantages of their own, all of which occur because there is no transaction overhead:

- Much faster
- Lower disk space requirements
- Less memory required to perform updates

## 14.1. The `MyISAM` Storage Engine

`MyISAM` is the default storage engine as of MySQL 3.23. It is based on the `ISAM` code but has many useful extensions.

Each `MyISAM` table is stored on disk in three files. The files have names that begin with the table name and have an extension to indicate the file type. An `.frm` file stores the table format. The data file has an `.MYD` (`MYData`) extension. The index file has an `.MYI` (`MYIndex`) extension.

To specify explicitly that you want a `MyISAM` table, indicate that with an `ENGINE` table option:

```
CREATE TABLE t (i INT) ENGINE = MYISAM;
```

The older term `TYPE` is supported as a synonym for `ENGINE` for backward compatibility, but `ENGINE` is the preferred term from MySQL 4.0.18 on and `TYPE` is deprecated.

Normally, the `ENGINE` or `TYPE` option is unnecessary; `MyISAM` is the default storage engine unless the default has been changed. To ensure that `MyISAM` is used in situations where the default might have been changed, specify the storage engine explicitly.

You can check or repair `MyISAM` tables with the `mysqlcheck` client or `myisamchk` utility. You can also compress `MyISAM` tables with `myisampack` to take up much less space. See [Section 8.11, “mysqlcheck — A Table Maintenance and Repair Program”](#), [Section 5.9.4.1, “Using myisamchk for Crash Recovery”](#), and [Section 8.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”](#).

The following characteristics of the `MyISAM` storage engine are improvements over the older `ISAM` engine:

- All data values are stored with the low byte first. This makes the data machine and operating system independent. The only requirements for binary portability are that the machine uses

two's-complement signed integers and IEEE floating-point format. These requirements are widely used among mainstream machines. Binary compatibility might not be applicable to embedded systems, which sometimes have peculiar processors.

There is no significant speed penalty for storing data low byte first; the bytes in a table row normally are unaligned and it takes little more processing to read an unaligned byte in order than in reverse order. Also, the code in the server that fetches column values is not time critical compared to other code.

- All numeric key values are stored with the high byte first to allow better index compression.
- Large files (up to 63-bit file length) are supported on filesystems and operating systems that support large files.
- The maximum number of indexes per table is 64 (32 before MySQL 4.1.2). This can be changed by changing the source and recompiling. The maximum number of columns per index is 16.
- The maximum key length is 1000 bytes (500 before MySQL 4.1.2). This can be changed by changing the source and recompiling. For the case of a key longer than 250 bytes, a larger key block size than the default of 1024 bytes is used.
- Index files are usually much smaller with `MyISAM` than with `ISAM`. This means that `MyISAM` normally uses less system resources than `ISAM`, but needs more CPU time when inserting data into a compressed index.
- When rows are inserted in sorted order (as when you are using an `AUTO_INCREMENT` column), the index tree is split so that the high node only contains one key. This improves space utilization in the index tree.
- Internal handling of one `AUTO_INCREMENT` column per table is supported. `MyISAM` automatically updates this column for `INSERT/UPDATE`. This makes `AUTO_INCREMENT` columns faster (at least 10%). Values at the top of the sequence are not reused after being deleted as they are with `ISAM`. (When an `AUTO_INCREMENT` column is defined as the last column of a multiple-column index, reuse of values deleted from the top of a sequence does occur.) The `AUTO_INCREMENT` value can be reset with `ALTER TABLE` or `myisamchk`.
- Dynamic-sized rows are much less fragmented when mixing deletes with updates and inserts. This is done by automatically combining adjacent deleted blocks and by extending blocks if the next block is deleted.
- If a table has no free blocks in the middle of the data file, you can `INSERT` new rows into it at the same time that other threads are reading from the table. (These are known as concurrent inserts.) A free block can occur as a result of deleting rows or an update of a dynamic length row with more data than its current contents. When all free blocks are used up (filled in), future inserts become concurrent again. See [Section 7.3.3, “Concurrent Inserts”](#).
- You can put the data file and index file on different directories to get more speed with the `DATA DIRECTORY` and `INDEX DIRECTORY` table options to `CREATE TABLE`. See [Section 13.1.5, “CREATE TABLE Syntax”](#).
- `BLOB` and `TEXT` columns can be indexed.
- `NULL` values are allowed in indexed columns. This takes 0-1 bytes per key.
- As of MySQL 4.1, each character column can have a different character set.
- There is a flag in the `MyISAM` index file that indicates whether the table was closed correctly. If `mysqld` is started with the `--myisam-recover` option, `MyISAM` tables are automatically checked when opened, and are repaired if the table wasn't closed properly.

- `myisamchk` marks tables as checked if you run it with the `--update-state` option. `myisamchk --fast` checks only those tables that don't have this mark.
- `myisamchk --analyze` stores statistics for portions of keys, not only for whole keys as in `ISAM`.
- `myisampack` can pack `BLOB` and `VARCHAR` columns; `pack_isam` cannot.

`MyISAM` also supports the following features, which MySQL will be able to use in the near future:

- Support for a true `VARCHAR` type; a `VARCHAR` column starts with a length stored in one or two bytes.
- Tables with `VARCHAR` columns may have fixed or dynamic row length.
- The sum of the lengths of the `VARCHAR` and `CHAR` columns in a table may be up to 64KB.
- A hashed computed index can be used for `UNIQUE`. This allows you to have `UNIQUE` on any combination of columns in a table. (However, you cannot search on a `UNIQUE` computed index.)

#### Additional resources

- A forum dedicated to the `MyISAM` storage engine is available at <http://forums.mysql.com/list.php?21>.

### 14.1.1. `MyISAM` Startup Options

The following options to `mysqld` can be used to change the behavior of `MyISAM` tables. For additional information, see [Section 5.2.1, “Command Options”](#).

- `--myisam-recover=mode`

Set the mode for automatic recovery of crashed `MyISAM` tables.

- `--delay-key-write=ALL`

Don't flush key buffers between writes for any `MyISAM` table.

**Note:** If you do this, you should not access `MyISAM` tables from another program (such as from another MySQL server or with `myisamchk`) when the tables are in use. Doing so risks index corruption. Using `--external-locking` does not eliminate this risk.

The following system variables affect the behavior of `MyISAM` tables. For additional information, see [Section 5.2.2, “System Variables”](#).

- `bulk_insert_buffer_size`

The size of the tree cache used in bulk insert optimization. **Note:** This is a limit *per thread*!

- `myisam_max_extra_sort_file_size`

Used to help MySQL to decide when to use the slow but safe key cache index creation method.

**Note:** This parameter is given in megabytes before MySQL 4.0.3, and in bytes as of 4.0.3.

- `myisam_max_sort_file_size`

The maximum size of the temporary file that MySQL is allowed to use while re-creating a **MyISAM** index (during `REPAIR TABLE`, `ALTER TABLE`, or `LOAD DATA INFILE`). If the file size would be larger than this value, the index is created using the key cache instead, which is slower. This variable was added in MySQL 3.23.37. **Note:** The value is given in megabytes before 4.0.3 and in bytes thereafter.

- `myisam_sort_buffer_size`

Set the size of the buffer used when recovering tables.

Automatic recovery is activated if you start `mysqld` with the `--myisam-recover` option. In this case, when the server opens a **MyISAM** table, it checks whether the table is marked as crashed or whether the open count variable for the table is not 0 and you are running the server with external locking disabled. If either of these conditions is true, the following happens:

- The server checks the table for errors.
- If the server finds an error, it tries to do a fast table repair (with sorting and without re-creating the data file).
- If the repair fails because of an error in the data file (for example, a duplicate-key error), the server tries again, this time re-creating the data file.
- If the repair still fails, the server tries once more with the old repair option method (write row by row without sorting). This method should be able to repair any type of error and has low disk space requirements.

If the recovery wouldn't be able to recover all rows from previously completed statements and you didn't specify `FORCE` in the value of the `--myisam-recover` option, automatic repair aborts with an error message in the error log:

```
Error: Couldn't repair table: test.g00pages
```

If you specify `FORCE`, a warning like this is written instead:

```
Warning: Found 344 of 354 rows when repairing ./test/g00pages
```

Note that if the automatic recovery value includes `BACKUP`, the recovery process creates files with names of the form `tbl_name-datetime.BAK`. You should have a `cron` script that automatically moves these files from the database directories to backup media.

## 14.1.2. Space Needed for Keys

**MyISAM** tables use B-tree indexes. You can roughly calculate the size for the index file as  $(key\_length+4)/0.67$ , summed over all keys. This is for the worst case when all keys are inserted in sorted order and the table doesn't have any compressed keys.

String indexes are space compressed. If the first index part is a string, it is also prefix compressed. Space compression makes the index file smaller than the worst-case figure if a string column has a lot of trail-

ing space or is a `VARCHAR` column that is not always used to the full length. Prefix compression is used on keys that start with a string. Prefix compression helps if there are many strings with an identical prefix.

In `MyISAM` tables, you can also prefix compress numbers by specifying the `PACK_KEYS=1` table option when you create the table. Numbers are stored with the high byte first, so this helps when you have many integer keys that have an identical prefix.

### 14.1.3. `MyISAM` Table Storage Formats

`MyISAM` supports three different storage formats. Two of them, fixed and dynamic format, are chosen automatically depending on the type of columns you are using. The third, compressed format, can be created only with the `myisampack` utility.

When you use `CREATE TABLE` or `ALTER TABLE` for a table that has no `BLOB` or `TEXT` columns, you can force the table format to `FIXED` or `DYNAMIC` with the `ROW_FORMAT` table option. This causes `CHAR` and `VARCHAR` columns to become `CHAR` for `FIXED` format, or `VARCHAR` for `DYNAMIC` format. See [Section 13.1.5, “CREATE TABLE Syntax”](#), for information about `ROW_FORMAT`.

#### 14.1.3.1. Static (Fixed-Length) Table Characteristics

Static format is the default for `MyISAM` tables. It is used when the table contains no variable-length columns (`VARCHAR`, `VARBINARY`, `BLOB`, or `TEXT`). Each row is stored using a fixed number of bytes.

Of the three `MyISAM` storage formats, static format is the simplest and most secure (least subject to corruption). It is also the fastest of the on-disk formats due to the ease with which rows in the data file can be found on disk: To look up a row based on a row number in the index, multiply the row number by the row length to calculate the row position. Also, when scanning a table, it is very easy to read a constant number of rows with each disk read operation.

The security is evidenced if your computer crashes while the MySQL server is writing to a fixed-format `MyISAM` file. In this case, `myisamchk` can easily determine where each row starts and ends, so it can usually reclaim all rows except the partially written one. Note that `MyISAM` table indexes can always be reconstructed based on the data rows.

Static-format tables have these characteristics:

- `CHAR` and `BINARY` columns are space-padded to the column width. This is also true for `NUMERIC` and `DECIMAL` columns.
- Very quick.
- Easy to cache.
- Easy to reconstruct after a crash, because rows are located in fixed positions.
- Reorganization is unnecessary unless you delete a huge number of rows and want to return free disk space to the operating system. To do this, use `OPTIMIZE TABLE` or `myisamchk -r`.
- Usually require more disk space than dynamic-format tables.

#### 14.1.3.2. Dynamic Table Characteristics

Dynamic storage format is used if a `MyISAM` table contains any variable-length columns (`VARCHAR`, `VARBINARY`, `BLOB`, or `TEXT`), or if the table was created with the `ROW_FORMAT=DYNAMIC` table option.

Dynamic format is a little more complex than static format because each row has a header that indicates how long it is. A row can become fragmented (stored in non-contiguous pieces) when it is made longer as a result of an update.

You can use `OPTIMIZE TABLE` or `myisamchk -r` to defragment a table. If you have fixed-length columns that you access or change frequently in a table that also contains some variable-length columns, it might be a good idea to move the variable-length columns to other tables just to avoid fragmentation.

Dynamic-format tables have these characteristics:

- All string columns are dynamic except those with a length less than four.
- Each row is preceded by a bitmap that indicates which columns contain the empty string (for string columns) or zero (for numeric columns). Note that this does not include columns that contain `NULL` values. If a string column has a length of zero after trailing space removal, or a numeric column has a value of zero, it is marked in the bitmap and not saved to disk. Non-empty strings are saved as a length byte plus the string contents.
- Much less disk space usually is required than for fixed-length tables.
- Each row uses only as much space as is required. However, if a row becomes larger, it is split into as many pieces as are required, resulting in row fragmentation. For example, if you update a row with information that extends the row length, the row becomes fragmented. In this case, you may have to run `OPTIMIZE TABLE` or `myisamchk -r` from time to time to improve performance. Use `myisamchk -ei` to obtain table statistics.
- More difficult than static-format tables to reconstruct after a crash, because rows may be fragmented into many pieces and links (fragments) may be missing.
- The expected row length for dynamic-sized rows is calculated using the following expression:

```

3
+ (number of columns + 7) / 8
+ (number of char columns)
+ (packed size of numeric columns)
+ (length of strings)
+ (number of NULL columns + 7) / 8

```

There is a penalty of 6 bytes for each link. A dynamic row is linked whenever an update causes an enlargement of the row. Each new link is at least 20 bytes, so the next enlargement probably goes in the same link. If not, another link is created. You can find the number of links using `myisamchk -ed`. All links may be removed with `OPTIMIZE TABLE` or `myisamchk -r`.

### 14.1.3.3. Compressed Table Characteristics

Compressed storage format is a read-only format that is generated with the `myisampack` tool.

All MySQL distributions as of version 3.23.19 include `myisampack` by default. (This version is when MySQL was placed under the GPL.) For earlier versions, `myisampack` was included only with licenses or support agreements, but the server still can read tables that were compressed with `myisampack`. Compressed tables can be uncompressed with `myisamchk`. (For the `ISAM` storage engine, compressed tables can be created with `pack_isam` and uncompressed with `isamchk`.)

Compressed tables have the following characteristics:

- Compressed tables take very little disk space. This minimizes disk usage, which is helpful when using slow disks (such as CD-ROMs).

- Each row is compressed separately, so there is very little access overhead. The header for a row takes up one to three bytes depending on the biggest row in the table. Each column is compressed differently. There is usually a different Huffman tree for each column. Some of the compression types are:
  - Suffix space compression.
  - Prefix space compression.
  - Numbers with a value of zero are stored using one bit.
  - If values in an integer column have a small range, the column is stored using the smallest possible type. For example, a `BIGINT` column (eight bytes) can be stored as a `TINYINT` column (one byte) if all its values are in the range from `-128` to `127`.
  - If a column has only a small set of possible values, the data type is converted to `ENUM`.
  - A column may use any combination of the preceding compression types.
- Can be used for fixed-length or dynamic-length rows.

**Note.** While a compressed table is read-only, and you cannot therefore update or add rows in the table, DDL (Data Definition Language) operations are still valid. For example, you may still use `DROP` to drop the table, and `TRUNCATE` to empty the table.

## 14.1.4. `MyISAM` Table Problems

The file format that MySQL uses to store data has been extensively tested, but there are always circumstances that may cause database tables to become corrupted. The following discussion describes how this can happen and how to handle it.

### 14.1.4.1. Corrupted `MyISAM` Tables

Even though the `MyISAM` table format is very reliable (all changes to a table made by an SQL statement are written before the statement returns), you can still get corrupted tables if any of the following events occur:

- The `mysqld` process is killed in the middle of a write.
- An unexpected computer shutdown occurs (for example, the computer is turned off).
- Hardware failures.
- You are using an external program (such as `myisamchk`) to modify a table that is being modified by the server at the same time.
- A software bug in the MySQL or `MyISAM` code.

Typical symptoms of a corrupt table are:

- You get the following error while selecting data from the table:

```
Incorrect key file for table: '...'. Try to repair it
```

- Queries don't find rows in the table or return incomplete results.

You can check the health of a `MyISAM` table using the `CHECK TABLE` statement, and repair a corrupted `MyISAM` table with `REPAIR TABLE`. When `mysqld` is not running, you can also check or repair a table with the `myisamchk` command. See [Section 13.5.2.3, “CHECK TABLE Syntax”](#), [Section 13.5.2.6, “REPAIR TABLE Syntax”](#), and [Section 8.3, “myisamchk — MyISAM Table-Maintenance Utility”](#).

If your tables become corrupted frequently, you should try to determine why this is happening. The most important thing to know is whether the table became corrupted as a result of a server crash. You can verify this easily by looking for a recent `restarted mysqld` message in the error log. If there is such a message, it is likely that table corruption is a result of the server dying. Otherwise, corruption may have occurred during normal operation. This is a bug. You should try to create a reproducible test case that demonstrates the problem. See [Section A.4.2, “What to Do If MySQL Keeps Crashing”](#), and [Section E.1.6, “Making a Test Case If You Experience Table Corruption”](#).

### 14.1.4.2. Problems from Tables Not Being Closed Properly

Each `MyISAM` index file (`.MYI` file) has a counter in the header that can be used to check whether a table has been closed properly. If you get the following warning from `CHECK TABLE` or `myisamchk`, it means that this counter has gone out of sync:

```
clients are using or haven't closed the table properly
```

This warning doesn't necessarily mean that the table is corrupted, but you should at least check the table.

The counter works as follows:

- The first time a table is updated in MySQL, a counter in the header of the index files is incremented.
- The counter is not changed during further updates.
- When the last instance of a table is closed (because a `FLUSH TABLES` operation was performed or because there is no room in the table cache), the counter is decremented if the table has been updated at any point.
- When you repair the table or check the table and it is found to be okay, the counter is reset to zero.
- To avoid problems with interaction with other processes that might check the table, the counter is not decremented on close if it was zero.

In other words, the counter can become incorrect only under these conditions:

- A `MyISAM` table is copied without first issuing `LOCK TABLES` and `FLUSH TABLES`.
- MySQL has crashed between an update and the final close. (Note that the table may still be okay, because MySQL always issues writes for everything between each statement.)
- A table was modified by `myisamchk --recover` or `myisamchk --update-state` at the same time that it was in use by `mysqld`.
- Multiple `mysqld` servers are using the table and one server performed a `REPAIR TABLE` or `CHECK TABLE` on the table while it was in use by another server. In this setup, it is safe to use `CHECK TABLE`, although you might get the warning from other servers. However, `REPAIR TA-`

`BLE` should be avoided because when one server replaces the data file with a new one, this is not known to the other servers.

In general, it is a bad idea to share a data directory among multiple servers. See [Section 5.12](#), “Running Multiple MySQL Servers on the Same Machine”, for additional discussion.

## 14.2. The `InnoDB` Storage Engine

### 14.2.1. `InnoDB` Overview

`InnoDB` provides MySQL with a transaction-safe (`ACID` compliant) storage engine that has commit, rollback, and crash recovery capabilities. `InnoDB` does locking on the row level and also provides an Oracle-style consistent non-locking read in `SELECT` statements. These features increase multi-user concurrency and performance. There is no need for lock escalation in `InnoDB` because row-level locks fit in very little space. `InnoDB` also supports `FOREIGN KEY` constraints. You can freely mix `InnoDB` tables with tables from other MySQL storage engines, even within the same statement.

`InnoDB` has been designed for maximum performance when processing large data volumes. Its CPU efficiency is probably not matched by any other disk-based relational database engine.

Fully integrated with MySQL Server, the `InnoDB` storage engine maintains its own buffer pool for caching data and indexes in main memory. `InnoDB` stores its tables and indexes in a tablespace, which may consist of several files (or raw disk partitions). This is different from, for example, `MyISAM` tables where each table is stored using separate files. `InnoDB` tables can be of any size even on operating systems where file size is limited to 2GB.

`InnoDB` is included in binary distributions by default as of MySQL 4.0. For information about `InnoDB` support in MySQL 3.23, see [Section 14.2.3](#), “`InnoDB` in MySQL 3.23”. Starting from MySQL 4.1.5, the improved Windows installer makes `InnoDB` the MySQL default storage engine on Windows.

`InnoDB` is used in production at numerous large database sites requiring high performance. The famous Internet news site Slashdot.org runs on `InnoDB`. Myrix, Inc. stores over 1TB of data in `InnoDB`, and another site handles an average load of 800 inserts/updates per second in `InnoDB`.

`InnoDB` is published under the same GNU GPL License Version 2 (of June 1991) as MySQL. For more information on MySQL licensing, see <http://www.mysql.com/company/legal/licensing/>.

A forum dedicated to the `InnoDB` storage engine is available at <http://forums.mysql.com/list.php?22>.

### 14.2.2. `InnoDB` Contact Information

Contact information for Innobase Oy, producer of the `InnoDB` engine:

```
Web site: http://www.innodb.com/
Email: <sales@innodb.com>
Phone: +358-9-6969 3250 (office)
       +358-40-5617367 (mobile)
```

```
Innbase Oy Inc.
World Trade Center Helsinki
Aleksanterinkatu 17
P.O.Box 800
00101 Helsinki
Finland
```

### 14.2.3. `InnoDB` in MySQL 3.23

Beginning with MySQL 4.0, `InnoDB` is enabled by default, so the following information applies only to MySQL 3.23.

`InnoDB` tables are included in the MySQL source distribution starting from 3.23.34a and are activated in the MySQL-Max binaries of the 3.23 series. For Windows, the MySQL-Max binaries are included in the standard distribution.

If you have downloaded a binary version of MySQL that includes support for `InnoDB`, simply follow the instructions of the MySQL manual for installing a binary version of MySQL. If you have MySQL 3.23 installed, the simplest way to install MySQL-Max is to replace the executable `mysqld` server with the corresponding executable from the MySQL-Max distribution. MySQL and MySQL-Max differ only in the server executable. See [Section 2.8, “Installing MySQL on Other Unix-Like Systems”](#), and [Section 5.3, “The `mysqld-max` Extended MySQL Server”](#).

To compile the MySQL source code with `InnoDB` support, download MySQL 3.23.34a or newer from <http://www.mysql.com/> and configure MySQL with the `--with-innodb` option. See [Section 2.9, “MySQL Installation Using a Source Distribution”](#).

To use `InnoDB` tables with MySQL 3.23, you must specify configuration parameters in the `[mysqld]` section of the `my.cnf` option file. On Windows, you can use `my.ini` instead. If you do not configure `InnoDB` in the option file, `InnoDB` does not start. (From MySQL 4.0 on, `InnoDB` uses default parameters if you do not specify any. However, to get best performance, it is still recommended that you use parameters appropriate for your system, as discussed in [Section 14.2.4, “InnoDB Configuration”](#).)

In MySQL 3.23, you must specify at the minimum an `innodb_data_file_path` value to configure the `InnoDB` data files. For example, to configure `InnoDB` to use a single 500MB data file, place the following setting in the `[mysqld]` section of your option file:

```
[mysqld]
innodb_data_file_path=ibdata1:500M
```

`InnoDB` creates the `ibdata1` file in the MySQL data directory by default. To specify the location explicitly, specify an `innodb_data_home_dir` setting. See [Section 14.2.4, “InnoDB Configuration”](#).

## 14.2.4. InnoDB Configuration

To enable `InnoDB` tables in MySQL 3.23, see [Section 14.2.3, “InnoDB in MySQL 3.23”](#).

From MySQL 4.0 on, the `InnoDB` storage engine is enabled by default. If you don't want to use `InnoDB` tables, you can add the `skip-innodb` option to your MySQL option file.

**Note:** `InnoDB` provides MySQL with a transaction-safe (`ACID` compliant) storage engine that has commit, rollback, and crash recovery capabilities. **However, it cannot do so** if the underlying operating system or hardware does not work as advertised. Many operating systems or disk subsystems may delay or reorder write operations to improve performance. On some operating systems, the very system call that should wait until all unwritten data for a file has been flushed — `fsync()` — might actually return before the data has been flushed to stable storage. Because of this, an operating system crash or a power outage may destroy recently committed data, or in the worst case, even corrupt the database because of write operations having been reordered. If data integrity is important to you, you should perform some “pull-the-plug” tests before using anything in production. On Mac OS X 10.3 and up, `InnoDB` uses a special `fcntl()` file flush method. Under Linux, it is advisable to **disable the write-back cache**.

On ATAPI hard disks, a command such `hdparm -W0 /dev/hda` may work to disable the write-back cache. **Beware that some drives or disk controllers may be unable to disable the write-back cache.**

Two important disk-based resources managed by the `InnoDB` storage engine are its tablespace data files and its log files.

**Note:** If you specify no [InnoDB](#) configuration options, MySQL 4.0 and above create an auto-extending 10MB data file named `ibdata1` and two 5MB log files named `ib_logfile0` and `ib_logfile1` in the MySQL data directory. (In MySQL 4.0.0 and 4.0.1, the data file is 64MB and not auto-extending.) In MySQL 3.23, [InnoDB](#) does not start if you provide no configuration options. To get good performance, you should explicitly provide [InnoDB](#) parameters as discussed in the following examples. Naturally, you should edit the settings to suit your hardware and requirements.

The examples shown here are representative. See [Section 14.2.5, “InnoDB Startup Options and System Variables”](#) for additional information about [InnoDB](#)-related configuration parameters.

To set up the [InnoDB](#) tablespace files, use the `innodb_data_file_path` option in the `[mysqld]` section of the `my.cnf` option file. On Windows, you can use `my.ini` instead. The value of `innodb_data_file_path` should be a list of one or more data file specifications. If you name more than one data file, separate them by semicolon (`;`) characters:

```
innodb_data_file_path=datafile_spec1[:datafile_spec2]...
```

For example, a setting that explicitly creates a tablespace having the same characteristics as the MySQL 4.0 default is as follows:

```
[mysqld]
innodb_data_file_path=ibdata1:10M:autoextend
```

This setting configures a single 10MB data file named `ibdata1` that is auto-extending. No location for the file is given, so by default, [InnoDB](#) creates it in the MySQL data directory.

Sizes are specified using `M` or `G` suffix letters to indicate units of MB or GB.

A tablespace containing a fixed-size 50MB data file named `ibdata1` and a 50MB auto-extending file named `ibdata2` in the data directory can be configured like this:

```
[mysqld]
innodb_data_file_path=ibdata1:50M;ibdata2:50M:autoextend
```

The full syntax for a data file specification includes the filename, its size, and several optional attributes:

```
file_name:file_size[:autoextend[:max:max_file_size]]
```

The `autoextend` attribute and those following can be used only for the last data file in the `innodb_data_file_path` line. `autoextend` is available starting from MySQL 3.23.50 and 4.0.2.

If you specify the `autoextend` option for the last data file, [InnoDB](#) extends the data file if it runs out of free space in the tablespace. The increment is 8MB at a time by default. It can be modified by changing the `innodb_autoextend_increment` system variable.

If the disk becomes full, you might want to add another data file on another disk. Instructions for reconfiguring an existing tablespace are given in [Section 14.2.8, “Adding and Removing InnoDB Data and Log Files”](#).

[InnoDB](#) is not aware of the filesystem maximum file size, so be cautious on filesystems where the maximum file size is a small value such as 2GB. To specify a maximum size for an auto-extending data file, use the `max` attribute. The following configuration allows `ibdata1` to grow up to a limit of 500MB:

```
[mysqld]
innodb_data_file_path=ibdata1:10M:autoextend:max:500M
```

[InnoDB](#) creates tablespace files in the MySQL data directory by default. To specify a location explicitly, use the `innodb_data_home_dir` option. For example, to use two files named `ibdata1` and

`ibdata2` but create them in the `/ibdata` directory, configure `InnoDB` like this:

```
[mysqld]
innodb_data_home_dir = /ibdata
innodb_data_file_path=ibdata1:50M;ibdata2:50M:autoextend
```

**Note:** `InnoDB` does not create directories, so make sure that the `/ibdata` directory exists before you start the server. This is also true of any log file directories that you configure. Use the Unix or DOS `mkdir` command to create any necessary directories.

`InnoDB` forms the directory path for each data file by textually concatenating the value of `innodb_data_home_dir` to the data file name, adding a pathname separator (slash or backslash) between values if necessary. If the `innodb_data_home_dir` option is not mentioned in `my.cnf` at all, the default value is the “dot” directory `./`, which means the MySQL data directory. (The MySQL server changes its current working directory to its data directory when it begins executing.)

If you specify `innodb_data_home_dir` as an empty string, you can specify absolute paths for the data files listed in the `innodb_data_file_path` value. The following example is equivalent to the preceding one:

```
[mysqld]
innodb_data_home_dir =
innodb_data_file_path=/ibdata/ibdata1:50M;/ibdata/ibdata2:50M:autoextend
```

**A simple `my.cnf` example.** Suppose that you have a computer with 128MB RAM and one hard disk. The following example shows possible configuration parameters in `my.cnf` or `my.ini` for `InnoDB`. The example assumes the use of MySQL-Max 3.23.50 or later or MySQL 4.0.2 or later because it uses the `autoextend` attribute. The example suits most users, both on Unix and Windows, who do not want to distribute `InnoDB` data files and log files onto several disks. It creates an auto-extending data file `ibdata1` and two `InnoDB` log files `ib_logfile0` and `ib_logfile1` in the MySQL data directory. Also, the small archived `InnoDB` log file `ib_arch_log_0000000000` that `InnoDB` creates automatically ends up in the data directory.

```
[mysqld]
# You can write your other MySQL server options here
# ...
# Data files must be able to hold your data and indexes.
# Make sure that you have enough free disk space.
innodb_data_file_path = ibdata1:10M:autoextend
#
# Set buffer pool size to 50-80% of your computer's memory
set-variable = innodb_buffer_pool_size=70M
set-variable = innodb_additional_mem_pool_size=10M
#
# Set the log file size to about 25% of the buffer pool size
set-variable = innodb_log_file_size=20M
set-variable = innodb_log_buffer_size=8M
#
innodb_flush_log_at_trx_commit=1
```

Make sure that the MySQL server has the proper access rights to create files in the data directory. More generally, the server must have access rights in any directory where it needs to create data files or log files.

Note that data files must be less than 2GB in some filesystems. The combined size of the log files must be less than 4GB. The combined size of data files must be at least 10MB.

When you create an `InnoDB` tablespace for the first time, it is best that you start the MySQL server from the command prompt. `InnoDB` then prints the information about the database creation to the screen, so you can see what is happening. For example, on Windows, if `mysqld` is located in `C:\Program Files\MySQL\MySQL Server 4.1\bin`, you can start it like this:

```
C:\> "C:\Program Files\MySQL\MySQL Server 4.1\bin\mysqld" --console
```

If you do not send server output to the screen, check the server's error log to see what `InnoDB` prints during the startup process.

See [Section 14.2.6, “Creating the InnoDB Tablespace”](#), for an example of what the information displayed by `InnoDB` should look like.

You can place `InnoDB` options in the `[mysqld]` group of any option file that your server reads when it starts. The locations for option files are described in [Section 4.3.2, “Using Option Files”](#).

If you installed MySQL on Windows using the installation and configuration wizards, the option file will be the `my.ini` file located in your MySQL installation directory. See [Section 2.3.4.14, “The Location of the my.ini File”](#).

If your PC uses a boot loader where the `C:` drive is not the boot drive, your only option is to use the `my.ini` file in your Windows directory (typically `C:\WINDOWS` or `C:\WINNT`). You can use the `SET` command at the command prompt in a console window to print the value of `WINDIR`:

```
C:\> SET WINDIR
windir=C:\WINDOWS
```

If you want to make sure that `mysqld` reads options only from a specific file, you can use the `--defaults-file` option as the first option on the command line when starting the server:

```
mysqld --defaults-file=your_path_to_my_cnf
```

**An advanced `my.cnf` example.** Suppose that you have a Linux computer with 2GB RAM and three 60GB hard disks at directory paths `/`, `/dr2` and `/dr3`. The following example shows possible configuration parameters in `my.cnf` for `InnoDB`.

```
[mysqld]
# You can write your other MySQL server options here
# ...
innodb_data_home_dir =
#
# Data files must be able to hold your data and indexes
innodb_data_file_path = /ibdata/ibdata1:2000M;/dr2/ibdata/ibdata2:2000M:autoextend
#
# Set buffer pool size to 50-80% of your computer's memory,
# but make sure on Linux x86 total memory usage is < 2GB
set-variable = innodb_buffer_pool_size=1G
set-variable = innodb_additional_mem_pool_size=20M
innodb_log_group_home_dir = /dr3/iblogs
#
# innodb_log_arch_dir must be the same as innodb_log_group_home_dir
# (starting from 4.0.6, you can omit it)
innodb_log_arch_dir = /dr3/iblogs
set-variable = innodb_log_files_in_group=2
#
# Set the log file size to about 25% of the buffer pool size
set-variable = innodb_log_file_size=250M
set-variable = innodb_log_buffer_size=8M
#
innodb_flush_log_at_trx_commit=1
set-variable = innodb_lock_wait_timeout=50
#
# Uncomment the next lines if you want to use them
#set-variable = innodb_thread_concurrency=5
```

In some cases, database performance improves if all data is not placed on the same physical disk. Putting log files on a different disk from data is very often beneficial for performance. The example illustrates how to do this. It places the two data files on different disks and places the log files on the third disk. `InnoDB` fills the tablespace beginning with the first data file. You can also use raw disk partitions (raw devices) as `InnoDB` data files, which may speed up I/O. See [Section 14.2.4.2, “Using Raw Devices for the Shared Tablespace”](#).

**Warning:** On 32-bit GNU/Linux x86, you must be careful not to set memory usage too high. `glibc` may allow the process heap to grow over thread stacks, which crashes your server. It is a risk if the value of the following expression is close to or exceeds 2GB:

```
innodb_buffer_pool_size
+ key_buffer_size
+ max_connections*(sort_buffer_size+read_buffer_size+binlog_cache_size)
+ max_connections*2MB
```

Each thread uses a stack (often 2MB, but only 256KB in MySQL AB binaries) and in the worst case also uses `sort_buffer_size + read_buffer_size` additional memory.

In MySQL 4.1, by compiling MySQL yourself, you can use up to 64GB of physical memory in 32-bit Windows. See the description for `innodb_buffer_pool_awesome_mem_mb` in Section 14.2.5, “InnoDB Startup Options and System Variables”.

**How to tune other `mysqld` server parameters?** The following values are typical and suit most users:

```
[mysqld]
skip-external-locking
set-variable = max_connections=200
set-variable = read_buffer_size=1M
set-variable = sort_buffer_size=1M
#
# Set key_buffer to 5 - 50% of your RAM depending on how much
# you use MyISAM tables, but keep key_buffer_size + InnoDB
# buffer pool size < 80% of your RAM
set-variable = key_buffer_size=...
```

### 14.2.4.1. Using Per-Table Tablespaces

**Note:** There is a known bug in versions prior to 4.1.8 that manifests itself if you specify `innodb_file_per_table` in `my.cnf`. If you shut down `mysqld`, then records may disappear from the secondary indexes of a table. See [Bug#7496](http://bugs.mysql.com/7496) [http://bugs.mysql.com/7496] for more information and workarounds. This is fixed in 4.1.9, but another bug ([Bug#8021](http://bugs.mysql.com/8021) [http://bugs.mysql.com/8021]) bit the Windows version in 4.1.9, and in the Windows version of 4.1.9 you must put the line `innodb_flush_method=unbuffered` to your `my.cnf` or `my.ini` to get `mysqld` to work.

Starting from MySQL 4.1.1, you can store each InnoDB table and its indexes in its own file. This feature is called “multiple tablespaces” because in effect each table has its own tablespace.

Using multiple tablespaces can be beneficial to users who want to move specific tables to separate physical disks or who wish to restore backups of single tables quickly without interrupting the use of the remaining InnoDB tables.

If you need to downgrade to 4.0, you must make table dumps and re-create the whole InnoDB tablespace. If you have not created new InnoDB tables under MySQL 4.1.1 or later, and need to downgrade quickly, you can also do a direct downgrade to the MySQL 4.0.18 or later in the 4.0 series. Before doing the direct downgrade to 4.0.x, you have to end all client connections to the `mysqld` server that is to be downgraded, and let it run the purge and insert buffer merge operations to completion, so that `SHOW INNODB STATUS` shows the main thread in the state `waiting for server activity`. Then you can shut down `mysqld` and start 4.0.18 or later in the 4.0 series.

You can enable multiple tablespaces by adding a line to the `[mysqld]` section of `my.cnf`:

```
[mysqld]
innodb_file_per_table
```

After restarting the server, InnoDB stores each newly created table into its own file `tbl_name.ibd` in the database directory where the table belongs. This is similar to what the MyISAM storage engine does, but MyISAM divides the table into a data file `tbl_name.MYD` and the index file

`.MYI`. For `InnoDB`, the data and the indexes are stored together in the `.ibd` file. The `tbl_name.frm` file is still created as usual.

If you remove the `innodb_file_per_table` line from `my.cnf` and restart the server, `InnoDB` creates tables inside the shared tablespace files again.

`innodb_file_per_table` affects only table creation, not access to existing tables. If you start the server with this option, new tables are created using `.ibd` files, but you can still access tables that exist in the shared tablespace. If you remove the option and restart the server, new tables are created in the shared tablespace, but you can still access any tables that were created using multiple tablespaces.

**Note:** `InnoDB` always needs the shared tablespace because it puts its internal data dictionary and undo logs there. The `.ibd` files are not sufficient for `InnoDB` to operate.

**Note:** You cannot freely move `.ibd` files between database directories as you can with `MyISAM` table files. This is because the table definition that is stored in the `InnoDB` shared tablespace includes the database name, and because `InnoDB` must preserve the consistency of transaction IDs and log sequence numbers.

To move an `.ibd` file and the associated table from one database to another, use a `RENAME TABLE` statement:

```
RENAME TABLE db1.tbl_name TO db2.tbl_name;
```

If you have a “clean” backup of an `.ibd` file, you can restore it to the MySQL installation from which it originated as follows:

1. Issue this `ALTER TABLE` statement:

```
ALTER TABLE tbl_name DISCARD TABLESPACE;
```

**Caution:** This statement deletes the current `.ibd` file.

2. Put the backup `.ibd` file back in the proper database directory.
3. Issue this `ALTER TABLE` statement:

```
ALTER TABLE tbl_name IMPORT TABLESPACE;
```

In this context, a “clean” `.ibd` file backup means:

- There are no uncommitted modifications by transactions in the `.ibd` file.
- There are no unmerged insert buffer entries in the `.ibd` file.
- Purge has removed all delete-marked index records from the `.ibd` file.
- `mysqld` has flushed all modified pages of the `.ibd` file from the buffer pool to the file.

You can make a clean backup `.ibd` file using the following method:

1. Stop all activity from the `mysqld` server and commit all transactions.
2. Wait until `SHOW INNODB STATUS` shows that there are no active transactions in the database,

and the main thread status of `InnoDB` is `Waiting for server activity`. Then you can make a copy of the `.ibd` file.

Another method for making a clean copy of an `.ibd` file is to use the commercial `InnoDB Hot Backup` tool:

1. Use `InnoDB Hot Backup` to back up the `InnoDB` installation.
2. Start a second `mysqld` server on the backup and let it clean up the `.ibd` files in the backup.

### 14.2.4.2. Using Raw Devices for the Shared Tablespace

Starting from MySQL 3.23.41, you can use raw disk partitions as data files in the shared tablespace. By using a raw disk, you can perform non-buffered I/O on Windows and on some Unix systems without filesystem overhead, which might improve performance.

When you create a new data file, you must put the keyword `newraw` immediately after the data file size in `innodb_data_file_path`. The partition must be at least as large as the size that you specify. Note that 1MB in `InnoDB` is  $1024 \times 1024$  bytes, whereas 1MB in disk specifications usually means 1,000,000 bytes.

```
[mysqld]
innodb_data_home_dir=
innodb_data_file_path=/dev/hdd1:3Gnewraw;/dev/hdd2:2Gnewraw
```

The next time you start the server, `InnoDB` notices the `newraw` keyword and initializes the new partition. However, do not create or change any `InnoDB` tables yet. Otherwise, when you next restart the server, `InnoDB` reinitializes the partition and your changes are lost. (Starting from MySQL 3.23.44, as a safety measure `InnoDB` prevents users from modifying data when any partition with `newraw` is specified.)

After `InnoDB` has initialized the new partition, stop the server, change `newraw` in the data file specification to `raw`:

```
[mysqld]
innodb_data_home_dir=
innodb_data_file_path=/dev/hdd1:5Graw;/dev/hdd2:2Graw
```

Then restart the server and `InnoDB` allows changes to be made.

On Windows, starting from 4.1.1, you can allocate a disk partition as a data file like this:

```
[mysqld]
innodb_data_home_dir=
innodb_data_file_path=//./D:10Gnewraw
```

The `//./` corresponds to the Windows syntax of `\\.\` for accessing physical drives.

When you use raw disk partitions, be sure that they have permissions that allow read and write access by the account used for running the MySQL server.

## 14.2.5. InnoDB Startup Options and System Variables

This section describes the `InnoDB`-related command options and system variables. System variables that take a numeric value can be specified as `--var_name=value` on the command line or as `var_name=value` in option files. Many of the system variables can be changed at runtime (see [Sec-](#)

tion 5.2.3.2, “Dynamic System Variables”). (Before MySQL 4.0.2, system variable values should be specified using `--set-variable` syntax.) For more information on specifying options and system variables, see Section 4.3, “Specifying Program Options”.

InnoDB command options:

- `--innodb`  
Enables the InnoDB storage engine, if the server was compiled with InnoDB support. Use `--skip-innodb` to disable InnoDB.
- `--innodb_status_file`  
Causes InnoDB to create a file named `<datadir>/innodb_status.<pid>` in the MySQL data directory. InnoDB periodically writes the output of `SHOW ENGINE INNODB STATUS` to this file. This option is available as of MySQL 4.0.21.

InnoDB system variables:

- `innodb_additional_mem_pool_size`  
The size in bytes of a memory pool InnoDB uses to store data dictionary information and other internal data structures. The more tables you have in your application, the more memory you need to allocate here. If InnoDB runs out of memory in this pool, it starts to allocate memory from the operating system, and writes warning messages to the MySQL error log. The default value is 1MB.
- `innodb_autoextend_increment`  
The increment size (in MB) for extending the size of an auto-extending tablespace when it becomes full. The default value is 8. This variable is available starting from MySQL 4.0.24 and 4.1.5. As of MySQL 4.0.24 and 4.1.6, it can be changed at runtime as a global system variable.
- `innodb_buffer_pool_awe_mem_mb`  
The size of the buffer pool (in MB), if it is placed in the AWE memory. This is relevant only in 32-bit Windows. If your 32-bit Windows operating system supports more than 4GB memory, using so-called “Address Windowing Extensions,” you can allocate the InnoDB buffer pool into the AWE physical memory using this variable. The maximum possible value for this variable is 63000. If it is greater than 0, `innodb_buffer_pool_size` is the window in the 32-bit address space of `mysqld` where InnoDB maps that AWE memory. A good value for `innodb_buffer_pool_size` is 500MB. This variable is available as of MySQL 4.1.0.  
  
To take advantage of AWE memory, you will need to recompile MySQL yourself. The current project settings needed for doing this can be found in the `innobase/os/os0proj.c` source file.
- `innodb_buffer_pool_size`  
The size in bytes of the memory buffer InnoDB uses to cache data and indexes of its tables. The larger you set this value, the less disk I/O is needed to access data in tables. On a dedicated database server, you may set this to up to 80% of the machine physical memory size. However, do not set it too large because competition for physical memory might cause paging in the operating system.
- `innodb_data_file_path`  
The paths to individual data files and their sizes. The full directory path to each data file is acquired by concatenating `innodb_data_home_dir` to each path specified here. The file sizes are specified in MB or GB (1024MB) by appending `M` or `G` to the size value. The sum of the sizes of the

files must be at least 10MB. On some operating systems, files must be less than 2GB. If you do not specify `innodb_data_file_path`, the default behavior starting from 4.0 is to create a single 10MB auto-extending data file named `ibdata1`. Starting from 3.23.44, you can set the file size larger than 4GB on those operating systems that support big files. You can also use raw disk partitions as data files. See [Section 14.2.4.2, “Using Raw Devices for the Shared Tablespace”](#).

- `innodb_data_home_dir`

The common part of the directory path for all InnoDB data files. If you do not set this value, the default is the MySQL data directory. You can specify this also as an empty string, in which case you can use absolute file paths in `innodb_data_file_path`.

- `innodb_fast_shutdown`

If you set this variable to 0, InnoDB does a full purge and an insert buffer merge before a shutdown. These operations can take minutes, or even hours in extreme cases. If you set this variable to 1, InnoDB skips these operations at shutdown. The default value is 1 starting from 3.23.50.

- `innodb_file_io_threads`

The number of file I/O threads in InnoDB. Normally, this should be left at the default value of 4, but disk I/O on Windows may benefit from a larger number. On Unix, increasing the number has no effect; InnoDB always uses the default value. This variable is available as of MySQL 3.23.37.

- `innodb_file_per_table`

**NOTE:** A bug in versions  $\leq 4.1.8$  if you specify `innodb_file_per_table` in `my.cnf`! If you shut down `mysqld`, then records may disappear from the secondary indexes of a table. See [Bug#7496](http://bugs.mysql.com/7496) [http://bugs.mysql.com/7496] for more information and workarounds. This is fixed in 4.1.9, but another bug ([Bug#8021](http://bugs.mysql.com/8021) [http://bugs.mysql.com/8021]) bit the Windows version in 4.1.9, and in the Windows version of 4.1.9 you must put the line `innodb_flush_method=unbuffered` in your `my.cnf` or `my.ini` to get `mysqld` to work.

If this variable is enabled, InnoDB creates each new table using its own `.ibd` file for storing data and indexes, rather than in the shared tablespace. The default is to create tables in the shared tablespace. See [Section 14.2.4.1, “Using Per-Table Tablespaces”](#). This variable is available as of MySQL 4.1.1.

- `innodb_flush_log_at_trx_commit`

When `innodb_flush_log_at_trx_commit` is set to 0, the log buffer is written out to the log file once per second and the flush to disk operation is performed on the log file, but nothing is done at a transaction commit. When this value is 1 (the default), the log buffer is written out to the log file at each transaction commit and the flush to disk operation is performed on the log file. When set to 2, the log buffer is written out to the file at each commit, but the flush to disk operation is not performed on it. However, the flushing on the log file takes place once per second also when the value is 2. Note that the once-per-second flushing is not 100% guaranteed to happen every second, due to process scheduling issues.

The default value of this variable is 1, which is the value that is required for ACID compliance. You can achieve better performance by setting the value different from 1, but then you can lose at most one second worth of transactions in a crash. If you set the value to 0, then any `mysqld` process crash can erase the last second of transactions. If you set the value to 2, then only an operating system crash or a power outage can erase the last second of transactions. However, InnoDB's crash recovery is not affected and thus crash recovery does work regardless of the value. Note that many operating systems and some disk hardware fool the flush-to-disk operation. They may tell `mysqld` that the flush has taken place, even though it has not. Then the durability of transactions is not guaranteed even with the setting 1, and in the worst case a power outage can even corrupt the InnoDB database. Using a battery-backed disk cache in the SCSI disk controller or in the disk itself speeds up

file flushes, and makes the operation safer. You can also try using the Unix command `hdparm` to disable the caching of disk writes in hardware caches, or use some other command specific to the hardware vendor. The default value of this variable is 1 (prior to MySQL 4.0.13, the default is 0).

Note: For the greatest possible durability and consistency in a replication setup using `InnoDB` with transactions, you should use `innodb_flush_log_at_trx_commit=1`, `sync_binlog=1`, and `innodb_safe_binlog` in your master server `my.cnf` file.

- `innodb_flush_method`

If set to `fdatasync` (the default), `InnoDB` uses `fsync()` to flush both the data and log files. If set to `O_DSYNC`, `InnoDB` uses `O_SYNC` to open and flush the log files, but uses `fsync()` to flush the data files. If `O_DIRECT` is specified (available on some GNU/Linux versions starting from MySQL 4.0.14), `InnoDB` uses `O_DIRECT` to open the data files, and uses `fsync()` to flush both the data and log files. Note that starting from MySQL 3.23.41, `InnoDB` uses `fsync()` instead of `fdatasync()`, and it does not use `O_DSYNC` by default because there have been problems with it on many varieties of Unix. This variable is relevant only for Unix. On Windows, the flush method is always `async_unbuffered` and cannot be changed. This variable is available as of MySQL 3.23.40.

Different values of this variable can have a marked effect on `InnoDB` performance. For example, on some systems where `InnoDB` data and log files are located on a SAN, it has been found that setting `innodb_flush_method` to `O_DIRECT` can degrade performance of simple `SELECT` statements by a factor of three.

- `innodb_force_recovery`

The crash recovery mode. Warning: This variable should be set greater than 0 only in an emergency situation when you want to dump your tables from a corrupt database! Possible values are from 1 to 6. The meanings of these values are described in [Section 14.2.9.1, “Forcing InnoDB Recovery”](#). As a safety measure, `InnoDB` prevents any changes to its data when this variable is greater than 0. This variable is available starting from MySQL 3.23.44.

- `innodb_lock_wait_timeout`

The timeout in seconds an `InnoDB` transaction may wait for a lock before being rolled back. `InnoDB` automatically detects transaction deadlocks in its own lock table and rolls back the transaction. Beginning with MySQL 4.0.20 and 4.1.2, `InnoDB` notices locks set using the `LOCK TABLES` statement. Before that, if you use the `LOCK TABLES` statement, or other transaction-safe storage engines than `InnoDB` in the same transaction, a deadlock may arise that `InnoDB` cannot notice. In cases like this, the timeout is useful to resolve the situation. The default is 50 seconds.

- `innodb_locks_unsafe_for_binlog`

This variable controls next-key locking in `InnoDB` searches and index scans. By default, this variable is 0 (disabled), which means that next-key locking is enabled.

Normally, `InnoDB` uses an algorithm called *next-key locking*. `InnoDB` performs row-level locking in such a way that when it searches or scans a table index, it sets shared or exclusive locks on any index records it encounters. Thus, the row-level locks are actually index record locks. The locks that `InnoDB` sets on index records also affect the “gap” preceding that index record. If a user has a shared or exclusive lock on record *R* in an index, another user cannot insert a new index record immediately before *R* in the order of the index. Enabling this variable causes `InnoDB` not to use next-key locking in searches or index scans. Next-key locking is still used to ensure foreign key constraints and duplicate key checking. Note that enabling this variable may cause phantom problems: Suppose that you want to read and lock all children from the `child` table with an identifier value larger than 100, with the intention of updating some column in the selected rows later:

```
SELECT * FROM child WHERE id > 100 FOR UPDATE;
```

Suppose that there is an index on the `id` column. The query scans that index starting from the first record where `id` is larger than 100. If the locks set on the index records do not lock out inserts made in the gaps, another client can insert a new row into the table. If you execute the same `SELECT` within the same transaction, you see a new row in the result set returned by the query. This also means that if new items are added to the database, `InnoDB` does not guarantee serializability. Therefore, if this variable is enabled `InnoDB` guarantees at most isolation level `READ COMMITTED`. (Conflict serializability is still guaranteed.) This variable is available as of MySQL 4.1.4.

- `innodb_log_arch_dir`

The directory where fully written log files would be archived if we used log archiving. The value of this variable should currently be set the same as `innodb_log_group_home_dir`. Starting from MySQL 4.0.6, there is no need to set this variable.

- `innodb_log_archive`

Whether to log `InnoDB` archive files. This variable is unused. Recovery from a backup is done by MySQL using its own log files, so there is no need to archive `InnoDB` log files. The default for this variable is 0.

- `innodb_log_buffer_size`

The size in bytes of the buffer that `InnoDB` uses to write to the log files on disk. Sensible values range from 1MB to 8MB. The default is 1MB. A large log buffer allows large transactions to run without a need to write the log to disk before the transactions commit. Thus, if you have big transactions, making the log buffer larger saves disk I/O.

- `innodb_log_file_size`

The size in bytes of each log file in a log group. The combined size of log files must be less than 4GB on 32-bit computers. The default is 5MB. Sensible values range from 1MB to 1/*N*-th of the size of the buffer pool, where *N* is the number of log files in the group. The larger the value, the less checkpoint flush activity is needed in the buffer pool, saving disk I/O. But larger log files also mean that recovery is slower in case of a crash.

- `innodb_log_files_in_group`

The number of log files in the log group. `InnoDB` writes to the files in a circular fashion. The default (and recommended) is 2.

- `innodb_log_group_home_dir`

The directory path to the `InnoDB` log files. It must have the same value as `innodb_log_arch_dir`. If you do not specify any `InnoDB` log variables, the default is to create two 5MB files names `ib_logfile0` and `ib_logfile1` in the MySQL data directory.

- `innodb_max_dirty_pages_pct`

This is an integer in the range from 0 to 100. The default is 90. The main thread in `InnoDB` tries to write pages from the buffer pool so that the percentage of dirty (not yet written) pages will not exceed this value. Available starting from 4.0.13 and 4.1.1.

- `innodb_max_purge_lag`

This variable controls how to delay `INSERT`, `UPDATE` and `DELETE` operations when the purge operations are lagging (see Section 14.2.13, “Implementation of Multi-Versioning”). The default value

of this variable is 0, meaning that there are no delays. `innodb_max_purge_lag` is available as of MySQL 4.0.22 and 4.1.6.

The InnoDB transaction system maintains a list of transactions that have delete-marked index records by `UPDATE` or `DELETE` operations. Let the length of this list be `purge_lag`. When `purge_lag` exceeds `innodb_max_purge_lag`, each `INSERT`, `UPDATE` and `DELETE` operation is delayed by  $((\text{purge\_lag}/\text{innodb\_max\_purge\_lag}) \times 10) - 5$  milliseconds. The delay is computed in the beginning of a purge batch, every ten seconds. The operations are not delayed if purge cannot run because of an old consistent read view that could see the rows to be purged.

A typical setting for a problematic workload might be 1 million, assuming that our transactions are small, only 100 bytes in size, and we can allow 100MB of unpurged rows in our tables.

- `innodb_mirrored_log_groups`

The number of identical copies of log groups to keep for the database. Currently, this should be set to 1.

- `innodb_open_files`

This variable is relevant only if you use multiple tablespaces in InnoDB. It specifies the maximum number of `.ibd` files that InnoDB can keep open at one time. The minimum value is 10. The default is 300. This variable is available as of MySQL 4.1.1.

The file descriptors used for `.ibd` files are for InnoDB only. They are independent of those specified by the `--open-files-limit` server option, and do not affect the operation of the table cache.

- `innodb_safe_binlog`

Adds consistency guarantees between the content of InnoDB tables and the binary log. See [Section 5.11.4, “The Binary Log”](#).

- `innodb_table_locks`

Starting from MySQL 4.0.20, and 4.1.2, InnoDB honors `LOCK TABLES`; MySQL does not return from `LOCK TABLE ... WRITE` until all other threads have released all their locks to the table. In MySQL 4.0.19 and before, InnoDB ignored table locks, which allowed one to more easily simulate transactions with a combination of MyISAM and InnoDB tables. The default value is 1, which means that `LOCK TABLES` causes also InnoDB internally to take a table lock. In applications using `AUTOCOMMIT=1`, InnoDB's internal table locks can cause deadlocks. You can set `innodb_table_locks=0` in the server option file to remove that problem.

- `innodb_thread_concurrency`

InnoDB tries to keep the number of operating system threads concurrently inside InnoDB less than or equal to the limit given by this variable. The default value is 8. If you have low performance and `SHOW INNODB STATUS` reveals many threads waiting for semaphores, you may have thread thrashing and should try setting this variable lower or higher. If you have a computer with many processors and disks, you can try setting the value higher to better utilize the resources of your computer. A recommended value is the sum of the number of processors and disks your system has. A value of 500 or greater disables the concurrency checking. This variable is available starting from MySQL 3.23.44 and 4.0.1.

- `sync_binlog`

If the value of this variable is positive, the MySQL server synchronizes its binary log to disk (`fsync()`) after every `sync_binlog` writes to this binary log. Note that there is one write to the binary log per statement if in autocommit mode, and otherwise one write per transaction. The

default value is 0 which does no sync'ing to disk. A value of 1 is the safest choice, because in case of crash you lose at most one statement/transaction from the binary log; but it is also the slowest choice (unless the disk has a battery-backed cache, which makes sync'ing very fast). This variable was added in MySQL 4.1.3.

## 14.2.6. Creating the InnoDB Tablespace

Suppose that you have installed MySQL and have edited your option file so that it contains the necessary InnoDB configuration parameters. Before starting MySQL, you should verify that the directories you have specified for InnoDB data files and log files exist and that the MySQL server has access rights to those directories. InnoDB does not create directories, only files. Check also that you have enough disk space for the data and log files.

It is best to run the MySQL server `mysqld` from the command prompt when you first start the server with InnoDB enabled, not from the `mysqld_safe` wrapper or as a Windows service. When you run from a command prompt you see what `mysqld` prints and what is happening. On Unix, just invoke `mysqld`. On Windows, use the `--console` option.

When you start the MySQL server after initially configuring InnoDB in your option file, InnoDB creates your data files and log files, and prints something like this:

```
InnoDB: The first specified datafile /home/heikki/data/ibdata1
did not exist:
InnoDB: a new database to be created!
InnoDB: Setting file /home/heikki/data/ibdata1 size to 134217728
InnoDB: Database physically writes the file full: wait...
InnoDB: datafile /home/heikki/data/ibdata2 did not exist:
new to be created
InnoDB: Setting file /home/heikki/data/ibdata2 size to 262144000
InnoDB: Database physically writes the file full: wait...
InnoDB: Log file /home/heikki/data/logs/ib_logfile0 did not exist:
new to be created
InnoDB: Setting log file /home/heikki/data/logs/ib_logfile0 size
to 5242880
InnoDB: Log file /home/heikki/data/logs/ib_logfile1 did not exist:
new to be created
InnoDB: Setting log file /home/heikki/data/logs/ib_logfile1 size
to 5242880
InnoDB: Doublewrite buffer not found: creating new
InnoDB: Doublewrite buffer created
InnoDB: Creating foreign key constraint system tables
InnoDB: Foreign key constraint system tables created
InnoDB: Started
mysqld: ready for connections
```

At this point InnoDB has initialized its tablespace and log files. You can connect to the MySQL server with the usual MySQL client programs like `mysql`. When you shut down the MySQL server with `mysqladmin shutdown`, the output is like this:

```
010321 18:33:34 mysqld: Normal shutdown
010321 18:33:34 mysqld: Shutdown Complete
InnoDB: Starting shutdown...
InnoDB: Shutdown completed
```

You can look at the data file and log directories and you see the files created there. The log directory also contains a small file named `ib_arch_log_0000000000`. That file resulted from the database creation, after which InnoDB switched off log archiving. When MySQL is started again, the data files and log files have been created already, so the output is much briefer:

```
InnoDB: Started
mysqld: ready for connections
```

Starting from MySQL 4.1.1, you can add the option `innodb_file_per_table` to `my.cnf` to make

**InnoDB** store each table to its own `.ibd` file in the same MySQL database directory where the `.frm` file is created. See [Section 14.2.4.1, “Using Per-Table Tablespaces”](#).

### 14.2.6.1. Dealing with **InnoDB** Initialization Problems

If **InnoDB** prints an operating system error during a file operation, usually the problem has one of the following causes:

- You did not create the **InnoDB** data file directory or the **InnoDB** log directory.
- `mysqld` does not have access rights to create files in those directories.
- `mysqld` cannot read the proper `my.cnf` or `my.ini` option file, and consequently does not see the options that you specified.
- The disk is full or a disk quota is exceeded.
- You have created a subdirectory whose name is equal to a data file that you specified, so the name cannot be used as a filename.
- There is a syntax error in the `innodb_data_home_dir` or `innodb_data_file_path` value.

If something goes wrong when **InnoDB** attempts to initialize its tablespace or its log files, you should delete all files created by **InnoDB**. This means all `ibdata` files and all `ib_logfile` files. In case you have already created some **InnoDB** tables, delete the corresponding `.frm` files for these tables (and any `.ibd` files if you are using multiple tablespaces) from the MySQL database directories as well. Then you can try the **InnoDB** database creation again. It is best to start the MySQL server from a command prompt so that you see what is happening.

### 14.2.7. Creating and Using **InnoDB** Tables

To create an **InnoDB** table, specify an `ENGINE = InnoDB` option in the `CREATE TABLE` statement:

```
CREATE TABLE customers (a INT, b CHAR (20), INDEX (a)) ENGINE=InnoDB;
```

The older term `TYPE` is supported as a synonym for `ENGINE` for backward compatibility, but `ENGINE` is the preferred term and `TYPE` is deprecated.

The statement creates a table and an index on column `a` in the **InnoDB** tablespace that consists of the data files that you specified in `my.cnf`. In addition, MySQL creates a file `customers.frm` in the `test` directory under the MySQL database directory. Internally, **InnoDB** adds an entry for the table to its own data dictionary. The entry includes the database name. For example, if `test` is the database in which the `customers` table is created, the entry is for `'test/customers'`. This means you can create a table of the same name `customers` in some other database, and the table names do not collide inside **InnoDB**.

You can query the amount of free space in the **InnoDB** tablespace by issuing a `SHOW TABLE STATUS` statement for any **InnoDB** table. The amount of free space in the tablespace appears in the `Comment` section in the output of `SHOW TABLE STATUS`. For example:

```
SHOW TABLE STATUS FROM test LIKE 'customers'
```

Note that the statistics `SHOW` displays for **InnoDB** tables are only approximate. They are used in SQL optimization. Table and index reserved sizes in bytes are accurate, though.

#### 14.2.7.1. How to Use Transactions in **InnoDB** with Different APIs

By default, each client that connects to the MySQL server begins with autocommit mode enabled, which automatically commits every SQL statement as you execute it. To use multiple-statement transactions, you can switch autocommit off with the SQL statement `SET AUTOCOMMIT = 0` and use `COMMIT` and `ROLLBACK` to commit or roll back your transaction. If you want to leave autocommit on, you can enclose your transactions within `START TRANSACTION` and either `COMMIT` or `ROLLBACK`. Before MySQL 4.0.11, you have to use the keyword `BEGIN` instead of `START TRANSACTION`. The following example shows two transactions. The first is committed and the second is rolled back.

```
shell> mysql test

mysql> CREATE TABLE CUSTOMER (A INT, B CHAR (20), INDEX (A))
-> TYPE=InnoDB;
Query OK, 0 rows affected (0.00 sec)
mysql> BEGIN;
Query OK, 0 rows affected (0.00 sec)
mysql> INSERT INTO CUSTOMER VALUES (10, 'Heikki');
Query OK, 1 row affected (0.00 sec)
mysql> COMMIT;
Query OK, 0 rows affected (0.00 sec)
mysql> SET AUTOCOMMIT=0;
Query OK, 0 rows affected (0.00 sec)
mysql> INSERT INTO CUSTOMER VALUES (15, 'John');
Query OK, 1 row affected (0.00 sec)
mysql> ROLLBACK;
Query OK, 0 rows affected (0.00 sec)
mysql> SELECT * FROM CUSTOMER;
+-----+-----+
| A     | B           |
+-----+-----+
| 10   | Heikki     |
+-----+-----+
1 row in set (0.00 sec)
mysql>
```

In APIs such as PHP, Perl DBI, JDBC, ODBC, or the standard C call interface of MySQL, you can send transaction control statements such as `COMMIT` to the MySQL server as strings just like any other SQL statements such as `SELECT` or `INSERT`. Some APIs also offer separate special transaction commit and rollback functions or methods.

### 14.2.7.2. Converting MyISAM Tables to InnoDB

Important: Do not convert MySQL system tables in the `mysql` database (such as `user` or `host`) to the `InnoDB` type. This is an unsupported operation. The system tables must always be of the `MyISAM` type.

If you want all your (non-system) tables to be created as `InnoDB` tables, you can, starting from the MySQL 3.23.43, add the line `default-table-type=innodb` to the `[mysqld]` section of your server option file.

`InnoDB` does not have a special optimization for separate index creation the way the `MyISAM` storage engine does. Therefore, it does not pay to export and import the table and create indexes afterward. The fastest way to alter a table to `InnoDB` is to do the inserts directly to an `InnoDB` table. That is, use `ALTER TABLE ... TYPE=INNODB`, or create an empty `InnoDB` table with identical definitions and insert the rows with `INSERT INTO ... SELECT * FROM ...`

If you have `UNIQUE` constraints on secondary keys, starting from MySQL 3.23.52, you can speed up a table import by turning off the uniqueness checks temporarily during the import operation:

```
SET UNIQUE_CHECKS=0;
... import operation ...
SET UNIQUE_CHECKS=1;
```

For big tables, this saves a lot of disk I/O because `InnoDB` can then use its insert buffer to write secondary index records in a batch. Be certain that the data contains no duplicate keys. `UNIQUE_CHECKS` allows but does not require storage engines to ignore duplicate keys.

To get better control over the insertion process, it might be good to insert big tables in pieces:

```
INSERT INTO newtable SELECT * FROM oldtable
WHERE yourkey > something AND yourkey <= somethingelse;
```

After all records have been inserted, you can rename the tables.

During the conversion of big tables, you should increase the size of the [InnoDB](#) buffer pool to reduce disk I/O. Do not use more than 80% of the physical memory, though. You can also increase the sizes of the [InnoDB](#) log files.

Make sure that you do not fill up the tablespace: [InnoDB](#) tables require a lot more disk space than [MyISAM](#) tables. If an `ALTER TABLE` operation runs out of space, it starts a rollback, and that can take hours if it is disk-bound. For inserts, [InnoDB](#) uses the insert buffer to merge secondary index records to indexes in batches. That saves a lot of disk I/O. For rollback, no such mechanism is used, and the rollback can take 30 times longer than the insertion.

In the case of a runaway rollback, if you do not have valuable data in your database, it may be advisable to kill the database process rather than wait for millions of disk I/O operations to complete. For the complete procedure, see [Section 14.2.9.1, “Forcing InnoDB Recovery”](#).

### 14.2.7.3. How `AUTO_INCREMENT` Columns Work in [InnoDB](#)

If you specify an `AUTO_INCREMENT` column for an [InnoDB](#) table, the table handle in the [InnoDB](#) data dictionary contains a special counter called the auto-increment counter that is used in assigning new values for the column. This counter is stored only in main memory, not on disk.

[InnoDB](#) uses the following algorithm to initialize the auto-increment counter for a table `T` that contains an `AUTO_INCREMENT` column named `ai_col`: After a server startup, for the first insert into a table `T`, [InnoDB](#) executes the equivalent of this statement:

```
SELECT MAX(ai_col) FROM T FOR UPDATE;
```

[InnoDB](#) increments by one the value retrieved by the statement and assigns it to the column and to the auto-increment counter for the table. If the table is empty, [InnoDB](#) uses the value `1`. If a user invokes a `SHOW TABLE STATUS` statement that displays output for the table `T` and the auto-increment counter has not been initialized, [InnoDB](#) initializes but does not increment the value and stores it for use by later inserts. Note that this initialization uses a normal exclusive-locking read on the table and the lock lasts to the end of the transaction.

[InnoDB](#) follows the same procedure for initializing the auto-increment counter for a freshly created table.

After the auto-increment counter has been initialized, if a user does not explicitly specify a value for an `AUTO_INCREMENT` column, [InnoDB](#) increments the counter by one and assigns the new value to the column. If the user inserts a row that explicitly specifies the column value, and the value is bigger than the current counter value, the counter is set to the specified column value.

You may see gaps in the sequence of values assigned to the `AUTO_INCREMENT` column if you roll back transactions that have generated numbers using the counter.

If a user specifies `NULL` or `0` for the `AUTO_INCREMENT` column in an `INSERT`, [InnoDB](#) treats the row as if the value had not been specified and generates a new value for it.

The behavior of the auto-increment mechanism is not defined if a user assigns a negative value to the column or if the value becomes bigger than the maximum integer that can be stored in the specified integer type.

When accessing the auto-increment counter, **InnoDB** uses a special table-level **AUTO-INC** lock that it keeps to the end of the current SQL statement, not to the end of the transaction. The special lock release strategy was introduced to improve concurrency for inserts into a table containing an **AUTO\_INCREMENT** column. Nevertheless, two transactions cannot have the **AUTO-INC** lock on the same table simultaneously, which can have a performance impact if the **AUTO-INC** lock is held for a long time. That might be the case for a statement such as `INSERT INTO t1 ... SELECT ... FROM t2` that inserts all rows from one table into another.

**InnoDB** uses the in-memory auto-increment counter as long as the server runs. When the server is stopped and restarted, **InnoDB** reinitializes the counter for each table for the first **INSERT** to the table, as described earlier.

Beginning with MySQL 4.1.12, **InnoDB** supports the **AUTO\_INCREMENT = n** table option in **ALTER TABLE** statements, to set the initial counter value or alter the current counter value. The same is true as of MySQL 4.1.14 for **CREATE TABLE**. The effect of this option is canceled by a server restart, for reasons discussed earlier in this section.

#### 14.2.7.4. FOREIGN KEY Constraints

Starting from MySQL 3.23.44, **InnoDB** features foreign key constraints.

The syntax of a foreign key constraint definition in **InnoDB** looks like this:

```
[CONSTRAINT symbol] FOREIGN KEY [id] (index_col_name, ...)
REFERENCES tbl_name (index_col_name, ...)
[ON DELETE {RESTRICT | CASCADE | SET NULL | NO ACTION}]
[ON UPDATE {RESTRICT | CASCADE | SET NULL | NO ACTION}]
```

Foreign keys definitions are subject to the following conditions:

- Both tables must be **InnoDB** tables and they must not be **TEMPORARY** tables.
- In the referencing table, there must be an index where the foreign key columns are listed as the *first* columns in the same order. Starting with MySQL 4.1.2, such an index is created on the referencing table automatically if it does not exist.
- In the referenced table, there must be an index where the referenced columns are listed as the *first* columns in the same order.
- Index prefixes on foreign key columns are not supported. One consequence of this is that **BLOB** and **TEXT** columns cannot be included in a foreign key, because indexes on those columns must always include a prefix length.
- If the **CONSTRAINT *symbol*** clause is given, the *symbol* value must be unique in the database. If the clause is not given, **InnoDB** creates the name automatically.

**InnoDB** rejects any **INSERT** or **UPDATE** operation that attempts to create a foreign key value in a child table if there is no a matching candidate key value in the parent table. The action **InnoDB** takes for any **UPDATE** or **DELETE** operation that attempts to update or delete a candidate key value in the parent table that has some matching rows in the child table is dependent on the *referential action* specified using **ON UPDATE** and **ON DELETE** subclauses of the **FOREIGN KEY** clause. When the user attempts to delete or update a row from a parent table, and there are one or more matching rows in the child table, **InnoDB** supports five options regarding the action to be taken:

- **CASCADE**: Delete or update the row from the parent table and automatically delete or update the matching rows in the child table. **ON DELETE CASCADE** is supported starting from MySQL

3.23.50 and `ON UPDATE CASCADE` is supported starting from 4.0.8. Between two tables, you should not define several `ON UPDATE CASCADE` clauses that act on the same column in the parent table or in the child table.

- `SET NULL`: Delete or update the row from the parent table and set the foreign key column or columns in the child table to `NULL`. This is valid only if the foreign key columns do not have the `NOT NULL` qualifier specified. `ON DELETE SET NULL` is available starting from MySQL 3.23.50 and `ON UPDATE SET NULL` is available starting from 4.0.8.
- `NO ACTION`: In standard sQL, `NO ACTION` means *no action* in the sense that an attempt to delete or update a primary key value will not be allowed to proceed if there is a related foreign key value in the referenced table. Starting from 4.0.18 `InnoDB` rejects the delete or update operation for the parent table.
- `RESTRICT`: Rejects the delete or update operation for the parent table. `NO ACTION` and `RESTRICT` are the same as omitting the `ON DELETE` or `ON UPDATE` clause. (Some database systems have deferred checks, and `NO ACTION` is a deferred check. In MySQL, foreign key constraints are checked immediately, so `NO ACTION` and `RESTRICT` are the same.)
- `SET DEFAULT`: This action is recognized by the parser, but `InnoDB` rejects table definitions containing `ON DELETE SET DEFAULT` or `ON UPDATE SET DEFAULT` clauses.

Note that `InnoDB` supports foreign key references within a table. In these cases, “child table records” really refers to dependent records within the same table.

`InnoDB` requires indexes on foreign keys and referenced keys so that foreign key checks can be fast and not require a table scan. Starting with MySQL 4.1.2, the index on the foreign key is created automatically. In older versions, the indexes must be created explicitly or the creation of foreign key constraints fails.

Corresponding columns in the foreign key and the referenced key must have similar internal data types inside `InnoDB` so that they can be compared without a type conversion. *The size and sign of integer types must be the same.* The length of string types need not be the same. If you specify a `SET NULL` action, *make sure that you have not declared the columns in the child table as `NOT NULL`.*

If MySQL reports an error number 1005 from a `CREATE TABLE` statement, and the error message refers to `errno 150`, table creation failed because a foreign key constraint was not correctly formed. Similarly, if an `ALTER TABLE` fails and it refers to `errno 150`, that means a foreign key definition would be incorrectly formed for the altered table. Starting from MySQL 4.0.13, you can use `SHOW INNODB STATUS` to display a detailed explanation of the latest `InnoDB` foreign key error in the server.

Starting from MySQL 3.23.50, `InnoDB` does not check foreign key constraints on those foreign key or referenced key values that contain a `NULL` column.

**Note:** Currently, triggers are not activated by cascaded foreign key actions.

You cannot create a table with a column name that matches the name of an internal `InnoDB` column (including `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR` and `DB_MIX_ID`). In versions of MySQL before 4.1.19 this would cause a crash, since 4.1.19 the server will report error 1005 and refers to `errno -1` in the error message.

**Deviation from SQL standards:** If there are several rows in the parent table that have the same referenced key value, `InnoDB` acts in foreign key checks as if the other parent rows with the same key value do not exist. For example, if you have defined a `RESTRICT` type constraint, and there is a child row with several parent rows, `InnoDB` does not allow the deletion of any of those parent rows.

`InnoDB` performs cascading operations through a depth-first algorithm, based on records in the indexes corresponding to the foreign key constraints.

**Deviation from SQL standards:** A `FOREIGN KEY` constraint that references a non-`UNIQUE` key is not standard SQL. It is an `InnoDB` extension to standard SQL.

**Deviation from SQL standards:** If `ON UPDATE CASCADE` or `ON UPDATE SET NULL` recurses to update the *same table* it has previously updated during the cascade, it acts like `RESTRICT`. This means that you cannot use self-referential `ON UPDATE CASCADE` or `ON UPDATE SET NULL` operations. This is to prevent infinite loops resulting from cascaded updates. A self-referential `ON DELETE SET NULL`, on the other hand, is possible from 4.0.13. A self-referential `ON DELETE CASCADE` has been possible since `ON DELETE` was implemented. Since 4.0.21, cascading operations may not be nested more than 15 levels.

**Deviation from SQL standards:** Like MySQL in general, in an SQL statement that inserts, deletes, or updates many rows, `InnoDB` checks `UNIQUE` and `FOREIGN KEY` constraints row-by-row. According to the SQL standard, the default behavior should be deferred checking. That is, constraints are only checked after the **whole SQL statement** has been processed. Until `InnoDB` implements deferred constraint checking, some things will be impossible, such as deleting a record that refers to itself via a foreign key.

Here is a simple example that relates `parent` and `child` tables through a single-column foreign key:

```
CREATE TABLE parent (id INT NOT NULL,
                     PRIMARY KEY (id)
) TYPE=INNODB;
CREATE TABLE child (id INT, parent_id INT,
                    INDEX par_ind (parent_id),
                    FOREIGN KEY (parent_id) REFERENCES parent(id)
                    ON DELETE CASCADE
) TYPE=INNODB;
```

A more complex example in which a `product_order` table has foreign keys for two other tables. One foreign key references a two-column index in the `product` table. The other references a single-column index in the `customer` table:

```
CREATE TABLE product (category INT NOT NULL, id INT NOT NULL,
                      price DECIMAL,
                      PRIMARY KEY(category, id)) TYPE=INNODB;
CREATE TABLE customer (id INT NOT NULL,
                       PRIMARY KEY (id)) TYPE=INNODB;
CREATE TABLE product_order (no INT NOT NULL AUTO_INCREMENT,
                             product_category INT NOT NULL,
                             product_id INT NOT NULL,
                             customer_id INT NOT NULL,
                             PRIMARY KEY(no),
                             INDEX (product_category, product_id),
                             FOREIGN KEY (product_category, product_id)
                             REFERENCES product(category, id)
                             ON UPDATE CASCADE ON DELETE RESTRICT,
                             INDEX (customer_id),
                             FOREIGN KEY (customer_id)
                             REFERENCES customer(id)) TYPE=INNODB;
```

Starting from MySQL 3.23.50, `InnoDB` allows you to add a new foreign key constraint to a table by using `ALTER TABLE`:

```
ALTER TABLE tbl_name
ADD [CONSTRAINT symbol] FOREIGN KEY [id] (index_col_name, ...)
REFERENCES tbl_name (index_col_name, ...)
[ON DELETE {RESTRICT | CASCADE | SET NULL | NO ACTION}]
[ON UPDATE {RESTRICT | CASCADE | SET NULL | NO ACTION}]
```

**Remember to create the required indexes first.** You can also add a self-referential foreign key constraint to a table using `ALTER TABLE`.

Starting from MySQL 4.0.13, `InnoDB` supports the use of `ALTER TABLE` to drop foreign keys:

```
ALTER TABLE tbl_name DROP FOREIGN KEY fk_symbol;
```

If the **FOREIGN KEY** clause included a **CONSTRAINT** name when you created the foreign key, you can refer to that name to drop the foreign key. (A constraint name can be given as of MySQL 4.0.18.) Otherwise, the *fk\_symbol* value is internally generated by InnoDB when the foreign key is created. To find out the symbol when you want to drop a foreign key, use the **SHOW CREATE TABLE** statement. For example:

```
mysql> SHOW CREATE TABLE ibtest11c\G
***** 1. row *****
      Table: ibtest11c
Create Table: CREATE TABLE `ibtest11c` (
  `A` int(11) NOT NULL auto_increment,
  `D` int(11) NOT NULL default '0',
  `B` varchar(200) NOT NULL default '',
  `C` varchar(175) default NULL,
  PRIMARY KEY (`A`,`D`,`B`),
  KEY `B` (`B`,`C`),
  KEY `C` (`C`),
  CONSTRAINT `0_38775` FOREIGN KEY (`A`, `D`)
REFERENCES `ibtest11a` (`A`, `D`)
ON DELETE CASCADE ON UPDATE CASCADE,
  CONSTRAINT `0_38776` FOREIGN KEY (`B`, `C`)
REFERENCES `ibtest11a` (`B`, `C`)
ON DELETE CASCADE ON UPDATE CASCADE
) TYPE=InnoDB CHARSET=latin1
1 row in set (0.01 sec)

mysql> ALTER TABLE ibtest11c DROP FOREIGN KEY `0_38775`;
```

You cannot add a foreign key and drop a foreign key in separate clauses of a single **ALTER TABLE** statement. Separate statements are required.

Starting from MySQL 3.23.50, the InnoDB parser allows table and column identifiers in a **FOREIGN KEY ... REFERENCES ...** clause to be quoted within backticks. (Alternatively, double quotes can be used if the **ANSI\_QUOTES** SQL mode is enabled.) The InnoDB parser also takes into account the setting of the **lower\_case\_table\_names** system variable.

Before MySQL 3.23.50, **ALTER TABLE** or **CREATE INDEX** should not be used in connection with tables that have foreign key constraints or that are referenced in foreign key constraints: Any **ALTER TABLE** removes all foreign key constraints defined for the table. You should not use **ALTER TABLE** with the referenced table, either. Instead, use **DROP TABLE** and **CREATE TABLE** to modify the schema. When MySQL does an **ALTER TABLE** it may internally use **RENAME TABLE**, and that confuses the foreign key constraints that refer to the table. In MySQL, a **CREATE INDEX** statement is processed as an **ALTER TABLE**, so the same considerations apply.

Starting from MySQL 3.23.50, InnoDB returns the foreign key definitions of a table as part of the output of the **SHOW CREATE TABLE** statement:

```
SHOW CREATE TABLE tbl_name;
```

**mysqldump** also produces correct definitions of tables to the dump file, and does not forget about the foreign keys.

You can also display the foreign key constraints for a table like this:

```
SHOW TABLE STATUS FROM db_name LIKE 'tbl_name';
```

The foreign key constraints are listed in the **Comment** column of the output.

When performing foreign key checks, InnoDB sets shared row-level locks on child or parent records it has to look at. InnoDB checks foreign key constraints immediately; the check is not deferred to transac-

tion commit.

To make it easier to reload dump files for tables that have foreign key relationships, `mysqldump` automatically includes a statement in the dump output to set `FOREIGN_KEY_CHECKS` to 0 as of MySQL 4.1.1. This avoids problems with tables having to be reloaded in a particular order when the dump is reloaded. For earlier versions, you can disable the variable manually within `mysql` when loading the dump file like this:

```
mysql> SET FOREIGN_KEY_CHECKS = 0;
mysql> SOURCE dump_file_name;
mysql> SET FOREIGN_KEY_CHECKS = 1;
```

This allows you to import the tables in any order if the dump file contains tables that are not correctly ordered for foreign keys. It also speeds up the import operation. Setting `FOREIGN_KEY_CHECKS` to 0 can also be useful for ignoring foreign key constraints during `LOAD DATA` or `ALTER TABLE` operations. However, even if `FOREIGN_KEY_CHECKS=0`, InnoDB does not allow the creation of a foreign key constraint where a column references a non-matching column type. `FOREIGN_KEY_CHECKS` is available starting from MySQL 3.23.52 and 4.0.3.

InnoDB does not allow you to drop a table that is referenced by a `FOREIGN KEY` constraint, unless you do `SET FOREIGN_KEY_CHECKS=0`. When you drop a table, the constraints that were defined in its create statement are also dropped.

If you re-create a table that was dropped, it must have a definition that conforms to the foreign key constraints referencing it. It must have the right column names and types, and it must have indexes on the referenced keys, as stated earlier. If these are not satisfied, MySQL returns error number 1005 and refers to errno 150 in the error message.

### 14.2.7.5. InnoDB and MySQL Replication

MySQL replication works for InnoDB tables as it does for MyISAM tables. It is also possible to use replication in a way where the storage engine on the slave is not the same as the original storage engine on the master. For example, you can replicate modifications to an InnoDB table on the master to a MyISAM table on the slave.

To set up a new slave for a master, you have to make a copy of the InnoDB tablespace and the log files, as well as the `.frm` files of the InnoDB tables, and move the copies to the slave. If the `innodb_file_per_table` variable is enabled, you must also copy the `.ibd` files as well. For the proper procedure to do this, see Section 14.2.9, “Backing Up and Recovering an InnoDB Database”.

If you can shut down the master or an existing slave, you can take a cold backup of the InnoDB tablespace and log files and use that to set up a slave. To make a new slave without taking down any server you can also use the non-free (commercial) InnoDB Hot Backup tool [http://www.innodb.com/order.html].

There are minor limitations in InnoDB replication:

- `LOAD TABLE FROM MASTER` does not work for InnoDB type tables. There are workarounds: 1) dump the table on the master and import the dump file into the slave, or 2) use `ALTER TABLE tbl_name TYPE=MyISAM` on the master before setting up replication with `LOAD TABLE tbl_name FROM MASTER`, and then use `ALTER TABLE` to alter the master table back to the InnoDB type afterward. However, this should not be done for tables that have foreign key definitions because the definitions will be lost.
- Before MySQL 4.0.6, `SLAVE STOP` did not respect the boundary of a multiple-statement transaction. An incomplete transaction would be rolled back, and the next `SLAVE START` would only execute the remaining part of the half transaction. That would cause replication to fail.

- Before MySQL 4.0.6, a slave crash in the middle of a multiple-statement transaction would cause the same problem as `SLAVE STOP`.
- Before MySQL 4.0.11, replication of the `SET FOREIGN_KEY_CHECKS=0` statement does not work properly.

Most of these limitations can be eliminated by using more recent server versions for which the limitations do not apply.

Transactions that fail on the master do not affect replication at all. MySQL replication is based on the binary log where MySQL writes SQL statements that modify data. A transaction that fails (for example, because of a foreign key violation, or because it is rolled back) is not written to the binary log, so it is not sent to slaves. See [Section 13.4.1](#), “`START TRANSACTION`, `COMMIT`, and `ROLLBACK Syntax`”.

## 14.2.8. Adding and Removing InnoDB Data and Log Files

This section describes what you can do when your InnoDB tablespace runs out of room or when you want to change the size of the log files.

From MySQL 3.23.50 and 4.0.2, the easiest way to increase the size of the InnoDB tablespace is to configure it from the beginning to be auto-extending. Specify the `autoextend` attribute for the last data file in the tablespace definition. Then InnoDB increases the size of that file automatically in 8MB increments when it runs out of space. Starting with MySQL 4.0.24 and 4.1.5, the increment size can be changed by setting the value of the `innodb_autoextend_increment` system variable, which is measured in MB.

Alternatively, you can increase the size of your tablespace by adding another data file. To do this, you have to shut down the MySQL server, change the tablespace configuration to add a new data file to the end of `innodb_data_file_path`, and start the server again.

If your last data file was defined with the keyword `autoextend`, the procedure for reconfiguring the tablespace must take into account the size to which the last data file has grown. Obtain the size of the data file, round it down to the closest multiple of  $1024 \times 1024$  bytes (= 1MB), and specify the rounded size explicitly in `innodb_data_file_path`. Then you can add another data file. Remember that only the last data file in the `innodb_data_file_path` can be specified as auto-extending.

As an example, assume that the tablespace has just one auto-extending data file `ibdata1`:

```
innodb_data_home_dir =
innodb_data_file_path = /ibdata/ibdata1:10M:autoextend
```

Suppose that this data file, over time, has grown to 988MB. Here is the configuration line after modifying the original data file to not be auto-extending and adding another auto-extending data file:

```
innodb_data_home_dir =
innodb_data_file_path = /ibdata/ibdata1:988M;/disk2/ibdata2:50M:autoextend
```

When you add a new file to the tablespace configuration, make sure that it does not exist. InnoDB will create and initialize the file when you restart the server.

Currently, you cannot remove a data file from the tablespace. To decrease the size of your tablespace, use this procedure:

1. Use `mysqldump` to dump all your InnoDB tables.
2. Stop the server.

3. Remove all the existing tablespace files.
4. Configure a new tablespace.
5. Restart the server.
6. Import the dump files.

If you want to change the number or the size of your `InnoDB` log files, you must stop the MySQL server and make sure that it shuts down without errors (to ensure that there is no information for outstanding transactions in the logs). Then copy the old log files into a safe place just in case something went wrong in the shutdown and you need them to recover the tablespace. Delete the old log files from the log file directory, edit `my.cnf` to change the log file configuration, and start the MySQL server again. `mysqld` sees that no log files exist at startup and tells you that it is creating new ones.

## 14.2.9. Backing Up and Recovering an `InnoDB` Database

The key to safe database management is making regular backups.

`InnoDB Hot Backup` is an online backup tool you can use to backup your `InnoDB` database while it is running. `InnoDB Hot Backup` does not require you to shut down your database and it does not set any locks or disturb your normal database processing. `InnoDB Hot Backup` is a non-free (commercial) add-on tool with an annual license fee of €390 per computer on which the MySQL server is run. See the `InnoDB Hot Backup` home page [<http://www.innodb.com/order.html>] for detailed information and screenshots.

If you are able to shut down your MySQL server, you can make a binary backup that consists of all files used by `InnoDB` to manage its tables. Use the following procedure:

1. Shut down your MySQL server and make sure that it shuts down without errors.
2. Copy all your data files (`ibdata` files and `.ibd` files) into a safe place.
3. Copy all your `ib_logfile` files to a safe place.
4. Copy your `my.cnf` configuration file or files to a safe place.
5. Copy all the `.frm` files for your `InnoDB` tables to a safe place.

Replication works with `InnoDB` tables, so you can use MySQL replication capabilities to keep a copy of your database at database sites requiring high availability.

In addition to making binary backups as just described, you should also regularly make dumps of your tables with `mysqldump`. The reason for this is that a binary file might be corrupted without you noticing it. Dumped tables are stored into text files that are human-readable, so spotting table corruption becomes easier. Also, because the format is simpler, the chance for serious data corruption is smaller. `mysqldump` also has a `--single-transaction` option that you can use to make a consistent snapshot without locking out other clients.

To be able to recover your `InnoDB` database to the present from the binary backup just described, you have to run your MySQL server with binary logging turned on. Then you can apply the binary log to the backup database to achieve point-in-time recovery:

```
mysqlbinlog yourhostname-bin.123 | mysql
```

To recover from a crash of your MySQL server, the only requirement is to restart it. [InnoDB](#) automatically checks the logs and performs a roll-forward of the database to the present. [InnoDB](#) automatically rolls back uncommitted transactions that were present at the time of the crash. During recovery, [mysqld](#) displays output something like this:

```
InnoDB: Database was not shut down normally.
InnoDB: Starting recovery from log files...
InnoDB: Starting log scan based on checkpoint at
InnoDB: log sequence number 0 13674004
InnoDB: Doing recovery: scanned up to log sequence number 0 13739520
InnoDB: Doing recovery: scanned up to log sequence number 0 13805056
InnoDB: Doing recovery: scanned up to log sequence number 0 13870592
InnoDB: Doing recovery: scanned up to log sequence number 0 13936128
...
InnoDB: Doing recovery: scanned up to log sequence number 0 20555264
InnoDB: Doing recovery: scanned up to log sequence number 0 20620800
InnoDB: Doing recovery: scanned up to log sequence number 0 20664692
InnoDB: 1 uncommitted transaction(s) which must be rolled back
InnoDB: Starting rollback of uncommitted transactions
InnoDB: Rolling back trx no 16745
InnoDB: Rolling back of trx no 16745 completed
InnoDB: Rollback of uncommitted transactions completed
InnoDB: Starting an apply batch of log records to the database...
InnoDB: Apply batch completed
InnoDB: Started
mysqld: ready for connections
```

If your database gets corrupted or your disk fails, you have to do the recovery from a backup. In the case of corruption, you should first find a backup that is not corrupted. After restoring the base backup, do the recovery from the binary log files using [mysqlbinlog](#) and [mysql](#) to restore the changes performed after the backup was made.

In some cases of database corruption it is enough just to dump, drop, and re-create one or a few corrupt tables. You can use the [CHECK TABLE](#) SQL statement to check whether a table is corrupt, although [CHECK TABLE](#) naturally cannot detect every possible kind of corruption. You can use [innodb\\_tablespace\\_monitor](#) to check the integrity of the file space management inside the tablespace files.

In some cases, apparent database page corruption is actually due to the operating system corrupting its own file cache, and the data on disk may be okay. It is best first to try restarting your computer. Doing so may eliminate errors that appeared to be database page corruption.

### 14.2.9.1. Forcing [InnoDB](#) Recovery

If there is database page corruption, you may want to dump your tables from the database with [SELECT INTO outfile](#). Usually, most of the data obtained in this way is intact. Even so, the corruption may cause [SELECT \\* FROM tbl\\_name](#) statements or [InnoDB](#) background operations to crash or assert, or even to cause [InnoDB](#) roll-forward recovery to crash. Starting from MySQL 3.23.44, there is an [InnoDB](#) variable that you can use to force the [InnoDB](#) storage engine to start up, and you can also prevent background operations from running, so that you are able to dump your tables. For example, you can add the following line to the [\[mysqld\]](#) section of your option file before restarting the server:

```
[mysqld]
innodb_force_recovery = 4
```

Before MySQL 4.0, use this syntax instead:

```
[mysqld]
set-variable = innodb_force_recovery=4
```

The allowable non-zero values for [innodb\\_force\\_recovery](#) follow. A larger number includes all precautions of smaller numbers. If you are able to dump your tables with an option value of at most 4, then you are relatively safe that only some data on corrupt individual pages is lost. A value of 6 is more

drastic because database pages are left in an obsolete state, which in turn may introduce more corruption into B-trees and other database structures.

- 1 (`SRV_FORCE_IGNORE_CORRUPT`)

Let the server run even if it detects a corrupt page. Try to make `SELECT * FROM tbl_name` jump over corrupt index records and pages, which helps in dumping tables.

- 2 (`SRV_FORCE_NO_BACKGROUND`)

Prevent the main thread from running. If a crash would occur during the purge operation, this recovery value prevents it.

- 3 (`SRV_FORCE_NO_TRX_UNDO`)

Do not run transaction rollbacks after recovery.

- 4 (`SRV_FORCE_NO_IBUF_MERGE`)

Prevent also insert buffer merge operations. If they would cause a crash, do not do them. Do not calculate table statistics.

- 5 (`SRV_FORCE_NO_UNDO_LOG_SCAN`)

Do not look at undo logs when starting the database: `InnoDB` treats even incomplete transactions as committed.

- 6 (`SRV_FORCE_NO_LOG_REDO`)

Do not do the log roll-forward in connection with recovery.

Starting from MySQL 3.23.53 and 4.0.4, you can `SELECT` from tables to dump them, or `DROP` or `CREATE` a table even if forced recovery is used. If you know that a certain table is causing a crash in rollback, you can drop it. You can use this also to stop a runaway rollback caused by a failing mass import or `ALTER TABLE`. You can kill the `mysqld` process and set `innodb_force_recovery` to 3 to bring the database up without the rollback, then `DROP` the table that is causing the runaway rollback.

*The database must not otherwise be used with any non-zero value of `innodb_force_recovery`. As a safety measure, `InnoDB` prevents users from performing `INSERT`, `UPDATE`, or `DELETE` operations when `innodb_force_recovery` is greater than 0.*

## 14.2.9.2. Checkpoints

`InnoDB` implements a checkpoint mechanism known as “fuzzy” checkpointing. `InnoDB` flushes modified database pages from the buffer pool in small batches. There is no need to flush the buffer pool in one single batch, which would in practice stop processing of user SQL statements during the checkpointing process.

During crash recovery, `InnoDB` looks for a checkpoint label written to the log files. It knows that all modifications to the database before the label are present in the disk image of the database. Then `InnoDB` scans the log files forward from the checkpoint, applying the logged modifications to the database.

`InnoDB` writes to its log files on a rotating basis. All committed modifications that make the database pages in the buffer pool different from the images on disk must be available in the log files in case `InnoDB` has to do a recovery. This means that when `InnoDB` starts to reuse a log file, it has to make sure that the database page images on disk contain the modifications logged in the log file that `InnoDB` is going to reuse. In other words, `InnoDB` must create a checkpoint and this often involves flushing of

modified database pages to disk.

The preceding description explains why making your log files very large may save disk I/O in check-pointing. It often makes sense to set the total size of the log files as big as the buffer pool or even bigger. The drawback of using large log files is that crash recovery can take longer because there is more logged information to apply to the database.

## 14.2.10. Moving an InnoDB Database to Another Machine

On Windows, InnoDB always stores database and table names internally in lowercase. To move databases in a binary format from Unix to Windows or from Windows to Unix, you should have all table and database names in lowercase. A convenient way to accomplish this is to add the following line to the `[mysqld]` section of your `my.cnf` or `my.ini` file before creating any databases or tables:

```
[mysqld]
set-variable = lower_case_table_names=1
```

Like MyISAM data files, InnoDB data and log files are binary-compatible on all platforms having the same floating-point number format. You can move an InnoDB database simply by copying all the relevant files listed in Section 14.2.9, “Backing Up and Recovering an InnoDB Database”. If the floating-point formats differ but you have not used `FLOAT` or `DOUBLE` data types in your tables, then the procedure is the same: simply copy the relevant files. If the formats differ and your tables contain floating-point data, you must use `mysqldump` to dump your tables on one machine and then import the dump files on the other machine.

One way to increase performance is to switch off autocommit mode when importing data, assuming that the tablespace has enough space for the big rollback segment that the import transactions generate. Do the commit only after importing a whole table or a segment of a table.

## 14.2.11. InnoDB Transaction Model and Locking

In the InnoDB transaction model, the goal is to combine the best properties of a multi-versioning database with traditional two-phase locking. InnoDB does locking on the row level and runs queries as non-locking consistent reads by default, in the style of Oracle. The lock table in InnoDB is stored so space-efficiently that lock escalation is not needed: Typically several users are allowed to lock every row in the database, or any random subset of the rows, without InnoDB running out of memory.

### 14.2.11.1. InnoDB Lock Modes

InnoDB implements standard row-level locking where there are two types of locks:

- A shared (*S*) lock allows a transaction to read a row (tuple).
- An exclusive (*X*) lock allows a transaction to update or delete a row.

If transaction **T1** holds a shared (*S*) lock on tuple **t**, then

- A request from some distinct transaction **T2** for an *S* lock on **t** can be granted immediately. As a result, both **T1** and **T2** hold an *S* lock on **t**.
- A request from some distinct transaction **T2** for an *X* lock on **t** cannot be granted immediately.

If a transaction **T1** holds an exclusive (*X*) lock on tuple **t**, then a request from some distinct transaction **T2** for a lock of either type on **t** cannot be granted immediately. Instead, transaction **T2** has to wait for

transaction **T1** to release its lock on tuple **t**.

Additionally, **InnoDB** supports *multiple granularity locking* which allows coexistence of record locks and locks on entire tables. To make locking at multiple granularity levels practical, additional types of locks called *intention locks* are used. Intention locks are table locks in **InnoDB**. The idea behind intention locks is for a transaction to indicate which type of lock (shared or exclusive) it will require later for a row in that table. There are two types of intention locks used in **InnoDB** (assume that transaction **T** has requested a lock of the indicated type on table **R**):

- Intention shared (**IS**): Transaction **T** intends to set **S** locks on individual rows in table **R**.
- Intention exclusive (**IX**): Transaction **T** intends to set **X** locks on those rows.

The intention locking protocol is as follows:

- Before a given transaction can acquire an **S** lock on a given row, it must first acquire an **IS** or stronger lock on the table containing that row.
- Before a given transaction can acquire an **X** lock on a given row, it must first acquire an **IX** lock on the table containing that row.

These rules can be conveniently summarized by means of a *lock type compatibility matrix*:

	<b>X</b>	<b>IX</b>	<b>S</b>	<b>IS</b>
<b>X</b>	Conflict	Conflict	Conflict	Conflict
<b>IX</b>	Conflict	Compatible	Conflict	Compatible
<b>S</b>	Conflict	Conflict	Compatible	Compatible
<b>IS</b>	Conflict	Compatible	Compatible	Compatible

A lock is granted to a requesting transaction if it is compatible with existing locks. A lock is not granted to a requesting transaction if it conflicts with existing locks. A transaction waits until the conflicting existing lock is released. If a lock request conflicts with an existing lock and cannot be granted because it would cause deadlock, an error occurs.

Thus, intention locks do not block anything except full table requests (for example, **LOCK TABLES ... WRITE**). The main purpose of **IX** and **IS** locks is to show that someone is locking a row, or going to lock a row in the table.

The following example illustrates how an error can occur when a lock request would cause a deadlock. The example involves two clients, A and B.

First, client A creates a table containing one row, and then begins a transaction. Within the transaction, A obtains an **S** lock on the row by selecting it in share mode:

```
mysql> CREATE TABLE t (i INT) ENGINE = InnoDB;
Query OK, 0 rows affected (1.07 sec)

mysql> INSERT INTO t (i) VALUES(1);
Query OK, 1 row affected (0.09 sec)

mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> SELECT * FROM t WHERE i = 1 LOCK IN SHARE MODE;
+-----+
| i     |
+-----+
```

```
| 1 |
+----+
1 row in set (0.10 sec)
```

Next, client B begins a transaction and attempts to delete the row from the table:

```
mysql> START TRANSACTION;
Query OK, 0 rows affected (0.00 sec)

mysql> DELETE FROM t WHERE i = 1;
```

The delete operation requires an *X* lock. The lock cannot be granted because it is incompatible with the *S* lock that client A holds, so the request goes on the queue of lock requests for the row and client B blocks.

Finally, client A also attempts to delete the row from the table:

```
mysql> DELETE FROM t WHERE i = 1;
ERROR 1213 (40001): Deadlock found when trying to get lock;
try restarting transaction
```

Deadlock occurs here because client A needs an *X* lock to delete the row. However, that lock request cannot be granted because client B is already has a request for an *X* lock and is waiting for client A to release its *S* lock. Nor can the *S* lock held by A be upgraded to an *X* lock because of the prior request by B for an *X* lock. As a result, *InnoDB* generates an error for client A and releases its locks. At that point, the lock request for client B can be granted and B deletes the row from the table.

### 14.2.11.2. *InnoDB* and AUTOCOMMIT

In *InnoDB*, all user activity occurs inside a transaction. If the autocommit mode is enabled, each SQL statement forms a single transaction on its own. By default, MySQL starts new connections with autocommit enabled.

If the autocommit mode is switched off with `SET AUTOCOMMIT = 0`, then we can consider that a user always has a transaction open. An SQL `COMMIT` or `ROLLBACK` statement ends the current transaction and a new one starts. A `COMMIT` means that the changes made in the current transaction are made permanent and become visible to other users. A `ROLLBACK` statement, on the other hand, cancels all modifications made by the current transaction. Both statements release all *InnoDB* locks that were set during the current transaction.

If the connection has autocommit enabled, the user can still perform a multiple-statement transaction by starting it with an explicit `START TRANSACTION` or `BEGIN` statement and ending it with `COMMIT` or `ROLLBACK`.

### 14.2.11.3. *InnoDB* and TRANSACTION ISOLATION LEVEL

In terms of the SQL:1992 transaction isolation levels, the *InnoDB* default is `REPEATABLE READ`. Starting from MySQL 4.0.5, *InnoDB* offers all four different transaction isolation levels described by the SQL standard. You can set the default isolation level for all connections by using the `--transaction-isolation` option on the command line or in an option file. For example, you can set the option in the `[mysqld]` section of an option file like this:

```
[mysqld]
transaction-isolation = {READ-UNCOMMITTED | READ-COMMITTED
                        | REPEATABLE-READ | SERIALIZABLE}
```

A user can change the isolation level for a single session or for all new incoming connections with the `SET TRANSACTION` statement. Its syntax is as follows:

```
SET [SESSION | GLOBAL] TRANSACTION ISOLATION LEVEL
```

```
{READ UNCOMMITTED | READ COMMITTED
 | REPEATABLE READ | SERIALIZABLE}
```

Note that there are hyphens in the level names for the `--transaction-isolation` option, but not for the `SET TRANSACTION` statement.

The default behavior is to set the isolation level for the next (not started) transaction. If you use the `GLOBAL` keyword, the statement sets the default transaction level globally for all new connections created from that point on (but not for existing connections). You need the `SUPER` privilege to do this. Using the `SESSION` keyword sets the default transaction level for all future transactions performed on the current connection.

Any client is free to change the session isolation level (even in the middle of a transaction), or the isolation level for the next transaction.

Before MySQL 3.23.50, `SET TRANSACTION` had no effect on `InnoDB` tables. Before 4.0.5, only `REPEATABLE READ` and `SERIALIZABLE` were available.

You can determine the global and session transaction isolation levels by checking the value of the `tx_isolation` system variable with these statements:

```
SELECT @@global.tx_isolation;
SELECT @@tx_isolation;
```

In row-level locking, `InnoDB` uses next-key locking. That means that besides index records, `InnoDB` can also lock the “gap” preceding an index record to block insertions by other users immediately before the index record. A next-key lock refers to a lock that locks an index record and the gap before it. A gap lock refers to a lock that only locks a gap before some index record.

A detailed description of each isolation level in `InnoDB` follows:

- `READ UNCOMMITTED`

`SELECT` statements are performed in a non-locking fashion, but a possible earlier version of a record might be used. Thus, using this isolation level, such reads are not consistent. This is also called a “dirty read.” Otherwise, this isolation level works like `READ COMMITTED`.

- `READ COMMITTED`

A somewhat Oracle-like isolation level. All `SELECT ... FOR UPDATE` and `SELECT ... LOCK IN SHARE MODE` statements lock only the index records, not the gaps before them, and thus allow the free insertion of new records next to locked records. `UPDATE` and `DELETE` statements using a unique index with a unique search condition lock only the index record found, not the gap before it. In range-type `UPDATE` and `DELETE` statements, `InnoDB` must set next-key or gap locks and block insertions by other users to the gaps covered by the range. This is necessary because “phantom rows” must be blocked for MySQL replication and recovery to work.

Consistent reads behave as in Oracle: Each consistent read, even within the same transaction, sets and reads its own fresh snapshot. See [Section 14.2.11.4, “Consistent Non-Locking Read”](#).

- `REPEATABLE READ`

This is the default isolation level of `InnoDB`. `SELECT ... FOR UPDATE`, `SELECT ... LOCK IN SHARE MODE`, `UPDATE`, and `DELETE` statements that use a unique index with a unique search condition lock only the index record found, not the gap before it. With other search conditions, these operations employ next-key locking, locking the index range scanned with next-key or gap locks, and block new insertions by other users.

In consistent reads, there is an important difference from the `READ COMMITTED` isolation level: All consistent reads within the same transaction read the same snapshot established by the first read. This convention means that if you issue several plain `SELECT` statements within the same transaction, these `SELECT` statements are consistent also with respect to each other. See [Section 14.2.11.4, “Consistent Non-Locking Read”](#).

- `SERIALIZABLE`

This level is like `REPEATABLE READ`, but `InnoDB` implicitly commits all plain `SELECT` statements to `SELECT ... LOCK IN SHARE MODE`.

#### 14.2.11.4. Consistent Non-Locking Read

A consistent read means that `InnoDB` uses multi-versioning to present to a query a snapshot of the database at a point in time. The query sees the changes made by those transactions that committed before that point of time, and no changes made by later or uncommitted transactions. The exception to this rule is that the query sees the changes made by earlier statements within the same transaction. Note that the exception to the rule causes the following anomaly: if you update some rows in a table, a `SELECT` will see the latest version of the updated rows, while it sees the old version of other rows. If other users simultaneously update the same table, the anomaly means that you may see the table in a state that never existed in the database.

If you are running with the default `REPEATABLE READ` isolation level, all consistent reads within the same transaction read the snapshot established by the first such read in that transaction. You can get a fresher snapshot for your queries by committing the current transaction and after that issuing new queries.

Consistent read is the default mode in which `InnoDB` processes `SELECT` statements in `READ COMMITTED` and `REPEATABLE READ` isolation levels. A consistent read does not set any locks on the tables it accesses, and therefore other users are free to modify those tables at the same time a consistent read is being performed on the table.

Note that consistent read does not work over `DROP TABLE` and over `ALTER TABLE`. Consistent read does not work over `DROP TABLE` because MySQL can't use a table that has been dropped and `InnoDB` destroys the table. Consistent read does not work over `ALTER TABLE` because `ALTER TABLE` works by making a temporary copy of the original table and deleting the original table when the temporary copy is built. When you reissue a consistent read within a transaction, rows in the new table are not visible because those rows did not exist when the transaction's snapshot was taken.

#### 14.2.11.5. `SELECT ... FOR UPDATE` and `SELECT ... LOCK IN SHARE MODE` Locking Reads

In some circumstances, a consistent read is not convenient. For example, you might want to add a new row into your table `child`, and make sure that the child has a parent in table `parent`. The following example shows how to implement referential integrity in your application code.

Suppose that you use a consistent read to read the table `parent` and indeed see the parent of the child in the table. Can you safely add the child row to table `child`? No, because it may happen that meanwhile some other user deletes the parent row from the table `parent` without you being aware of it.

The solution is to perform the `SELECT` in a locking mode using `LOCK IN SHARE MODE`:

```
SELECT * FROM parent WHERE NAME = 'Jones' LOCK IN SHARE MODE;
```

Performing a read in share mode means that we read the latest available data, and set a shared mode lock

on the rows we read. A shared mode lock prevents others from updating or deleting the row we have read. Also, if the latest data belongs to a yet uncommitted transaction of another client connection, we wait until that transaction commits. After we see that the preceding query returns the parent 'Jones', we can safely add the child record to the `child` table and commit our transaction.

Let us look at another example: We have an integer counter field in a table `child_codes` that we use to assign a unique identifier to each child added to table `child`. Obviously, using a consistent read or a shared mode read to read the present value of the counter is not a good idea because two users of the database may then see the same value for the counter, and a duplicate-key error occurs if two users attempt to add children with the same identifier to the table.

Here, `LOCK IN SHARE MODE` is not a good solution because if two users read the counter at the same time, at least one of them ends up in deadlock when attempting to update the counter.

In this case, there are two good ways to implement the reading and incrementing of the counter: (1) update the counter first by incrementing it by 1 and only after that read it, or (2) read the counter first with a lock mode `FOR UPDATE`, and increment after that. The latter approach can be implemented as follows:

```
SELECT counter_field FROM child_codes FOR UPDATE;
UPDATE child_codes SET counter_field = counter_field + 1;
```

A `SELECT ... FOR UPDATE` reads the latest available data, setting exclusive locks on each row it reads. Thus, it sets the same locks a searched SQL `UPDATE` would set on the rows.

The preceding description is merely an example of how `SELECT ... FOR UPDATE` works. In MySQL, the specific task of generating a unique identifier actually can be accomplished using only a single access to the table:

```
UPDATE child_codes SET counter_field = LAST_INSERT_ID(counter_field + 1);
SELECT LAST_INSERT_ID();
```

The `SELECT` statement merely retrieves the identifier information (specific to the current connection). It does not access any table.

Locks set by `IN SHARE MODE` and `FOR UPDATE` reads are released when the transaction is committed or rolled back.

### 14.2.11.6. Next-Key Locking: Avoiding the Phantom Problem

In row-level locking, `InnoDB` uses an algorithm called *next-key locking*. `InnoDB` performs the row-level locking in such a way that when it searches or scans an index of a table, it sets shared or exclusive locks on the index records it encounters. Thus, the row-level locks are actually index record locks.

The locks `InnoDB` sets on index records also affect the “gap” before that index record. If a user has a shared or exclusive lock on record `R` in an index, another user cannot insert a new index record immediately before `R` in the index order. This locking of gaps is done to prevent the so-called “phantom problem.” Suppose that you want to read and lock all children from the `child` table having an identifier value greater than 100, with the intention of updating some column in the selected rows later:

```
SELECT * FROM child WHERE id > 100 FOR UPDATE;
```

Suppose that there is an index on the `id` column. The query scans that index starting from the first record where `id` is bigger than 100. If the locks set on the index records would not lock out inserts made in the gaps, a new row might meanwhile be inserted to the table. If you execute the same `SELECT` within the same transaction, you would see a new row in the result set returned by the query. This is contrary to the isolation principle of transactions: A transaction should be able to run so that the data it has read

does not change during the transaction. If we regard a set of rows as a data item, the new “phantom” child would violate this isolation principle.

When `InnoDB` scans an index, it can also lock the gap after the last record in the index. Just that happens in the previous example: The locks set by `InnoDB` prevent any insert to the table where `id` would be bigger than 100.

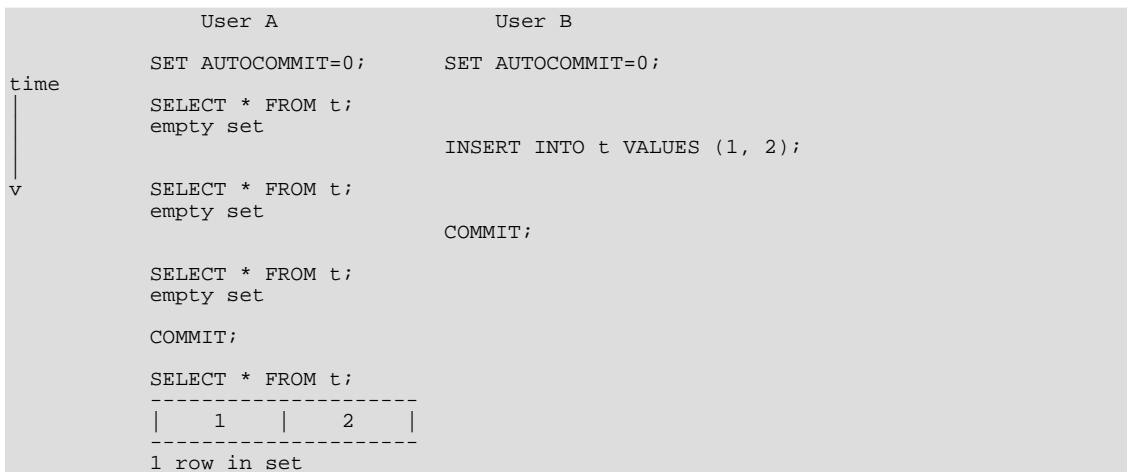

You can use next-key locking to implement a uniqueness check in your application: If you read your data in share mode and do not see a duplicate for a row you are going to insert, then you can safely insert your row and know that the next-key lock set on the successor of your row during the read prevents anyone meanwhile inserting a duplicate for your row. Thus, the next-key locking allows you to “lock” the non-existence of something in your table.

### 14.2.11.7. An Example of Consistent Read in `InnoDB`

Suppose that you are running in the default `REPEATABLE READ` isolation level. When you issue a consistent read (that is, an ordinary `SELECT` statement), `InnoDB` gives your transaction a timepoint according to which your query sees the database. If another transaction deletes a row and commits after your timepoint was assigned, you do not see the row as having been deleted. Inserts and updates are treated similarly.

You can advance your timepoint by committing your transaction and then doing another `SELECT`.

This is called *multi-versioned concurrency control*.

In this example, user A sees the row inserted by B only when B has committed the insert and A has committed as well, so that the timepoint is advanced past the commit of B.

If you want to see the “freshest” state of the database, you should use either the `READ COMMITTED` isolation level or a locking read:

```
SELECT * FROM t LOCK IN SHARE MODE;
```

### 14.2.11.8. Locks Set by Different SQL Statements in `InnoDB`

A locking read, an `UPDATE`, or a `DELETE` generally set record locks on every index record that is scanned in the processing of the SQL statement. It does not matter if there are `WHERE` conditions in the statement that would exclude the row. `InnoDB` does not remember the exact `WHERE` condition, but only knows which index ranges were scanned. The record locks are normally next-key locks that also block inserts to the “gap” immediately before the record.

If the locks to be set are exclusive, `InnoDB` always retrieves also the clustered index record and sets a lock on it.

If you do not have indexes suitable for your statement and MySQL has to scan the whole table to process the statement, every row of the table becomes locked, which in turn blocks all inserts by other users to the table. It is important to create good indexes so that your queries do not unnecessarily need to scan many rows.

`InnoDB` sets specific types of locks as follows:

- `SELECT ... FROM` is a consistent read, reading a snapshot of the database and setting no locks unless the transaction isolation level is set to `SERIALIZABLE`. For `SERIALIZABLE` level, this sets shared next-key locks on the index records it encounters.
- `SELECT ... FROM ... LOCK IN SHARE MODE` sets shared next-key locks on all index records the read encounters.
- `SELECT ... FROM ... FOR UPDATE` sets exclusive next-key locks on all index records the read encounters.
- `INSERT INTO ... VALUES (...)` sets an exclusive lock on the inserted row. Note that this lock is not a next-key lock and does not prevent other users from inserting to the gap before the inserted row. If a duplicate-key error occurs, a shared lock on the duplicate index record is set.
- While initializing a previously specified `AUTO_INCREMENT` column on a table, `InnoDB` sets an exclusive lock on the end of the index associated with the `AUTO_INCREMENT` column. In accessing the auto-increment counter, `InnoDB` uses a specific table lock mode `AUTO-INC` where the lock lasts only to the end of the current SQL statement, not to the end of the entire transaction. Note that other clients cannot insert into the table while the `AUTO-INC` table lock is held; see [Section 14.2.11.2, “InnoDB and AUTOCOMMIT”](#).

Before MySQL 3.23.50, `SHOW TABLE STATUS` applied to a table with an `AUTO_INCREMENT` column sets an exclusive row-level lock to the high end of the `AUTO_INCREMENT` index. This means also that `SHOW TABLE STATUS` could cause a deadlock of transactions, something that may surprise users. Starting from MySQL 3.23.50, `InnoDB` fetches the value of a previously initialized `AUTO_INCREMENT` column without setting any locks.

- `INSERT INTO T SELECT ... FROM S WHERE ...` sets an exclusive (non-next-key) lock on each row inserted into `T`. It does the search on `S` as a consistent read, but sets shared next-key locks on `S` if MySQL binary logging is turned on. `InnoDB` has to set locks in the latter case: In roll-forward recovery from a backup, every SQL statement has to be executed in exactly the same way it was done originally.
- `CREATE TABLE ... SELECT ...` performs the `SELECT` as a consistent read or with shared locks, as in the previous item.
- `REPLACE` is done like an insert if there is no collision on a unique key. Otherwise, an exclusive next-key lock is placed on the row that has to be updated.
- `UPDATE ... WHERE ...` sets an exclusive next-key lock on every record the search encounters.
- `DELETE FROM ... WHERE ...` sets an exclusive next-key lock on every record the search encounters.
- If a `FOREIGN KEY` constraint is defined on a table, any insert, update, or delete that requires the constraint condition to be checked sets shared record-level locks on the records that it looks at to check the constraint. `InnoDB` also sets these locks in the case where the constraint fails.

- `LOCK TABLES` sets table locks, but it is the higher MySQL layer above the `InnoDB` layer that sets these locks. Beginning with MySQL 4.0.20 and 4.1.2, `InnoDB` is aware of table locks if `innodb_table_locks=1` (the default) and `AUTOCOMMIT=0`, and the MySQL layer above `InnoDB` knows about row-level locks. Otherwise, `InnoDB`'s automatic deadlock detection cannot detect deadlocks where such table locks are involved. Also, because the higher MySQL layer does not know about row-level locks, it is possible to get a table lock on a table where another user currently has row-level locks. However, this does not endanger transaction integrity, as discussed in [Section 14.2.11.10, “Deadlock Detection and Rollback”](#). See also [Section 14.2.17, “Restrictions on InnoDB Tables”](#).

### 14.2.11.9. Implicit Transaction Commit and Rollback

By default, MySQL begins each client connection with autocommit mode enabled. When autocommit is enabled, MySQL does a commit after each SQL statement if that statement did not return an error. If an SQL statement returns an error, the commit or rollback behavior depends on the error. See [Section 14.2.16, “InnoDB Error Handling”](#).

If you have the autocommit mode off and close a connection without explicitly committing the final transaction, MySQL rolls back that transaction.

Each of the following statements (and any synonyms for them) implicitly end a transaction, as if you had done a `COMMIT` before executing the statement:

- `ALTER TABLE`, `BEGIN`, `CREATE DATABASE`, `CREATE INDEX`, `CREATE TABLE`, `DROP DATABASE`, `DROP INDEX`, `DROP TABLE`, `LOAD MASTER DATA`, `LOCK TABLES`, `RENAME TABLE`, `SET AUTOCOMMIT=1`, `START TRANSACTION`, `TRUNCATE TABLE`, `UNLOCK TABLES`.
- `UNLOCK TABLES` commits a transaction only if any tables currently are locked.
- Prior to MySQL 4.0.13, `CREATE TABLE` commits a transaction if the binary update log is enabled. The `CREATE TABLE`, `CREATE DATABASE DROP DATABASE`, and `TRUNCATE TABLE` statements cause an implicit commit beginning with MySQL 4.1.13.
- The `CREATE TABLE` statement in `InnoDB` is processed as a single transaction. This means that a `ROLLBACK` from the user does not undo `CREATE TABLE` statements the user made during that transaction.

Transactions cannot be nested. This is a consequence of the implicit `COMMIT` performed for any current transaction when you issue a `START TRANSACTION` statement or one of its synonyms.

### 14.2.11.10. Deadlock Detection and Rollback

`InnoDB` automatically detects a deadlock of transactions and rolls back a transaction or transactions to break the deadlock. Starting from MySQL 4.0.5, `InnoDB` tries to pick small transactions to roll back, the size of a transaction being determined by the number of rows inserted, updated, or deleted. Prior to 4.0.5, `InnoDB` always rolled back the transaction whose lock request was the last one to build a deadlock, that is, a cycle in the “waits-for” graph of transactions.

Beginning with MySQL 4.0.20 and 4.1.2, `InnoDB` is aware of table locks if `innodb_table_locks=1` (the default) and `AUTOCOMMIT=0`, and the MySQL layer above `InnoDB` knows about row-level locks. Before that, `InnoDB` cannot detect deadlocks where a table lock set by a MySQL `LOCK TABLES` statement is involved, or if a lock set by another storage engine than `InnoDB` is involved. You have to resolve these situations by setting the value of the `innodb_lock_wait_timeout` system variable.

When `InnoDB` performs a complete rollback of a transaction, all locks set by the transaction are released. However, if just a single SQL statement is rolled back as a result of an error, some of the locks set by the statement may be preserved. This happens because `InnoDB` stores row locks in a format such that it cannot know afterward which lock was set by which statement.

### 14.2.11.11. How to Cope with Deadlocks

Deadlocks are a classic problem in transactional databases, but they are not dangerous unless they are so frequent that you cannot run certain transactions at all. Normally, you must write your applications so that they are always prepared to re-issue a transaction if it gets rolled back because of a deadlock.

`InnoDB` uses automatic row-level locking. You can get deadlocks even in the case of transactions that just insert or delete a single row. That is because these operations are not really “atomic”; they automatically set locks on the (possibly several) index records of the row inserted or deleted.

You can cope with deadlocks and reduce the likelihood of their occurrence with the following techniques:

- Use `SHOW INNODB STATUS` to determine the cause of the latest deadlock. That can help you to tune your application to avoid deadlocks. This strategy can be used as of MySQL 3.23.52 and 4.0.3, depending on your MySQL series. From 4.1.2 on, use `SHOW ENGINE INNODB STATUS`.
- Always be prepared to re-issue a transaction if it fails due to deadlock. Deadlocks are not dangerous. Just try again.
- Commit your transactions often. Small transactions are less prone to collision.
- If you are using locking reads (`SELECT ... FOR UPDATE` or `... LOCK IN SHARE MODE`), try using a lower isolation level such as `READ COMMITTED`.
- Access your tables and rows in a fixed order. Then transactions form well-defined queues and do not deadlock.
- Add well-chosen indexes to your tables. Then your queries need to scan fewer index records and consequently set fewer locks. Use `EXPLAIN SELECT` to determine which indexes the MySQL server regards as the most appropriate for your queries.
- Use less locking. If you can afford to allow a `SELECT` to return data from an old snapshot, do not add the clause `FOR UPDATE` or `LOCK IN SHARE MODE` to it. Using the `READ COMMITTED` isolation level is good here, because each consistent read within the same transaction reads from its own fresh snapshot.
- If nothing else helps, serialize your transactions with table-level locks. The correct way to use `LOCK TABLES` with transactional tables, such as `InnoDB` tables, is to set `AUTOCOMMIT = 0` and not to call `UNLOCK TABLES` until after you commit the transaction explicitly. For example, if you need to write to table `t1` and read from table `t2`, you can do this:

```
SET AUTOCOMMIT=0;
LOCK TABLES t1 WRITE, t2 READ, ...;
... do something with tables t1 and t2 here ...
COMMIT;
UNLOCK TABLES;
```

Table-level locks make your transactions queue nicely, and deadlocks are avoided.

- Another way to serialize transactions is to create an auxiliary “semaphore” table that contains just a single row. Have each transaction update that row before accessing other tables. In that way, all transactions happen in a serial fashion. Note that the `InnoDB` instant deadlock detection algorithm

also works in this case, because the serializing lock is a row-level lock. With MySQL table-level locks, the timeout method must be used to resolve deadlocks.

- In applications that use `AUTOCOMMIT=1` and MySQL's `LOCK TABLES` command, InnoDB's internal table locks that were present from 4.0.20 to 4.0.23 can cause deadlocks. Starting from 4.0.22, you can set `innodb_table_locks=0` in `my.cnf` to fall back to the old behavior and remove the problem. 4.0.24 does not set InnoDB table locks if `AUTOCOMMIT=1`.

## 14.2.12. InnoDB Performance Tuning Tips

- In InnoDB, having a long `PRIMARY KEY` wastes a lot of disk space because its value must be stored with every secondary index record. (See [Section 14.2.14, “InnoDB Table and Index Structures”](#).) Create an `AUTO_INCREMENT` column as the primary key if your primary key is long.
- If the Unix `top` tool or the Windows Task Manager shows that the CPU usage percentage with your workload is less than 70%, your workload is probably disk-bound. Maybe you are making too many transaction commits, or the buffer pool is too small. Making the buffer pool bigger can help, but do not set it equal to more than 80% of physical memory.
- Wrap several modifications into one transaction. InnoDB must flush the log to disk at each transaction commit if that transaction made modifications to the database. The rotation speed of a disk is typically at most 167 revolutions/second, which constrains the number of commits to the same 167<sup>th</sup> of a second if the disk does not “fool” the operating system.
- If you can afford the loss of some of the latest committed transactions if a crash occurs, you can set the `innodb_flush_log_at_trx_commit` parameter to 0. InnoDB tries to flush the log once per second anyway, although the flush is not guaranteed.
- Make your log files big, even as big as the buffer pool. When InnoDB has written the log files full, it has to write the modified contents of the buffer pool to disk in a checkpoint. Small log files cause many unnecessary disk writes. The drawback of big log files is that the recovery time is longer.
- Make the log buffer quite large as well (on the order of 8MB).
- Use the `VARCHAR` data type instead of `CHAR` if you are storing variable-length strings or if the column may contain many `NULL` values. A `CHAR(N)` column always takes `N` characters to store data, even if the string is shorter or its value is `NULL`. Smaller tables fit better in the buffer pool and reduce disk I/O.
- (Relevant from 3.23.39 up.) In some versions of GNU/Linux and Unix, flushing files to disk with the Unix `fsync()` call (which InnoDB uses by default) and other similar methods is surprisingly slow. If you are dissatisfied with database write performance, you might try setting the `innodb_flush_method` parameter to `O_DSYNC`. Although `O_DSYNC` seems to be slower on most systems, yours might not be one of them.
- (Verified using MySQL 4.1, assumed for other MySQL versions, given that this is a platform architecture issue.) When using the InnoDB storage engine on Solaris 10 for x86\_64 architecture (AMD Opteron), it is important to mount any filesystems used for storing InnoDB-related files using the `forcedirectio` option. (The default on Solaris 10/x86\_64 is *not* to use this option.) Failure to use `forcedirectio` causes a serious degradation of InnoDB's speed and performance on this platform.

When using the InnoDB storage engine with a large `innodb_buffer_pool_size` value on any release of Solaris 2.6 and up and any platform (sparc/x86/x64/amd64), a significant performance gain can be achieved by placing InnoDB data files and log files on raw devices or on a separate direct I/O UFS filesystem (using mount option `forcedirectio`; see `mount_ufs(1M)`). Users of

the Veritas filesystem VxFS should use the mount option `convosync=direct`.

Other MySQL data files, such as those for `MyISAM` tables, should not be placed on a direct I/O filesystem. Executables or libraries *must not* be placed on a direct I/O filesystem.

- When importing data into `InnoDB`, make sure that MySQL does not have autocommit mode enabled because that requires a log flush to disk for every insert. To disable autocommit during your import operation, surround it with `SET AUTOCOMMIT` and `COMMIT` statements:

```
SET AUTOCOMMIT=0;
... SQL import statements ...
COMMIT;
```

If you use the `mysqldump` option `--opt`, you get dump files that are fast to import into an `InnoDB` table, even without wrapping them with the `SET AUTOCOMMIT` and `COMMIT` statements.

- Beware of big rollbacks of mass inserts: `InnoDB` uses the insert buffer to save disk I/O in inserts, but no such mechanism is used in a corresponding rollback. A disk-bound rollback can take 30 times as long to perform as the corresponding insert. Killing the database process does not help because the rollback starts again on server startup. The only way to get rid of a runaway rollback is to increase the buffer pool so that the rollback becomes CPU-bound and runs fast, or to use a special procedure. See [Section 14.2.9.1, “Forcing InnoDB Recovery”](#).
- Beware also of other big disk-bound operations. Use `DROP TABLE` and `CREATE TABLE` to empty a table, not `DELETE FROM tbl_name`.
- Use the multiple-row `INSERT` syntax to reduce communication overhead between the client and the server if you need to insert many rows:

```
INSERT INTO yourtable VALUES (1,2), (5,5), ...;
```

This tip is valid for inserts into any table, not just `InnoDB` tables.

- If you have `UNIQUE` constraints on secondary keys, starting from MySQL 3.23.52 and 4.0.3, you can speed up table imports by temporarily turning off the uniqueness checks during the import session:

```
SET UNIQUE_CHECKS=0;
... import operation ...
SET UNIQUE_CHECKS=1;
```

For big tables, this saves a lot of disk I/O because `InnoDB` can use its insert buffer to write secondary index records in a batch. Be certain that the data contains no duplicate keys. `UNIQUE_CHECKS` allows but does not require storage engines to ignore duplicate keys.

- If you have `FOREIGN KEY` constraints in your tables, starting from MySQL 3.23.52 and 4.0.3, you can speed up table imports by turning the foreign key checks off for a while in the import session:

```
SET FOREIGN_KEY_CHECKS=0;
... import operation ...
SET FOREIGN_KEY_CHECKS=1;
```

For big tables, this can save a lot of disk I/O.

- If you often have recurring queries for tables that are not updated frequently, use the query cache available as of MySQL 4.0:

```
[mysqld]
query_cache_type = ON
query_cache_size = 10M
```

In MySQL 4.0, the query cache works only with autocommit enabled. This restriction is removed in MySQL 4.1.1 and up.

- Unlike `MyISAM`, `InnoDB` does not store an index cardinality value in its tables. Instead, `InnoDB` computes a cardinality for a table the first time it accesses it after startup. With a large number of tables, this might take significant time. It is the initial table open operation that is important, so to “warm up” a table for later use, you might want to use it immediately after start up by issuing a statement such as `SELECT 1 FROM tbl_name LIMIT 1`.

### 14.2.12.1. `SHOW ENGINE INNODB STATUS` and the `InnoDB` Monitors

Starting from MySQL 3.23.42, `InnoDB` includes `InnoDB` Monitors that print information about the `InnoDB` internal state. Starting from MySQL 3.23.52 and 4.0.3, you can use the `SHOW INNODB STATUS` SQL statement at any time to fetch the output of the standard `InnoDB` Monitor to your SQL client. (In MySQL 4.1.2 and up, the statement is `SHOW ENGINE INNODB STATUS`.) The information is useful in performance tuning. If you are using the `mysql` interactive SQL client, the output is more readable if you replace the usual semicolon statement terminator by `\G`: For a discussion about the `InnoDB` lock modes, see [Section 14.2.11.1, “InnoDB Lock Modes”](#).

```
mysql> SHOW INNODB STATUS\G
```

Another way to use `InnoDB` Monitors is to let them periodically write data to the standard output of the `mysqld` server. In this case, no output is sent to clients. When switched on, `InnoDB` Monitors print data about every 15 seconds. Server output usually is directed to the `.err` log in the MySQL data directory. This data is useful in performance tuning. On Windows, you must start the server from a command prompt in a console window with the `--console` option if you want to direct the output to the window rather than to the error log.

Monitor output includes the following types of information:

- Table and record locks held by each active transaction
- Lock waits of a transactions
- Semaphore waits of threads
- Pending file I/O requests
- Buffer pool statistics
- Purge and insert buffer merge activity of the main `InnoDB` thread

To cause the standard `InnoDB` Monitor to write to the standard output of `mysqld`, use the following SQL statement:

```
CREATE TABLE innodb_monitor (a INT) TYPE=InnoDB;
```

The monitor can be stopped by issuing the following statement:

```
DROP TABLE innodb_monitor;
```

The `CREATE TABLE` syntax is just a way to pass a command to the `InnoDB` engine through MySQL's

SQL parser: The only things that matter are the table name `innodb_monitor` and that it be an `InnoDB` table. The structure of the table is not relevant at all for the `InnoDB` Monitor. If you shut down the server, the monitor does not restart automatically when you restart the server. You must drop the monitor table and issue a new `CREATE TABLE` statement to start the monitor. (This syntax may change in a future release.)

In a similar way, you can start `innodb_lock_monitor`, which is otherwise the same as `innodb_monitor` but also prints a lot of lock information. A separate `innodb_tablespace_monitor` prints a list of created file segments existing in the tablespace and also validates the tablespace allocation data structures. Starting from 3.23.44, there is `innodb_table_monitor` with which you can print the contents of the `InnoDB` internal data dictionary.

A sample of `InnoDB` Monitor output:

```
mysql> SHOW INNODB STATUS\G
***** 1. row *****
Status:
=====
030709 13:00:59 INNODB MONITOR OUTPUT

END OF INNODB MONITOR OUTPUT
=====

```

Some notes on the output:

- If the [TRANSACTIONS](#) section reports lock waits, your applications may have lock contention. The output can also help to trace the reasons for transaction deadlocks.
- The [SEMAPHORES](#) section reports threads waiting for a semaphore and statistics on how many times threads have needed a spin or a wait on a mutex or a rw-lock semaphore. A large number of threads waiting for semaphores may be a result of disk I/O, or contention problems inside [InnoDB](#). Contention can be due to heavy parallelism of queries or problems in operating system thread scheduling. Setting [innodb\\_thread\\_concurrency](#) smaller than the default value can help in such situations.
- The [BUFFER POOL AND MEMORY](#) section gives you statistics on pages read and written. You can calculate from these numbers how many data file I/O operations your queries currently are doing.
- The [ROW OPERATIONS](#) section shows what the main thread is doing.

Beginning with MySQL 4.0.19, [InnoDB](#) sends diagnostic output to stderr or files instead of stdout or fixed-size memory buffers, to avoid potential buffer overflow errors. As a side effect, the output of [SHOW INNODB STATUS](#) is written to a status file in the MySQL data directory every fifteen seconds. The name of the file is [innodb\\_status.pid](#), where [pid](#) is the server process ID. [InnoDB](#) removes the file for a normal shutdown. If abnormal shutdowns have occurred, instances of these status files may be present and must be removed manually. Before removing them, you might want to examine them to see whether they contain useful information about the cause of abnormal shutdowns. Beginning with MySQL 4.0.21, the [innodb\\_status.pid](#) file is created only if the configuration option [innodb\\_status\\_file=1](#) is set.

## 14.2.13. Implementation of Multi-Versioning

Because **InnoDB** is a multi-versioned storage engine, it must keep information about old versions of rows in the tablespace. This information is stored in a data structure called a *rollback segment* (after an analogous data structure in Oracle).

Internally, **InnoDB** adds two fields to each row stored in the database. A 6-byte field indicates the transaction identifier for the last transaction that inserted or updated the row. Also, a deletion is treated internally as an update where a special bit in the row is set to mark it as deleted. Each row also contains a 7-byte field called the roll pointer. The roll pointer points to an undo log record written to the rollback segment. If the row was updated, the undo log record contains the information necessary to rebuild the content of the row before it was updated.

**InnoDB** uses the information in the rollback segment to perform the undo operations needed in a transaction rollback. It also uses the information to build earlier versions of a row for a consistent read.

Undo logs in the rollback segment are divided into insert and update undo logs. Insert undo logs are needed only in transaction rollback and can be discarded as soon as the transaction commits. Update undo logs are used also in consistent reads, but they can be discarded only after there is no transaction present for which **InnoDB** has assigned a snapshot that in a consistent read could need the information in the update undo log to build an earlier version of a database row.

You must remember to commit your transactions regularly, including those transactions that issue only consistent reads. Otherwise, **InnoDB** cannot discard data from the update undo logs, and the rollback segment may grow too big, filling up your tablespace.

The physical size of an undo log record in the rollback segment is typically smaller than the corresponding inserted or updated row. You can use this information to calculate the space need for your rollback segment.

In the **InnoDB** multi-versioning scheme, a row is not physically removed from the database immediately when you delete it with an SQL statement. Only when **InnoDB** can discard the update undo log record written for the deletion can it also physically remove the corresponding row and its index records from the database. This removal operation is called a purge, and it is quite fast, usually taking the same order of time as the SQL statement that did the deletion.

In a scenario where the user inserts and deletes rows in smallish batches at about the same rate in the table, it is possible that the purge thread starts to lag behind, and the table grows bigger and bigger, making everything disk-bound and very slow. Even if the table would carry just 10MB of useful data, it may grow to occupy 10GB with all the dead rows. In such a case, it would be good to throttle new row operations, and allocate more resources for the purge thread. Starting with MySQL 4.0.22 and 4.1.6, the `innodb_max_purge_lag` system variable exists for exactly this purpose. See [Section 14.2.5, “InnoDB Startup Options and System Variables”](#), for more information.

## 14.2.14. InnoDB Table and Index Structures

MySQL stores its data dictionary information for tables in `.frm` files in database directories. This is true for all MySQL storage engines. But every **InnoDB** table also has its own entry in the **InnoDB** internal data dictionary inside the tablespace. When MySQL drops a table or a database, it has to delete both an `.frm` file or files, and the corresponding entries inside the **InnoDB** data dictionary. This is the reason why you cannot move **InnoDB** tables between databases simply by moving the `.frm` files. It is also the reason why `DROP DATABASE` did not work for **InnoDB** type tables before MySQL 3.23.44.

Every **InnoDB** table has a special index called the *clustered index* where the data for the rows is stored. If you define a **PRIMARY KEY** on your table, the index of the primary key is the clustered index.

If you do not define a **PRIMARY KEY** for your table, MySQL picks the first **UNIQUE** index that has only **NOT NULL** columns as the primary key and **InnoDB** uses it as the clustered index. If there is no

such index in the table, [InnoDB](#) internally generates a clustered index where the rows are ordered by the row ID that [InnoDB](#) assigns to the rows in such a table. The row ID is a 6-byte field that increases monotonically as new rows are inserted. Thus, the rows ordered by the row ID are physically in insertion order.

Accessing a row through the clustered index is fast because the row data is on the same page where the index search leads. If a table is large, the clustered index architecture often saves a disk I/O when compared to the traditional solution. (In many database systems, data storage uses a different page from the index record.)

In [InnoDB](#), the records in non-clustered indexes (also called secondary indexes) contain the primary key value for the row. [InnoDB](#) uses this primary key value to search for the row from the clustered index. Note that if the primary key is long, the secondary indexes use more space.

[InnoDB](#) compares [CHAR](#) and [VARCHAR](#) strings of different lengths such that the remaining length in the shorter string is treated as if padded with spaces.

### 14.2.14.1. Physical Structure of an Index

All [InnoDB](#) indexes are B-trees where the index records are stored in the leaf pages of the tree. The default size of an index page is 16KB. When new records are inserted, [InnoDB](#) tries to leave 1/16 of the page free for future insertions and updates of the index records.

If index records are inserted in a sequential order (ascending or descending), the resulting index pages are about 15/16 full. If records are inserted in a random order, the pages are from 1/2 to 15/16 full. If the fill factor of an index page drops below 1/2, [InnoDB](#) tries to contract the index tree to free the page.

### 14.2.14.2. Insert Buffering

It is a common situation in database applications that the primary key is a unique identifier and new rows are inserted in the ascending order of the primary key. Thus, the insertions to the clustered index do not require random reads from a disk.

On the other hand, secondary indexes are usually non-unique, and insertions into secondary indexes happen in a relatively random order. This would cause a lot of random disk I/O operations without a special mechanism used in [InnoDB](#).

If an index record should be inserted to a non-unique secondary index, [InnoDB](#) checks whether the secondary index page is in the buffer pool. If that is the case, [InnoDB](#) does the insertion directly to the index page. If the index page is not found in the buffer pool, [InnoDB](#) inserts the record to a special insert buffer structure. The insert buffer is kept so small that it fits entirely in the buffer pool, and insertions can be done very fast.

Periodically, the insert buffer is merged into the secondary index trees in the database. Often it is possible to merge several insertions to the same page of the index tree, saving disk I/O operations. It has been measured that the insert buffer can speed up insertions into a table up to 15 times.

The insert buffer merging may continue to happen *after* the inserting transaction has been committed. In fact, it may continue to happen after a server shutdown and restart (see [Section 14.2.9.1, “Forcing InnoDB Recovery”](#)).

The insert buffer merging may take many hours, when many secondary indexes must be updated, and many rows have been inserted. During this time, disk I/O will be increased, which can cause significant slowdown on disk-bound queries. Another significant background I/O operation is the purge thread (see [Section 14.2.13, “Implementation of Multi-Versioning”](#)).

### 14.2.14.3. Adaptive Hash Indexes

If a table fits almost entirely in main memory, the fastest way to perform queries on it is to use hash indexes. [InnoDB](#) has a mechanism that monitors index searches made to the indexes defined for a table. If [InnoDB](#) notices that queries could benefit from building a hash index, it does so automatically.

Note that the hash index is always built based on an existing B-tree index on the table. [InnoDB](#) can build a hash index on a prefix of any length of the key defined for the B-tree, depending on the pattern of searches that [InnoDB](#) observes for the B-tree index. A hash index can be partial: It is not required that the whole B-tree index is cached in the buffer pool. [InnoDB](#) builds hash indexes on demand for those pages of the index that are often accessed.

In a sense, [InnoDB](#) tailors itself through the adaptive hash index mechanism to ample main memory, coming closer to the architecture of main-memory databases.

#### 14.2.14.4. Physical Row Structure

Records in [InnoDB](#) tables have the following characteristics:

- Each index record contains a six-byte header. The header is used to link together consecutive records, and also in row-level locking.
- Records in the clustered index contain fields for all user-defined columns. In addition, there is a six-byte field for the transaction ID and a seven-byte field for the roll pointer.
- If no primary key was defined for a table, each clustered index record also contains a six-byte row ID field.
- Each secondary index record contains also all the fields defined for the clustered index key.
- A record contains also a pointer to each field of the record. If the total length of the fields in a record is less than 128 bytes, the pointer is one byte; otherwise, two bytes. The array of these pointers is called the record directory. The area where these pointers point is called the data part of the record.
- Internally, [InnoDB](#) stores fixed-length character columns such as `CHAR(10)` in a fixed-length format. [InnoDB](#) truncates trailing spaces from `VARCHAR` columns. Note that MySQL may internally convert `CHAR` columns to `VARCHAR`. See [Section 13.1.5.1, “Silent Column Specification Changes”](#).
- An SQL `NULL` value reserves 1 or 2 bytes in the record directory. Besides that, an SQL `NULL` value reserves zero bytes in the data part of the record if stored in a variable length column. In a fixed-length column, it reserves the fixed length of the column in the data part of the record. The motivation behind reserving the fixed space for `NULL` values is that it enables an update of the column from `NULL` to a non-`NULL` value to be done in place without causing fragmentation of the index page.

### 14.2.15. [InnoDB](#) File Space Management and Disk I/O

#### 14.2.15.1. [InnoDB](#) Disk I/O

[InnoDB](#) uses simulated asynchronous disk I/O: [InnoDB](#) creates a number of threads to take care of I/O operations, such as read-ahead.

There are two read-ahead heuristics in [InnoDB](#):

- In sequential read-ahead, if [InnoDB](#) notices that the access pattern to a segment in the tablespace is sequential, it posts in advance a batch of reads of database pages to the I/O system.

- In random read-ahead, if `InnoDB` notices that some area in a tablespace seems to be in the process of being fully read into the buffer pool, it posts the remaining reads to the I/O system.

`InnoDB` uses a novel file flush technique called *doublewrite*. It adds safety to recovery following an operating system crash or a power outage, and improves performance on most varieties of Unix by reducing the need for `fsync()` operations.

Doublewrite means that before writing pages to a data file, `InnoDB` first writes them to a contiguous tablespace area called the doublewrite buffer. Only after the write and the flush to the doublewrite buffer has completed does `InnoDB` write the pages to their proper positions in the data file. If the operating system crashes in the middle of a page write, `InnoDB` can later find a good copy of the page from the doublewrite buffer during recovery.

### 14.2.15.2. File Space Management

The data files that you define in the configuration file form the tablespace of `InnoDB`. The files are simply concatenated to form the tablespace. There is no striping in use. Currently, you cannot define where within the tablespace your tables are allocated. However, in a newly created tablespace, `InnoDB` allocates space starting from the first data file.

The tablespace consists of database pages with a default size of 16KB. The pages are grouped into extents of 64 consecutive pages. The “files” inside a tablespace are called *segments* in `InnoDB`. The term “rollback segment” is somewhat confusing because it actually contains many tablespace segments.

Two segments are allocated for each index in `InnoDB`. One is for non-leaf nodes of the B-tree, the other is for the leaf nodes. The idea here is to achieve better sequentiality for the leaf nodes, which contain the data.

When a segment grows inside the tablespace, `InnoDB` allocates the first 32 pages to it individually. After that `InnoDB` starts to allocate whole extents to the segment. `InnoDB` can add to a large segment up to 4 extents at a time to ensure good sequentiality of data.

Some pages in the tablespace contain bitmaps of other pages, and therefore a few extents in an `InnoDB` tablespace cannot be allocated to segments as a whole, but only as individual pages.

When you ask for available free space in the tablespace by issuing a `SHOW TABLE STATUS` statement, `InnoDB` reports the extents that are definitely free in the tablespace. `InnoDB` always reserves some extents for cleanup and other internal purposes; these reserved extents are not included in the free space.

When you delete data from a table, `InnoDB` contracts the corresponding B-tree indexes. Whether the freed space becomes available for other users depends on whether the pattern of deletes frees individual pages or extents to the tablespace. Dropping a table or deleting all rows from it is guaranteed to release the space to other users, but remember that deleted rows are physically removed only in an (automatic) purge operation after they are no longer needed for transaction rollbacks or consistent reads. (See [Section 14.2.13, “Implementation of Multi-Versioning”](#).)

### 14.2.15.3. Defragmenting a Table

If there are random insertions into or deletions from the indexes of a table, the indexes may become fragmented. Fragmentation means that the physical ordering of the index pages on the disk is not close to the index ordering of the records on the pages, or that there are many unused pages in the 64-page blocks that were allocated to the index.

A symptom of fragmentation is that a table takes more space than it “should” take. How much that is exactly, is difficult to determine. All `InnoDB` data and indexes are stored in B-trees, and their fill factor may vary from 50% to 100%. Another symptom of fragmentation is that a table scan such as this takes more time than it “should” take:

```
SELECT COUNT(*) FROM t WHERE a_non_indexed_column <> 12345;
```

(In the preceding query, we are “fooling” the SQL optimizer into scanning the clustered index, rather than a secondary index.) Most disks can read 10 to 50MB/s, which can be used to estimate how fast a table scan should run.

It can speed up index scans if you periodically perform a “null” `ALTER TABLE` operation:

```
ALTER TABLE tbl_name TYPE=InnoDB;
```

That causes MySQL to rebuild the table. Another way to perform a defragmentation operation is to use `mysqldump` to dump the table to a text file, drop the table, and reload it from the dump file.

If the insertions to an index are always ascending and records are deleted only from the end, the `InnoDB` filespace management algorithm guarantees that fragmentation in the index does not occur.

## 14.2.16. InnoDB Error Handling

Error handling in `InnoDB` is not always the same as specified in the SQL standard. According to the standard, any error during an SQL statement should cause the rollback of that statement. `InnoDB` sometimes rolls back only part of the statement, or the whole transaction. The following items describe how `InnoDB` performs error handling:

- If you run out of file space in the tablespace, a MySQL `Table is full` error occurs and `InnoDB` rolls back the SQL statement.
- A transaction deadlock or a timeout in a lock wait causes `InnoDB` to roll back the whole transaction.

When a transaction rollback occurs due to a deadlock or lock wait timeout, it cancels the effect of the statements within the transaction. But if the start-transaction statement was `START TRANSACTION` or `BEGIN` statement, rollback does not cancel that statement. Further SQL statements become part of the transaction until the occurrence of `COMMIT`, `ROLLBACK`, or some SQL statement that causes an implicit commit.

- A duplicate-key error rolls back the SQL statement, if you have not specified the `IGNORE` option in your statement.
- A `row too long error` rolls back the SQL statement.
- Other errors are mostly detected by the MySQL layer of code (above the `InnoDB` storage engine level), and they roll back the corresponding SQL statement. Locks are not released in a rollback of a single SQL statement.

During such implicit rollbacks, as well as during the explicit `ROLLBACK SQL` command, `SHOW PROCESSLIST` displays “Rolling back” in the `State` column for the connection (starting from MySQL 4.1.8).

### 14.2.16.1. InnoDB Error Codes

The following is a non-exhaustive list of common `InnoDB`-specific errors that you may encounter, with information about why each occurs and how to resolve the problem.

- 1005 (`ER_CANT_CREATE_TABLE`)

Cannot create table. If the error message refers to `errno` 150, table creation failed because a foreign key constraint was not correctly formed. If the error message refers to `errno` -1, table creation probably failed because the table included a column name that matched the name of an internal InnoDB table.

- 1016 (`ER_CANT_OPEN_FILE`)

Cannot find the InnoDB table from the InnoDB data files, although the `.frm` file for the table exists. See [Section 14.2.18.1, “Troubleshooting InnoDB Data Dictionary Operations”](#).

- 1114 (`ER_RECORD_FILE_FULL`)

InnoDB has run out of free space in the tablespace. You should reconfigure the tablespace to add a new data file.

- 1205 (`ER_LOCK_WAIT_TIMEOUT`)

Lock wait timeout expired. Transaction was rolled back.

- 1213 (`ER_LOCK_DEADLOCK`)

Transaction deadlock. You should rerun the transaction.

- 1216 (`ER_NO_REFERENCED_ROW`)

You are trying to add a row but there is no parent row, and a foreign key constraint fails. You should add the parent row first.

- 1217 (`ER_ROW_IS_REFERENCED`)

You are trying to delete a parent row that has children, and a foreign key constraint fails. You should delete the children first.

## 14.2.16.2. Operating System Error Codes

To print the meaning of an operating system error number, use the `pererror` program that comes with the MySQL distribution.

The following table provides a list of some common Linux system error codes. For a more complete list, see [Linux source code](http://www.iglu.org.il/lxr/source/include/asm-i386/errno.h) [<http://www.iglu.org.il/lxr/source/include/asm-i386/errno.h>].

- 1 (`EPERM`)

Operation not permitted

- 2 (`ENOENT`)

No such file or directory

- 3 (`ESRCH`)

No such process

- 4 (`EINTR`)

Interrupted system call

- 5 (EIO)  
I/O error
- 6 (ENXIO)  
No such device or address
- 7 (E2BIG)  
Arg list too long
- 8 (ENOEXEC)  
Exec format error
- 9 (EBADF)  
Bad file number
- 10 (ECHILD)  
No child processes
- 11 (EAGAIN)  
Try again
- 12 (ENOMEM)  
Out of memory
- 13 (EACCES)  
Permission denied
- 14 (EFAULT)  
Bad address
- 15 (ENOTBLK)  
Block device required
- 16 (EBUSY)  
Device or resource busy
- 17 (EEXIST)  
File exists
- 18 (EXDEV)  
Cross-device link
- 19 (ENODEV)  
No such device

- 20 (ENOTDIR)  
Not a directory
- 21 (EISDIR)  
Is a directory
- 22 (EINVAL)  
Invalid argument
- 23 (ENFILE)  
File table overflow
- 24 (EMFILE)  
Too many open files
- 25 (ENOTTY)  
Inappropriate ioctl for device
- 26 (ETXTBSY)  
Text file busy
- 27 (EFBIG)  
File too large
- 28 (ENOSPC)  
No space left on device
- 29 (ESPIPE)  
Illegal seek
- 30 (EROFS)  
Read-only file system
- 31 (EMLINK)  
Too many links

The following table provides a list of some common Windows system error codes. For a complete list see the [Microsoft Web site](http://msdn.microsoft.com/library/default.asp?url=/library/en-us/debug/base/system_error_codes.asp) [http://msdn.microsoft.com/library/default.asp?url=/library/en-us/debug/base/system\_error\_codes.asp].

- 1 (ERROR\_INVALID\_FUNCTION)  
Incorrect function.
- 2 (ERROR\_FILE\_NOT\_FOUND)

The system cannot find the file specified.

- 3 ( `ERROR_PATH_NOT_FOUND` )

The system cannot find the path specified.

- 4 ( `ERROR_TOO_MANY_OPEN_FILES` )

The system cannot open the file.

- 5 ( `ERROR_ACCESS_DENIED` )

Access is denied.

- 6 ( `ERROR_INVALID_HANDLE` )

The handle is invalid.

- 7 ( `ERROR_ARENA_TRASHED` )

The storage control blocks were destroyed.

- 8 ( `ERROR_NOT_ENOUGH_MEMORY` )

Not enough storage is available to process this command.

- 9 ( `ERROR_INVALID_BLOCK` )

The storage control block address is invalid.

- 10 ( `ERROR_BAD_ENVIRONMENT` )

The environment is incorrect.

- 11 ( `ERROR_BAD_FORMAT` )

An attempt was made to load a program with an incorrect format.

- 12 ( `ERROR_INVALID_ACCESS` )

The access code is invalid.

- 13 ( `ERROR_INVALID_DATA` )

The data is invalid.

- 14 ( `ERROR_OUTOFMEMORY` )

Not enough storage is available to complete this operation.

- 15 ( `ERROR_INVALID_DRIVE` )

The system cannot find the drive specified.

- 16 ( `ERROR_CURRENT_DIRECTORY` )

The directory cannot be removed.

- 17 ( `ERROR_NOT_SAME_DEVICE` )

The system cannot move the file to a different disk drive.

- 18 ( `ERROR_NO_MORE_FILES` )

There are no more files.

- 19 ( `ERROR_WRITE_PROTECT` )

The media is write protected.

- 20 ( `ERROR_BAD_UNIT` )

The system cannot find the device specified.

- 21 ( `ERROR_NOT_READY` )

The device is not ready.

- 22 ( `ERROR_BAD_COMMAND` )

The device does not recognize the command.

- 23 ( `ERROR_CRC` )

Data error (cyclic redundancy check).

- 24 ( `ERROR_BAD_LENGTH` )

The program issued a command but the command length is incorrect.

- 25 ( `ERROR_SEEK` )

The drive cannot locate a specific area or track on the disk.

- 26 ( `ERROR_NOT_DOS_DISK` )

The specified disk or diskette cannot be accessed.

- 27 ( `ERROR_SECTOR_NOT_FOUND` )

The drive cannot find the sector requested.

- 28 ( `ERROR_OUT_OF_PAPER` )

The printer is out of paper.

- 29 ( `ERROR_WRITE_FAULT` )

The system cannot write to the specified device.

- 30 ( `ERROR_READ_FAULT` )

The system cannot read from the specified device.

- 31 ( `ERROR_GEN_FAILURE` )

A device attached to the system is not functioning.

- 32 ( `ERROR_SHARING_VIOLATION` )

The process cannot access the file because it is being used by another process.

- 33 ( [ERROR\\_LOCK\\_VIOLATION](#) )

The process cannot access the file because another process has locked a portion of the file.

- 34 ( [ERROR\\_WRONG\\_DISK](#) )

The wrong diskette is in the drive. Insert %2 (Volume Serial Number: %3) into drive %1.

- 36 ( [ERROR\\_SHARING\\_BUFFER\\_EXCEEDED](#) )

Too many files opened for sharing.

- 38 ( [ERROR\\_HANDLE\\_EOF](#) )

Reached the end of the file.

- 39 ( [ERROR\\_HANDLE\\_DISK\\_FULL](#) )

The disk is full.

- 87 ( [ERROR\\_INVALID\\_PARAMETER](#) )

The parameter is incorrect. (If this error occurs on MySQL 4.1.9 on Windows and you have set `innodb_file_per_table` in a server option file, this is [Bug#8021](#) [<http://bugs.mysql.com/8021>], and a workaround is to add the line `innodb_flush_method=unbuffered` to the file as well.)

- 112 ( [ERROR\\_DISK\\_FULL](#) )

The disk is full.

- 123 ( [ERROR\\_INVALID\\_NAME](#) )

The filename, directory name, or volume label syntax is incorrect.

- 1450 ( [ERROR\\_NO\\_SYSTEM\\_RESOURCES](#) )

Insufficient system resources exist to complete the requested service.

## 14.2.17. Restrictions on InnoDB Tables

- **Warning:** Do *not* convert MySQL system tables in the `mysql` database from `MyISAM` to `InnoDB` tables! This is an unsupported operation. If you do this, MySQL does not restart until you restore the old system tables from a backup or re-generate them with the `mysql_install_db` script.
- A table cannot contain more than 1000 columns.
- The internal maximum key length is 3500 bytes, but MySQL itself restricts this to 1024 bytes.
- The maximum row length, except for `VARCHAR`, `BLOB` and `TEXT` columns, is slightly less than half of a database page. That is, the maximum row length is about 8000 bytes. `LONGBLOB` and `LONGTEXT` columns must be less than 4GB, and the total row length, including also `BLOB` and `TEXT` columns, must be less than 4GB. `InnoDB` stores the first 768 bytes of a `VARCHAR`, `BLOB`, or `TEXT` column in the row, and the rest into separate pages.

- On some older operating systems, files must be less than 2GB. This is not a limitation of `InnoDB` itself, but if you require a large tablespace, you will need to configure it using several smaller data files rather than one or a file large data files.
- The combined size of the `InnoDB` log files must be less than 4GB.
- The minimum tablespace size is 10MB. The maximum tablespace size is four billion database pages (64TB). This is also the maximum size for a table.
- `InnoDB` tables do not support `FULLTEXT` indexes.
- `InnoDB` tables do not support spatial data types.
- `ANALYZE TABLE` determines index cardinality (as displayed in the `Cardinality` column of `SHOW INDEX` output) by doing ten random dives to each of the index trees and updating index cardinality estimates accordingly. Note that because these are only estimates, repeated runs of `ANALYZE TABLE` may produce different numbers. This makes `ANALYZE TABLE` fast on `InnoDB` tables but not 100% accurate as it doesn't take all rows into account.

MySQL uses index cardinality estimates only in join optimization. If some join is not optimized in the right way, you can try using `ANALYZE TABLE`. In the few cases that `ANALYZE TABLE` doesn't produce values good enough for your particular tables, you can use `FORCE INDEX` with your queries to force the use of a particular index, or set the `max_seeks_for_key` system variable to ensure that MySQL prefers index lookups over table scans. See [Section 5.2.2, “System Variables”](#), and [Section A.6, “Optimizer-Related Issues”](#).

- `SHOW TABLE STATUS` does not give accurate statistics on `InnoDB` tables, except for the physical size reserved by the table. The row count is only a rough estimate used in SQL optimization.
- `InnoDB` does not keep an internal count of rows in a table. (In practice, this would be somewhat complicated due to multi-versioning.) To process a `SELECT COUNT(*) FROM t` statement, `InnoDB` must scan an index of the table, which takes some time if the index is not entirely in the buffer pool. To get a fast count, you have to use a counter table you create yourself and let your application update it according to the inserts and deletes it does. If your table does not change often, using the MySQL query cache is a good solution. `SHOW TABLE STATUS` also can be used if an approximate row count is sufficient. See [Section 14.2.12, “InnoDB Performance Tuning Tips”](#).
- On Windows, `InnoDB` always stores database and table names internally in lowercase. To move databases in binary format from Unix to Windows or from Windows to Unix, you should always use explicitly lowercase names when creating databases and tables.
- For an `AUTO_INCREMENT` column, you must always define an index for the table, and that index must contain just the `AUTO_INCREMENT` column. In `MyISAM` tables, the `AUTO_INCREMENT` column may be part of a multi-column index.
- Before MySQL 4.1.12, `InnoDB` does not support the `AUTO_INCREMENT` table option for setting the initial sequence value in an `ALTER TABLE` statement. Before MySQL 4.1.14, the same is true for `CREATE TABLE`. To set the value with `InnoDB`, insert a dummy row with a value one less and delete that dummy row, or insert the first row with an explicit value specified.
- While initializing a previously specified `AUTO_INCREMENT` column on a table, `InnoDB` sets an exclusive lock on the end of the index associated with the `AUTO_INCREMENT` column. In accessing the auto-increment counter, `InnoDB` uses a specific table lock mode `AUTO-INC` where the lock lasts only to the end of the current SQL statement, not to the end of the entire transaction. Note that other clients cannot insert into the table while the `AUTO-INC` table lock is held; see [Section 14.2.11.2, “InnoDB and AUTOCOMMIT”](#).
- When you restart the MySQL server, `InnoDB` may reuse an old value that was generated for an `AUTO_INCREMENT` column but never stored (that is, a value that was generated during an old

transaction that was rolled back).

- When an `AUTO_INCREMENT` column runs out of values, `InnoDB` wraps a `BIGINT` to `-9223372036854775808` and `BIGINT UNSIGNED` to `1`. However, `BIGINT` values have 64 bits, so do note that if you were to insert one million rows per second, it would still take nearly three hundred thousand years before `BIGINT` reached its upper bound. With all other integer type columns, a duplicate-key error results. This is similar to how `MyISAM` works, because it is mostly general MySQL behavior and not about any storage engine in particular.
- `DELETE FROM tbl_name` does not regenerate the table but instead deletes all rows, one by one.
- Under some conditions, `TRUNCATE tbl_name` for an `InnoDB` table is mapped to `DELETE FROM+ tbl_name` and doesn't reset the `AUTO_INCREMENT` counter. See [Section 13.2.9, “TRUNCATE Syntax”](#).
- Before MySQL 4.0.14 or 4.1.0, if you tried to create a unique index on a prefix of a column you got an error:

```
CREATE TABLE T (A CHAR(20), B INT, UNIQUE (A(5))) TYPE = InnoDB;
```

If you created a non-unique index on a prefix of a column, `InnoDB` created an index over the whole column. These restrictions were removed in MySQL 4.0.14.

- Before MySQL 4.0.20 or 4.1.2, the MySQL `LOCK TABLES` operation does not know about `InnoDB` row-level locks set by completed SQL statements. This means that you can get a table lock on a table even if there still exist transactions by other users who have row-level locks on the same table. Thus, your operations on the table may have to wait if they collide with these locks of other users. Also a deadlock is possible. However, this does not endanger transaction integrity, because the row-level locks set by `InnoDB` always take care of the integrity. Also, a table lock prevents other transactions from acquiring more row-level locks (in a conflicting lock mode) on the table.
- Beginning with MySQL 4.0.20 and 4.1.2, the MySQL `LOCK TABLES` operation acquires two locks on each table if `innodb_table_locks=1` (the default). In addition to a table lock on the MySQL layer, it also acquires an `InnoDB` table lock. Older versions of MySQL do not acquire `InnoDB` table locks. Beginning with MySQL 4.0.22 and 4.1.7, the old behavior can be selected by setting `innodb_table_locks=0`. If no `InnoDB` table lock is acquired, `LOCK TABLES` completes even if some records of the tables are being locked by other transactions.
- All `InnoDB` locks held by a transaction are released when the transaction is committed or aborted. Thus, it does not make much sense to invoke `LOCK TABLES` on `InnoDB` tables in `AUTOCOMMIT=1` mode, because the acquired `InnoDB` table locks would be released immediately.
- Sometimes it would be useful to lock further tables in the course of a transaction. Unfortunately, `LOCK TABLES` in MySQL performs an implicit `COMMIT` and `UNLOCK TABLES`. An `InnoDB` variant of `LOCK TABLES` has been planned that can be executed in the middle of a transaction.
- Before MySQL 3.23.52, replication always ran with autocommit enabled. Therefore consistent reads in the slave would also see partially processed transactions, and thus the read would not be really consistent in the slave. This restriction was removed in MySQL 3.23.52.
- The `LOAD TABLE FROM MASTER` statement for setting up replication slave servers does not work for `InnoDB` tables. A workaround is to alter the table to `MyISAM` on the master, do then the load, and after that alter the master table back to `InnoDB`. Do not do this if the tables use `InnoDB`-specific features such as foreign keys.
- The default database page size in `InnoDB` is 16KB. By recompiling the code, you can set it to values ranging from 8KB to 64KB. You must update the values of `UNIV_PAGE_SIZE` and `UNIV_PAGE_SIZE_SHIFT` in the `univ.i` source file.

## 14.2.18. InnoDB Troubleshooting

The following general guidelines apply to troubleshooting InnoDB problems:

- When an operation fails or you suspect a bug, you should look at the MySQL server error log, which is the file in the data directory that has a suffix of `.err`.
- When troubleshooting, it is usually best to run the MySQL server from the command prompt, rather than through the `mysqld_safe` wrapper or as a Windows service. You can then see what `mysqld` prints to the console, and so have a better grasp of what is going on. On Windows, you must start the server with the `--console` option to direct the output to the console window.
- Use the InnoDB Monitors to obtain information about a problem (see Section 14.2.12.1, “SHOW ENGINE INNODB STATUS and the InnoDB Monitors”). If the problem is performance-related, or your server appears to be hung, you should use `innodb_monitor` to print information about the internal state of InnoDB. If the problem is with locks, use `innodb_lock_monitor`. If the problem is in creation of tables or other data dictionary operations, use `innodb_table_monitor` to print the contents of the InnoDB internal data dictionary.
- If you suspect that a table is corrupt, run `CHECK TABLE` on that table.

### 14.2.18.1. Troubleshooting InnoDB Data Dictionary Operations

A specific issue with tables is that the MySQL server keeps data dictionary information in `.frm` files it stores in the database directories, whereas InnoDB also stores the information into its own data dictionary inside the tablespace files. If you move `.frm` files around, or use `DROP DATABASE` in MySQL versions before 3.23.44, or the server crashes in the middle of a data dictionary operation, the locations of the `.frm` files may end up out of synchrony with the locations recorded in the InnoDB internal data dictionary.

A symptom of an out-of-sync data dictionary is that a `CREATE TABLE` statement fails. If this occurs, you should look in the server's error log. If the log says that the table already exists inside the InnoDB internal data dictionary, you have an orphaned table inside the InnoDB tablespace files that has no corresponding `.frm` file. The error message looks like this:

```
InnoDB: Error: table test/parent already exists in InnoDB internal
InnoDB: data dictionary. Have you deleted the .frm file
InnoDB: and not used DROP TABLE? Have you used DROP DATABASE
InnoDB: for InnoDB tables in MySQL version <= 3.23.43?
InnoDB: See the Restrictions section of the InnoDB manual.
InnoDB: You can drop the orphaned table inside InnoDB by
InnoDB: creating an InnoDB table with the same name in another
InnoDB: database and moving the .frm file to the current database.
InnoDB: Then MySQL thinks the table exists, and DROP TABLE will
InnoDB: succeed.
```

You can drop the orphaned table by following the instructions given in the error message. If you are still unable to use `DROP TABLE` successfully, the problem may be due to name completion in the `mysql` client. To work around this problem, start the `mysql` client with the `--skip-auto-rehash` option and try `DROP TABLE` again. (With name completion on, `mysql` tries to construct a list of table names, which fails when a problem such as just described exists.)

Another symptom of an out-of-sync data dictionary is that MySQL prints an error that it cannot open a `.InnoDB` file:

```
ERROR 1016: Can't open file: 'child2.InnoDB'. (errno: 1)
```

In the error log you can find a message like this:

```
InnoDB: Cannot find table test/child2 from the internal data dictionary
InnoDB: of InnoDB though the .frm file for the table exists. Maybe you
InnoDB: have deleted and recreated InnoDB data files but have forgotten
InnoDB: to delete the corresponding .frm files of InnoDB tables?
```

This means that there is an orphaned `.frm` file without a corresponding table inside `InnoDB`. You can drop the orphaned `.frm` file by deleting it manually.

If MySQL crashes in the middle of an `ALTER TABLE` operation, you may end up with an orphaned temporary table inside the `InnoDB` tablespace. With `innodb_table_monitor` you see a table whose name is `#sql-...`. Starting from MySQL 4.0.6, you can perform SQL statements also on tables whose name contains the character `#` if you enclose the name within backticks. Thus, you can drop such an orphaned table like any other orphaned table using the method described earlier. Note that to copy or rename a file in the Unix shell, you need to put the file name in double quotes if the file name contains `#`.

Older MySQL versions did not allow accessing any table with a name containing `#`. The solution in older MySQL versions is to use a special `InnoDB` mechanism available starting from MySQL 3.23.48. When you have an orphaned table `#sql-id` inside the tablespace, you can cause `InnoDB` to rename it to `rsql-id_recover_innodb_tmp_table` with the following statement:

```
CREATE TABLE `rsql-id_recover_innodb_tmp_table` (...) TYPE=InnoDB;
```

## 14.3. The `MERGE` Storage Engine

The `MERGE` storage engine was introduced in MySQL 3.23.25. It is also known as the `MRG_MyISAM` engine.

A `MERGE` table is a collection of identical `MyISAM` tables that can be used as one. “Identical” means that all tables have identical column and index information. You cannot merge `MyISAM` tables in which the columns are listed in a different order, do not have exactly the same columns, or have the indexes in different order. However, any or all of the `MyISAM` tables can be compressed with `myisampack`. See [Section 8.5, “myisampack — Generate Compressed, Read-Only MyISAM Tables”](#). Differences in table options such as `AVG_ROW_LENGTH`, `MAX_ROWS`, or `PACK_KEYS` do not matter.

When you create a `MERGE` table, MySQL creates two files on disk. The files have names that begin with the table name and have an extension to indicate the file type. An `.frm` file stores the table format, and an `.MRG` file contains the names of the tables that should be used as one. (Originally, all used tables had to be in the same database as the `MERGE` table itself. This restriction has been lifted as of MySQL 4.1.1.)

You can use `SELECT`, `DELETE`, `UPDATE`, and (as of MySQL 4.0) `INSERT` on `MERGE` tables. You must have `SELECT`, `UPDATE`, and `DELETE` privileges on the `MyISAM` tables that you map to a `MERGE` table.

**Note:** The use of `MERGE` tables entails the following security issue: If a user has access to `MyISAM` table `t`, that user can create a `MERGE` table `m` that accesses `t`. However, if the user's privileges on `t` are subsequently revoked, the user can continue to access `t` by doing so through `m`. If this behavior is undesirable, you can start the server with the new `--skip-merge` option to disable the `MERGE` storage engine. This option is available as of MySQL 4.1.21.

If you `DROP` the `MERGE` table, you are dropping only the `MERGE` specification. The underlying tables are not affected.

To create a `MERGE` table, you must specify a `UNION=(list-of-tables)` clause that indicates which `MyISAM` tables you want to use as one. You can optionally specify an `INSERT_METHOD` option if you want inserts for the `MERGE` table to take place in the first or last table of the `UNION` list. Use a value of `FIRST` or `LAST` to cause inserts to be made in the first or last table, respectively. If you do not specify an `INSERT_METHOD` option or if you specify it with a value of `NO`, attempts to insert rows into

the `MERGE` table result in an error.

The following example shows how to create a `MERGE` table:

```
mysql> CREATE TABLE t1 (
->   a INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
->   message CHAR(20)) ENGINE=MyISAM;
mysql> CREATE TABLE t2 (
->   a INT NOT NULL AUTO_INCREMENT PRIMARY KEY,
->   message CHAR(20)) ENGINE=MyISAM;
mysql> INSERT INTO t1 (message) VALUES ('Testing'),('table'),('t1');
mysql> INSERT INTO t2 (message) VALUES ('Testing'),('table'),('t2');
mysql> CREATE TABLE total (
->   a INT NOT NULL AUTO_INCREMENT,
->   message CHAR(20), INDEX(a))
->   ENGINE=MERGE UNION=(t1,t2) INSERT_METHOD=LAST;
```

The older term `TYPE` is supported as a synonym for `ENGINE` for backward compatibility, but `ENGINE` is the preferred term from MySQL 4.0.18 on and `TYPE` is deprecated.

Note that the `a` column is indexed as a `PRIMARY KEY` in the underlying `MyISAM` tables, but not in the `MERGE` table. There it is indexed but not as a `PRIMARY KEY` because a `MERGE` table cannot enforce uniqueness over the set of underlying tables.

After creating the `MERGE` table, you can issue queries that operate on the group of tables as a whole:

```
mysql> SELECT * FROM total;
+----+-----+
| a | message |
+----+-----+
| 1 | Testing |
| 2 | table   |
| 3 | t1      |
| 1 | Testing |
| 2 | table   |
| 3 | t2      |
+----+-----+
```

To remap a `MERGE` table to a different collection of `MyISAM` tables, you can use one of the following methods:

- `DROP` the `MERGE` table and re-create it.
- Use `ALTER TABLE tbl_name UNION=(...)` to change the list of underlying tables.

`MERGE` tables can help you solve the following problems:

- Easily manage a set of log tables. For example, you can put data from different months into separate tables, compress some of them with `myisampack`, and then create a `MERGE` table to use them as one.
- Obtain more speed. You can split a big read-only table based on some criteria, and then put individual tables on different disks. A `MERGE` table on this could be much faster than using the big table.
- Perform more efficient searches. If you know exactly what you are looking for, you can search in just one of the split tables for some queries and use a `MERGE` table for others. You can even have many different `MERGE` tables that use overlapping sets of tables.
- Perform more efficient repairs. It is easier to repair individual tables that are mapped to a `MERGE` table than to repair a single large table.
- Instantly map many tables as one. A `MERGE` table need not maintain an index of its own because it

uses the indexes of the individual tables. As a result, **MERGE** table collections are *very* fast to create or remap. (Note that you must still specify the index definitions when you create a **MERGE** table, even though no indexes are created.)

- If you have a set of tables from which you create a large table on demand, you should instead create a **MERGE** table on them on demand. This is much faster and saves a lot of disk space.
- Exceed the file size limit for the operating system. Each **MyISAM** table is bound by this limit, but a collection of **MyISAM** tables is not.
- You can create an alias or synonym for a **MyISAM** table by defining a **MERGE** table that maps to that single table. There should be no really notable performance impact from doing this (only a couple of indirect calls and `memcpy()` calls for each read).

The disadvantages of **MERGE** tables are:

- You can use only identical **MyISAM** tables for a **MERGE** table.
- You cannot use a number of **MyISAM** features in **MERGE** tables. For example, you cannot create **FULLTEXT** indexes on **MERGE** tables. (You can, of course, create **FULLTEXT** indexes on the underlying **MyISAM** tables, but you cannot search the **MERGE** table with a full-text search.)
- If the **MERGE** table is non-temporary, all underlying **MyISAM** tables must be non-temporary, too. If the **MERGE** table is temporary, the **MyISAM** tables can be any mix of temporary and non-temporary.
- **MERGE** tables use more file descriptors. If 10 clients are using a **MERGE** table that maps to 10 tables, the server uses  $(10 \times 10) + 10$  file descriptors. (10 data file descriptors for each of the 10 clients, and 10 index file descriptors shared among the clients.)
- Key reads are slower. When you read a key, the **MERGE** storage engine needs to issue a read on all underlying tables to check which one most closely matches the given key. To read the next key, the **MERGE** storage engine needs to search the read buffers to find the next key. Only when one key buffer is used up does the storage engine need to read the next key block. This makes **MERGE** keys much slower on `eq_ref` searches, but not much slower on `ref` searches. See [Section 7.2.1, “Optimizing Queries with EXPLAIN”](#), for more information about `eq_ref` and `ref`.

#### Additional resources

- A forum dedicated to the **MERGE** storage engine is available at <http://forums.mysql.com/list.php?93>.

### 14.3.1. **MERGE** Table Problems

The following are known problems with **MERGE** tables:

- If you use `ALTER TABLE` to change a **MERGE** table to another storage engine, the mapping to the underlying tables is lost. Instead, the rows from the underlying **MyISAM** tables are copied into the altered table, which then uses the specified storage engine.
- Before MySQL 4.1.1, all underlying tables and the **MERGE** table itself had to be in the same database.
- `REPLACE` does not work.

- You cannot use `DROP TABLE`, `ALTER TABLE`, `DELETE` without a `WHERE` clause, `REPAIR TABLE`, `TRUNCATE TABLE`, `OPTIMIZE TABLE`, or `ANALYZE TABLE` on any of the tables that are mapped into an open `MERGE` table. If you do so, the `MERGE` table may still refer to the original table, which yields unexpected results. The easiest way to work around this deficiency is to ensure that no `MERGE` tables remain open by issuing a `FLUSH TABLES` statement prior to performing any of those operations.
- `DROP TABLE` on a table that is in use by a `MERGE` table does not work on Windows because the `MERGE` storage engine's table mapping is hidden from the upper layer of MySQL. Windows does not allow open files to be deleted, so you first must flush all `MERGE` tables (with `FLUSH TABLES`) or drop the `MERGE` table before dropping the table.
- A `MERGE` table cannot maintain uniqueness constraints over the entire table. When you perform an `INSERT`, the data goes into the first or last `MyISAM` table (depending on the value of the `INSERT_METHOD` option). MySQL ensures that unique key values remain unique within that `MyISAM` table, but not across all the tables in the collection.
- Before MySQL 3.23.49, `DELETE FROM merge_table` used without a `WHERE` clause only clears the mapping for the table. That is, it incorrectly empties the `.MRG` file rather than deleting records from the mapped tables.
- Using `RENAME TABLE` on an active `MERGE` table may corrupt the table. This is fixed in MySQL 4.1.x.
- When you create or alter `MERGE` table, there is no check to ensure that the underlying tables are existing `MyISAM` tables and have identical structures. When the `MERGE` table is used, MySQL checks that the row length for all mapped tables is equal, but this is not foolproof. If you create a `MERGE` table from dissimilar `MyISAM` tables, you are very likely to run into strange problems.

Similarly, if you create a `MERGE` table from non-`MyISAM` tables, or if you drop an underlying table or alter it to be a non-`MyISAM` table, no error for the `MERGE` table occurs until later when you attempt to use it.

- The order of indexes in the `MERGE` table and its underlying tables should be the same. If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table, and then use `ALTER TABLE` to add a non-unique index on the `MERGE` table, the index ordering is different for the tables if there was already a non-unique index in the underlying table. (This happens because `ALTER TABLE` puts `UNIQUE` indexes before non-unique indexes to facilitate rapid detection of duplicate keys.) Consequently, queries on tables with such indexes may return unexpected results.
- If you encounter an error message similar to `ERROR 1017 (HY000): Can't find file: 'mm.MRG' (errno: 2)` it generally indicates that some of the base tables are not using the `MyISAM` storage engine. Confirm that all tables are `MyISAM`.

## 14.4. The `MEMORY (HEAP)` Storage Engine

The `MEMORY` storage engine creates tables with contents that are stored in memory. Before MySQL 4.1, `MEMORY` tables are called `HEAP` tables. As of 4.1, `MEMORY` is the preferred term, although `HEAP` remains supported for backward compatibility.

Each `MEMORY` table is associated with one disk file. The filename begins with the table name and has an extension of `.frm` to indicate that it stores the table definition.

To specify explicitly that you want to create a `MEMORY` table, indicate that with an `ENGINE` table option:

```
CREATE TABLE t (i INT) ENGINE = MEMORY;
```

The older term `TYPE` is supported as a synonym for `ENGINE` for backward compatibility, but `ENGINE` is the preferred term from MySQL 4.0.18 on and `TYPE` is deprecated.

As indicated by the name, `MEMORY` tables are stored in memory. They use hash indexes by default, which makes them very fast, and very useful for creating temporary tables. However, when the server shuts down, all rows stored in `MEMORY` tables are lost. The tables themselves continue to exist because their definitions are stored in `.frm` files on disk, but they are empty when the server restarts.

This example shows how you might create, use, and remove a `MEMORY` table:

```
mysql> CREATE TABLE test TYPE=MEMORY
-> SELECT ip,SUM(downloads) AS down
-> FROM log_table GROUP BY ip;
mysql> SELECT COUNT(ip),AVG(down) FROM test;
mysql> DROP TABLE test;
```

`MEMORY` tables have the following characteristics:

- Space for `MEMORY` tables is allocated in small blocks. Tables use 100% dynamic hashing for inserts. No overflow area or extra key space is needed. No extra space is needed for free lists. Deleted rows are put in a linked list and are reused when you insert new data into the table. `MEMORY` tables also have none of the problems commonly associated with deletes plus inserts in hashed tables.
- `MEMORY` tables allow up to 32 indexes per table and 16 columns per index. Previously, the maximum key length supported by this storage engine was 255 bytes; as of MySQL 4.1.13, `MEMORY` tables support a maximum key length of 500 bytes. (See [Section D.1.20](#), “Changes in release 4.1.3 (28 June 2004: Beta)”.)
- Before MySQL 4.1, the `MEMORY` storage engine implements only hash indexes. From MySQL 4.1 on, hash indexes are still the default, but you can specify explicitly that a `MEMORY` table index should be a `HASH` or `BTREE` by adding a `USING` clause as shown here:

```
CREATE TABLE lookup
(id INT, INDEX USING HASH (id))
ENGINE = MEMORY;
CREATE TABLE lookup
(id INT, INDEX USING BTREE (id))
ENGINE = MEMORY;
```

General characteristics of B-tree and hash indexes are described in [Section 7.4.5](#), “How MySQL Uses Indexes”.

- You can have non-unique keys in a `MEMORY` table. (This is an uncommon feature for implementations of hash indexes.)
- If you have a hash index on a `MEMORY` table that has a high degree of key duplication (many index entries containing the same value), updates to the table that affect key values and all deletes are significantly slower. The degree of this slowdown is proportional to the degree of duplication (or, inversely proportional to the index cardinality). You can use a `BTREE` index to avoid this problem.
- As of MySQL 4.0.2, columns that are indexed can contain `NULL` values.
- `MEMORY` tables use a fixed-length row storage format.
- `MEMORY` tables cannot contain `BLOB` or `TEXT` columns.
- `MEMORY` supports `AUTO_INCREMENT` columns as of MySQL 4.1.0.
- As of MySQL 4.1, you can use `INSERT DELAYED` with `MEMORY` tables. See [Section 13.2.4.2](#), “`INSERT DELAYED` Syntax”.

- `MEMORY` tables are shared among all clients (just like any other non-`TEMPORARY` table).
- `MEMORY` table contents are stored in memory, which is a property that `MEMORY` tables share with internal tables that the server creates on the fly while processing queries. However, the two types of tables differ in that `MEMORY` tables are not subject to storage conversion, whereas internal tables are:
  - If an internal table becomes too large, the server automatically converts it to an on-disk table. The size limit is determined by the value of the `tmp_table_size` system variable.
  - `MEMORY` tables are never converted to disk tables. To ensure that you don't accidentally do anything foolish, you can set the `max_heap_table_size` system variable to impose a maximum size on `MEMORY` tables. For individual tables, you can also specify a `MAX_ROWS` table option in the `CREATE TABLE` statement.
- The server needs sufficient memory to maintain all `MEMORY` tables that are in use at the same time.
- To free memory used by a `MEMORY` table when you no longer require its contents, you should execute `DELETE` or `TRUNCATE TABLE`, or remove the table altogether using `DROP TABLE`.
- If you want to populate a `MEMORY` table when the MySQL server starts, you can use the `--init-file` option. For example, you can put statements such as `INSERT INTO ... SELECT` or `LOAD DATA INFILE` into this file to load the table from a persistent data source. See [Section 5.2.1, “Command Options”](#), and [Section 13.2.5, “LOAD DATA INFILE Syntax”](#).
- If you are using replication, the master server's `MEMORY` tables become empty when it is shut down and restarted. However, a slave is not aware that these tables have become empty, so it returns out-of-date content if you select data from them. Beginning with MySQL 4.0.18, when a `MEMORY` table is used on the master for the first time since the master was started, a `DELETE FROM` statement is written to the master's binary log automatically, thus synchronizing the slave to the master again. Note that even with this strategy, the slave still has outdated data in the table during the interval between the master's restart and its first use of the table. However, if you use the `--init-file` option to populate the `MEMORY` table on the master at startup, it ensures that this time interval is zero.
- The memory needed for one row in a `MEMORY` table is calculated using the following expression:

```
SUM_OVER_ALL_BTREE_KEYS(max_length_of_key + sizeof(char*) × 4)
+ SUM_OVER_ALL_HASH_KEYS(sizeof(char*) × 2)
+ ALIGN(length_of_row+1, sizeof(char*))
```

`ALIGN()` represents a round-up factor to cause the row length to be an exact multiple of the `char` pointer size. `sizeof(char*)` is 4 on 32-bit machines and 8 on 64-bit machines.

#### Additional resources

- A forum dedicated to the `MEMORY` storage engine is available at <http://forums.mysql.com/list.php?92>.

## 14.5. The BDB (BerkeleyDB) Storage Engine

Sleepycat Software has provided MySQL with the Berkeley DB transactional storage engine. This storage engine typically is called `BDB` for short. `BDB` tables may have a greater chance of surviving crashes and are also capable of `COMMIT` and `ROLLBACK` operations on transactions.

Support for the `BDB` storage engine is included in MySQL source distributions starting from version

3.23.34a and is activated in MySQL-Max binary distributions. The MySQL source distribution comes with a BDB distribution that is patched to make it work with MySQL. You cannot use a non-patched version of BDB with MySQL.

We at MySQL AB work in close cooperation with Sleepycat to keep the quality of the MySQL/BDB interface high. (Even though Berkeley DB is in itself very tested and reliable, the MySQL interface is still considered gamma quality. We continue to improve and optimize it.)

When it comes to support for any problems involving BDB tables, we are committed to helping our users locate the problem and create reproducible test cases. Any such test case is forwarded to Sleepycat, which in turn helps us find and fix the problem. As this is a two-stage operation, any problems with BDB tables may take a little longer for us to fix than for other storage engines. However, we anticipate no significant difficulties with this procedure because the Berkeley DB code itself is used in many applications other than MySQL.

For general information about Berkeley DB, please visit the Sleepycat Web site, <http://www.sleepycat.com/>.

## 14.5.1. Operating Systems Supported by BDB

Currently, we know that the BDB storage engine works with the following operating systems:

- Linux 2.x Intel
- Sun Solaris (SPARC and x86)
- FreeBSD 4.x/5.x (x86, sparc64)
- IBM AIX 4.3.x
- SCO OpenServer
- SCO UnixWare 7.1.x
- Windows NT/2000/XP

The BDB storage engine does *not* work with the following operating systems:

- Linux 2.x Alpha
- Linux 2.x AMD64
- Linux 2.x IA-64
- Linux 2.x s390
- Mac OS X

**Note:** The preceding lists are not complete. We update them as we receive more information.

If you build MySQL from source with support for BDB tables, but the following error occurs when you start `mysqld`, it means that the BDB storage engine is not supported for your architecture:

```
bdb: architecture lacks fast mutexes: applications cannot be threaded
Can't init databases
```

In this case, you must rebuild MySQL without `BDB` support or start the server with the `--skip-bdb` option.

## 14.5.2. Installing `BDB`

If you have downloaded a binary version of MySQL that includes support for Berkeley DB, simply follow the usual binary distribution installation instructions. (MySQL-Max distributions include `BDB` support.)

If you build MySQL from source, you can enable `BDB` support by invoking `configure` with the `--with-berkeley-db` option in addition to any other options that you normally use. Download a distribution for MySQL 3.23.34 or newer, change location into its top-level directory, and run this command:

```
shell> ./configure --with-berkeley-db [other-options]
```

For more information, see [Section 5.3, “The `mysqld-max` Extended MySQL Server”](#), [Section 2.8, “Installing MySQL on Other Unix-Like Systems”](#), and [Section 2.9, “MySQL Installation Using a Source Distribution”](#).

## 14.5.3. `BDB` Startup Options

The following options to `mysqld` can be used to change the behavior of the `BDB` storage engine. For more information, see [Section 5.2.1, “Command Options”](#).

- `--bdb-home=path`

The base directory for `BDB` tables. This should be the same directory that you use for `--datadir`.

- `--bdb-lock-detect=method`

The `BDB` lock detection method. The option value should be `DEFAULT`, `OLDEST`, `RANDOM`, or `YOUNGEST`.

- `--bdb-logdir=file_name`

The `BDB` log file directory.

- `--bdb-no-recover`

Do not start Berkeley DB in recover mode.

- `--bdb-no-sync`

Don't synchronously flush the `BDB` logs. This option is deprecated as of MySQL 4.0.18; use `--skip-sync-bdb-logs` instead (see the description for `--sync-bdb-logs`).

- `--bdb-shared-data`

Start Berkeley DB in multi-process mode. (Do not use `DB_PRIVATE` when initializing Berkeley DB.)

- `--bdb-tmpdir=path`

The `BDB` temporary file directory.

- `--skip-bdb`

Disable the [BDB](#) storage engine.

- `--sync-bdb-logs`

Synchronously flush the [BDB](#) logs. This option is enabled by default. Use `--skip-sync-bdb-logs` to disable it. This option was added in MySQL 4.0.18.

If you use the `--skip-bdb` option, MySQL does not initialize the Berkeley DB library and this saves a lot of memory. However, if you use this option, you cannot use [BDB](#) tables. If you try to create a [BDB](#) table, MySQL uses the default storage engine instead.

Normally, you should start `mysqld` without the `--bdb-no-recover` option if you intend to use [BDB](#) tables. However, this may cause problems when you try to start `mysqld` if the [BDB](#) log files are corrupted. See [Section 2.10.2.3, “Starting and Troubleshooting the MySQL Server”](#).

With the `bdb_max_lock` variable, you can specify the maximum number of locks that can be active on a [BDB](#) table. The default is 10,000. You should increase this if errors such as the following occur when you perform long transactions or when `mysqld` has to examine many rows to execute a query:

```
bdb: Lock table is out of available locks
Got error 12 from ...
```

You may also want to change the `binlog_cache_size` and `max_binlog_cache_size` variables if you are using large multiple-statement transactions. See [Section 5.11.4, “The Binary Log”](#).

See also [Section 5.2.2, “System Variables”](#).

## 14.5.4. Characteristics of [BDB](#) Tables

Each [BDB](#) table is stored on disk in two files. The files have names that begin with the table name and have an extension to indicate the file type. An `.frm` file stores the table format, and a `.db` file contains the table data and indexes.

To specify explicitly that you want a [BDB](#) table, indicate that with an [ENGINE](#) table option:

```
CREATE TABLE t (i INT) ENGINE = BDB;
```

The older term [TYPE](#) is supported as a synonym for [ENGINE](#) for backward compatibility, but [ENGINE](#) is the preferred term from MySQL 4.0.18 on and [TYPE](#) is deprecated.

[BerkeleyDB](#) is a synonym for [BDB](#) in the [ENGINE](#) table option.

The [BDB](#) storage engine provides transactional tables. The way you use these tables depends on the autocommit mode:

- If you are running with autocommit enabled (which is the default), changes to [BDB](#) tables are committed immediately and cannot be rolled back.
- If you are running with autocommit disabled, changes do not become permanent until you execute a [COMMIT](#) statement. Instead of committing, you can execute [ROLLBACK](#) to forget the changes.

You can start a transaction with the [START TRANSACTION](#) or [BEGIN](#) statement to suspend autocommit, or with [SET AUTOCOMMIT=0](#) to disable autocommit explicitly.

For more information about transactions, see [Section 13.4.1, “START TRANSACTION, COMMIT, and ROLLBACK Syntax”](#).

The [BDB](#) storage engine has the following characteristics:

- [BDB](#) tables can have up to 31 indexes per table, 16 columns per index, and a maximum key size of 1024 bytes (500 bytes before MySQL 4.0).
- MySQL requires a primary key in each [BDB](#) table so that each row can be uniquely identified. If you don't create one explicitly by declaring a [PRIMARY KEY](#), MySQL creates and maintains a hidden primary key for you. The hidden key has a length of five bytes and is incremented for each insert attempt. This key does not appear in the output of [SHOW CREATE TABLE](#) or [DESCRIBE](#).
- The primary key is faster than any other index, because it is stored together with the row data. The other indexes are stored as the key data plus the primary key, so it's important to keep the primary key as short as possible to save disk space and get better speed.

This behavior is similar to that of [InnoDB](#), where shorter primary keys save space not only in the primary index but in secondary indexes as well.

- If all columns that you access in a [BDB](#) table are part of the same index or part of the primary key, MySQL can execute the query without having to access the actual row. In a [MyISAM](#) table, this can be done only if the columns are part of the same index.
- Sequential scanning is slower for [BDB](#) tables than for [MyISAM](#) tables because the data in [BDB](#) tables is stored in B-trees and not in a separate data file.
- Key values are not prefix- or suffix-compressed like key values in [MyISAM](#) tables. In other words, key information takes a little more space in [BDB](#) tables compared to [MyISAM](#) tables.
- There are often holes in the [BDB](#) table to allow you to insert new rows in the middle of the index tree. This makes [BDB](#) tables somewhat larger than [MyISAM](#) tables.
- [SELECT COUNT\(\\*\) FROM tbl\\_name](#) is slow for [BDB](#) tables, because no row count is maintained in the table.
- The optimizer needs to know the approximate number of rows in the table. MySQL solves this by counting inserts and maintaining this in a separate segment in each [BDB](#) table. If you don't issue a lot of [DELETE](#) or [ROLLBACK](#) statements, this number should be accurate enough for the MySQL optimizer. However, MySQL stores the number only on close, so it may be incorrect if the server terminates unexpectedly. It should not be fatal even if this number is not 100% correct. You can update the row count by using [ANALYZE TABLE](#) or [OPTIMIZE TABLE](#). See [Section 13.5.2.1, “ANALYZE TABLE Syntax”](#), and [Section 13.5.2.5, “OPTIMIZE TABLE Syntax”](#).
- Internal locking in [BDB](#) tables is done at the page level.
- [LOCK TABLES](#) works on [BDB](#) tables as with other tables. If you do not use [LOCK TABLES](#), MySQL issues an internal multiple-write lock on the table (a lock that does not block other writers) to ensure that the table is properly locked if another thread issues a table lock.
- To support transaction rollback, the [BDB](#) storage engine maintains log files. For maximum performance, you can use the [--bdb-logdir](#) option to place the [BDB](#) logs on a different disk than the one where your databases are located.
- MySQL performs a checkpoint each time a new [BDB](#) log file is started, and removes any [BDB](#) log files that are not needed for current transactions. You can also use [FLUSH LOGS](#) at any time to checkpoint the Berkeley DB tables.

For disaster recovery, you should use table backups plus MySQL's binary log. See [Section 5.9.1, “Database Backups”](#).

**Warning:** If you delete old log files that are still in use, **BDB** is not able to do recovery at all and you may lose data if something goes wrong.

- Applications must always be prepared to handle cases where any change of a **BDB** table may cause an automatic rollback and any read may fail with a deadlock error.
- If you get a full disk with a **BDB** table, you get an error (probably error 28) and the transaction should roll back. This contrasts with **MyISAM** and **ISAM** tables, for which `mysqld` waits for sufficient free disk space before continuing.

### 14.5.5. Restrictions on **BDB** Tables

The following list indicates restrictions that you must observe when using **BDB** tables:

- Each **BDB** table stores in its `.db` file the path to the file as it was created. This is done to enable detection of locks in a multi-user environment that supports symlinks. As a consequence of this, it is not possible to move **BDB** table files from one database directory to another.
- When making backups of **BDB** tables, you must either use `mysqldump` or else make a backup that includes the files for each **BDB** table (the `.frm` and `.db` files) as well as the **BDB** log files. The **BDB** storage engine stores unfinished transactions in its log files and requires them to be present when `mysqld` starts. The **BDB** logs are the files in the data directory with names of the form `log.NNNNNNNNNN` (ten digits).
- If a column that allows **NULL** values has a unique index, only a single **NULL** value is allowed. This differs from other storage engines, which allow multiple **NULL** values in unique indexes.

### 14.5.6. Errors That May Occur When Using **BDB** Tables

- If the following error occurs when you start `mysqld` after upgrading, it means that the current version of **BDB** doesn't support the old log file format:

```
bdb: Ignoring log file: ../log.NNNNNNNNNN:
unsupported log version #
```

In this case, you must delete all **BDB** logs from your data directory (the files that have names of the form `log.NNNNNNNNNN`) and restart `mysqld`. We also recommend that you then use `mysql-dump --opt` to dump your **BDB** tables, drop the tables, and restore them from the dump file.

- If autocommit mode is disabled and you drop a **BDB** table that is referenced in another transaction, you may get error messages of the following form in your MySQL error log:

```
001119 23:43:56 bdb: Missing log fileid entry
001119 23:43:56 bdb: txn_abort: Log undo failed for LSN:
1 3644744: Invalid
```

This is not fatal, but the fix is not trivial. Until the problem is fixed, we recommend that you not drop **BDB** tables except while autocommit mode is enabled.

## 14.6. The **EXAMPLE** Storage Engine

The **EXAMPLE** storage engine was added in MySQL 4.1.3. It is a “stub” engine that does nothing. Its purpose is to serve as an example in the MySQL source code that illustrates how to begin writing new storage engines. As such, it is primarily of interest to developers.

The **EXAMPLE** storage engine is included in MySQL-Max binary distributions. To enable this storage engine if you build MySQL from source, invoke `configure` with the `-with-example-storage-engine` option.

To examine the source for the **EXAMPLE** engine, look in the `sql/examples` directory of a MySQL source distribution.

When you create an **EXAMPLE** table, the server creates a table format file in the database directory. The file begins with the table name and has an `.frm` extension. No other files are created. No data can be stored into the table. Retrievals return an empty result.

```
mysql> CREATE TABLE test (i INT) ENGINE = EXAMPLE;
Query OK, 0 rows affected (0.78 sec)

mysql> INSERT INTO test VALUES(1),(2),(3);
ERROR 1031 (HY000): Table storage engine for 'test' doesn't have this option

mysql> SELECT * FROM test;
Empty set (0.31 sec)
```

The **EXAMPLE** storage engine does not support indexing.

## 14.7. The **ARCHIVE** Storage Engine

The **ARCHIVE** storage engine was added in MySQL 4.1.3. It is used for storing large amounts of data without indexes in a very small footprint.

The **ARCHIVE** storage engine is included in MySQL binary distributions. To enable this storage engine if you build MySQL from source, invoke `configure` with the `-with-archive-storage-engine` option.

To examine the source for the **ARCHIVE** engine, look in the `sql` directory of a MySQL source distribution.

You can check whether the **ARCHIVE** storage engine is available with this statement:

```
mysql> SHOW VARIABLES LIKE 'have_archive';
```

When you create an **ARCHIVE** table, the server creates a table format file in the database directory. The file begins with the table name and has an `.frm` extension. The storage engine creates other files, all having names beginning with the table name. The data and metadata files have extensions of `.ARZ` and `.ARM`, respectively. An `.ARN` file may appear during optimization operations.

The **ARCHIVE** engine supports `INSERT` and `SELECT`, but not `DELETE`, `REPLACE`, or `UPDATE`. It does support `ORDER BY` operations, `BLOB` columns, and basically all but spatial data types (see [Section 16.4.1, “MySQL Spatial Data Types”](#)). The **ARCHIVE** engine uses row-level locking.

**Storage:** Rows are compressed as they are inserted. The **ARCHIVE** engine uses `zlib` lossless data compression (see <http://www.zlib.net/>). You can use `OPTIMIZE TABLE` to analyze the table and pack it into a smaller format (for a reason to use `OPTIMIZE TABLE`, see later in this section). There are several types of insertions that are used:

- An `INSERT` statement just pushes rows into a compression buffer, and that buffer flushes as necessary. The insertion into the buffer is protected by a lock. A `SELECT` forces a flush to occur, unless the only insertions that have come in were `INSERT DELAYED` (those flush as necessary). See [Section 13.2.4.2, “INSERT DELAYED Syntax”](#).
- A bulk insert is visible only after it completes, unless other inserts occur at the same time, in which case it can be seen partially. A `SELECT` never causes a flush of a bulk insert unless a normal insert occurs while it is loading.

**Retrieval:** On retrieval, rows are uncompressed on demand; there is no row cache. A `SELECT` operation performs a complete table scan: When a `SELECT` occurs, it finds out how many rows are currently available and reads that number of rows. `SELECT` is performed as a consistent read. Note that lots of `SELECT` statements during insertion can deteriorate the compression, unless only bulk or delayed inserts are used. To achieve better compression, you can use `OPTIMIZE TABLE` or `REPAIR TABLE`. The number of rows in `ARCHIVE` tables reported by `SHOW TABLE STATUS` is always accurate. See [Section 13.5.2.5, “OPTIMIZE TABLE Syntax”](#), [Section 13.5.2.6, “REPAIR TABLE Syntax”](#), and [Section 13.5.4.18, “SHOW TABLE STATUS Syntax”](#).

#### Additional resources

- A forum dedicated to the `ARCHIVE` storage engine is available at <http://forums.mysql.com/list.php?112>.

## 14.8. The `CSV` Storage Engine

The `CSV` storage engine was added in MySQL 4.1.4. This engine stores data in text files using comma-separated values format.

To enable this storage engine, use the `--with-csv-storage-engine` option to `configure` when you build MySQL.

The `CSV` storage engine is included in MySQL-Max binary distributions. To enable this storage engine if you build MySQL from source, invoke `configure` with the `--with-csv-storage-engine` option.

To examine the source for the `CSV` engine, look in the `sql/examples` directory of a MySQL source distribution.

When you create a `CSV` table, the server creates a table format file in the database directory. The file begins with the table name and has an `.frm` extension. The storage engine also creates a data file. Its name begins with the table name and has a `.CSV` extension. The data file is a plain text file. When you store data into the table, the storage engine saves it into the data file in comma-separated values format.

```
mysql> CREATE TABLE test(i INT, c CHAR(10)) ENGINE = CSV;
Query OK, 0 rows affected (0.12 sec)

mysql> INSERT INTO test VALUES(1,'record one'),(2,'record two');
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM test;
+-----+-----+
| i   | c           |
+-----+-----+
| 1   | record one  |
| 2   | record two  |
+-----+-----+
2 rows in set (0.00 sec)
```

If you examine the `test.CSV` file in the database directory created by executing the preceding statements, its contents should look like this:

```
"1","record one"
"2","record two"
```

This format can be read, and even written, by spreadsheet applications such as Microsoft Excel or StarOffice Calc.

The `CSV` storage engine does not support indexing.

## 14.9. The `BLACKHOLE` Storage Engine

The `BLACKHOLE` storage engine was added in MySQL 4.1.11. This engine acts as a “black hole” that accepts data but throws it away and does not store it. Retrievals always return an empty result:

```
mysql> CREATE TABLE test(i INT, c CHAR(10)) ENGINE = BLACKHOLE;
Query OK, 0 rows affected (0.03 sec)

mysql> INSERT INTO test VALUES(1,'record one'),(2,'record two');
Query OK, 2 rows affected (0.00 sec)
Records: 2 Duplicates: 0 Warnings: 0

mysql> SELECT * FROM test;
Empty set (0.00 sec)
```

The `BLACKHOLE` storage engine is included in MySQL-Max binary distributions. To enable this storage engine if you build MySQL from source, invoke `configure` with the `-with-blackhole-storage-engine` option.

To examine the source for the `BLACKHOLE` engine, look in the `sql` directory of a MySQL source distribution.

When you create a `BLACKHOLE` table, the server creates a table format file in the database directory. The file begins with the table name and has an `.frm` extension. There are no other files associated with the table.

The `BLACKHOLE` storage engine supports all kinds of indexes. That is, you can include index declarations in the table definition.

You can check whether the `BLACKHOLE` storage engine is available with this statement:

```
mysql> SHOW VARIABLES LIKE 'have_blackhole_engine';
```

Inserts into a `BLACKHOLE` table do not store any data, but if the binary log is enabled, the SQL statements are logged (and replicated to slave servers). This can be useful as a repeater or filter mechanism. For example, suppose that your application requires slave-side filtering rules, but transferring all binary log data to the slave first results in too much traffic. In such a case, it is possible to set up on the master host a “dummy” slave process whose default storage engine is `BLACKHOLE`, depicted as follows:

The master writes to its binary log. The “dummy” `mysqld` process acts as a slave, applying the desired combination of `replicate-do-*` and `replicate-ignore-*` rules, and writes a new, filtered binary log of its own. (See [Section 6.8, “Replication Startup Options”](#).) This filtered log is provided to the slave.

The dummy process does not actually store any data, so there is little processing overhead incurred by running the additional `mysqld` process on the replication master host. This type of setup can be repeated with additional replication slaves.

Other possible uses for the `BLACKHOLE` storage engine include:

- Verification of dump file syntax.
- Measurement of the overhead from binary logging, by comparing performance using `BLACKHOLE` with and without binary logging enabled.
- `BLACKHOLE` is essentially a “no-op” storage engine, so it could be used for finding performance bottlenecks not related to the storage engine itself.

## 14.10. The `ISAM` Storage Engine

The original storage engine in MySQL was the `ISAM` engine. It was the only storage engine available until MySQL 3.23, when the improved `MyISAM` engine was introduced as the default. `ISAM` is deprecated. As of MySQL 4.1, it's included in the source but not enabled in binary distributions. It is not available in MySQL 5.0. Embedded MySQL server versions do not support `ISAM` tables by default.

Due to the deprecated status of `ISAM`, and because `MyISAM` is an improvement over `ISAM`, you are advised to convert any remaining `ISAM` tables to `MyISAM` as soon as possible. To convert an `ISAM` table to a `MyISAM` table, use an `ALTER TABLE` statement:

```
mysql> ALTER TABLE tbl_name TYPE = MYISAM;
```

For more information about `MyISAM`, see [Section 14.1, “The MyISAM Storage Engine”](#).

Each `ISAM` table is stored on disk in three files. The files have names that begin with the table name and have an extension to indicate the file type. An `.frm` file stores the table definition. The data file has an `.ISD` extension. The index file has an `.ISM` extension.

ISAM uses B-tree indexes.

You can check or repair ISAM tables with the `isamchk` utility. See [Section 5.9.4.1, “Using `myisamchk` for Crash Recovery”](#).

ISAM has the following properties:

- Compressed and fixed-length keys
- Fixed and dynamic record length
- 16 indexes per table, with 16 key parts per key
- Maximum key length 256 bytes (default)
- Data values are stored in machine format; this is fast, but machine/OS dependent

Many of the properties of MyISAM tables are also true for ISAM tables. However, there are also many differences. The following list describes some of the ways that ISAM is distinct from MyISAM:

- Not binary portable across OS/platforms.
- Can't handle tables larger than 4GB.
- Only supports prefix compression on strings.
- Smaller (more restrictive) key limits.
- Dynamic tables become more fragmented.
- Doesn't support MERGE tables.
- Tables are checked and repaired with `isamchk` rather than with `myisamchk`.
- Tables are compressed with `pack_isam` rather than with `myisampack`.
- Cannot be used with the `BACKUP TABLE` or `RESTORE TABLE` backup-related statements.
- Cannot be used with the `CHECK TABLE`, `REPAIR TABLE`, `OPTIMIZE TABLE`, or `ANALYZE TABLE` table-maintenance statements.
- No support for full-text searching or spatial data types.
- No support for multiple character sets per table.
- Indexes cannot be assigned to specific key caches.

---

# Chapter 15. MySQL Cluster

MySQL Cluster is a high-availability, high-redundancy version of MySQL adapted for the distributed computing environment. It uses the [NDB Cluster](#) storage engine to enable running several MySQL servers in a cluster. This storage engine is available and in binary releases from MySQL-Max 4.1.3. Beginning with MySQL 4.1.10a, it is also available in RPMs compatible with most modern Linux distributions. (If you install using RPM files, note that both the [mysql-server](#) and [mysql-max](#) RPMs must be installed to have MySQL Cluster capability.)

MySQL Cluster is currently available and supported on the following platforms:

- **Linux:** x86, AMD64, EMT64, s/390, PPC, Alpha, SPARC, UltraSparc
- **Solaris:** SPARC, UltraSparc, x86, AMD64, EMT64
- **BSD** (FreeBSD, NetBSD, OpenBSD): x86, AMD64, EMT64, PPC
- **Mac OS X:** PPC
- **HP-UX:** PA-RISC
- **Tru64:** Alpha
- **OpenVMS:** Alpha
- **IRIX:** MIPS
- **Novell Netware:** x86
- **QNX Neutrino:** x86
- **SCO OpenServer, OpenUnix, UnixWare:** x86

For exact levels of support available for MySQL Cluster on specific combinations of operating system versions, operating system distributions, and hardware platforms, please refer to the [Cluster Supported Platforms list](http://www.mysql.com/support/clusterplatforms.html) [http://www.mysql.com/support/clusterplatforms.html] maintained by the MySQL Support Team on the MySQL AB website.

MySQL Cluster is *not* currently supported on Microsoft Windows. We are working to make Cluster available on all operating systems supported by MySQL, including Windows, and will update the information provided here as this work continues.

This chapter represents a work in progress, and its contents are subject to revision as MySQL Cluster continues to evolve. Additional information regarding MySQL Cluster can be found on the MySQL AB Web site at <http://www.mysql.com/products/cluster/>.

## Additional resources

- Answers to some commonly asked questions about Cluster may be found in the [Section 15.12, “MySQL Cluster FAQ”](#).
- The MySQL Cluster mailing list: <http://lists.mysql.com/cluster>.
- The MySQL Cluster Forum: <http://forums.mysql.com/list.php?25>.

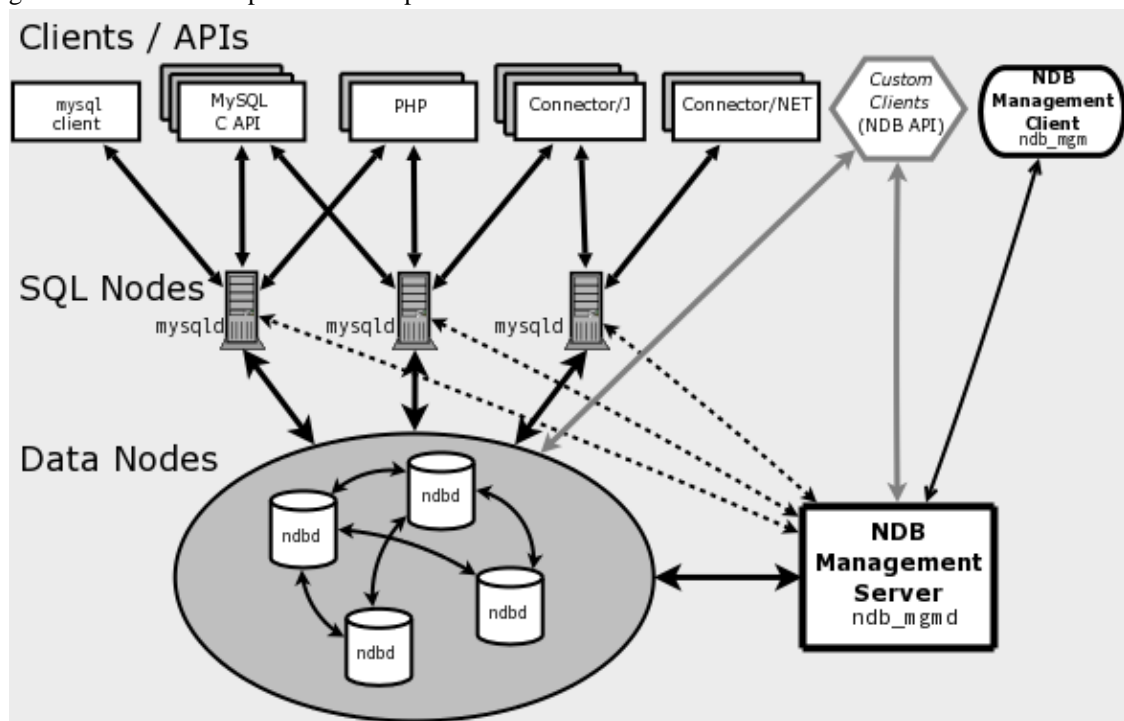

- Many MySQL Cluster users and some of the MySQL Cluster developers blog about their experiences with Cluster, and make feeds of these available through [PlanetMySQL](http://www.planetmysql.org/) [<http://www.planetmysql.org/>].
- If you are new to MySQL Cluster, you may find our Developer Zone article [How to set up a MySQL Cluster for two servers](http://dev.mysql.com/tech-resources/articles/mysql-cluster-for-two-servers.html) [<http://dev.mysql.com/tech-resources/articles/mysql-cluster-for-two-servers.html>] to be helpful.

## 15.1. MySQL Cluster Overview

*MySQL Cluster* is a technology that enables clustering of in-memory databases in a shared-nothing system. The shared-nothing architecture allows the system to work with very inexpensive hardware, and without any specific requirements on hardware or software. It also does not have any single point of failure because each component has its own memory and disk.

MySQL Cluster integrates the standard MySQL server with an in-memory clustered storage engine called **NDB**. In our documentation, the term **NDB** refers to the part of the setup that is specific to the storage engine, whereas “MySQL Cluster” refers to the combination of MySQL and the **NDB** storage engine.

A MySQL Cluster consists of a set of computers, each running a one or more processes which may include a MySQL server, a data node, a management server, and (possibly) a specialized data access programs. The relationship of these components in a cluster is shown here:

All these programs work together to form a MySQL Cluster. When data is stored in the **NDB Cluster** storage engine, the tables are stored in the data nodes. Such tables are directly accessible from all other MySQL servers in the cluster. Thus, in a payroll application storing data in a cluster, if one application updates the salary of an employee, all other MySQL servers that query this data can see this change immediately.

The data stored in the data nodes for MySQL Cluster can be mirrored; the cluster can handle failures of individual data nodes with no other impact than that a small number of transactions are aborted due to

losing the transaction state. Because transactional applications are expected to handle transaction failure, this should not be a source of problems.

## 15.2. Basic MySQL Cluster Concepts

*NDB* is an in-memory storage engine offering high-availability and data-persistence features.

The *NDB* storage engine can be configured with a range of failover and load-balancing options, but it is easiest to start with the storage engine at the cluster level. MySQL Cluster's *NDB* storage engine contains a complete set of data, dependent only on other data within the cluster itself.

The cluster portion of MySQL Cluster is currently configured independently of the MySQL servers. In a MySQL Cluster, each part of the cluster is considered to be a *node*.

**Note:** In many contexts, the term “node” is used to indicate a computer, but when discussing MySQL Cluster it means a *process*. It is possible to run any number of nodes on a single computer, for which we use the term *cluster host*.

(However, it should be noted MySQL does not currently support the use of multiple data nodes on a single computer in a production setting. See [Issues exclusive to MySQL Cluster](#).)

There are three types of cluster nodes, and in a minimal MySQL Cluster configuration, there will be at least three nodes, one of each of these types:

- *Management node* (MGM node): The role of this type of node is to manage the other nodes within the MySQL Cluster, performing such functions as providing configuration data, starting and stopping nodes, running backup, and so forth. Because this node type manages the configuration of the other nodes, a node of this type should be started first, before any other node. An MGM node is started with the command `ndb_mgmd`.
- *Data node*: This type of node stores cluster data. There are as many data nodes as there are replicas, times the number of fragments. For example, with two replicas, each having two fragments, you will need four data nodes. It is not necessary to have more than one replica. A data node is started with the command `ndbd`.
- *SQL node*: This is a node that accesses the cluster data. In the case of MySQL Cluster, an SQL node is a traditional MySQL server that uses the *NDB Cluster* storage engine. An SQL node is typically started with the command `mysqld --ndbcluster` or by using `mysqld` with the `ndb-cluster` option added to `my.cnf`.

An SQL node is actually just a specialised type of *API node*, which designates any application which accesses Cluster data. One example of an API node is the `ndb_restore` utility that is used to restore a cluster backup. It is possible to write such applications using the [NDB API](#) [<http://dev.mysql.com/doc/en/ndbapi/>].

**Important:** It is not realistic to expect to employ a three-node setup in a production environment. Such a configuration provides no redundancy; in order to benefit from MySQL Cluster's high-availability features, you must use multiple data and SQL nodes. The use of multiple management nodes is also highly recommended.

For a brief introduction to the relationships between nodes, node groups, replicas, and partitions in MySQL Cluster, see [Section 15.2.1, “MySQL Cluster Nodes, Node Groups, Replicas, and Partitions”](#).

Configuration of a cluster involves configuring each individual node in the cluster and setting up individual communication links between nodes. MySQL Cluster is currently designed with the intention that data nodes are homogeneous in terms of processor power, memory space, and bandwidth. In addition, to

provide a single point of configuration, all configuration data for the cluster as a whole is located in one configuration file.

The management server (MGM node) manages the cluster configuration file and the cluster log. Each node in the cluster retrieves the configuration data from the management server, and so requires a way to determine where the management server resides. When interesting events occur in the data nodes, the nodes transfer information about these events to the management server, which then writes the information to the cluster log.

In addition, there can be any number of cluster client processes or applications. These are of two types:

- **Standard MySQL clients:** These are no different for MySQL Cluster than they are for standard (non-Cluster) MySQL. In other words, MySQL Cluster can be accessed from existing MySQL applications written in PHP, Perl, C, C++, Java, Python, Ruby, and so on.
- **Management clients:** These clients connect to the management server and provide commands for starting and stopping nodes gracefully, starting and stopping message tracing (debug versions only), showing node versions and status, starting and stopping backups, and so on.

## 15.2.1. MySQL Cluster Nodes, Node Groups, Replicas, and Partitions

This section discusses the manner in which MySQL Cluster divides and duplicates data for storage.

Central to an understanding of this topic are the following concepts, listed here with brief definitions:

- **(Data) Node:** An `ndbd` process, which stores a *replica*—that is, a copy of the *partition* (see below) assigned to the node group of which the node is a member.

Each data node should be located on a separate computer. While it is also possible to host multiple `ndbd` processes on a single computer, such a configuration is not supported.

It is common for the terms “node” and “data node” to be used interchangeably when referring to an `ndbd` process; where mentioned, management (MGM) nodes (`ndb_mgmd` processes) and SQL nodes (`mysqld` processes) are specified as such in this discussion.

- **Node Group:** A node group consists of one or more nodes, and stores partitions, or sets of *replicas* (see next item).

**Note:** Currently, all node groups in a cluster must have the same number of nodes.

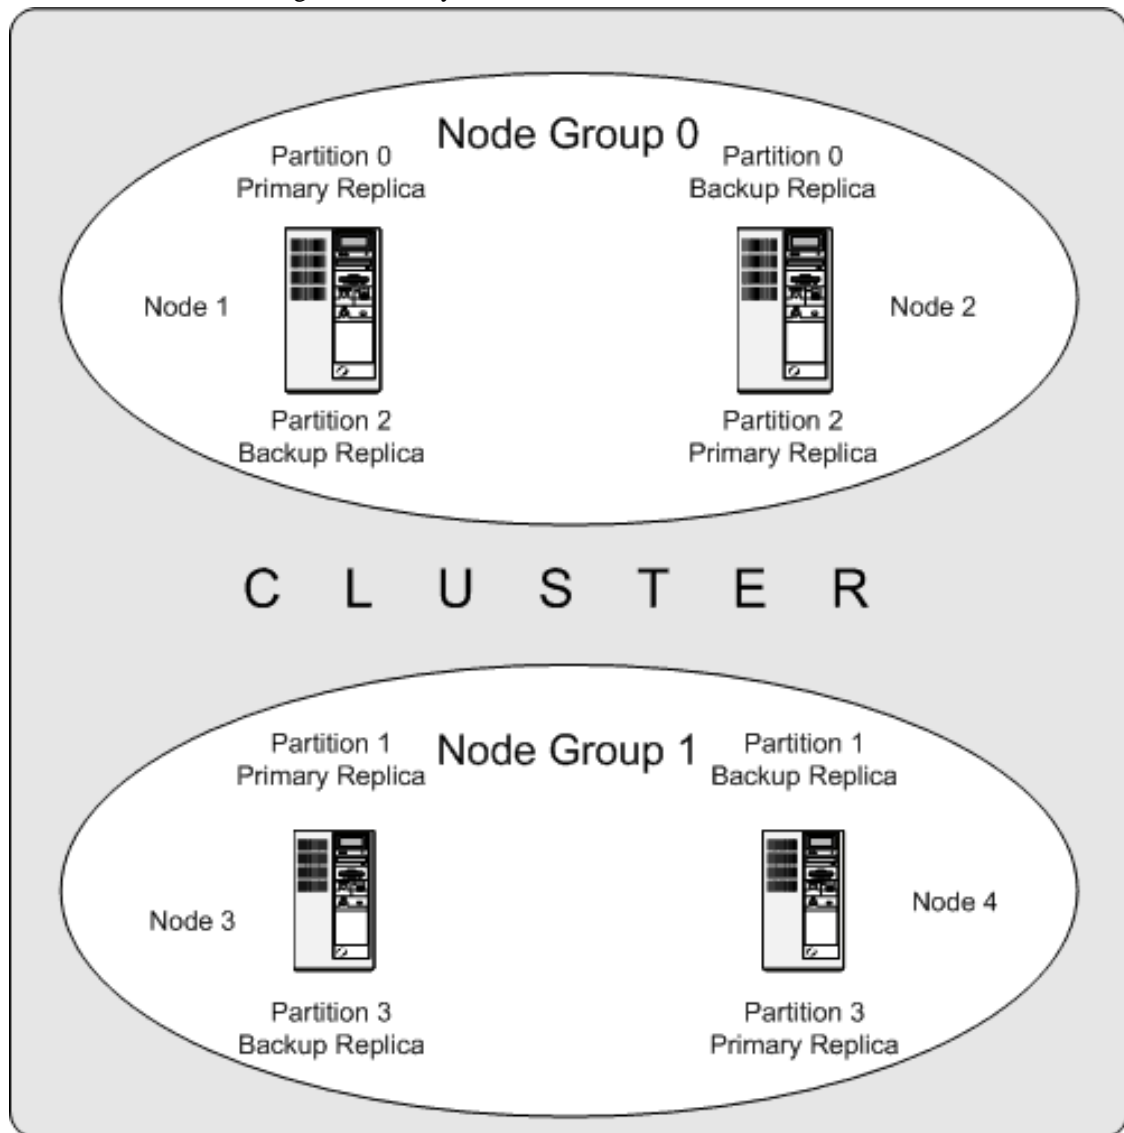

- **Partition:** This is a portion of the data stored by the cluster. There are as many cluster partitions as nodes participating in the cluster. Each node is responsible for keeping at least one copy of any partitions assigned to it (that is, at least one replica) available to the cluster.

A replica belongs entirely to a single node; a node can (and usually does) store several replicas.

- **Replica:** This is a copy of a cluster partition. Each node in a node group stores a replica. Also sometimes known as a *partition replica*. The number of replicas is equal to the number of nodes per node group.

The following diagram illustrates a MySQL Cluster with four data nodes, arranged in two node groups of two nodes each; nodes 1 and 2 belong to node group 0, and nodes 3 and 4 belong to node group 1. Note that only data (`ndbd`) nodes are shown here; although a working cluster requires an `ndb_mgm`

process for cluster management and at least one SQL node to access the data stored by the cluster, these have been omitted in the figure for clarity.

The data stored by the cluster is divided into four partitions, numbered 0, 1, 2, and 3. Each partition is stored — in multiple copies — on the same node group. Partitions are stored on alternate node groups:

- Partition 0 is stored on node group 0; a *primary replica* (primary copy) is stored on node 1, and a *backup replica* (backup copy of the partition) is stored on node 2.
- Partition 1 is stored on the other node group (node group 1); this partition's primary replica is on node 3, and its backup replica is on node 4.
- Partition 2 is stored on node group 0. However, the placing of its two replicas is reversed from that of Partition 0; for Partition 2, the primary replica is stored on node 2, and the backup on node 1.
- Partition 3 is stored on node group 1, and the placement of its two replicas are reversed from those of partition 1. That is, its primary replica is located on node 4, with the backup on node 3.

What this means regarding the continued operation of a MySQL Cluster is this: so long as each node group participating in the cluster has at least one node operating, the cluster has a complete copy of all data and remains viable. This is illustrated in the next diagram.

In this example, where the cluster consists of two node groups of two nodes each, any combination of at least one node in node group 0 and at least one node in node group 1 is sufficient to keep the cluster “alive” (indicated by arrows in the diagram). However, if *both* nodes from *either* node group fail, the remaining two nodes are not sufficient (shown by the arrows marked out with an **X**); in either case, the cluster has lost an entire partition and so can no longer provide access to a complete set of all cluster data.

## 15.3. Simple Multi-Computer How-To

This section is a “How-To” that describes the basics for how to plan, install, configure, and run a MySQL Cluster. Whereas the examples in [Section 15.4, “MySQL Cluster Configuration”](#) provide more in-depth information on a variety of clustering options and configuration, the result of following the guidelines and procedures outlined here should be a usable MySQL Cluster which meets the *minimum* requirements for availability and safeguarding of data.

This section covers hardware and software requirements; networking issues; installation of MySQL Cluster; configuration issues; starting, stopping, and restarting the cluster; loading of a sample database; and performing queries.

### Basic Assumptions

This How-To makes the following assumptions:

- The cluster setup has four nodes, each on a separate host, and each with a fixed network address on a typical Ethernet as shown here:

Node	IP Address
Management (MGM) node	192.168.0.10
MySQL server (SQL) node	192.168.0.20
Data (NDBD) node "A"	192.168.0.30
Data (NDBD) node "B"	192.168.0.40

This may be made clearer in the following diagram:

**Note:** In the interest of simplicity (and reliability), this How-To uses only numeric IP addresses. However, if DNS resolution is available on your network, it is possible to use hostnames in lieu of IP addresses in configuring Cluster. Alternatively, you can use the `/etc/hosts` file or your operating system's equivalent for providing a means to do host lookup if such is available.

- Each host in our scenario is an Intel-based desktop PC running a common, generic Linux distribution installed to disk in a standard configuration, and running no unnecessary services. The core OS with standard TCP/IP networking capabilities should be sufficient. Also for the sake of simplicity, we also assume that the filesystems on all hosts are set up identically. In the event that they are not, you will need to adapt these instructions accordingly.
- Standard 100 Mbps or 1 gigabit Ethernet cards are installed on each machine, along with the proper drivers for the cards, and that all four hosts are connected via a standard-issue Ethernet networking appliance such as a switch. (All machines should use network cards with the same throughput. That is, all four machines in the cluster should have 100 Mbps cards *or* all four machines should have 1

Gbps cards.) MySQL Cluster will work in a 100 Mbps network; however, gigabit Ethernet will provide better performance.

Note that MySQL Cluster is *not* intended for use in a network for which throughput is less than 100 Mbps. For this reason (among others), attempting to run a MySQL Cluster over a public network such as the Internet is not likely to be successful, and is not recommended.

4. For our sample data, we will use the `world` database which is available for download from the MySQL AB Web site. As this database takes up a relatively small amount of space, we assume that each machine has 256MB RAM, which should be sufficient for running the operating system, host NDB process, and (for the data nodes) for storing the database.

Although we refer to a Linux operating system in this How-To, the instructions and procedures that we provide here should be easily adaptable to other supported operating systems. We also assume that you already know how to perform a minimal installation and configuration of the operating system with networking capability, or that you are able to obtain assistance in this elsewhere if needed.

We discuss MySQL Cluster hardware, software, and networking requirements in somewhat greater detail in the next section. (See [Section 15.3.1, “Hardware, Software, and Networking”](#).)

### 15.3.1. Hardware, Software, and Networking

One of the strengths of MySQL Cluster is that it can be run on commodity hardware and has no unusual requirements in this regard, other than for large amounts of RAM, due to the fact that all live data storage is done in memory. (Note that this is subject to change, and that we intend to implement disk-based storage in a future MySQL Cluster release.) Naturally, multiple and faster CPUs will enhance performance. Memory requirements for Cluster processes are relatively small.

The software requirements for Cluster are also modest. Host operating systems do not require any unusual modules, services, applications, or configuration to support MySQL Cluster. For supported operating systems, a standard installation should be sufficient. The MySQL software requirements are simple: all that is needed is a production release of MySQL-max 4.1.3 or newer; you must use the `-max` version of MySQL to have Cluster support. (See [Section 5.3, “The `mysqld-max` Extended MySQL Server”](#).) It is not necessary to compile MySQL yourself merely to be able to use Cluster. In this How-To, we assume that you are using the `-max` binary appropriate to your operating system, available via the MySQL software downloads page at <http://dev.mysql.com/downloads/>.

For inter-node communication, Cluster supports TCP/IP networking in any standard topology, and the minimum expected for each host is a standard 100 Mbps Ethernet card, plus a switch, hub, or router to provide network connectivity for the cluster as a whole. We strongly recommend that a MySQL Cluster be run on its own subnet which is not shared with non-Cluster machines for the following reasons:

- **Security:** Communications between Cluster nodes are not encrypted or shielded in any way. The only means of protecting transmissions within a MySQL Cluster is to run your Cluster on a protected network. If you intend to use MySQL Cluster for Web applications, the cluster should definitely reside behind your firewall and not in your network's De-Militarized Zone (DMZ [[http://compnetworking.about.com/cs/networksecurity/g/bldef\\_dmz.htm](http://compnetworking.about.com/cs/networksecurity/g/bldef_dmz.htm)]) or elsewhere.
- **Efficiency:** Setting up a MySQL Cluster on a private or protected network allows the cluster to make exclusive use of bandwidth between cluster hosts. Using a separate switch for your MySQL Cluster not only helps protect against unauthorized access to Cluster data, it also ensures that Cluster nodes are shielded from interference caused by transmissions between other computers on the network. For enhanced reliability, you can use dual switches and dual cards to remove the network as a single point of failure; many device drivers support failover for such communication links.

It is also possible to use the high-speed Scalable Coherent Interface (SCI) with MySQL Cluster, but this is not a requirement. See [Section 15.10, “Using High-Speed Interconnects with MySQL Cluster”](#), for more about this protocol and its use with MySQL Cluster.

## 15.3.2. Multi-Computer Installation

Each MySQL Cluster host computer running data or SQL nodes must have installed on it a MySQL-max binary. For management nodes, it is not necessary to install the MySQL server binary, but you do have to install the MGM server daemon and client binaries (`ndb_mgmd` and `ndb_mgm`, respectively). This section covers the steps necessary to install the correct binaries for each type of Cluster node.

MySQL AB provides precompiled binaries that support Cluster, and there is generally no need to compile these yourself. Therefore, the first step in the installation process for each cluster host is to download the file `mysql-max-4.1.22-pc-linux-gnu-i686.tar.gz` from the [MySQL downloads area](#) [<http://dev.mysql.com/downloads/>]. We assume that you have placed it in each machine's `/var/tmp` directory. (If you do require a custom binary, see [Section 2.9.3, “Installing from the Development Source Tree”](#).)

RPMs are also available for both 32-bit and 64-bit Linux platforms; as of MySQL 4.1.10a, the `-max` binaries installed by the RPMs support the `NDBCluster` storage engine. If you choose to use these rather than the binary files, be aware that you must install *both* the `-server` and `-max` packages on all machines that are to host cluster nodes. (See [Section 2.4, “Installing MySQL on Linux”](#), for more information about installing MySQL using the RPMs.) After installing from RPM, you will still need to configure the cluster as discussed in [Section 15.3.3, “Multi-Computer Configuration”](#).

**Note:** After completing the installation, do not yet start any of the binaries. We will show you how to do so following the configuration of all nodes.

### Storage and SQL Node Installation

On each of the three machines designated to host storage or SQL nodes, perform the following steps as the system `root` user:

1. Check your `/etc/passwd` and `/etc/group` files (or use whatever tools are provided by your operating system for managing users and groups) to see whether there is already a `mysql` group and `mysql` user on the system. Some OS distributions create these as part of the operating system installation process. If they are not already present, create a new `mysql` user group, and then add a `mysql` user to this group:

```
shell> groupadd mysql
shell> useradd -g mysql mysql
```

The syntax for `useradd` and `groupadd` may differ slightly on different versions of Unix, or they may have different names such as `adduser` and `addgroup`.

2. Change location to the directory containing the downloaded file, unpack the archive, and create a symlink to the `mysql-max` directory named `mysql`. Note that the actual file and directory names will vary according to the MySQL version number.

```
shell> cd /var/tmp
shell> tar -xzvf -C /usr/local mysql-max-4.1.22-pc-linux-gnu-i686.tar.gz
shell> ln -s /usr/local/mysql-max-4.1.22-pc-linux-gnu-i686 /usr/local/mysql
```

3. Change location to the `mysql` directory and run the supplied script for creating the system databases:

```
shell> cd mysql
shell> scripts/mysql_install_db --user=mysql
```

4. Set the necessary permissions for the MySQL server and data directories:

```
shell> chown -R root .
shell> chown -R mysql data
shell> chgrp -R mysql .
```

Note that the data directory on each machine hosting a data node is `/usr/local/mysql/data`. We will use this piece of information when we configure the management node. (See [Section 15.3.3, “Multi-Computer Configuration”](#).)

5. Copy the MySQL startup script to the appropriate directory, make it executable, and set it to start when the operating system is booted up:

```
shell> cp support-files/mysql.server /etc/rc.d/init.d/
shell> chmod +x /etc/rc.d/init.d/mysql.server
shell> chkconfig --add mysql.server
```

(The startup scripts directory may vary depending on your operating system and version — for example, in some Linux distributions, it is `/etc/init.d`.)

Here we use Red Hat's `chkconfig` for creating links to the startup scripts; use whatever means is appropriate for this purpose on your operating system and distribution, such as `update-rc.d` on Debian.

Remember that the preceding steps must be performed separately for each machine on which a storage or SQL node is to reside.

### Management Node Installation

Installation for the management (MGM) node does not require installation of the `mysqld` binary. Only the binaries for the MGM server and client are required, which can be found in the downloaded archive. Again, we assume that you have placed this file in `/var/tmp`.

As system `root` (that is, after using `sudo`, `su root`, or your system's equivalent for temporarily assuming the system administrator account's privileges), perform the following steps to install `ndb_mgmd` and `ndb_mgm` on the Cluster management node host:

1. Change location to the `/var/tmp` directory, and extract the `ndb_mgm` and `ndb_mgmd` from the archive into a suitable directory such as `/usr/local/bin`:

```
shell> cd /var/tmp
shell> tar -zxvf mysql-4.1.22-pc-linux-gnu-i686.tar.gz
shell> cd mysql-4.1.22-pc-linux-gnu-i686
shell> cp /bin/ndb_mgm* /usr/local/bin
```

(You can safely delete the directory created by unpacking the downloaded archive, and the files it contains, from `/var/tmp` once `ndb_mgm` and `ndb_mgmd` have been copied to the executables directory.)

2. Change location to the directory into which you copied the files, and then make both of them executable:

```
shell> cd /usr/local/bin
shell> chmod +x ndb_mgm*
```

In [Section 15.3.3, “Multi-Computer Configuration”](#), we will create and write configuration files for all of the nodes in our example Cluster.

### 15.3.3. Multi-Computer Configuration

For our four-node, four-host MySQL Cluster, we will need to write four configuration files, one per node/host.

- Each data node or SQL node requires a `my.cnf` file that provides two pieces of information: a **connectstring** telling the node where to find the MGM node, and a line telling the MySQL server on this host (the machine hosting the data node) to run in NDB mode.

For more information on connectstrings, see [Section 15.4.4.2, “The Cluster connectstring”](#).

- The management node needs a `config.ini` file telling it how many replicas to maintain, how much memory to allocate for data and indexes on each data node, where to find the data nodes, where to save data to disk on each data node, and where to find any SQL nodes.

#### Configuring the Storage and SQL Nodes

The `my.cnf` file needed for the data nodes is fairly simple. The configuration file should be located in the `/etc` directory and can be edited using any text editor. (Create the file if it does not exist.) For example:

```
shell> vi /etc/my.cnf
```

We show `vi` being used here to create the file, but any text editor should work just as well.

For each data node and SQL node in our example setup, `my.cnf` should look like this:

```
# Options for mysqld process:
[MYSQLD]
ndbcluster                # run NDB engine
ndb-connectstring=192.168.0.10 # location of MGM node

# Options for ndbd process:
[MYSQL_CLUSTER]
ndb-connectstring=192.168.0.10 # location of MGM node
```

After entering the preceding information, save this file and exit the text editor. Do this for the machines hosting data node “A”, data node “B”, and the SQL node.

**Important:** Once you have started a `mysqld` process with the `ndbcluster` and `ndb-connectstring` parameters in the `[MYSQLD]` in the `my.cnf` file as shown previously, you cannot execute any `CREATE TABLE` or `ALTER TABLE` statements without having actually started the cluster. Otherwise, these statements will fail with an error. *This is by design.*

#### Configuring the Management Node

The first step in configuring the MGM node is to create the directory in which the configuration file can be found and then to create the file itself. For example (running as `root`):

```
shell> mkdir /var/lib/mysql-cluster
shell> cd /var/lib/mysql-cluster
shell> vi config.ini
```

For our representative setup, the `config.ini` file should read as follows:

```

# Options affecting ndbd processes on all data nodes:
[NDBD DEFAULT]
NoOfReplicas=2      # Number of replicas
DataMemory=80M     # How much memory to allocate for data storage
IndexMemory=18M    # How much memory to allocate for index storage
                   # For DataMemory and IndexMemory, we have used the
                   # default values. Since the "world" database takes up
                   # only about 500KB, this should be more than enough for
                   # this example Cluster setup.

# TCP/IP options:
[TCP DEFAULT]
portnumber=2202    # This the default; however, you can use any
                   # port that is free for all the hosts in cluster
                   # Note: It is recommended beginning with MySQL 5.0 that
                   # you do not specify the portnumber at all and simply allow
                   # the default value to be used instead

# Management process options:
[NDB_MGMD]
hostname=192.168.0.10 # Hostname or IP address of MGM node
datadir=/var/lib/mysql-cluster # Directory for MGM node logfiles

# Options for data node "A":
[NDBD]
hostname=192.168.0.30 # (one [NDBD] section per data node)
                       # Hostname or IP address
datadir=/usr/local/mysql/data # Directory for this data node's datafiles

# Options for data node "B":
[NDBD]
hostname=192.168.0.40 # Hostname or IP address
datadir=/usr/local/mysql/data # Directory for this data node's datafiles

# SQL node options:
[MYSQLD]
hostname=192.168.0.20 # Hostname or IP address
                       # (additional mysqld connections can be
                       # specified for this node for various
                       # purposes such as running ndb_restore)

```

(**Note:** The `world` database can be downloaded from <http://dev.mysql.com/doc/>, where it can be found listed under “Examples.”)

After all the configuration files have been created and these minimal options have been specified, you are ready to proceed with starting the cluster and verifying that all processes are running. We discuss how this is done in [Section 15.3.4, “Initial Startup”](#).

For more detailed information about the available MySQL Cluster configuration parameters and their uses, see [Section 15.4.4, “Configuration File”](#), and [Section 15.4, “MySQL Cluster Configuration”](#). For configuration of MySQL Cluster as relates to making backups, see [Section 15.8.4, “Configuration for Cluster Backup”](#).

**Note:** The default port for Cluster management nodes is 1186; the default port for data nodes is 2202. In MySQL 4.1, ports for data nodes are allocated sequentially beginning with port 2202 and these ports must be available for the cluster to use.

## 15.3.4. Initial Startup

Starting the cluster is not very difficult after it has been configured. Each cluster node process must be started separately, and on the host where it resides. Although it is possible to start the nodes in any order, it is recommended that the management node be started first, followed by the storage nodes, and then finally by any SQL nodes:

1. On the management host, issue the following command from the system shell to start the MGM node process:

```
shell> ndb_mgmd -f /var/lib/mysql-cluster/config.ini
```

Note that `ndb_mgmd` must be told where to find its configuration file, using the `-f` or `-config-file` option. (See [Section 15.6.3, “ndb\\_mgmd, the Management Server Process”](#), for details.)

2. On each of the data node hosts, run this command to start the `ndbd` process for the first time:

```
shell> ndbd --initial
```

Note that it is very important to use the `--initial` parameter *only* when starting `ndbd` for the first time, or when restarting after a backup/restore operation or a configuration change. This is because the `--initial` option causes the node to delete any files created by earlier `ndbd` instances that are needed for recovery, including the recovery log files.

3. If you used RPM files to install MySQL on the cluster host where the SQL node is to reside, you can (and should) use the startup script installed in `/etc/init.d` to start the MySQL server process on the SQL node. Note that you need to install the `-max` server RPM *in addition to* the Standard server RPM to run the `-max` server binary.

If all has gone well, and the cluster has been set up correctly, the cluster should now be operational. You can test this by invoking the `ndb_mgm` management node client. The output should look like that shown here, although you might see some slight differences in the output depending upon the exact version of MySQL that you are using:

```
shell> ndb_mgm
-- NDB Cluster -- Management Client --
ndb_mgm> SHOW
Connected to Management Server at: localhost:1186
Cluster Configuration
-----
[ndbd(NDB)]      2 node(s)
id=2      @192.168.0.30  (Version: 4.1.22, Nodegroup: 0, Master)
id=3      @192.168.0.40  (Version: 4.1.22, Nodegroup: 0)

[ndb_mgmd(MGM)] 1 node(s)
id=1      @192.168.0.10  (Version: 4.1.22)

[mysqld(SQL)]   1 node(s)
id=4      (Version: 4.1.22)
```

**Note:** The SQL node is referenced here as `[mysqld(API)]`. This is perfectly normal, and reflects the fact that the `mysqld` process is acting as a cluster API node.

You should now be ready to work with databases, tables, and data in MySQL Cluster. See [Section 15.3.5, “Loading Sample Data and Performing Queries”](#), for a brief discussion.

## 15.3.5. Loading Sample Data and Performing Queries

Working with data in MySQL Cluster is not much different from doing so in MySQL without Cluster. There are two points to keep in mind:

- For a table to be replicated in the cluster, it must use the `NDB Cluster` storage engine. To specify this, use the `ENGINE=NDB` or `ENGINE=NDBCLUSTER` table option. You can add this option when creating the table:

```
CREATE TABLE tbl_name ( ... ) ENGINE=NDBCLUSTER;
```

Alternatively, for an existing table that uses a different storage engine, use `ALTER TABLE` to

change the table to use **NDB Cluster**:

```
ALTER TABLE tbl_name ENGINE=NDBCLUSTER;
```

- Each **NDB** table *must* have a primary key. If no primary key is defined by the user when a table is created, the **NDB Cluster** storage engine automatically generates a hidden one. (**Note:** This hidden key takes up space just as does any other table index. It is not uncommon to encounter problems due to insufficient memory for accommodating these automatically created indexes.)

If you are importing tables from an existing database using the output of `mysqldump`, you can open the SQL script in a text editor and add the **ENGINE** option to any table creation statements, or replace any existing **ENGINE** (or **TYPE**) options. Suppose that you have the `world` sample database on another MySQL server that does not support MySQL Cluster, and you want to export the `City` table:

```
shell> mysqldump --add-drop-table world City > city_table.sql
```

The resulting `city_table.sql` file will contain this table creation statement (and the **INSERT** statements necessary to import the table data):

```
DROP TABLE IF EXISTS `City`;
CREATE TABLE `City` (
  `ID` int(11) NOT NULL auto_increment,
  `Name` char(35) NOT NULL default '',
  `CountryCode` char(3) NOT NULL default '',
  `District` char(20) NOT NULL default '',
  `Population` int(11) NOT NULL default '0',
  PRIMARY KEY (`ID`)
) ENGINE=MyISAM DEFAULT CHARSET=latin1;

INSERT INTO `City` VALUES (1,'Kabul','AFG','Kabol',1780000);
INSERT INTO `City` VALUES (2,'Qandahar','AFG','Qandahar',237500);
INSERT INTO `City` VALUES (3,'Herat','AFG','Herat',186800);
(remaining INSERT statements omitted)
```

You will need to make sure that MySQL uses the **NDB** storage engine for this table. There are two ways that this can be accomplished. One of these is to modify the table definition *before* importing it into the Cluster database. Using the `City` table as an example, modify the **ENGINE** option of the definition as follows:

```
DROP TABLE IF EXISTS `City`;
CREATE TABLE `City` (
  `ID` int(11) NOT NULL auto_increment,
  `Name` char(35) NOT NULL default '',
  `CountryCode` char(3) NOT NULL default '',
  `District` char(20) NOT NULL default '',
  `Population` int(11) NOT NULL default '0',
  PRIMARY KEY (`ID`)
) ENGINE=NDBCLUSTER DEFAULT CHARSET=latin1;

INSERT INTO `City` VALUES (1,'Kabul','AFG','Kabol',1780000);
INSERT INTO `City` VALUES (2,'Qandahar','AFG','Qandahar',237500);
INSERT INTO `City` VALUES (3,'Herat','AFG','Herat',186800);
(remaining INSERT statements omitted)
```

This must be done for the definition of each table that is to be part of the clustered database. The easiest way to accomplish this is to do a search-and-replace on the file that contains the definitions and replace all instances of **TYPE=engine\_name** or **ENGINE=engine\_name** with **ENGINE=NDBCLUSTER**. If you do not want to modify the file, you can use the unmodified file to create the tables, and then use **ALTER TABLE** to change their storage engine. The particulars are given later in this section.

Assuming that you have already created a database named `world` on the SQL node of the cluster, you can then use the `mysql` command-line client to read `city_table.sql`, and create and populate the corresponding table in the usual manner:

```
shell> mysql world < city_table.sql
```

It is very important to keep in mind that the preceding command must be executed on the host where the SQL node is running (in this case, on the machine with the IP address 192.168.0.20).

To create a copy of the entire `world` database on the SQL node, use `mysqldump` on the non-cluster server to export the database to a file named `world.sql`; for example, in the `/tmp` directory. Then modify the table definitions as just described and import the file into the SQL node of the cluster like this:

```
shell> mysql world < /tmp/world.sql
```

If you save the file to a different location, adjust the preceding instructions accordingly.

It is important to note that `NDB Cluster` in MySQL 4.1 does not support autodiscovery of databases. (See [Section 15.11, “Known Limitations of MySQL Cluster”](#).) This means that, once the `world` database and its tables have been created on one data node, you need to issue the `CREATE DATABASE world` statement followed by `FLUSH TABLES` on each SQL node in the cluster. This causes the node to recognize the database and read its table definitions.

Running `SELECT` queries on the SQL node is no different from running them on any other instance of a MySQL server. To run queries from the command line, you first need to log in to the MySQL Monitor in the usual way (specify the `root` password at the `Enter password:` prompt):

```
shell> mysql -u root -p
Enter password:
Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 1 to server version: 4.1.22

Type 'help;' or '\h' for help. Type '\c' to clear the buffer.

mysql>
```

We simply use the MySQL server's `root` account and assume that you have followed the standard security precautions for installing a MySQL server, including setting a strong `root` password. For more information, see [Section 2.10.3, “Securing the Initial MySQL Accounts”](#).

It is worth taking into account that Cluster nodes do not make use of the MySQL privilege system when accessing one another. Setting or changing MySQL user accounts (including the `root` account) effects only applications that access the SQL node, not interaction between nodes.

If you did not modify the `ENGINE` clauses in the table definitions prior to importing the SQL script, you should run the following statements at this point:

```
mysql> USE world;
mysql> ALTER TABLE City ENGINE=NDBCLUSTER;
mysql> ALTER TABLE Country ENGINE=NDBCLUSTER;
mysql> ALTER TABLE CountryLanguage ENGINE=NDBCLUSTER;
```

Selecting a database and running a `SELECT` query against a table in that database is also accomplished in the usual manner, as is exiting the MySQL Monitor:

```
mysql> USE world;
mysql> SELECT Name, Population FROM City ORDER BY Population DESC LIMIT 5;
+-----+-----+
| Name      | Population |
+-----+-----+
| Bombay    | 10500000  |
| Seoul     | 9981619   |
| São Paulo | 9968485   |
| Shanghai  | 9696300   |
| Jakarta   | 9604900   |
+-----+-----+
```

```
5 rows in set (0.34 sec)
```

```
mysql> \q
Bye

shell>
```

Applications that use MySQL can employ standard APIs to access NDB tables. It is important to remember that your application must access the SQL node, and not the MGM or data nodes. This brief example shows how we might execute the `SELECT` statement just shown by using PHP 5's `mysqli` extension running on a Web server elsewhere on the network:

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.01 Transitional//EN"
"http://www.w3.org/TR/html4/loose.dtd">
<html>
<head>
<meta http-equiv="Content-Type"
content="text/html; charset=iso-8859-1">
<title>SIMPLE mysqli SELECT</title>
</head>
<body>
<?php
# connect to SQL node:
$link = new mysqli('192.168.0.20', 'root', 'root_password', 'world');
# parameters for mysqli constructor are:
# host, user, password, database

if( mysqli_connect_errno() )
die("Connect failed: " . mysqli_connect_error());

$query = "SELECT Name, Population
FROM City
ORDER BY Population DESC
LIMIT 5";

# if no errors...
if( $result = $link->query($query) )
{
?>
<table border="1" width="40%" cellpadding="4" cellspacing="1">
<tbody>
<tr>
<th width="10%">City</th>
<th>Population</th>
</tr>
<?
# then display the results...
while($row = $result->fetch_object())
printf("<tr>\n <td align=\"center\">%s</td><td>%d</td>\n</tr>\n",
$row->Name, $row->Population);
?>
</tbody>
</table>
<?
# ...and verify the number of rows that were retrieved
printf("<p>Affected rows: %d</p>\n", $link->affected_rows);
}
else
# otherwise, tell us what went wrong
echo mysqli_error();

# free the result set and the mysqli connection object
$result->close();
$link->close();
?>
</body>
</html>
```

We assume that the process running on the Web server can reach the IP address of the SQL node.

In a similar fashion, you can use the MySQL C API, Perl-DBI, Python-mysql, or MySQL AB's own Connectors to perform the tasks of data definition and manipulation just as you would normally with MySQL.

## 15.3.6. Safe Shutdown and Restart

To shut down the cluster, enter the following command in a shell on the machine hosting the MGM node:

```
shell> ndb_mgm -e shutdown
```

The `-e` option here is used to pass a command to the `ndb_mgm` client from the shell. See [Section 4.3.1, “Using Options on the Command Line”](#). The command causes the `ndb_mgm`, `ndb_mgmd`, and any `ndbd` processes to terminate gracefully. Any SQL nodes can be terminated using `mysqladmin shutdown` and other means.

To restart the cluster, run these commands:

- On the management host (192.168.0.10 in our example setup):

```
shell> ndb_mgmd -f /var/lib/mysql-cluster/config.ini
```

- On each of the data node hosts (192.168.0.30 and 192.168.0.40):

```
shell> ndbd
```

Remember *not* to invoke this command with the `--initial` option when restarting an NDBD node normally.

- On the SQL host (192.168.0.20):

```
shell> mysqld &
```

For information on making Cluster backups, see [Section 15.8.2, “Using The Management Client to Create a Backup”](#).

To restore the cluster from backup requires the use of the `ndb_restore` command. This is covered in [Section 15.8.3, “How to Restore a Cluster Backup”](#).

More information on configuring MySQL Cluster can be found in [Section 15.4, “MySQL Cluster Configuration”](#).

## 15.4. MySQL Cluster Configuration

A MySQL server that is part of a MySQL Cluster differs in only one respect from a normal (non-clustered) MySQL server, in that it employs the `NDB Cluster` storage engine. This engine is also referred to simply as `NDB`, and the two forms of the name are synonymous.

To avoid unnecessary allocation of resources, the server is configured by default with the `NDB` storage engine disabled. To enable `NDB`, you must modify the server's `my.cnf` configuration file, or start the server with the `--ndbcluster` option.

The MySQL server is a part of the cluster, so it also must know how to access an MGM node to obtain the cluster configuration data. The default behavior is to look for the MGM node on `localhost`. However, should you need to specify that its location is elsewhere, this can be done in `my.cnf` or on the MySQL server command line. Before the `NDB` storage engine can be used, at least one MGM node must be operational, as well as any desired data nodes.

## 15.4.1. Building MySQL Cluster from Source Code

**NDB**, the Cluster storage engine, is available in binary distributions for Linux, Mac OS X, and Solaris. We are working to make Cluster run on all operating systems supported by MySQL, including Windows.

If you choose to build from a source tarball or the MySQL 4.1 BitKeeper tree, be sure to use the `--with-ndbcluster` option when running `configure`. You can also use the `BUILD/compile-pentium-max` build script. Note that this script includes OpenSSL, so you must either have or obtain OpenSSL to build successfully, or else modify `compile-pentium-max` to exclude this requirement. Of course, you can also just follow the standard instructions for compiling your own binaries, and then perform the usual tests and installation procedure. See [Section 2.9.3, “Installing from the Development Source Tree”](#).

## 15.4.2. Installing the Software

In the next few sections, we assume that you are already familiar with installing MySQL, and here we cover only the differences between configuring MySQL Cluster and configuring MySQL without clustering. (See [Chapter 2, \*Installing and Upgrading MySQL\*](#), if you require more information about the latter.)

You will find Cluster configuration easiest if you have already have all management and data nodes running first; this is likely to be the most time-consuming part of the configuration. Editing the `my.cnf` file is fairly straightforward, and this section will cover only any differences from configuring MySQL without clustering.

## 15.4.3. Quick Test Setup of MySQL Cluster

To familiarize you with the basics, we will describe the simplest possible configuration for a functional MySQL Cluster. After this, you should be able to design your desired setup from the information provided in the other relevant sections of this chapter.

First, you need to create a configuration directory such as `/var/lib/mysql-cluster`, by executing the following command as the system `root` user:

```
shell> mkdir /var/lib/mysql-cluster
```

In this directory, create a file named `config.ini` that contains the following information. Substitute appropriate values for `HostName` and `DataDir` as necessary for your system.

```
# file "config.ini" - showing minimal setup consisting of 1 data node,
# 1 management server, and 3 MySQL servers.
# The empty default sections are not required, and are shown only for
# the sake of completeness.
# Data nodes must provide a hostname but MySQL Servers are not required
# to do so.
# If you don't know the hostname for your machine, use localhost.
# The DataDir parameter also has a default value, but it is recommended to
# set it explicitly.
# Note: DB, API, and MGM are aliases for NDBD, MYSQLD, and NDB_MGMD
# respectively. DB and API are deprecated and should not be used in new
# installations.
[NDBD DEFAULT]
NoOfReplicas= 1

[MYSQLD DEFAULT]
[NDB_MGMD DEFAULT]
[TCP DEFAULT]

[NDB_MGMD]
HostName= myhost.example.com

[NDBD]
HostName= myhost.example.com
```

```
DataDir= /var/lib/mysql-cluster
[MYSQLD]
[MYSQLD]
[MYSQLD]
```

You can now start the `ndb_mgmd` management server. By default, it attempts to read the `config.ini` file in its current working directory, so change location into the directory where the file is located and then invoke `ndb_mgmd`:

```
shell> cd /var/lib/mysql-cluster
shell> ndb_mgmd
```

Then start a single data node by running `ndbd`. When starting `ndbd` for a given data node for the very first time, you should use the `--initial` option as shown here:

```
shell> ndbd --initial
```

For subsequent `ndbd` starts, you will generally want to *omit* the `--initial` option:

```
shell> ndbd
```

The reason for omitting `--initial` on subsequent restarts is that this option causes `ndbd` to delete and re-create all existing data and log files (as well as all table metadata) for this data node. One exception to this rule about not using `--initial` except for the first `ndbd` invocation is that you use it when restarting the cluster and restoring from backup after adding new data nodes.

By default, `ndbd` looks for the management server at `localhost` on port 1186. (Prior to MySQL 4.1.8, the default port was 2200.)

**Note:** If you have installed MySQL from a binary tarball, you will need to specify the path of the `ndb_mgmd` and `ndbd` servers explicitly. (Normally, these will be found in `/usr/local/mysql/bin`.)

Finally, change location to the MySQL data directory (usually `/var/lib/mysql` or `/usr/local/mysql/data`), and make sure that the `my.cnf` file contains the option necessary to enable the NDB storage engine:

```
[mysqld]
ndbcluster
```

You can now start the MySQL server as usual:

```
shell> mysqld_safe --user=mysql &
```

Wait a moment to make sure the MySQL server is running properly. If you see the notice `mysql ended`, check the server's `.err` file to find out what went wrong.

If all has gone well so far, you now can start using the cluster. Connect to the server and verify that the `NDBCLUSTER` storage engine is enabled:

```
shell> mysql
Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 1 to server version: 4.1.22-Max

Type 'help;' or '\h' for help. Type '\c' to clear the buffer.

mysql> SHOW ENGINES\G
...
***** 12. row *****
Engine: NDBCLUSTER
```

```
Support: YES
Comment: Clustered, fault-tolerant, memory-based tables
***** 13. row *****
Engine: NDB
Support: YES
Comment: Alias for NDBCLUSTER
...
```

The row numbers shown in the preceding example output may be different from those shown on your system, depending upon how your server is configured.

Try to create an `NDBCLUSTER` table:

```
shell> mysql
mysql> USE test;
Database changed

mysql> CREATE TABLE ctest (i INT) ENGINE=NDBCLUSTER;
Query OK, 0 rows affected (0.09 sec)

mysql> SHOW CREATE TABLE ctest \G
***** 1. row *****
      Table: ctest
Create Table: CREATE TABLE `ctest` (
  `i` int(11) default NULL
) ENGINE=ndbcluster DEFAULT CHARSET=latin1
1 row in set (0.00 sec)
```

To check that your nodes were set up properly, start the management client:

```
shell> ndb_mgm
```

Use the `SHOW` command from within the management client to obtain a report on the cluster's status:

```
NDB> SHOW
Cluster Configuration
-----
[nbdb(NDB)]      1 node(s)
id=2      @127.0.0.1 (Version: 3.5.3, Nodegroup: 0, Master)

[ndb_mgmd(MGM)] 1 node(s)
id=1      @127.0.0.1 (Version: 3.5.3)

[mysqld(API)]   3 node(s)
id=3      @127.0.0.1 (Version: 3.5.3)
id=4 (not connected, accepting connect from any host)
id=5 (not connected, accepting connect from any host)
```

At this point, you have successfully set up a working MySQL Cluster. You can now store data in the cluster by using any table created with `ENGINE=NDBCLUSTER` or its alias `ENGINE=NDB`.

## 15.4.4. Configuration File

Configuring MySQL Cluster requires working with two files:

- `my.cnf`: Specifies options for all MySQL Cluster executables. This file, with which you should be familiar with from previous work with MySQL, must be accessible by each executable running in the cluster.
- `config.ini`: This file is read only by the MySQL Cluster management server, which then distributes the information contained therein to all processes participating in the cluster. `config.ini` contains a description of each node involved in the cluster. This includes configuration parameters for data nodes and configuration parameters for connections between all nodes in the cluster. For a quick reference to the sections that can appear in this file, and what sorts of configuration parameters may be placed in each section, see [Sections of the config.ini File](#).

We are continuously making improvements in Cluster configuration and attempting to simplify this process. Although we strive to maintain backward compatibility, there may be times when introduce an incompatible change. In such cases we will try to let Cluster users know in advance if a change is not backward compatible. If you find such a change and we have not documented it, please report it in the MySQL bugs database using the instructions given in [Section 1.8, “How to Report Bugs or Problems”](#).

### 15.4.4.1. Basic Example Configuration

To support MySQL Cluster, you will need to update `my.cnf` as shown in the following example. Note that the options shown here should not be confused with those that are used in `config.ini` files. You may also specify these parameters on the command line when invoking the executables.

From version 4.1.8 some simplifications in `my.cnf` were made, including new sections for `ndb-cluster` executables. However, these should not be confused with those occurring in `config.ini` files. As always, you may specify these parameters when invoking those executables from the command line.

```
# my.cnf
# example additions to my.cnf for MySQL Cluster
# (valid from 4.1.8)

# enable ndbcluster storage engine, and provide connectstring for
# management server host (default port is 1186)
[mysqld]
ndbcluster
ndb-connectstring=ndb_mgmd.mysql.com

# provide connectstring for management server host (default port: 1186)
[ndbd]
connect-string=ndb_mgmd.mysql.com

# provide connectstring for management server host (default port: 1186)
[ndb_mgm]
connect-string=ndb_mgmd.mysql.com

# provide location of cluster configuration file
[ndb_mgmd]
config-file=/etc/config.ini
```

(For more information on connectstrings, see [Section 15.4.4.2, “The Cluster connectstring”](#).)

```
# my.cnf
# example additions to my.cnf for MySQL Cluster
# (will work on all versions)

# enable ndbcluster storage engine, and provide connectstring for management
# server host to the default port 1186
[mysqld]
ndbcluster
ndb-connectstring=ndb_mgmd.mysql.com:1186
```

**Important:** Once you have started a `mysqld` process with the `ndbcluster` and `ndb-connectstring` parameters in the `[MYSQLD]` in the `my.cnf` file as shown previously, you cannot execute any `CREATE TABLE` or `ALTER TABLE` statements without having actually started the cluster. Otherwise, these statements will fail with an error. *This is by design.*

Starting with MySQL 4.1.8, you may also use a separate `[mysql_cluster]` section in the cluster `my.cnf` file for settings to be read and used by all executables:

```
# cluster-specific settings
[mysql_cluster]
ndb-connectstring=ndb_mgmd.mysql.com:1186
```

For additional `NDB` variables that can be set in the `my.cnf` file, see [Section 5.2.2, “System Variables”](#).

The configuration file is named `config.ini` by default. It is read by `ndb_mgmd` at startup and can be placed anywhere. Its location and name are specified by using `--config-file=path_name` on the `ndb_mgmd` command line. If the configuration file is not specified, `ndb_mgmd` by default tries to read a file named `config.ini` located in the current working directory.

Currently, the configuration file is in INI format, which consists of sections preceded by section headings (surrounded by square brackets), followed by the appropriate parameter names and values. One deviation from the standard INI format is that the parameter name and value can be separated by a colon (':') as well as the equals sign ('='). Another deviation is that sections are not uniquely identified by section name. Instead, unique sections (such as two different nodes of the same type) are identified by a unique ID specified as a parameter within the section.

Default values are defined for most parameters, and can also be specified in `config.ini`. To create a default value section, simply add the word `DEFAULT` to the section name. For example, an `[NDBD]` section contains parameters that apply to a particular data node, whereas an `[NDBD DEFAULT]` section contains parameters that apply to all data nodes. Suppose that all data nodes should use the same data memory size. To configure them all, create an `[NDBD DEFAULT]` section that contains a `DataMemory` line to specify the data memory size.

At a minimum, the configuration file must define the computers and nodes involved in the cluster and on which computers these nodes are located. An example of a simple configuration file for a cluster consisting of one management server, two data nodes and two MySQL servers is shown here:

```
# file "config.ini" - 2 data nodes and 2 SQL nodes
# This file is placed in the startup directory of ndb_mgmd (the
# management server)
# The first MySQL Server can be started from any host. The second
# can be started only on the host mysqld_5.mysql.com

[NDBD DEFAULT]
NoOfReplicas= 2
DataDir= /var/lib/mysql-cluster

[NDB_MGMD]
Hostname= ndb_mgmd.mysql.com
DataDir= /var/lib/mysql-cluster

[NDBD]
HostName= ndbd_2.mysql.com

[NDBD]
HostName= ndbd_3.mysql.com

[MYSQLD]
[MYSQLD]
HostName= mysqld_5.mysql.com
```

Note that each node has its own section in the `config.ini`. For instance, this cluster has two data nodes, so the preceding configuration file contains two `[NDBD]` sections defining these nodes.

### Sections of the `config.ini` File

There are six different sections that you can use in the `config.ini` configuration file, as described in the following list:

- `[COMPUTER]`: Defines cluster hosts. This is not required to configure a viable MySQL Cluster, but be may used as a convenience when setting up a large cluster. See [Section 15.4.4.3, “Defining Cluster Computers”](#), for more information.
- `[NDBD]`: Defines a cluster data node (`ndbd` process). See [Section 15.4.4.5, “Defining Data Nodes”](#), for details.
- `[MYSQLD]`: Defines the cluster's MySQL server nodes (also called SQL or API nodes). For a dis-

discussion of SQL node configuration, see [Section 15.4.4.6, “Defining SQL and Other API Nodes”](#).

- `[MGM]` or `[NDB_MGMD]`: Defines a cluster management server (MGM) node. For information concerning the configuration of MGM nodes, see [Section 15.4.4.4, “Defining the Management Server”](#).
- `[TCP]`: Defines a TCP/IP connection between cluster nodes, with TCP/IP being the default connection protocol. Normally, `[TCP]` or `[TCP DEFAULT]` sections are not required to set up a MySQL Cluster, as the cluster handles this automatically; however, it may be necessary in some situations to override the defaults provided by the cluster. See [Section 15.4.4.7, “Cluster TCP/IP Connections”](#), for information about available TCP/IP configuration parameters and how to use them. (You may also find [Section 15.4.4.8, “TCP/IP Connections Using Direct Connections”](#) to be of interest in some cases.)
- `[SHM]`: Defines shared-memory connections between nodes. Prior to MySQL 4.1.9, this type of connection was available only in binaries that were built using the `--with-ndb-shm` option. Beginning with MySQL 4.1.9-max, it is enabled by default, but should still be considered experimental. For a discussion of SHM interconnects, see [Section 15.4.4.9, “Shared-Memory Connections”](#).
- `[SCI]`: Defines *Scalable Coherent Interface* connections between cluster data nodes. Such connections require software which, while freely available, is not part of the MySQL Cluster distribution, as well as specialised hardware. See [Section 15.4.4.10, “SCI Transport Connections”](#) for detailed information about SCI interconnects.

You can define `DEFAULT` values for each section. As of MySQL 4.1.5, all parameter names are case-insensitive, which differs from parameters specified in `my.cnf` or `my.ini` files.

### 15.4.4.2. The Cluster `connectstring`

With the exception of the MySQL Cluster management server (`ndb_mgmd`), each node that is part of a MySQL Cluster requires a *connectstring* that points to the management server's location. This connectstring is used in establishing a connection to the management server as well as in performing other tasks depending on the node's role in the cluster. The syntax for a connectstring is as follows:

```
<connectstring> :=
  [<nodeid-specification>,<host-specification>[,<host-specification>]
<nodeid-specification> := node_id
<host-specification> := host_name[:port_num]
```

`node_id` is an integer larger than 1 which identifies a node in `config.ini`. `host_name` is a string representing a valid Internet host name or IP address. `port_num` is an integer referring to a TCP/IP port number.

```
example 1 (long):  "nodeid=2,myhost1:1100,myhost2:1100,192.168.0.3:1200"
example 2 (short): "myhost1"
```

All nodes will use `localhost:1186` as the default connectstring value if none is provided. If `port_num` is omitted from the connectstring, the default port is 1186. (**Note:** Prior to MySQL 4.1.8, the default port was 2200.) This port should always be available on the network because it has been assigned by IANA for this purpose (see <http://www.iana.org/assignments/port-numbers> for details).

By listing multiple `<host-specification>` values, it is possible to designate several redundant management servers. A cluster node will attempt to contact successive management servers on each host in the order specified, until a successful connection has been established.

There are a number of different ways to specify the connectstring:

- Each executable has its own command-line option which enables specifying the management server at startup. (See the documentation for the respective executable.)
- Beginning with MySQL 4.1.8, it is also possible to set the connectstring for all nodes in the cluster at once by placing it in a `[mysql_cluster]` section in the management server's `my.cnf` file.
- For backward compatibility, two other options are available, using the same syntax:
  1. Set the `NDB_CONNECTSTRING` environment variable to contain the connectstring.
  2. Write the connectstring for each executable into a text file named `Ndb.cfg` and place this file in the executable's startup directory.

However, these are now deprecated and should not be used for new installations.

The recommended method for specifying the connectstring is to set it on the command line or in the `my.cnf` file for each executable.

### 15.4.4.3. Defining Cluster Computers

The `[COMPUTER]` section has no real significance other than serving as a way to avoid the need of defining host names for each node in the system. All parameters mentioned here are required.

- `Id`

This is an integer value, used to refer to the host computer elsewhere in the configuration file. This is not the same as the node ID.

- `HostName`

This is the computer's hostname or IP address.

### 15.4.4.4. Defining the Management Server

The `[NDB_MGMD]` section is used to configure the behavior of the management server. `[MGM]` can be used as an alias; the two section names are equivalent. All parameters in the following list are optional and assume their default values if omitted. **Note:** If neither the `ExecuteOnComputer` nor the `HostName` parameter is present, the default value `localhost` will be assumed for both.

- `Id`

Each node in the cluster has a unique identity, which is represented by an integer value in the range 1 to 63 inclusive. This ID is used by all internal cluster messages for addressing the node.

- `ExecuteOnComputer`

This refers to the `Id` set for one of the computers defined in a `[COMPUTER]` section of the `config.ini` file.

- `PortNumber`

This is the port number on which the management server listens for configuration requests and man-

agement commands.

- `HostName`

Specifying this parameter defines the hostname of the computer on which the management node is to reside. To specify a hostname other than `localhost`, either this parameter or `ExecuteOnComputer` is required.

- `LogDestination`

This parameter specifies where to send cluster logging information. There are three options in this regard: `CONSOLE`, `SYSLOG`, and `FILE`:

- `CONSOLE` outputs the log to `stdout`:

```
CONSOLE
```

- `SYSLOG` sends the log to a `syslog` facility, possible values being one of `auth`, `authpriv`, `cron`, `daemon`, `ftp`, `kern`, `lpr`, `mail`, `news`, `syslog`, `user`, `uucp`, `local0`, `local1`, `local2`, `local3`, `local4`, `local5`, `local6`, or `local7`.

**Note:** Not every facility is necessarily supported by every operating system.

```
SYSLOG:facility=syslog
```

- `FILE` pipes the cluster log output to a regular file on the same machine. The following values can be specified:
  - `filename`: The name of the logfile.
  - `maxsize`: The maximum size (in bytes) to which the file can grow before logging rolls over to a new file. When this occurs, the old logfile is renamed by appending `.N` to the filename, where `N` is the next number not yet used with this name.
  - `maxfiles`: The maximum number of logfiles.

```
FILE:filename=cluster.log,maxsize=1000000,maxfiles=6
```

It is possible to specify multiple log destinations separated by semicolons as shown here:

```
CONSOLE;SYSLOG:facility=local0;FILE:filename=/var/log/mgmd
```

The default value for the `FILE` parameter is

```
FILE:filename=ndb_node_id_cluster.log,maxsize=1000000,maxfiles=6,
```

where `node_id` is the ID of the node.

- `ArbitrationRank`

This parameter is used to define which nodes can act as arbitrators. Only MGM nodes and SQL nodes can be arbitrators. `ArbitrationRank` can take one of the following values:

- `0`: The node will never be used as an arbitrator.
- `1`: The node has high priority; that is, it will be preferred as an arbitrator over low-priority nodes.

- **2**: Indicates a low-priority node which be used as an arbitrator only if a node with a higher priority is not available for that purpose.

Normally, the management server should be configured as an arbitrator by setting its `ArbitrationRank` to 1 (the default value) and that of all SQL nodes to 0.

- `ArbitrationDelay`

An integer value which causes the management server's responses to arbitration requests to be delayed by that number of milliseconds. By default, this value is 0; it is normally not necessary to change it.

- `DataDir`

This specifies the directory where output files from the management server will be placed. These files include cluster log files, process output files, and the daemon's process ID (PID) file. (For log files, this location can be overridden by setting the `FILE` parameter for `LogDestination` as discussed previously in this section.)

### 15.4.4.5. Defining Data Nodes

The `[NDBD]` and `[NDBD DEFAULT]` sections are used to configure the behavior of the cluster's data nodes. There are many parameters which control buffer sizes, pool sizes, timeouts, and so forth. The only mandatory parameters are:

- Either `ExecuteOnComputer` or `HostName`, which must be defined in the local `[NDBD]` section.
- The parameter `NoOfReplicas`, which must be defined in the `[NDBD DEFAULT]` section, as it is common to all Cluster data nodes.

Most data node parameters are set in the `[NDBD DEFAULT]` section. Only those parameters explicitly stated as being able to set local values are allowed to be changed in the `[NDBD]` section. Where present, `HostName`, `Id` and `ExecuteOnComputer` *must* be defined in the local `[NDBD]` section, and not in any other section of `config.ini`. In other words, settings for these parameters are specific to one data node.

For those parameters affecting memory usage or buffer sizes, it is possible to use `K`, `M`, or `G` as a suffix to indicate units of 1024, 1024×1024, or 1024×1024×1024. (For example, `100K` means 100 × 1024 = 102400.) Parameter names and values are currently case-sensitive.

#### Identifying Data Nodes

The `Id` value (that is, the data node identifier) can be allocated on the command line when the node is started or in the configuration file.

- `Id`

This is the node ID used as the address of the node for all cluster internal messages. This is an integer in the range 1 to 63 inclusive. Each node in the cluster must have a unique identity.

-

### `ExecuteOnComputer`

This refers to the `Id` set for one of the computers defined in a `[COMPUTER]` section.

- 

### `HostName`

Specifying this parameter defines the hostname of the computer on which the data node is to reside. To specify a hostname other than `localhost`, either this parameter or `ExecuteOnComputer` is required.

- 

### `ServerPort` (*OBSOLETE*)

Each node in the cluster uses a port to connect to other nodes. This port is used also for non-TCP transporters in the connection setup phase. The default port is allocated dynamically in such a way as to ensure that no two nodes on the same computer receive the same port number, so it should not normally be necessary to specify a value for this parameter.

- 

### `NoOfReplicas`

This global parameter can be set only in the `[NDBD DEFAULT]` section, and defines the number of replicas for each table stored in the cluster. This parameter also specifies the size of node groups. A node group is a set of nodes all storing the same information.

Node groups are formed implicitly. The first node group is formed by the set of data nodes with the lowest node IDs, the next node group by the set of the next lowest node identities, and so on. By way of example, assume that we have 4 data nodes and that `NoOfReplicas` is set to 2. The four data nodes have node IDs 2, 3, 4 and 5. Then the first node group is formed from nodes 2 and 3, and the second node group by nodes 4 and 5. It is important to configure the cluster in such a manner that nodes in the same node groups are not placed on the same computer because a single hardware failure would cause the entire cluster to crash.

If no node IDs are provided, the order of the data nodes will be the determining factor for the node group. Whether or not explicit assignments are made, they can be viewed in the output of the management client's `SHOW` statement.

There is no default value for `NoOfReplicas`; the maximum possible value is 4.

- 

### `DataDir`

This parameter specifies the directory where trace files, log files, pid files and error logs are placed.

- 

### `FileSystemPath`

This parameter specifies the directory where all files created for metadata, REDO logs, UNDO logs and data files are placed. The default is the directory specified by `DataDir`. **Note:** This directory must exist before the `ndbd` process is initiated.

The recommended directory hierarchy for MySQL Cluster includes `/var/lib/mysql-cluster`, under which a directory for the node's filesystem is created. The name of this subdirectory contains the node ID. For example, if the node ID is 2, this subdirectory is named `ndb_2_fs`.

- 

### `BackupDataDir`

This parameter specifies the directory in which backups are placed. If omitted, the default backup location is the directory named `BACKUP` under the location specified by the `FileSystemPath` parameter. (See above.)

### Data Memory, Index Memory, and String Memory

`DataMemory` and `IndexMemory` are [NDBD] parameters specifying the size of memory segments used to store the actual records and their indexes. In setting values for these, it is important to understand how `DataMemory` and `IndexMemory` are used, as they usually need to be updated to reflect actual usage by the cluster:

- 

#### `DataMemory`

This parameter defines the amount of space (in bytes) available for storing database records. The entire amount specified by this value is allocated in memory, so it is extremely important that the machine has sufficient physical memory to accommodate it.

The memory allocated by `DataMemory` is used to store both the actual records and indexes. Each record is currently of fixed size. (Even `VARCHAR` columns are stored as fixed-width columns.) There is a 16-byte overhead on each record; an additional amount for each record is incurred because it is stored in a 32KB page with 128 byte page overhead (see below). There is also a small amount wasted per page due to the fact that each record is stored in only one page. The maximum record size is currently 8052 bytes.

The memory space defined by `DataMemory` is also used to store ordered indexes, which use about 10 bytes per record. Each table row is represented in the ordered index. A common error among users is to assume that all indexes are stored in the memory allocated by `IndexMemory`, but this is not the case: Only primary key and unique hash indexes use this memory; ordered indexes use the memory allocated by `DataMemory`. However, creating a primary key or unique hash index also creates an ordered index on the same keys, unless you specify `USING HASH` in the index creation statement. This can be verified by running `ndb_desc -d db_name table_name` in the management client.

The memory space allocated by `DataMemory` consists of 32KB pages, which are allocated to table fragments. Each table is normally partitioned into the same number of fragments as there are data nodes in the cluster. Thus, for each node, there are the same number of fragments as are set in `NoOfReplicas`.

Once a page has been allocated, it is currently not possible to return it to the pool of free pages, except by deleting the table. (This also means that `DataMemory` pages, once allocated to a given table, cannot be used by other tables.) Performing a node recovery also compresses the partition because all records are inserted into empty partitions from other live nodes.

The `DataMemory` memory space also contains UNDO information: For each update, a copy of the unaltered record is allocated in the `DataMemory`. There is also a reference to each copy in the ordered table indexes. Unique hash indexes are updated only when the unique index columns are updated, in which case a new entry in the index table is inserted and the old entry is deleted upon commit. For this reason, it is also necessary to allocate enough memory to handle the largest transactions performed by applications using the cluster. In any case, performing a few large transactions holds no advantage over using many smaller ones, for the following reasons:

- Large transactions are not any faster than smaller ones
- Large transactions increase the number of operations that are lost and must be repeated in event of transaction failure

- Large transactions use more memory

The default value for `DataMemory` is 80MB; the minimum is 1MB. There is no maximum size, but in reality the maximum size has to be adapted so that the process does not start swapping when the limit is reached. This limit is determined by the amount of physical RAM available on the machine and by the amount of memory that the operating system may commit to any one process. 32-bit operating systems are generally limited to 2–4GB per process; 64-bit operating systems can use more. For large databases, it may be preferable to use a 64-bit operating system for this reason. In addition, it is also possible to run more than one `ndbd` process per machine, and this may prove advantageous on machines with multiple CPUs.

- `IndexMemory`

This parameter controls the amount of storage used for hash indexes in MySQL Cluster. Hash indexes are always used for primary key indexes, unique indexes, and unique constraints. Note that when defining a primary key and a unique index, two indexes will be created, one of which is a hash index used for all tuple accesses as well as lock handling. It is also used to enforce unique constraints.

The size of the hash index is 25 bytes per record, plus the size of the primary key. For primary keys larger than 32 bytes another 8 bytes is added.

The default value for `IndexMemory` is 18MB. The minimum is 1MB.

- `StringMemory`

This parameter determines how much memory is allocated for strings such as table names, and is specified in an `[NDBD]` or `[NDBD DEFAULT]` section of the `config.ini` file. A value between 0 and 100 inclusive is interpreted as a percent of the maximum default value, which is calculated based on a number of factors including the number of tables, maximum table name size, maximum size of `.FRM` files, `MaxNoOfTriggers`, maximum column name size, and maximum default column value. In general it is safe to assume that the maximum default value is approximately 5 MB for a MySQL Cluster having 1000 tables.

A value greater than 100 is interpreted as a number of bytes.

In MySQL 4.1, the default value is 100 — that is, 100 percent of the default maximum, or roughly 5 MB. It is possible to reduce this value safely, but it should never be less than 5 percent. If you encounter Error 773 Out of string memory, please modify `StringMemory` config parameter: Permanent error: Schema error, this means that means that you have set the `StringMemory` value too low. 25 (25 percent) is not excessive, and should prevent this error from recurring in all but the most extreme conditions, as when there are hundreds or thousands of `NDB` tables with names whose lengths and columns whose number approach their permitted maximums.

The following example illustrates how memory is used for a table. Consider this table definition:

```
CREATE TABLE example (
  a INT NOT NULL,
  b INT NOT NULL,
  c INT NOT NULL,
  PRIMARY KEY(a),
  UNIQUE(b)
) ENGINE=NDBCLUSTER;
```

For each record, there are 12 bytes of data plus 12 bytes overhead. Having no nullable columns saves 4 bytes of overhead. In addition, we have two ordered indexes on columns `a` and `b` consuming roughly 10

bytes each per record. There is a primary key hash index on the base table using roughly 29 bytes per record. The unique constraint is implemented by a separate table with `b` as primary key and `a` as a column. This other table consumes an additional 29 bytes of index memory per record in the `example` table as well 8 bytes of record data plus 12 bytes of overhead.

Thus, for one million records, we need 58MB for index memory to handle the hash indexes for the primary key and the unique constraint. We also need 64MB for the records of the base table and the unique index table, plus the two ordered index tables.

You can see that hash indexes takes up a fair amount of memory space; however, they provide very fast access to the data in return. They are also used in MySQL Cluster to handle uniqueness constraints.

Currently, the only partitioning algorithm is hashing and ordered indexes are local to each node. Thus, ordered indexes cannot be used to handle uniqueness constraints in the general case.

An important point for both `IndexMemory` and `DataMemory` is that the total database size is the sum of all data memory and all index memory for each node group. Each node group is used to store replicated information, so if there are four nodes with two replicas, there will be two node groups. Thus, the total data memory available is  $2 \times \text{DataMemory}$  for each data node.

It is highly recommended that `DataMemory` and `IndexMemory` be set to the same values for all nodes. Data distribution is even over all nodes in the cluster, so the maximum amount of space available for any node can be no greater than that of the smallest node in the cluster.

`DataMemory` and `IndexMemory` can be changed, but decreasing either of these can be risky; doing so can easily lead to a node or even an entire MySQL Cluster that is unable to restart due to there being insufficient memory space. Increasing these values should be acceptable, but it is recommended that such upgrades are performed in the same manner as a software upgrade, beginning with an update of the configuration file, and then restarting the management server followed by restarting each data node in turn.

Updates do not increase the amount of index memory used. Inserts take effect immediately; however, rows are not actually deleted until the transaction is committed.

### Transaction Parameters

The next three `[NDBD]` parameters that we discuss are important because they affect the number of parallel transactions and the sizes of transactions that can be handled by the system. `MaxNoOfConcurrentTransactions` sets the number of parallel transactions possible in a node. `MaxNoOfConcurrentOperations` sets the number of records that can be in update phase or locked simultaneously.

Both of these parameters (especially `MaxNoOfConcurrentOperations`) are likely targets for users setting specific values and not using the default value. The default value is set for systems using small transactions, to ensure that these do not use excessive memory.

- `MaxNoOfConcurrentTransactions`

For each active transaction in the cluster there must be a record in one of the cluster nodes. The task of coordinating transactions is spread among the nodes. The total number of transaction records in the cluster is the number of transactions in any given node times the number of nodes in the cluster.

Transaction records are allocated to individual MySQL servers. Normally, there is at least one transaction record allocated per connection that using any table in the cluster. For this reason, one should ensure that there are more transaction records in the cluster than there are concurrent connections to all MySQL servers in the cluster.

This parameter must be set to the same value for all cluster nodes.

Changing this parameter is never safe and doing so can cause a cluster to crash. When a node crashes, one of the nodes (actually the oldest surviving node) will build up the transaction state of all transactions ongoing in the crashed node at the time of the crash. It is thus important that this node has as many transaction records as the failed node.

The default value is 4096.

- 

#### `MaxNoOfConcurrentOperations`

It is a good idea to adjust the value of this parameter according to the size and number of transactions. When performing transactions of only a few operations each and not involving a great many records, there is no need to set this parameter very high. When performing large transactions involving many records need to set this parameter higher.

Records are kept for each transaction updating cluster data, both in the transaction coordinator and in the nodes where the actual updates are performed. These records contain state information needed to find UNDO records for rollback, lock queues, and other purposes.

This parameter should be set to the number of records to be updated simultaneously in transactions, divided by the number of cluster data nodes. For example, in a cluster which has four data nodes and which is expected to handle 1,000,000 concurrent updates using transactions, you should set this value to  $1000000 / 4 = 250000$ .

Read queries which set locks also cause operation records to be created. Some extra space is allocated within individual nodes to accommodate cases where the distribution is not perfect over the nodes.

When queries make use of the unique hash index, there are actually two operation records used per record in the transaction. The first record represents the read in the index table and the second handles the operation on the base table.

The default value is 32768.

This parameter actually handles two values that can be configured separately. The first of these specifies how many operation records are to be placed with the transaction coordinator. The second part specifies how many operation records are to be local to the database.

A very large transaction performed on an eight-node cluster requires as many operation records in the transaction coordinator as there are reads, updates, and deletes involved in the transaction. However, the operation records of the are spread over all eight nodes. Thus, if it is necessary to configure the system for one very large transaction, it is a good idea to configure the two parts separately. `MaxNoOfConcurrentOperations` will always be used to calculate the number of operation records in the transaction coordinator portion of the node.

It is also important to have an idea of the memory requirements for operation records. These consume about 1KB per record.

- 

#### `MaxNoOfLocalOperations`

By default, this parameter is calculated as  $1.1 \times \text{MaxNoOfConcurrentOperations}$ . This fits systems with many simultaneous transactions, none of them being very large. If there is a need to handle one very large transaction at a time and there are many nodes, it is a good idea to override the default value by explicitly specifying this parameter.

### Transaction Temporary Storage

The next set of [NDBD] parameters is used to determine temporary storage when executing a statement that is part of a Cluster transaction. All records are released when the statement is completed and the cluster is waiting for the commit or rollback.

The default values for these parameters are adequate for most situations. However, users with a need to support transactions involving large numbers of rows or operations may need to increase these values to enable better parallelism in the system, whereas users whose applications require relatively small transactions can decrease the values to save memory.

- `MaxNoOfConcurrentIndexOperations`

For queries using a unique hash index, another temporary set of operation records is used during a query's execution phase. This parameter sets the size of that pool of records. Thus, this record is allocated only while executing a part of a query. As soon as this part has been executed, the record is released. The state needed to handle aborts and commits is handled by the normal operation records, where the pool size is set by the parameter `MaxNoOfConcurrentOperations`.

The default value of this parameter is 8192. Only in rare cases of extremely high parallelism using unique hash indexes should it be necessary to increase this value. Using a smaller value is possible and can save memory if the DBA is certain that a high degree of parallelism is not required for the cluster.

- `MaxNoOfFiredTriggers`

The default value of `MaxNoOfFiredTriggers` is 4000, which is sufficient for most situations. In some cases it can even be decreased if the DBA feels certain the need for parallelism in the cluster is not high.

A record is created when an operation is performed that affects a unique hash index. Inserting or deleting a record in a table with unique hash indexes or updating a column that is part of a unique hash index fires an insert or a delete in the index table. The resulting record is used to represent this index table operation while waiting for the original operation that fired it to complete. This operation is short-lived but can still require a large number of records in its pool for situations with many parallel write operations on a base table containing a set of unique hash indexes.

- `TransactionBufferMemory`

The memory affected by this parameter is used for tracking operations fired when updating index tables and reading unique indexes. This memory is used to store the key and column information for these operations. It is only very rarely that the value for this parameter needs to be altered from the default.

The default value for `TransactionBufferMemory` is 1MB.

Normal read and write operations use a similar buffer, whose usage is even more short-lived. The compile-time parameter `ZATTRBUF_FILESIZE` (found in `ndb/src/kernel/blocks/Dbtc/Dbtc.hpp`) set to  $4000 \times 128$  bytes (500KB). A similar buffer for key information, `ZDATABUF_FILESIZE` (also in `Dbtc.hpp`) contains  $4000 \times 16 = 62.5$ KB of buffer space. `Dbtc` is the module that handles transaction coordination.

## Scans and Buffering

There are additional [NDBD] parameters in the `Dblqh` module (in `ndb/src/kernel/blocks/Dblqh/Dblqh.hpp`) that affect reads and updates. These include `ZAT-`

`TRINIBUF_FILESIZE`, set by default to 10000 × 128 bytes (1250KB) and `ZDATABUF_FILE_SIZE`, set by default to 10000\*16 bytes (roughly 156KB) of buffer space. To date, there have been neither any reports from users nor any results from our own extensive tests suggesting that either of these compile-time limits should be increased.

- `MaxNoOfConcurrentScans`

This parameter is used to control the number of parallel scans that can be performed in the cluster. Each transaction coordinator can handle the number of parallel scans defined for this parameter. Each scan query is performed by scanning all partitions in parallel. Each partition scan uses a scan record in the node where the partition is located, the number of records being the value of this parameter times the number of nodes. The cluster should be able to sustain `MaxNoOfConcurrentScans` scans concurrently from all nodes in the cluster.

Scans are actually performed in two cases. The first of these cases occurs when no hash or ordered indexes exists to handle the query, in which case the query is executed by performing a full table scan. The second case is encountered when there is no hash index to support the query but there is an ordered index. Using the ordered index means executing a parallel range scan. The order is kept on the local partitions only, so it is necessary to perform the index scan on all partitions.

The default value of `MaxNoOfConcurrentScans` is 256. The maximum value is 500.

This parameter specifies the number of scans possible in the transaction coordinator. If the number of local scan records is not provided, it is calculated as the product of `MaxNoOfConcurrentScans` and the number of data nodes in the system.

- `MaxNoOfLocalScans`

Specifies the number of local scan records if many scans are not fully parallelized.

- `BatchSizePerLocalScan`

This parameter is used to calculate the number of lock records which must be there to handle many concurrent scan operations.

The default value is 64; this value has a strong connection to the `ScanBatchSize` defined in the SQL nodes.

- `LongMessageBuffer`

This is an internal buffer used for passing messages within individual nodes and between nodes. Although it is highly unlikely that this would need to be changed, it is configurable. By default, it is set to 1MB.

## Logging and Checkpointing

These `[NDBD]` parameters control log and checkpoint behavior.

- `NoOfFragmentLogFiles`

This parameter sets the size of the node's REDO log files. REDO log files are organized in a ring. It is extremely important that the first and last log files (sometimes referred to as the “head” and “tail” log files, respectively) do not meet. When these approach one another too closely, the node begins

aborting all transactions encompassing updates due to a lack of room for new log records.

A REDO log record is not removed until three local checkpoints have been completed since that log record was inserted. Checkpointing frequency is determined by its own set of configuration parameters discussed elsewhere in this chapter.

How these parameters interact and proposals for how to configure them are discussed in [Section 15.4.6, “Configuring Parameters for Local Checkpoints”](#).

The default parameter value is 8, which means 8 sets of 4 16MB files for a total of 512MB. In other words, REDO log space must be allocated in blocks of 64MB. In scenarios requiring a great many updates, the value for `NoOfFragmentLogFiles` may need to be set as high as 300 or even higher to provide sufficient space for REDO logs.

If the checkpointing is slow and there are so many writes to the database that the log files are full and the log tail cannot be cut without jeopardizing recovery, all updating transactions are aborted with internal error code 410 (*Out of log file space temporarily*). This condition prevails until a checkpoint has completed and the log tail can be moved forward.

**Important:** This parameter cannot be changed “on the fly”; you must restart the node using `--initial`. If you wish to change this value for a running cluster, you can do so via a rolling node restart.

- `MaxNoOfOpenFiles`

This parameter sets a ceiling on how many internal threads to allocate for open files. *Any situation requiring a change in this parameter should be reported as a bug.*

The default value is 40.

- `MaxNoOfSavedMessages`

This parameter sets the maximum number of trace files that are kept before overwriting old ones. Trace files are generated when, for whatever reason, the node crashes.

The default is 25 trace files.

## Metadata Objects

The next set of `[NDBD]` parameters defines pool sizes for metadata objects, used to define the maximum number of attributes, tables, indexes, and trigger objects used by indexes, events, and replication between clusters. Note that these act merely as “suggestions” to the cluster, and any that are not specified revert to the default values shown.

- `MaxNoOfAttributes`

Defines the number of attributes that can be defined in the cluster.

The default value is 1000, with the minimum possible value being 32. The maximum is 4294967039. Each attribute consumes around 200 bytes of storage per node due to the fact that all metadata is fully replicated on the servers.

When setting `MaxNoOfAttributes`, it is important to prepare in advance for any `ALTER TABLE` statements that you might want to perform in the future. This is due to the fact, during the exe-

cution of `ALTER TABLE` on a Cluster table, 3 times the number of attributes as in the original table are used. For example, if a table requires 100 attributes, and you want to be able to alter it later, you need to set the value of `MaxNoOfAttributes` to 300. Assuming that you can create all desired tables without any problems, a good rule of thumb is to add two times the number of attributes in the largest table to `MaxNoOfAttributes` to be sure. You should also verify that this number is sufficient by trying an actual `ALTER TABLE` after configuring the parameter. If this is not successful, increase `MaxNoOfAttributes` by another multiple of the original value and test it again.

- `MaxNoOfTables`

A table object is allocated for each table, unique hash index, and ordered index. This parameter sets the maximum number of table objects for the cluster as a whole.

For each attribute that has a `BLOB` data type an extra table is used to store most of the `BLOB` data. These tables also must be taken into account when defining the total number of tables.

The default value of this parameter is 128. The minimum is 8 and the maximum is 1600. Each table object consumes approximately 20KB per node.

- `MaxNoOfOrderedIndexes`

For each ordered index in the cluster, an object is allocated describing what is being indexed and its storage segments. By default, each index so defined also defines an ordered index. Each unique index and primary key has both an ordered index and a hash index.

The default value of this parameter is 128. Each object consumes approximately 10KB of data per node.

- `MaxNoOfUniqueHashIndexes`

For each unique index that is not a primary key, a special table is allocated that maps the unique key to the primary key of the indexed table. By default, an ordered index is also defined for each unique index. To prevent this, you must specify the `USING HASH` option when defining the unique index.

The default value is 64. Each index consumes approximately 15KB per node.

- `MaxNoOfTriggers`

Internal update, insert, and delete triggers are allocated for each unique hash index. (This means that three triggers are created for each unique hash index.) However, an *ordered* index requires only a single trigger object. Backups also use three trigger objects for each normal table in the cluster.

This parameter sets the maximum number of trigger objects in the cluster.

The default value is 768.

- `MaxNoOfIndexes`

This parameter was deprecated in MySQL 4.1.5. In MySQL 4.1.6 and newer versions, you should use `MaxNoOfOrderedIndexes` and `MaxNoOfUniqueHashIndexes` instead.

This parameter is used only by unique hash indexes. There needs to be one record in this pool for each unique hash index defined in the cluster.

The default value of this parameter is 128.

## Boolean Parameters

The behavior of data nodes is also affected by a set of [NDBD] parameters taking on boolean values. These parameters can each be specified as `TRUE` by setting them equal to `1` or `Y`, and as `FALSE` by setting them equal to `0` or `N`.

- `LockPagesInMainMemory`

For a number of operating systems, including Solaris and Linux, it is possible to lock a process into memory and so avoid any swapping to disk. This can be used to help guarantee the cluster's real-time characteristics.

This feature is disabled by default.

- `StopOnError`

This parameter specifies whether an `ndbd` process should exit or perform an automatic restart when an error condition is encountered.

This feature is enabled by default.

- `Diskless`

It is possible to specify MySQL Cluster tables as *diskless*, meaning that tables are not checkpointed to disk and that no logging occurs. Such tables exist only in main memory. A consequence of using diskless tables is that neither the tables nor the records in those tables survive a crash. However, when operating in diskless mode, it is possible to run `ndbd` on a diskless computer.

**Important:** This feature causes the *entire* cluster to operate in diskless mode.

When this feature is enabled, Cluster online backup is disabled. In addition, a partial start of the cluster is not possible.

`Diskless` is disabled by default.

- `RestartOnErrorInsert`

This feature is accessible only when building the debug version where it is possible to insert errors in the execution of individual blocks of code as part of testing.

This feature is disabled by default.

## Controlling Timeouts, Intervals, and Disk Paging

There are a number of [NDBD] parameters specifying timeouts and intervals between various actions in Cluster data nodes. Most of the timeout values are specified in milliseconds. Any exceptions to this are mentioned where applicable.

- `TimeBetweenWatchDogCheck`

To prevent the main thread from getting stuck in an endless loop at some point, a “watchdog” thread checks the main thread. This parameter specifies the number of milliseconds between checks. If the

process remains in the same state after three checks, the watchdog thread terminates it.

This parameter can easily be changed for purposes of experimentation or to adapt to local conditions. It can be specified on a per-node basis although there seems to be little reason for doing so.

The default timeout is 4000 milliseconds (4 seconds).

- `StartPartialTimeout`

This parameter specifies how long the Cluster waits for all data nodes to come up before the cluster initialization routine is invoked. This timeout is used to avoid a partial Cluster startup whenever possible.

The default value is 30000 milliseconds (30 seconds). 0 disables the timeout. In other words, the cluster may start only if all nodes are available.

- `StartPartitionedTimeout`

If the cluster is ready to start after waiting for `StartPartialTimeout` milliseconds but is still possibly in a partitioned state, the cluster waits until this timeout has also passed.

The default timeout is 60000 milliseconds (60 seconds).

- `StartFailureTimeout`

If a data node has not completed its startup sequence within the time specified by this parameter, the node startup fails. Setting this parameter to 0 (the default value) means that no data node timeout is applied.

For nonzero values, this parameter is measured in milliseconds. For data nodes containing extremely large amounts of data, this parameter should be increased. For example, in the case of a data node containing several gigabytes of data, a period as long as 10–15 minutes (that is, 600000 to 1000000 milliseconds) might be required to to perform a node restart.

- `HeartbeatIntervalDbDb`

One of the primary methods of discovering failed nodes is by the use of heartbeats. This parameter states how often heartbeat signals are sent and how often to expect to receive them. After missing three heartbeat intervals in a row, the node is declared dead. Thus, the maximum time for discovering a failure through the heartbeat mechanism is four times the heartbeat interval.

The default heartbeat interval is 1500 milliseconds (1.5 seconds). This parameter must not be changed drastically and should not vary widely between nodes. If one node uses 5000 milliseconds and the node watching it uses 1000 milliseconds, obviously the node will be declared dead very quickly. This parameter can be changed during an online software upgrade, but only in small increments.

- `HeartbeatIntervalDbApi`

Each data node sends heartbeat signals to each MySQL server (SQL node) to ensure that it remains in contact. If a MySQL server fails to send a heartbeat in time it is declared “dead,” in which case all ongoing transactions are completed and all resources released. The SQL node cannot reconnect until all activities initiated by the previous MySQL instance have been completed. The three-heartbeat cri-

teria for this determination are the same as described for [HeartbeatIntervalDbDb](#).

The default interval is 1500 milliseconds (1.5 seconds). This interval can vary between individual data nodes because each data node watches the MySQL servers connected to it, independently of all other data nodes.

- [TimeBetweenLocalCheckpoints](#)

This parameter is an exception in that it does not specify a time to wait before starting a new local checkpoint; rather, it is used to ensure that local checkpoints are not performed in a cluster where relatively few updates are taking place. In most clusters with high update rates, it is likely that a new local checkpoint is started immediately after the previous one has been completed.

The size of all write operations executed since the start of the previous local checkpoints is added. This parameter is also exceptional in that it is specified as the base-2 logarithm of the number of 4-byte words, so that the default value 20 means 4MB ( $4 \times 2^{20}$ ) of write operations, 21 would mean 8MB, and so on up to a maximum value of 31, which equates to 8GB of write operations.

All the write operations in the cluster are added together. Setting [TimeBetweenLocalCheckpoints](#) to 6 or less means that local checkpoints will be executed continuously without pause, independent of the cluster's workload.

- [TimeBetweenGlobalCheckpoints](#)

When a transaction is committed, it is committed in main memory in all nodes on which the data is mirrored. However, transaction log records are not flushed to disk as part of the commit. The reasoning behind this behavior is that having the transaction safely committed on at least two autonomous host machines should meet reasonable standards for durability.

It is also important to ensure that even the worst of cases — a complete crash of the cluster — is handled properly. To guarantee that this happens, all transactions taking place within a given interval are put into a global checkpoint, which can be thought of as a set of committed transactions that has been flushed to disk. In other words, as part of the commit process, a transaction is placed in a global checkpoint group. Later, this group's log records are flushed to disk, and then the entire group of transactions is safely committed to disk on all computers in the cluster.

This parameter defines the interval between global checkpoints. The default is 2000 milliseconds.

- [TimeBetweenInactiveTransactionAbortCheck](#)

Timeout handling is performed by checking a timer on each transaction once for every interval specified by this parameter. Thus, if this parameter is set to 1000 milliseconds, every transaction will be checked for timing out once per second.

The default value is 1000 milliseconds (1 second).

- [TransactionInactiveTimeout](#)

This parameter states the maximum time that is permitted to lapse between operations in the same transaction before the transaction is aborted.

The default for this parameter is zero (no timeout). For a real-time database that needs to ensure that no transaction keeps locks for too long, this parameter should be set to a much smaller value. The unit is milliseconds.

- [TransactionDeadlockDetectionTimeout](#)

When a node executes a query involving a transaction, the node waits for the other nodes in the cluster to respond before continuing. A failure to respond can occur for any of the following reasons:

- The node is “dead”
- The operation has entered a lock queue
- The node requested to perform the action could be heavily overloaded.

This timeout parameter states how long the transaction coordinator waits for query execution by another node before aborting the transaction, and is important for both node failure handling and deadlock detection. Setting it too high can cause a undesirable behavior in situations involving deadlocks and node failure.

The default timeout value is 1200 milliseconds (1.2 seconds).

- [NoOfDiskPagesToDiskAfterRestartTUP](#)

When executing a local checkpoint, the algorithm flushes all data pages to disk. Merely doing so as quickly as possible without any moderation is likely to impose excessive loads on processors, networks, and disks. To control the write speed, this parameter specifies how many pages per 100 milliseconds are to be written. In this context, a “page” is defined as 8KB. This parameter is specified in units of 80KB per second, so , setting [NoOfDiskPagesToDiskAfterRestartTUP](#) to a value of 20 entails writing 1.6MB in data pages to disk each second during a local checkpoint. This value includes the writing of UNDO log records for data pages. That is, this parameter handles the limitation of writes from data memory. UNDO log records for index pages are handled by the parameter [NoOfDiskPagesToDiskAfterRestartACC](#). (See the entry for [IndexMemory](#) for information about index pages.)

In short, this parameter specifies how quickly to execute local checkpoints. It operates in conjunction with [NoOfFragmentLogFiles](#), [DataMemory](#), and [IndexMemory](#).

For more information about the interaction between these parameters and possible strategies for choosing appropriate values for them, see [Section 15.4.6, “Configuring Parameters for Local Checkpoints”](#).

The default value is 40 (3.2MB of data pages per second).

- [NoOfDiskPagesToDiskAfterRestartACC](#)

This parameter uses the same units as [NoOfDiskPagesToDiskAfterRestartTUP](#) and acts in a similar fashion, but limits the speed of writing index pages from index memory.

The default value of this parameter is 20 (1.6MB of index memory pages per second).

- [NoOfDiskPagesToDiskDuringRestartTUP](#)

This parameter is used in a fashion similar to [NoOfDiskPagesToDiskAfterRestartTUP](#) and [NoOfDiskPagesToDiskAfterRestartACC](#), only it does so with regard to local checkpoints executed in the node when a node is restarting. A local checkpoint is always performed as part of all node restarts. During a node restart it is possible to write to disk at a higher speed than at other times, because fewer activities are being performed in the node.

This parameter covers pages written from data memory.

The default value is 40 (3.2MB per second).

- [NoOfDiskPagesToDiskDuringRestartACC](#)

Controls the number of index memory pages that can be written to disk during the local checkpoint phase of a node restart.

As with [NoOfDiskPagesToDiskAfterRestartTUP](#) and [NoOfDiskPagesToDiskAfterRestartACC](#), values for this parameter are expressed in terms of 8KB pages written per 100 milliseconds (80KB/second).

The default value is 20 (1.6MB per second).

- [ArbitrationTimeout](#)

This parameter specifies how long data nodes wait for a response from the arbitrator to an arbitration message. If this is exceeded, the network is assumed to have split.

The default value is 1000 milliseconds (1 second).

## Buffering and Logging

Several [\[NDBD\]](#) configuration parameters corresponding to former compile-time parameters were introduced in MySQL 4.1.5. These enable the advanced user to have more control over the resources used by node processes and to adjust various buffer sizes at need.

These buffers are used as front ends to the file system when writing log records to disk. If the node is running in diskless mode, these parameters can be set to their minimum values without penalty due to the fact that disk writes are “faked” by the [NDB](#) storage engine's filesystem abstraction layer.

- [UndoIndexBuffer](#)

The UNDO index buffer, whose size is set by this parameter, is used during local checkpoints. The [NDB](#) storage engine uses a recovery scheme based on checkpoint consistency in conjunction with an operational REDO log. To produce a consistent checkpoint without blocking the entire system for writes, UNDO logging is done while performing the local checkpoint. UNDO logging is activated on a single table fragment at a time. This optimization is possible because tables are stored entirely in main memory.

The UNDO index buffer is used for the updates on the primary key hash index. Inserts and deletes rearrange the hash index; the [NDB](#) storage engine writes UNDO log records that map all physical changes to an index page so that they can be undone at system restart. It also logs all active insert operations for each fragment at the start of a local checkpoint.

Reads and updates set lock bits and update a header in the hash index entry. These changes are handled by the page-writing algorithm to ensure that these operations need no UNDO logging.

This buffer is 2MB by default. The minimum value is 1MB, which is sufficient for most applications. For applications doing extremely large or numerous inserts and deletes together with large transactions and large primary keys, it may be necessary to increase the size of this buffer. If this buffer is too small, the [NDB](#) storage engine issues internal error code 677 ([Index UNDO buf-](#)

fers overloaded).

**Important:** It is not safe to decrease the value of this parameter during a rolling restart.

- 

#### UndoDataBuffer

This parameter sets the size of the UNDO data buffer, which performs a function similar to that of the UNDO index buffer, except the UNDO data buffer is used with regard to data memory rather than index memory. This buffer is used during the local checkpoint phase of a fragment for inserts, deletes, and updates.

Because UNDO log entries tend to grow larger as more operations are logged, this buffer is also larger than its index memory counterpart, with a default value of 16MB.

This amount of memory may be unnecessarily large for some applications. In such cases, it is possible to decrease this size to a minimum of 1MB.

It is rarely necessary to increase the size of this buffer. If there is such a need, it is a good idea to check whether the disks can actually handle the load caused by database update activity. A lack of sufficient disk space cannot be overcome by increasing the size of this buffer.

If this buffer is too small and gets congested, the NDB storage engine issues internal error code 891 (Data UNDO buffers overloaded).

**Important:** It is not safe to decrease the value of this parameter during a rolling restart.

- 

#### RedoBuffer

All update activities also need to be logged. The REDO log makes it possible to replay these updates whenever the system is restarted. The NDB recovery algorithm uses a “fuzzy” checkpoint of the data together with the UNDO log, and then applies the REDO log to play back all changes up to the restoration point.

`RedoBuffer` sets the size of the buffer in which the REDO log is written, and is 8MB by default. The minimum value is 1MB.

If this buffer is too small, the NDB storage engine issues error code 1221 (`REDO log buffers overloaded`).

**Important:** It is not safe to decrease the value of this parameter during a rolling restart.

### Controlling Log Messages

In managing the cluster, it is very important to be able to control the number of log messages sent for various event types to `stdout`. For each event category, there are 16 possible event levels (numbered 0 through 15). Setting event reporting for a given event category to level 15 means all event reports in that category are sent to `stdout`; setting it to 0 means that there will be no event reports made in that category.

By default, only the startup message is sent to `stdout`, with the remaining event reporting level defaults being set to 0. The reason for this is that these messages are also sent to the management server's cluster log.

An analogous set of levels can be set for the management client to determine which event levels to record in the cluster log.

- `LogLevelStartup`  
The reporting level for events generated during startup of the process.  
The default level is 1.
- `LogLevelShutdown`  
The reporting level for events generated as part of graceful shutdown of a node.  
The default level is 0.
- `LogLevelStatistic`  
The reporting level for statistical events such as number of primary key reads, number of updates, number of inserts, information relating to buffer usage, and so on.  
The default level is 0.
- `LogLevelCheckpoint`  
The reporting level for events generated by local and global checkpoints.  
The default level is 0.
- `LogLevelNodeRestart`  
The reporting level for events generated during node restart.  
The default level is 0.
- `LogLevelConnection`  
The reporting level for events generated by connections between cluster nodes.  
The default level is 0.
- `LogLevelError`  
The reporting level for events generated by errors and warnings by the cluster as a whole. These errors do not cause any node failure but are still considered worth reporting.  
The default level is 0.
- `LogLevelInfo`  
The reporting level for events generated for information about the general state of the cluster.  
The default level is 0.

## Backup Parameters

The [NDBD] parameters discussed in this section define memory buffers set aside for execution of on-line backups.

- [BackupDataBufferSize](#)

In creating a backup, there are two buffers used for sending data to the disk. The backup data buffer is used to fill in data recorded by scanning a node's tables. Once this buffer has been filled to the level specified as [BackupWriteSize](#) (see below), the pages are sent to disk. While flushing data to disk, the backup process can continue filling this buffer until it runs out of space. When this happens, the backup process pauses the scan and waits until some disk writes have completed freed up memory so that scanning may continue.

The default value is 2MB.

- [BackupLogBufferSize](#)

The backup log buffer fulfills a role similar to that played by the backup data buffer, except that it is used for generating a log of all table writes made during execution of the backup. The same principles apply for writing these pages as with the backup data buffer, except that when there is no more space in the backup log buffer, the backup fails. For that reason, the size of the backup log buffer must be large enough to handle the load caused by write activities while the backup is being made. See [Section 15.8.4, “Configuration for Cluster Backup”](#).

The default value for this parameter should be sufficient for most applications. In fact, it is more likely for a backup failure to be caused by insufficient disk write speed than it is for the backup log buffer to become full. If the disk subsystem is not configured for the write load caused by applications, the cluster is unlikely to be able to perform the desired operations.

It is preferable to configure cluster nodes in such a manner that the processor becomes the bottleneck rather than the disks or the network connections.

The default value is 2MB.

- [BackupMemory](#)

This parameter is simply the sum of [BackupDataBufferSize](#) and [BackupLogBufferSize](#).

The default value is  $2\text{MB} + 2\text{MB} = 4\text{MB}$ .

**Important:** If [BackupDataBufferSize](#) and [BackupLogBufferSize](#) taken together exceed 4MB, then this parameter must be set explicitly in the `config.ini` file to their sum.

- [BackupWriteSize](#)

This parameter specifies the default size of messages written to disk by the backup log and backup data buffers.

- [BackupMaxWriteSize](#)

This parameter specifies the maximum size of messages written to disk by the backup log and backup data buffers.

The default value is 256KB.

**Important:** When specifying these parameters, the following relationships must hold true. Otherwise, the data node will be unable to start.

- `BackupDataBufferSize >= BackupWriteSize + 188KB`
- `BackupLogBufferSize >= BackupWriteSize + 16KB`
- `BackupMaxWriteSize >= BackupWriteSize`

### 15.4.4.6. Defining SQL and Other API Nodes

The `[MYSQLD]` and `[API]` sections in the `config.ini` file define the behavior of the MySQL servers (SQL nodes) and other applications (API nodes) used to access cluster data. None of the parameters shown is required. If no computer or host name is provided, any host can use this SQL or API node.

Generally speaking, a `[MYSQLD]` section is used to indicate a MySQL server providing an SQL interface to the cluster, and an `[API]` section is used for applications other than `mysqld` processes accessing cluster data, but the two designations are actually synonymous; you can, for instance, list parameters for a MySQL server acting as an SQL node in an `[API]` section.

- `Id`

The `Id` value is used to identify the node in all cluster internal messages. It must be an integer in the range 1 to 63 inclusive, and must be unique among all node IDs within the cluster.
- `ExecuteOnComputer`

This refers to the `Id` set for one of the computers (hosts) defined in a `[COMPUTER]` section of the configuration file.
- `HostName`

Specifying this parameter defines the hostname of the computer on which the SQL node (API node) is to reside. To specify a hostname other than `localhost`, either this parameter or `ExecuteOnComputer` is required.
- `ArbitrationRank`

This parameter defines which nodes can act as arbitrators. Both MGM nodes and SQL nodes can be arbitrators. A value of 0 means that the given node is never used as an arbitrator, a value of 1 gives the node high priority as an arbitrator, and a value of 2 gives it low priority. A normal configuration uses the management server as arbitrator, setting its `ArbitrationRank` to 1 (the default) and those for all SQL nodes to 0.
- `ArbitrationDelay`

Setting this parameter to any other value than 0 (the default) means that responses by the arbitrator to arbitration requests will be delayed by the stated number of milliseconds. It is usually not necessary to change this value.
-

### BatchByteSize

For queries that are translated into full table scans or range scans on indexes, it is important for best performance to fetch records in properly sized batches. It is possible to set the proper size both in terms of number of records ([BatchSize](#)) and in terms of bytes ([BatchByteSize](#)). The actual batch size is limited by both parameters.

The speed at which queries are performed can vary by more than 40% depending upon how this parameter is set. In future releases, MySQL Server will make educated guesses on how to set parameters relating to batch size, based on the query type.

This parameter is measured in bytes and by default is equal to 32KB.

- 

### BatchSize

This parameter is measured in number of records and is by default set to 64. The maximum size is 992.

- 

### MaxScanBatchSize

The batch size is the size of each batch sent from each data node. Most scans are performed in parallel to protect the MySQL Server from receiving too much data from many nodes in parallel; this parameter sets a limit to the total batch size over all nodes.

The default value of this parameter is set to 256KB. Its maximum size is 16MB.

You can obtain some information from a MySQL server running as a Cluster SQL node using [SHOW STATUS](#) in the `mysql` client, as shown here:

```
mysql> SHOW STATUS LIKE 'ndb%';
+-----+-----+
| Variable_name | Value |
+-----+-----+
| Ndb_cluster_node_id | 5 |
| Ndb_config_from_host | 192.168.0.112 |
| Ndb_config_from_port | 1186 |
| Ndb_number_of_storage_nodes | 4 |
+-----+-----+
4 rows in set (0.02 sec)
```

For information about these Cluster system status variables, see [Section 5.2.4, “Status Variables”](#).

## 15.4.4.7. Cluster TCP/IP Connections

TCP/IP is the default transport mechanism for establishing connections in MySQL Cluster. It is normally not necessary to define connections because Cluster automatically set ups a connection between each of the data nodes, between each data node and all MySQL server nodes, and between each data node and the management server. (For one exception to this rule, see [Section 15.4.4.8, “TCP/IP Connections Using Direct Connections”](#).) [TCP] sections in the `config.ini` file explicitly define TCP/IP connections between nodes in the cluster.

It is only necessary to define a connection to override the default connection parameters. In that case, it is necessary to define at least `NodeId1`, `NodeId2`, and the parameters to change.

It is also possible to change the default values for these parameters by setting them in the [TCP DEFAULT] section.

- `NodeId1, NodeId2`

To identify a connection between two nodes it is necessary to provide their node IDs in the `[TCP]` section of the configuration file. These are the same unique `Id` values for each of these nodes as described in [Section 15.4.4.6, “Defining SQL and Other API Nodes”](#).

- `SendBufferMemory`

TCP transporters use a buffer to store all messages before performing the send call to the operating system. When this buffer reaches 64KB its contents are sent; these are also sent when a round of messages have been executed. To handle temporary overload situations it is also possible to define a bigger send buffer. The default size of the send buffer is 256KB.

- `SendSignalId`

To be able to retrace a distributed message datagram, it is necessary to identify each message. When this parameter is set to `Y`, message IDs are transported over the network. This feature is disabled by default.

- `Checksum`

This parameter is a boolean parameter (enabled by setting it to `Y` or `1`, disabled by setting it to `N` or `0`). It is disabled by default. When it is enabled, checksums for all messages are calculated before they placed in the send buffer. This feature ensures that messages are not corrupted while waiting in the send buffer, or by the transport mechanism.

- `PortNumber` (*OBSOLETE*)

This formerly specified the port number to be used for listening for connections from other nodes. This parameter should no longer be used.

- `ReceiveBufferMemory`

Specifies the size of the buffer used when receiving data from the TCP/IP socket. There is seldom any need to change this parameter from its default value of 64KB, except possibly to save memory.

### 15.4.4.8. TCP/IP Connections Using Direct Connections

Setting up a cluster using direct connections between data nodes requires specifying explicitly the crossover IP addresses of the data nodes so connected in the `[TCP]` section of the cluster `config.ini` file.

In the following example, we envision a cluster with at least four hosts, one each for a management server, an SQL node, and two data nodes. The cluster as a whole resides on the `172.23.72.*` subnet of a LAN. In addition to the usual network connections, the two data nodes are connected directly using a standard crossover cable, and communicate with one another directly using IP addresses in the `1.1.0.*` address range as shown:

```
# Management Server
[NDB_MGMD]
Id=1
HostName=172.23.72.20

# SQL Node
[MYSQLD]
```

```

Id=2
HostName=172.23.72.21

# Data Nodes
[NDBD]
Id=3
HostName=172.23.72.22

[NDBD]
Id=4
HostName=172.23.72.23

# TCP/IP Connections
[TCP]
NodeId1=3
NodeId2=4
HostName1=1.1.0.1
HostName2=1.1.0.2

```

The `HostName $N$`  parameter, where  $N$  is an integer, is used only when specifying direct TCP/IP connections.

The use of direct connections between data nodes can improve the cluster's overall efficiency by allowing the data nodes to bypass an Ethernet device such as a switch, hub, or router, thus cutting down on the cluster's latency. It is important to note that to take the best advantage of direct connections in this fashion with more than two data nodes, you must have a direct connection between each data node and every other data node in the same node group.

### 15.4.4.9. Shared-Memory Connections

Beginning with MySQL 4.1.9-max, MySQL Cluster will attempt to use the shared memory transporter and configure it automatically where possible. (In previous versions of MySQL Cluster, shared memory segments functioned only when the `-max` binary was built using `--with-ndb-shm`.) [SHM] sections in the `config.ini` file explicitly define shared-memory connections between nodes in the cluster. When explicitly defining shared memory as the connection method, it is necessary to define at least `NodeId1`, `NodeId2` and `ShmKey`. All other parameters have default values that should work well in most cases.

**Important:** *SHM functionality is considered experimental only.* It is not officially supported in MySQL 4.1. This means that you must determine for yourself or by using our free resources (forums, mailing lists) whether it can be made to work correctly in your specific case.

- `NodeId1`, `NodeId2`

To identify a connection between two nodes it is necessary to provide node identifiers for each of them, as `NodeId1` and `NodeId2`.

- `ShmKey`

When setting up shared memory segments, a node ID, expressed as an integer, is used to identify uniquely the shared memory segment to use for the communication. There is no default value.

- `ShmSize`

Each SHM connection has a shared memory segment where messages between nodes are placed by the sender and read by the reader. The size of this segment is defined by `ShmSize`. The default value is 1MB.

-

### SendSignalId

To retrace the path of a distributed message, it is necessary to provide each message with a unique identifier. Setting this parameter to **Y** causes these message IDs to be transported over the network as well. This feature is disabled by default.

•

### Checksum

This parameter is a boolean (**Y/N**) parameter which is disabled by default. When it is enabled, checksums for all messages are calculated before being placed in the send buffer.

This feature prevents messages from being corrupted while waiting in the send buffer. It also serves as a check against data being corrupted during transport.

## 15.4.4.10. SCI Transport Connections

[**SCI**] sections in the `config.ini` file explicitly define SCI (Scalable Coherent Interface) connections between cluster nodes. Using SCI transporters in MySQL Cluster is supported only when the MySQL-Max binaries are built using `--with-ndb-sci=/your/path/to/SCI`. The `path` should point to a directory that contains at a minimum `lib` and `include` directories containing SISI libraries and header files. (See [Section 15.10, “Using High-Speed Interconnects with MySQL Cluster”](#) for more information about SCI.)

In addition, SCI requires specialized hardware.

It is strongly recommended to use SCI Transporters only for communication between `ndbd` processes. Note also that using SCI Transporters means that the `ndbd` processes never sleep. For this reason, SCI Transporters should be used only on machines having at least two CPUs dedicated for use by `ndbd` processes. There should be at least one CPU per `ndbd` process, with at least one CPU left in reserve to handle operating system activities.

•

### NodeId1, NodeId2

To identify a connection between two nodes it is necessary to provide node identifiers for each of them, as `NodeId1` and `NodeId2`.

•

### Host1SciId0

This identifies the SCI node ID on the first Cluster node (identified by `NodeId1`).

•

### Host1SciId1

It is possible to set up SCI Transporters for failover between two SCI cards which then should use separate networks between the nodes. This identifies the node ID and the second SCI card to be used on the first node.

•

### Host2SciId0

This identifies the SCI node ID on the second Cluster node (identified by `NodeId2`).

•

### Host2SciId1

When using two SCI cards to provide failover, this parameter identifies the second SCI card to be

used on the second node.

- **SharedBufferSize**  
Each SCI transporter has a shared memory segment used for communication between the two nodes. Setting the size of this segment to the default value of 1MB should be sufficient for most applications. Using a smaller value can lead to problems when performing many parallel inserts; if the shared buffer is too small, this can also result in a crash of the `ndbd` process.
- **SendLimit**  
A small buffer in front of the SCI media stores messages before transmitting them over the SCI network. By default, this is set to 8KB. Our benchmarks show that performance is best at 64KB but 16KB reaches within a few percent of this, and there was little if any advantage to increasing it beyond 8KB.
- **SendSignalId**  
To trace a distributed message it is necessary to identify each message uniquely. When this parameter is set to `Y`, message IDs are transported over the network. This feature is disabled by default.
- **Checksum**  
This parameter is a boolean value, and is disabled by default. When `Checksum` is enabled, checksums are calculated for all messages before they are placed in the send buffer. This feature prevents messages from being corrupted while waiting in the send buffer. It also serves as a check against data being corrupted during transport.

## 15.4.5. Overview of Cluster Configuration Parameters

The next three sections provide summary tables of MySQL Cluster configuration parameters used in the `config.ini` file to govern the cluster's functioning. Each table lists the parameters for one of the Cluster node process types (`ndbd`, `ndb_mgmd`, and `mysqld`), and includes the parameter's type as well as its default, minimum, and maximum values as applicable.

It is also stated what type of restart is required (node restart or system restart) — and whether the restart must be done with `--initial` — to change the value of a given configuration parameter. This information is provided in each table's **Restart Type** column, which contains one of the values shown in this list:

- **N**: Node Restart
- **IN**: Initial Node Restart
- **S**: System Restart
- **IS**: Initial System Restart

When performing a node restart or an initial node restart, all of the cluster's data nodes must be restarted in turn (also referred to as a *rolling restart*). It is possible to update cluster configuration parameters marked **N** or **IN** online — that is, without shutting down the cluster — in this fashion. An initial node re-

start requires restarting each `ndbd` process with the `--initial` option.

A system restart requires a complete shutdown and restart of the entire cluster. An initial system restart requires taking a backup of the cluster, wiping the cluster filesystem after shutdown, and then restoring from the backup following the restart.

In any cluster restart, all of the cluster's management servers must be restarted in order for them to read the updated configuration parameter values.

**Important:** Values for numeric cluster parameters can generally be increased without any problems, although it is advisable to do so progressively, making such adjustments in relatively small increments. However, decreasing the values of such parameters — particularly those relating to memory usage and disk space — is not to be undertaken lightly, and it is recommended that you do so only following careful planning and testing. In addition, it is generally the case that parameters relating to memory and disk usage which can be raised using a simple node restart require an initial node restart to be lowered.

Because some of these parameters can be used for configuring more than one type of cluster node, they may appear in more than one of the tables.

(Note that `4294967039` — which often appears as a maximum value in these tables — is equal to  $2^{32} - 2^8 - 1$ .)

### 15.4.5.1. Data Node Configuration Parameters

The following table provides information about parameters used in the `[NDBD]` or `[NDB_DEFAULT]` sections of a `config.ini` file for configuring MySQL Cluster data nodes. For detailed descriptions and other additional information about each of these parameters, see [Section 15.4.4.5, “Defining Data Nodes”](#).

#### *Restart Type Column Values*

- **N:** Node Restart
- **IN:** Initial Node Restart
- **S:** System Restart
- **IS:** Initial System Restart

See [Section 15.4.5, “Overview of Cluster Configuration Parameters”](#), for additional explanations of these abbreviations.

Parameter Name	Type/Units	Default Value	Minimum Value	Maximum Value	Restart Type
<code>ArbitrationTimeout</code>	milli-seconds	1000	10	4294967039	N
<code>BackupDataBufferSize</code>	bytes	2M	0	4294967039	N
<code>BackupDataDir</code>	string	FileSystem-Path/BACKUP	N/A	N/A	IN

MySQL Cluster

BackupLogBufferSize	bytes	2M	0	4294967039	N

### 15.4.5.2. Management Node Configuration Parameters

The following table provides information about parameters used in the [NDB\_MGMD] or [MGM] sections of a `config.ini` file for configuring MySQL Cluster management nodes. For detailed descriptions and other additional information about each of these parameters, see [Section 15.4.4.4, “Defining the Management Server”](#).

**Restart Type Column Values**

- **N**: Node Restart
- **IN**: Initial Node Restart
- **S**: System Restart
- **IS**: Initial System Restart

See [Section 15.4.5, “Overview of Cluster Configuration Parameters”](#), for additional explanations of these abbreviations.

Parameter Name	Type/Units	Default Value	Minimum Value	Maximum Value	Restart Type
<a href="#">ArbitrationDelay</a>	mil- li- sec onds	0	0	4294967039	N
<a href="#">ArbitrationRank</a>	in- tege r	1	0	2	N
<a href="#">DataDir</a>	stri ng	N/A	N/A	N/A	IN
<a href="#">ExecuteOnComputer</a>	in- tege r				
<a href="#">HostName</a>	stri ng	localhost	N/A	N/A	IN
<a href="#">Id</a>	in- tege r	None	1	63	IN
<a href="#">LogDestination</a>	CO NS OL E, SY SL OG, or FI LE	CONSOLE	N/A	N/A	N

### 15.4.5.3. SQL Node and API Node Configuration Parameters

The following table provides information about parameters used in the [SQL] and [API] sections of a `config.ini` file for configuring MySQL Cluster SQL nodes and API nodes. For detailed descriptions and other additional information about each of these parameters, see [Section 15.4.4.6, “Defining SQL and Other API Nodes”](#).

#### *Restart Type Column Values*

- **N**: Node Restart
- **IN**: Initial Node Restart
- **S**: System Restart
- **IS**: Initial System Restart

See [Section 15.4.5, “Overview of Cluster Configuration Parameters”](#), for additional explanations of these abbreviations.

Parameter Name	Type/Units	Default Value	Minimum Value	Maximum Value	Restart Type
<code>ArbitrationDelay</code>	milliseconds	0	0	4294967039	N
<code>ArbitrationRank</code>	integer	1	0	2	N
<code>BatchByteSize</code>	bytes	32K	1K	1M	N
<code>BatchSize</code>	integer	64	1	992	N
<code>ExecuteOnComputer</code>	integer				
<code>HostName</code>	string	<code>localhost</code>	N/A	N/A	IN
<code>Id</code>	integer	<i>None</i>	1	63	IN
<code>MaxScanBatchSize</code>	bytes	256K	32K	16M	N

### 15.4.6. Configuring Parameters for Local Checkpoints

The parameters discussed in [Logging and Checkpointing](#) and in [Data Memory, Index Memory, and String Memory](#) that are used to configure local checkpoints for a MySQL Cluster do not exist in isolation, but rather are very much interdependent on each other. In this section, we illustrate how these parameters — including `DataMemory`, `IndexMemory`, `NoOfDiskPagesToDiskAfterRestartTUP`, `NoOfDiskPagesToDiskAfterRestartACC`, and `NoOfFragmentLogFiles` — relate to one another in a working Cluster.

In this example, we assume that our application performs the following numbers of types of operations per hour:

- 50000 selects
- 15000 inserts
- 15000 updates
- 15000 deletes

We also make the following assumptions about the data used in the application:

- We are working with a single table having 40 columns.
- Each column can hold up to 32 bytes of data.
- A typical `UPDATE` run by the application affects the values of 5 columns.
- No `NULL` values are inserted by the application.

A good starting point is to determine the amount of time that should elapse between local checkpoints (LCPs). It worth noting that, in the event of a system restart, it takes 40-60 percent of this interval to execute the REDO log — for example, if the time between LCPs is 5 minutes (300 seconds), then it should take 2 to 3 minutes (120 to 180 seconds) for the REDO log to be read.

The maximum amount of data per node can be assumed to be the size of the `DataMemory` parameter. In this example, we assume that this is 2 GB. The `NoOfDiskPagesToDiskAfterRestartTUP` parameter represents the amount of data to be checkpointed per unit time — however, this parameter is actually expressed as the number of 8K memory pages to be checkpointed per 100 milliseconds. 2 GB per 300 seconds is approximately 6.8 MB per second, or 700 KB per 100 milliseconds, which works out to roughly 85 pages per 100 milliseconds.

Similarly, we can calculate `NoOfDiskPagesToDiskAfterRestartACC` in terms of the time for local checkpoints and the amount of memory required for indexes — that is, the `IndexMemory`. Assuming that we allow 512 MB for indexes, this works out to approximately 20 8-KB pages per 100 milliseconds for this parameter.

Next, we need to determine the number of REDO logfiles required — that is, fragment log files — the corresponding parameter being `NoOfFragmentLogFiles`. We need to make sure that there are sufficient REDO logfiles for keeping records for at least 3 local checkpoints. In a production setting, there are always uncertainties — for instance, we cannot be sure that disks always operate at top speed or with maximum throughput. For this reason, it is best to err on the side of caution, so we double our requirement and calculate a number of fragment logfiles which should be enough to keep records covering 6 local checkpoints.

It is also important to remember that the disk also handles writes to the REDO log and UNDO log, so if you find that the amount of data being written to disk as determined by the values of `NoOf-`

`DiskPagesToDiskAfterRestartACC` and `NoOfDiskPagesToDiskAfterRestartTUP` is approaching the amount of disk bandwidth available, you may wish to increase the time between local checkpoints.

Given 5 minutes (300 seconds) per local checkpoint, this means that we need to support writing log records at maximum speed for  $6 * 300 = 1800$  seconds. The size of a REDO log record is 72 bytes plus 4 bytes per updated column value plus the maximum size of the updated column, and there is one REDO log record for each table record updated in a transaction, on each node where the data reside. Using the numbers of operations set out previously in this section, we derive the following:

- 50000 select operations per hour yields 0 log records (and thus 0 bytes), since `SELECT` statements are not recorded in the REDO log.
- 15000 `DELETE` statements per hour is approximately 5 delete operations per second. (Since we wish to be conservative in our estimate, we round up here and in the following calculations.) No columns are updated by deletes, so these statements consume only 5 operations \* 72 bytes per operation = 360 bytes per second.
- 15000 `UPDATE` statements per hour is roughly the same as 5 updates per second. Each update uses 72 bytes, plus 4 bytes per column \* 5 columns updated, plus 32 bytes per column \* 5 columns — this works out to  $72 + 20 + 160 = 252$  bytes per operation, and multiplying this by 5 operation per second yields 1260 bytes per second.
- 15000 `INSERT` statements per hour is equivalent to 5 insert operations per second. Each insert requires REDO log space of 72 bytes, plus 4 bytes per record \* 40 columns, plus 32 bytes per column \* 40 columns, which is  $72 + 160 + 1280 = 1512$  bytes per operation. This times 5 operations per second yields 7560 bytes per second.

So the total number of REDO log bytes being written per second is approximately  $0 + 360 + 1260 + 7560 = 9180$  bytes. Multiplied by 1800 seconds, this yields 16524000 bytes required for REDO logging, or approximately 15.75 MB. The unit used for `NoOfFragmentLogFiles` represents a set of 4 16-MB logfiles — that is, 64 MB. Thus, the minimum value (3) for this parameter is sufficient for the scenario envisioned in this example, since 3 times 64 = 192 MB, or about 12 times what is required; the default value of 8 (or 512 MB) is more than ample in this case.

A copy of each altered table record is kept in the UNDO log. In the scenario discussed above, the UNDO log would not require any more space than what is provided by the default settings. However, given the size of disks, it is sensible to allocate at least 1 GB for it.

## 15.5. Upgrading and Downgrading MySQL Cluster

This portion of the MySQL Cluster chapter covers upgrading and downgrading a MySQL Cluster from one MySQL release to another. It discusses different types of Cluster upgrades and downgrades, and provides a Cluster upgrade/downgrade compatibility matrix (see [Section 15.5.2, “Cluster Upgrade and Downgrade Compatibility”](#)).

**Important:** You are expected already to be familiar with installing and configuring a MySQL Cluster prior to attempting an upgrade or downgrade. See [Section 15.4, “MySQL Cluster Configuration”](#).

This section remains in development, and continues to be updated and expanded.

### 15.5.1. Performing a Rolling Restart of the Cluster

This section discusses how to perform a *rolling restart* of a MySQL Cluster installation, so called because it involves stopping and starting (or restarting) each node in turn, so that the cluster itself remains operational. This is often done as part of a *rolling upgrade* or *rolling downgrade*, where high availability

of the cluster is mandatory and no downtime of the cluster as a whole is permissible. Where we refer to upgrades, the information provided here also generally applies to downgrades as well.

There are a number of reasons why a rolling restart might be desirable:

- **Cluster Configuration Change:** To make a change in the cluster's configuration, such as adding an SQL node to the cluster, or setting a configuration parameter to a new value.
- **Cluster Software Upgrade/Downgrade:** To upgrade the cluster to a newer version of the MySQL Cluster software (or to downgrade it to an older version). This is usually referred to as a “rolling upgrade” (or “rolling downgrade”, when reverting to an older version of MySQL Cluster).
- **Change on Node Host:** To make changes in the hardware or operating system on which one or more cluster nodes are running
- **Cluster Reset:** To reset the cluster because it has reached an undesirable state

The process for performing a rolling restart may be generalised as follows:

1. Stop, reconfigure, then restart each cluster management node (`ndb_mgmd` process) in turn
2. Stop, reconfigure, then restart each cluster data node (`ndbd` process) in turn
3. Stop, reconfigure, then restart each cluster SQL node (`mysqld` process) in turn

The specifics for implementing a particular rolling upgrade depend upon the actual changes being made. A more detailed view of the process is presented in the table shown here:

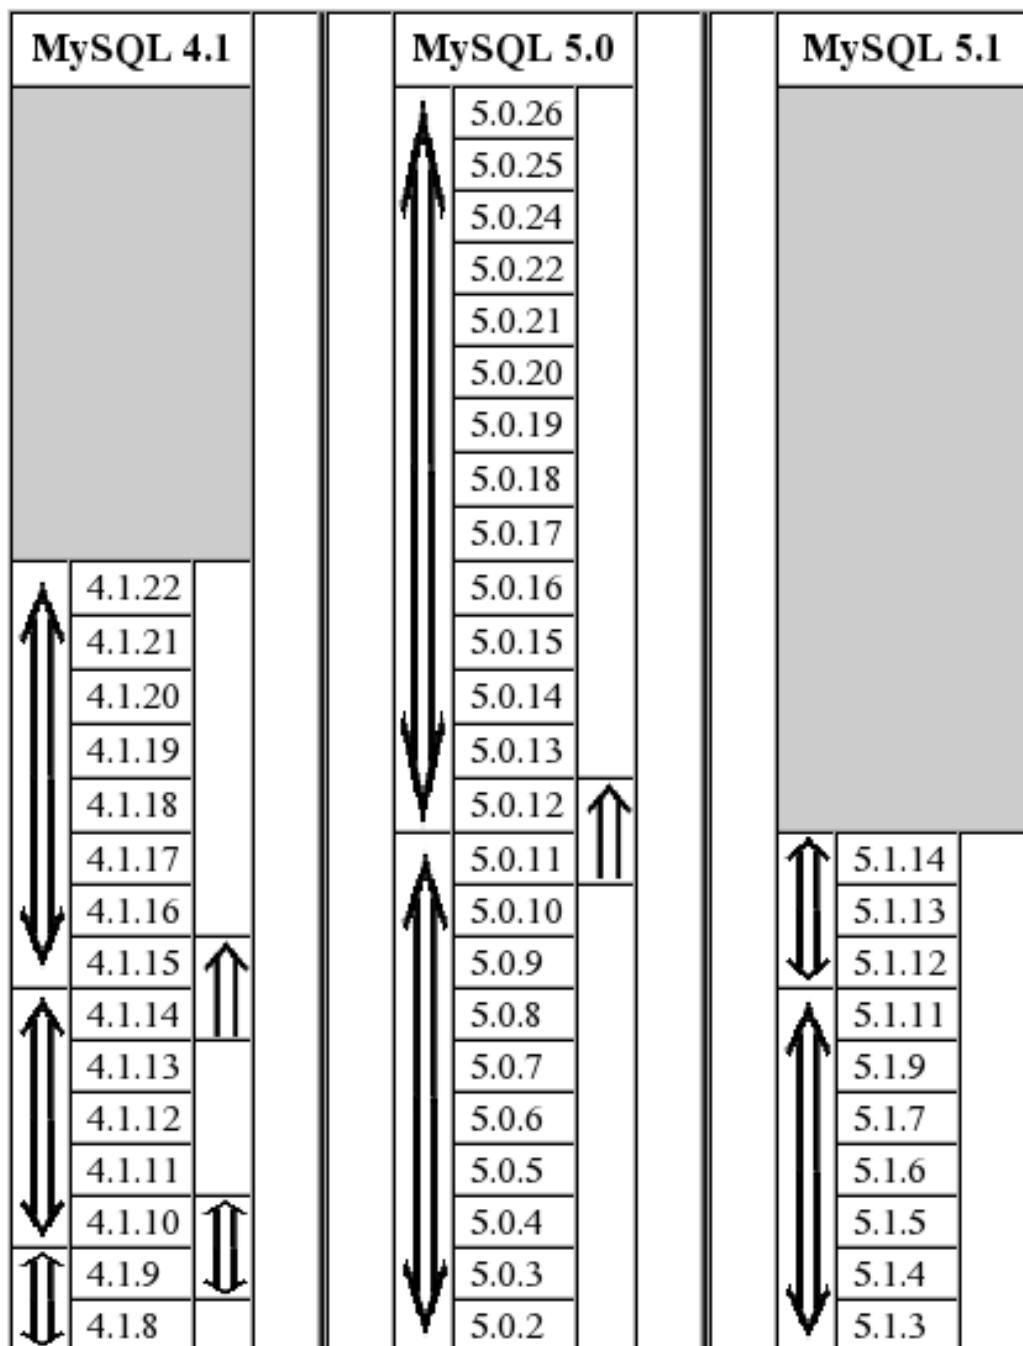

In the previous table, **Stop** and **Start** steps indicate that the process must be stopped completely using a shell command (such as `kill` on most Unix systems) or the management client `STOP` command, then started again from a system shell by invoking the `ndbd` or `ndb_mgmd` executable as appropriate. **Restart** indicates the process may be restarted using the `ndb_mgm` management client `RESTART` command.

## 15.5.2. Cluster Upgrade and Downgrade Compatibility

This section provides information regarding Cluster software and table file compatibility between differing versions of the MySQL Server for purposes of performing upgrades and downgrades.

**Important:** Only compatibility between MySQL versions with regard to `NDB Cluster` is taken into account in this section, and there are likely other issues to be considered. *As with any other MySQL software upgrade or downgrade, you are strongly encouraged to review the relevant portions of the MySQL Manual for the MySQL versions from which and to which you intend to migrate, before attempting an upgrade or downgrade of the MySQL Cluster software. See Section 2.11, “Upgrading MySQL”.*

The following table shows Cluster upgrade and downgrade compatibility between different versions of the MySQL Server.

**KEY:**

↑↓ Upgrades and downgrades supported

↑ Upgrade only

**Notes:**

- **4.1 Series:**

You cannot upgrade directly from 4.1.8 to 4.1.10 (or newer); you must first upgrade from 4.1.8 to 4.1.9, then upgrade to 4.1.10. Similarly, you cannot downgrade directly from 4.1.10 (or newer) to 4.1.8; you must first downgrade from 4.1.10 to 4.1.9, then downgrade from 4.1.9 to 4.1.8.

If you wish to upgrade a MySQL Cluster to 4.1.15, you must upgrade to 4.1.14 first, and you must upgrade to 4.1.15 before upgrading to 4.1.16 or newer.

Cluster downgrades from 4.1.15 to 4.1.14 (or earlier versions) are not supported.

Cluster upgrades from MySQL Server versions previous to 4.1.8 are not supported; when upgrading from these, you must dump all **NDB** tables, install the new version of the software, and then reload the tables from the dump.

- **5.0 Series:**

MySQL 5.0.2 was the first public release in this series.

Cluster downgrades from MySQL 5.0 to MySQL 4.1 are not supported.

Cluster downgrades from 5.0.12 to 5.0.11 (or earlier) are not supported.

You cannot restore with `ndb_restore` to a MySQL 5.0 Cluster using a backup made from a Cluster running MySQL 5.1. You must use `mysqldump` in such cases.

There was no public release for MySQL 5.0.23.

- **5.1 Series:**

MySQL 5.1.3 was the first public release in this series.

You cannot downgrade a MySQL 5.1.6 or later Cluster using Disk Data tables to MySQL 5.1.5 or earlier unless you convert all such tables to in-memory Cluster tables first.

MySQL 5.1.8 and MySQL 5.1.10 were not released.

Online cluster upgrades and downgrades between MySQL 5.1.11 (or an earlier version) and 5.1.12 (or a later version) are not possible due to major changes in the cluster filesystem. In such cases, you must perform a backup or dump, upgrade (or downgrade) the software, start each data node with `-initial`, and then restore from the backup or dump. You can use **NDB** backup/restore or `mysqldump` for this purpose.

## 15.6. Process Management in MySQL Cluster

Understanding how to manage MySQL Cluster requires a knowledge of four essential processes. In the next few sections of this chapter, we cover the roles played by these processes in a cluster, how to use them, and what startup options are available for each of them:

- [Section 15.6.1, “MySQL Server Process Usage for MySQL Cluster”](#)
- [Section 15.6.2, “ndbd, the Storage Engine Node Process”](#)
- [Section 15.6.3, “ndb\\_mgmd, the Management Server Process”](#)

- [Section 15.6.4, “ndb\\_mgm, the Management Client Process”](#)

## 15.6.1. MySQL Server Process Usage for MySQL Cluster

`mysqld` is the traditional MySQL server process. To be used with MySQL Cluster, `mysqld` needs to be built with support for the `NDB Cluster` storage engine, as it is in the precompiled `-max` binaries available from <http://dev.mysql.com/downloads/> for MySQL versions 4.1.3 and newer. If you build MySQL from source, you must invoke `configure` with the `--with-ndbcluster` option to enable `NDB Cluster` storage engine support.

If the `mysqld` binary has been built with Cluster support, the `NDB Cluster` storage engine is still disabled by default. You can use either of two possible options to enable this engine:

- Use `--ndbcluster` as a startup option on the command line when starting `mysqld`.
- Insert a line containing `ndbcluster` in the `[mysqld]` section of your `my.cnf` file.

An easy way to verify that your server is running with the `NDB Cluster` storage engine enabled is to issue the `SHOW ENGINES` statement in the MySQL Monitor (`mysql`). You should see the value `YES` as the `Support` value in the row for `NDBCLUSTER`. If you see `NO` in this row or if there is no such row displayed in the output, you are not running an `NDB-enabled` version of MySQL. If you see `DISABLED` in this row, you need to enable it in either one of the two ways just described.

To read cluster configuration data, the MySQL server requires at a minimum three pieces of information:

- The MySQL server's own cluster node ID
- The hostname or IP address for the management server (MGM node)
- The number of the TCP/IP port on which it can connect to the management server

Beginning with MySQL 4.1.5, node IDs can be dynamically allocated, in which case there is no need to specify them explicitly.

The `mysqld` parameter `ndb-connectstring` is used to specify the connectstring either on the command line when starting `mysqld` or in `my.cnf`. The connectstring contains the hostname or IP address where the management server can be found, as well as the TCP/IP port it uses.

In the following example, `ndb_mgmd.mysql.com` is the host where the management server resides, and the management server listens for cluster messages on port 1186:

```
shell> mysqld --ndb-connectstring=ndb_mgmd.mysql.com:1186
```

See [Section 15.4.4.2, “The Cluster connectstring”](#), for more information on connectstrings.

Given this information, the MySQL server will be a full participant in the cluster. (We sometimes refer to a `mysqld` process running in this manner as an SQL node.) It will be fully aware of all cluster data nodes as well as their status, and will establish connections to all data nodes. In this case, it is able to use any data node as a transaction coordinator and to read and update node data.

You can see in the `mysql` client whether a MySQL server is connected to the cluster using `SHOW PROCESSLIST`. If the MySQL server is connected to the cluster, and you have the `PROCESS` privilege,

then the first row of the output is as shown here:

```
mysql> SHOW PROCESSLIST \G
***** 1. row *****
  Id: 1
  User: system user
  Host:
  db:
  Command: Daemon
  Time: 1
  State: Waiting for event from ndbcluster
  Info: NULL
```

## 15.6.2. `ndbd`, the Storage Engine Node Process

`ndbd` is the process that is used to handle all the data in tables using the NDB Cluster storage engine. This is the process that empowers a data node to accomplish distributed transaction handling, node recovery, checkpointing to disk, online backup, and related tasks.

In a MySQL Cluster, a set of `ndbd` processes cooperate in handling data. These processes can execute on the same computer (host) or on different computers. The correspondences between data nodes and Cluster hosts is completely configurable.

In MySQL versions prior to 4.1.5, each `ndbd` process should be started in a separate directory, the reason for this being that `ndbd` generated a set of log files in its starting directory. In MySQL 4.1.5, this behavior was changed such that these files are placed in the directory specified by `DataDir` in the configuration file. Thus `ndbd` can be started from anywhere.

These log files are listed below. `node_id` is the node's unique identifier. Note that `node_id` represents the node's unique identifier. For example, `ndb_2_error.log` is the error log generated by the data node whose node ID is 2.

- `ndb_node_id_error.log` (was `error.log` in version 4.1.3) is a file containing records of all crashes which the referenced `ndbd` process has encountered. Each record in this file contains a brief error string and a reference to a trace file for this crash. A typical entry in this file might appear as shown here:

```
Date/Time: Saturday 30 July 2004 - 00:20:01
Type of error: error
Message: Internal program error (failed ndbrequire)
Fault ID: 2341
Problem data: DbtupFixAlloc.cpp
Object of reference: DBTUP (Line: 173)
ProgramName: NDB Kernel
ProcessID: 14909
TraceFile: ndb_2_trace.log.2
***EOM***
```

**Note:** *It is very important to be aware that the last entry in the error log file is not necessarily the newest one* (nor is it likely to be). Entries in the error log are *not* listed in chronological order; rather, they correspond to the order of the trace files as determined in the `ndb_node_id_trace.log.next` file (see below). Error log entries are thus overwritten in a cyclical and not sequential fashion.

- `ndb_node_id_trace.log.trace_id` (was `NDB_TraceFile_trace_id.trace` in version 4.1.3) is a trace file describing exactly what happened just before the error occurred. This information is useful for analysis by the MySQL Cluster development team.

It is possible to configure the number of these trace files that will be created before old files are overwritten. `trace_id` is a number which is incremented for each successive trace file.

- `ndb_node_id_trace.log.next` (was `NextTraceFileNo.log` in version 4.1.3) is the file that keeps track of the next trace file number to be assigned.
- `ndb_node_id_out.log` is a file containing any data output by the `ndbd` process. This file is created only if `ndbd` is started as a daemon, which is the default behavior beginning with MySQL 4.1.5. This file was named `nodenode_id.out` in versions 4.1.3 and 4.1.4.
- `ndb_node_id.pid` is a file containing the process ID of the `ndbd` process when started as a daemon. It also functions as a lock file to avoid the starting of nodes with the same identifier.
- `ndb_node_id_signal.log` (was `Signal.log` in version 4.1.3) is a file used only in debug versions of `ndbd`, where it is possible to trace all incoming, outgoing, and internal messages with their data in the `ndbd` process.

It is recommended not to use a directory mounted through NFS because in some environments this can cause problems whereby the lock on the `.pid` file remains in effect even after the process has terminated.

To start `ndbd`, it may also be necessary to specify the hostname of the management server and the port on which it is listening. Optionally, one may also specify the node ID that the process is to use.

```
shell> ndbd --connect-string="nodeid=2;host=ndb_mgmd.mysql.com:1186"
```

See [Section 15.4.4.2, “The Cluster `connectstring`”](#), for additional information about this issue. [Section 15.6.5, “Command Options for MySQL Cluster Processes”](#), describes other options for `ndbd`.

When `ndbd` starts, it actually initiates two processes. The first of these is called the “angel process”; its only job is to discover when the execution process has been completed, and then to restart the `ndbd` process if it is configured to do so. Thus, if you attempt to kill `ndbd` via the Unix `kill` command, it is necessary to kill both processes, beginning with the angel process. The preferred method of terminating an `ndbd` process is to use the management client and stop the process from there.

The execution process uses one thread for reading, writing, and scanning data, as well as all other activities. This thread is implemented asynchronously so that it can easily handle thousands of concurrent activities. In addition, a watch-dog thread supervises the execution thread to make sure that it does not hang in an endless loop. A pool of threads handles file I/O, with each thread able to handle one open file. Threads can also be used for transporter connections by the transporters in the `ndbd` process. In a multi-processor system performing a large number of operations (including updates), the `ndbd` process can consume up to 2 CPUs if permitted to do so.

For a machine with many CPUs it is possible to use several `ndbd` processes which belong to different node groups; however, such a configuration is still considered experimental and is not supported for MySQL 4.1 in a production setting. See [Section 15.11, “Known Limitations of MySQL Cluster”](#).

### 15.6.3. `ndb_mgmd`, the Management Server Process

The management server is the process that reads the cluster configuration file and distributes this information to all nodes in the cluster that request it. It also maintains a log of cluster activities. Management clients can connect to the management server and check the cluster's status.

As of MySQL 4.1.5, it is no longer necessary to specify a connectstring when starting the management server. However, if you are using more than one management server, a connectstring should be provided and each node in the cluster should specify its node ID explicitly.

See [Section 15.4.4.2, “The Cluster `connectstring`”](#), for information about using connectstrings. [Section 15.6.5, “Command Options for MySQL Cluster Processes”](#), describes other options for `ndb_mgmd`.

The following files are created or used by `ndb_mgmd` in its starting directory. From MySQL 4.1.5, the log and PID files are placed in the `DataDir` as specified in the `config.ini` configuration file. In the list that follows, `node_id` is the unique node identifier.

- `config.ini` is the configuration file for the cluster as a whole. This file is created by the user and read by the management server. [Section 15.4, “MySQL Cluster Configuration”](#), discusses how to set up this file.
- `ndb_node_id_cluster.log` (was `cluster.log` in version 4.1.3) is the cluster events log file. Examples of such events include checkpoint startup and completion, node startup events, node failures, and levels of memory usage. A complete listing of cluster events with descriptions may be found in [Section 15.7, “Management of MySQL Cluster”](#).

When the size of the cluster log reaches one million bytes, the file is renamed to `ndb_node_id_cluster.log.seq_id` (was `cluster.log.seq_id` in version 4.1.3) where `seq_id` is the sequence number of the cluster log file. (For example: If files with the sequence numbers 1, 2, and 3 already exist, the next log file is named using the number 4.)

- `ndb_node_id_out.log` (was `node1.out` in version 4.1.3) is the file used for `stdout` and `stderr` when running the management server as a daemon.
- `ndb_node_id.pid` (was `nodenode_id.pid` in version 4.1.3) is the process ID file used when running the management server as a daemon.

## 15.6.4. `ndb_mgm`, the Management Client Process

The management client process is actually not needed to run the cluster. Its value lies in providing a set of commands for checking the cluster's status, starting backups, and performing other administrative functions. The management client accesses the management server using a C API. Advanced users can also employ this API for programming dedicated management processes to perform tasks similar to those performed by `ndb_mgm`.

To start the management client, it is necessary to supply the hostname and port number of the management server:

```
shell> ndb_mgm [host_name [port_num]]
```

For example:

```
shell> ndb_mgm ndb_mgmd.mysql.com 1186
```

The default hostname and port number are `localhost` and 1186, respectively. (Prior to MySQL 4.1.8, the default Cluster port was 2200.)

Additional information about using `ndb_mgm` can be found in [Section 15.6.5.4, “Command Options for `ndb\_mgm`”](#), and [Section 15.7.2, “Commands in the Management Client”](#).

## 15.6.5. Command Options for MySQL Cluster Processes

All MySQL Cluster executables (except for `mysqld`) take the options described in this section as of MySQL 4.1.8. Users of earlier MySQL Cluster versions should note that some of these options have been changed to make consistent with one another as well as with `mysqld`. You can use the `--help` option with any MySQL Cluster executable to view a list of the options which it supports.

The following options are common to all MySQL Cluster executables:

- `--help --usage, -?`

Prints a short list with descriptions of the available command options.

- `--connect-string=connect_string`

`connect_string` sets the connectstring to the management server as a command option. Available with `ndb_mgm` from MySQL 4.1.8 onward.

```
shell> ndbd --connect-string="nodeid=2;host=ndb_mgmd.mysql.com:1186"
```

- `--debug[=options]`

This option can be used only for versions compiled with debugging enabled. It is used to enable output from debug calls in the same manner as for the `mysqld` process.

- `--execute=command, -e command`

Can be used to send a command to a Cluster executable from the system shell. For example, either of the following:

```
shell> ndb_mgm -e "SHOW"
```

or

```
shell> ndb_mgm --execute="SHOW"
```

is equivalent to

```
NDB> SHOW;
```

This is analogous to how the `--execute` or `-e` option works with the `mysql` command-line client. See [Section 4.3.1, “Using Options on the Command Line”](#).

- `--version, -V`

Prints the MySQL Cluster version number of the executable. The version number is relevant because not all versions can be used together, and the MySQL Cluster startup process verifies that the versions of the binaries being used can co-exist in the same cluster. This is also important when performing an online (rolling) software upgrade or downgrade of MySQL Cluster. (See [Section 15.5.1, “Performing a Rolling Restart of the Cluster”](#)).

The next few sections describe options specific to individual NDB programs.

### 15.6.5.1. MySQL Cluster-Related Command Options for `mysqld`

- `--ndb-connectstring=connect_string`

When using the `NDB Cluster` storage engine, this option specifies the management server that distributes cluster configuration data.

- `--ndbcluster`

The `NDB Cluster` storage engine is necessary for using MySQL Cluster. If a `mysqld` binary includes support for the `NDB Cluster` storage engine, the engine is disabled by default. Use the `--ndbcluster` option to enable it. Use `--skip-ndbcluster` to explicitly disable the engine.

### 15.6.5.2. Command Options for `ndbd`

For options common to all `NDB` programs, see [Section 15.6.5, “Command Options for MySQL Cluster Processes”](#).

- `--daemon, -d`

Instructs `ndbd` to execute as a daemon process. From MySQL 4.1.5 on, this is the default behavior, and `--nodaemon` can be used to prevent the process from running as a daemon.

- `--initial`

Instructs `ndbd` to perform an initial start. An initial start erases any files created for recovery purposes by earlier instances of `ndbd`. It also re-creates recovery log files. Note that on some operating systems this process can take a substantial amount of time.

An `--initial` start is to be used only the very first time that the `ndbd` process is started because it removes all files from the Cluster filesystem and re-creates all REDO log files. The exceptions to this rule are:

- When performing a software upgrade which has changed the contents of any files.
- When restarting the node with a new version of `ndbd`.
- As a measure of last resort when for some reason the node restart or system restart repeatedly fails. In this case, be aware that this node can no longer be used to restore data due to the destruction of the datafiles.

This option does not affect any backup files that have already been created by the affected node.

It is possible to achieve the same effect by deleting by other means (such as using `rm -r -f`) all files and directories in the data node's `DataDir` — with the possible exception of the `BACKUP` directory in `DataDir`, should you wish to retain any backups that have been created on that data node — and then starting `ndbd` without having to use the `--initial` option. This may be useful when scripting Cluster administrative tasks.

In older versions of MySQL Cluster, it was possible to use `-i` for this option. This shortcut was removed to prevent this option from being used by mistake.

- `--nodaemon`

Instructs `ndbd` not to start as a daemon process. This is useful when `ndbd` is being debugged and you want output to be redirected to the screen.

- `--nostart, -n`

Instructs `ndbd` not to start automatically. When this option is used, `ndbd` connects to the management server, obtains configuration data from it, and initializes communication objects. However, it does not actually start the execution engine until specifically requested to do so by the management server. This can be accomplished by issuing the proper `START` command in the management client (see [Section 15.7.2, “Commands in the Management Client”](#)).

### 15.6.5.3. Command Options for `ndb_mgmd`

For options common to NDB programs, see [Section 15.6.5, “Command Options for MySQL Cluster Processes”](#).

- `--config-file=filename, -c filename, -f filename`

Instructs the management server as to which file it should use for its configuration file. This option must be specified. The filename defaults to `config.ini`. The `-f` shortcut is available beginning with MySQL Cluster 4.1.8.

- `--daemon, -d`

Instructs `ndb_mgmd` to start as a daemon process. This is the default behavior.

- `--nodaemon`

Instructs `ndb_mgmd` not to start as a daemon process.

### 15.6.5.4. Command Options for `ndb_mgm`

For options common to NDB programs, see [Section 15.6.5, “Command Options for MySQL Cluster Processes”](#).

- `--try-reconnect=number`

If the connection to the management server is broken, the node tries to reconnect to it every 5 seconds until it succeeds. By using this option, it is possible to limit the number of attempts to `number` before giving up and reporting an error instead.

## 15.7. Management of MySQL Cluster

Managing a MySQL Cluster involves a number of tasks, the first of which is to configure and start MySQL Cluster. This is covered in [Section 15.4, “MySQL Cluster Configuration”](#), and [Section 15.6, “Process Management in MySQL Cluster”](#).

The following sections cover the management of a running MySQL Cluster.

There are essentially two methods of actively managing a running MySQL Cluster. The first of these is through the use of commands entered into the management client whereby cluster status can be checked, log levels changed, backups started and stopped, and nodes stopped and started. The second method involves studying the contents of the cluster log `ndb_node_id_cluster.log`; this is usually found in the management server's `DataDir` directory, but this location can be overridden using the `LogDestination` option — see [Section 15.4.4.4, “Defining the Management Server”](#), for details. (Recall that `node_id` represents the unique identifier of the node whose activity is being logged.) The cluster log contains event reports generated by `ndbd`. It is also possible to send cluster log entries to a Unix system log.

### 15.7.1. MySQL Cluster Startup Phases

This section describes the steps involved when the cluster is started.

There are several different startup types and modes, as shown here:

- **Initial Start:** The cluster starts with a clean filesystem on all data nodes. This occurs either when the cluster started for the very first time, or when it is restarted using the `--initial` option.
- **System Restart:** The cluster starts and reads data stored in the data nodes. This occurs when the cluster has been shut down after having been in use, when it is desired for the cluster to resume operations from the point where it left off.
- **Node Restart:** This is the online restart of a cluster node while the cluster itself is running.
- **Initial Node Restart:** This is the same as a node restart, except that the node is reinitialized and started with a clean filesystem.

Prior to startup, each data node (`ndbd` process) must be initialized. Initialization consists of the following steps:

1. Obtain a Node ID.
2. Fetch configuration data.
3. Allocate ports to be used for inter-node communications.
4. Allocate memory according to settings obtained from the configuration file.

When a data node or SQL node first connects to the management node, it reserves a cluster node ID. To make sure that no other node allocates the same node ID, this ID is retained until the node has managed to connect to the cluster and at least one `ndbd` reports that this node is connected. This retention of the node ID is guarded by the connection between the node in question and `ndb_mgmd`.

Normally, in the event of a problem with the node, the node disconnects from the management server, the socket used for the connection is closed, and the reserved node ID is freed. However, if a node is disconnected abruptly — for example, due to a hardware failure in one of the cluster hosts, or because of network issues — the normal closing of the socket by the operating system may not take place. In this case, the node ID continues to be reserved and not released until a TCP timeout occurs 10 or so minutes later.

To take care of this problem, you can use `PURGE STALE SESSIONS`. Running this statement forces all reserved node IDs to be checked; any that are not being used by nodes actually connected to the cluster are then freed.

After each data node has been initialized, the cluster startup process can proceed. The stages which the cluster goes through during this process are listed here:

- **Stage 0**

Clear the cluster filesystem. This stage occurs *only* if the cluster was started with the `--initial` option.

- **Stage 1**

This stage sets up Cluster connections, establishes inter-node communications, and starts Cluster heartbeats.

**Note:** When one or more nodes hang in Phase 1 while the remaining node or nodes hang in Phase 2, this often indicates network problems. One possible cause of such issues is one or more cluster hosts having multiple network interfaces. Another common source of problems causing this condition is

the blocking of TCP/IP ports needed for communications between cluster nodes. In the latter case, this is often due to a misconfigured firewall.

- **Stage 2**

The arbitrator node is elected. If this is a system restart, the cluster determines the latest restorable global checkpoint.

- **Stage 3**

This stage initializes a number of internal cluster variables.

- **Stage 4**

For an initial start or initial node restart, the redo log files are created. The number of these files is equal to `NoOfFragmentLogFiles`.

For a system restart:

- Read schema or schemas.
- Read data from the local checkpoint and undo logs.
- Apply all redo information until the latest restorable global checkpoint has been reached.

For a node restart, find the tail of the redo log.

- **Stage 5**

If this is an initial start, create the `SYSTAB_0` and `NDB$EVENTS` internal system tables.

For a node restart or an initial node restart:

1. The node is included in transaction handling operations.
2. The node schema is compared with that of the master and synchronized with it.
3. Synchronize data received in the form of `INSERT` from the other data nodes in this node's node group.
4. In all cases, wait for complete local checkpoint as determined by the arbitrator.

- **Stage 6**

Update internal variables.

- **Stage 7**

Update internal variables.

- **Stage 8**

In a system restart, rebuild all indexes.

- **Stage 9**

Update internal variables.

- **Stage 10**

At this point in a node restart or initial node restart, APIs may connect to the node and begin to receive events.

- **Stage 11**

At this point in a node restart or initial node restart, event delivery is handed over to the node joining the cluster. The newly-joined node takes over responsibility for delivering its primary data to subscribers.

After this process is completed for an initial start or system restart, transaction handling is enabled. For a node restart or initial node restart, completion of the startup process means that the node may now act as a transaction coordinator.

## 15.7.2. Commands in the Management Client

In addition to the central configuration file, a cluster may also be controlled through a command-line interface available through the management client `ndb_mgm`. This is the primary administrative interface to a running cluster.

Commands for the event logs are given in [Section 15.7.3, “Event Reports Generated in MySQL Cluster”](#); commands for creating backups and restoring from backup are provided in [Section 15.8, “On-line Backup of MySQL Cluster”](#).

The management client has the following basic commands. In the listing that follows, *node\_id* denotes either a database node ID or the keyword `ALL`, which indicates that the command should be applied to all of the cluster's data nodes.

- `HELP`

Displays information on all available commands.

- `SHOW`

Displays information on the cluster's status.

**Note:** In a cluster where multiple management nodes are in use, this command displays information only for data nodes that are actually connected to the current management server.

- `node_id START`

Brings online the data node identified by *node\_id* (or all data nodes).

**Important:** To use this command to bring a data node online, the data node must have been started using `ndbd --nostart` or `ndbd -n`.

- `node_id STOP`

Stops the data node identified by *node\_id* (or all data nodes). A data node affected by this command disconnects from the cluster, and its associated `ndbd` process terminates.

- `node_id RESTART [-n] [-i]`

Restarts the data node identified by `node_id` (or all data nodes).

Using the `-i` option with `RESTART` causes the data node to perform an initial restart; that is, the node's filesystem is deleted and recreated. The effect is the same as that obtained from stopping the data node process and then starting it again using `ndbd --initial` from the system shell.

Using the `-n` option causes the data node process to be restarted, but the data node is not actually brought online until the appropriate `START` command is issued. The effect of this option is the same as that obtained from stopping the data node and then starting it again using `ndbd --nostart` or `ndbd -n` from the system shell.

- `node_id STATUS`  
Displays status information for the data node identified by `node_id` (or for all data nodes).
- `ENTER SINGLE USER MODE node_id`  
Enters single-user mode, whereby only the MySQL server identified by the node ID `node_id` is allowed to access the database.
- `EXIT SINGLE USER MODE`  
Exits single-user mode, allowing all SQL nodes (that is, all running `mysqld` processes) to access the database.
- `QUIT, EXIT`  
Terminates the management client.  
This command does not affect any nodes connected to the cluster.
- `SHUTDOWN`  
Shuts down all cluster data nodes and management nodes. To exit the management client after this has been done, use `EXIT` or `QUIT`.  
This command does *not* shut down any SQL nodes or API nodes that are connected to the cluster.

### 15.7.3. Event Reports Generated in MySQL Cluster

In this section, we discuss the types of event logs provided by MySQL Cluster, and the types of events that are logged.

MySQL Cluster provides two types of event log. These are the *cluster log*, which includes events generated by all cluster nodes, and the *node logs*, which are local to each data node.

Output generated by cluster event logging can have multiple destinations including a file, the management server console window, or `syslog`. Output generated by node event logging is written to the data node's console window.

Both types of event logs can be set to log different subsets of events.

**Note:** The cluster log is the log recommended for most uses because it provides logging information for an entire cluster in a single file. Node logs are intended to be used only during application development, or for debugging application code.

Each reportable event can be distinguished according to three different criteria:

- *Category:* This can be any one of the following values: `STARTUP`, `SHUTDOWN`, `STATISTICS`, `CHECKPOINT`, `NODERESTART`, `CONNECTION`, `ERROR`, or `INFO`.
- *Priority:* This is represented by one of the numbers from 1 to 15 inclusive, where 1 indicates “most important” and 15 “least important.”
- *Severity Level:* This can be any one of the following values: `ALERT`, `CRITICAL`, `ERROR`, `WARNING`, `INFO`, or `DEBUG`.

Both the cluster log and the node log can be filtered on these properties.

### 15.7.3.1. Logging Management Commands

The following management commands are related to the cluster log:

- `CLUSTERLOG ON`  
Turns the cluster log on.
- `CLUSTERLOG OFF`  
Turns the cluster log off.
- `CLUSTERLOG INFO`  
Provides information about cluster log settings.
- `node_id CLUSTERLOG category=threshold`  
Logs *category* events with priority less than or equal to *threshold* in the cluster log.
- `CLUSTERLOG FILTER severity_level`  
Toggles cluster logging of events of the specified *severity\_level*.

The following table describes the default setting (for all data nodes) of the cluster log category threshold. If an event has a priority with a value lower than or equal to the priority threshold, it is reported in the cluster log.

Note that events are reported per data node, and that the threshold can be set to different values on different nodes.

Category	Default threshold (All data nodes)
<code>STARTUP</code>	7
<code>SHUTDOWN</code>	7
<code>STATISTICS</code>	7
<code>CHECKPOINT</code>	7

NODERESTART	7
CONNECTION	7
ERROR	15
INFO	7

Thresholds are used to filter events within each category. For example, a `STARTUP` event with a priority of 3 is not logged unless the threshold for `STARTUP` is changed to 3 or lower. Only events with priority 3 or lower are sent if the threshold is 3.

The following table shows the event severity levels. (**Note:** These correspond to Unix `syslog` levels, except for `LOG_EMERG` and `LOG_NOTICE`, which are not used or mapped.)

1	ALERT	A condition that should be corrected immediately, such as a corrupted system database
2	CRITICAL	Critical conditions, such as device errors or insufficient resources
3	ERROR	Conditions that should be corrected, such as configuration errors
4	WARNING	Conditions that are not errors, but that might require special handling
5	INFO	Informational messages
6	DEBUG	Debugging messages used for NDB Cluster development

Event severity levels can be turned on or off (using `CLUSTERLOG FILTER` — see above). If a severity level is turned on, then all events with a priority less than or equal to the category thresholds are logged. If the severity level is turned off then no events belonging to that severity level are logged.

### 15.7.3.2. Log Events

An event report reported in the event logs has the following format:

```
datetime [string] severity -- message
```

For example:

```
09:19:30 2005-07-24 [NDB] INFO -- Node 4 Start phase 4 completed
```

This section discusses all reportable events, ordered by category and severity level within each category.

In the event descriptions, GCP and LCP mean “Global Checkpoint” and “Local Checkpoint,” respectively.

#### CONNECTION Events

These events are associated with connections between Cluster nodes.

Event	Priority	Severity Level	Description
data nodes connected	8	INFO	Data nodes connected
data nodes disconnected	8	INFO	Data nodes disconnected
Communication closed	8	INFO	SQL node or data node connection closed
Communication opened	8	INFO	SQL node or data node connection opened

**CHECKPOINT Events**

The logging messages shown here are associated with checkpoints.

Event	Priority	Severity Level	Description
LCP stopped in calc keep GCI	0	ALERT	LCP stopped
Local checkpoint fragment completed	11	INFO	LCP on a fragment has been completed
Global checkpoint completed	10	INFO	GCP finished
Global checkpoint started	9	INFO	Start of GCP: REDO log is written to disk
Local checkpoint completed	8	INFO	LCP completed normally
Local checkpoint started	7	INFO	Start of LCP: data written to disk
Report undo log blocked	7	INFO	UNDO logging blocked; buffer near overflow

**STARTUP Events**

The following events are generated in response to the startup of a node or of the cluster and of its success or failure. They also provide information relating to the progress of the startup process, including information concerning logging activities.

Event	Priority	Severity Level	Description
Internal start signal received ST-TORRY	15	INFO	Blocks received after completion of restart
Undo records executed	15	INFO	
New REDO log started	10	INFO	GCI keep <i>X</i> , newest restorable GCI <i>Y</i>
New log started	10	INFO	Log part <i>X</i> , start MB <i>Y</i> , stop MB <i>Z</i>
Node has been refused for inclusion in the cluster	8	INFO	Node cannot be included in cluster due to misconfiguration, inability to establish communication, or other problem
data node neighbors	8	INFO	Shows neighboring data nodes
data node start phase <i>X</i> completed	4	INFO	A data node start phase has been completed
Node has been successfully included into the cluster	3	INFO	Displays the node, managing node, and dynamic ID
data node start phases initiated	1	INFO	NDB Cluster nodes starting
data node all start phases completed	1	INFO	NDB Cluster nodes started
data node shutdown initiated	1	INFO	Shutdown of data node has commenced
data node shutdown aborted	1	INFO	Unable to shut down data node normally

**NODERESTART Events**

The following events are generated when restarting a node and relate to the success or failure of the node restart process.

Event	Priority	Severity Level	Description
-------	----------	----------------	-------------

Node failure phase completed	8	ALERT	Reports completion of node failure phases
Node has failed, node state was <i>X</i>	8	ALERT	Reports that a node has failed
Report arbitrator results	2	ALERT	<p>There are eight different possible results for arbitration attempts:</p> <ul style="list-style-type: none"> <li>• Arbitration check failed — less than 1/2 nodes left</li> <li>• Arbitration check succeeded — node group majority</li> <li>• Arbitration check failed — missing node group</li> <li>• Network partitioning — arbitration required</li> <li>• Arbitration succeeded — affirmative response from node <i>X</i></li> <li>• Arbitration failed - negative response from node <i>X</i></li> <li>• Network partitioning - no arbitrator available</li> <li>• Network partitioning - no arbitrator configured</li> </ul>
Completed copying a fragment	10	INFO	
Completed copying of dictionary information	8	INFO	
Completed copying distribution information	8	INFO	
Starting to copy fragments	8	INFO	
Completed copying all fragments	8	INFO	
GCP takeover started	7	INFO	
GCP takeover completed	7	INFO	
LCP takeover started	7	INFO	
LCP takeover completed (state = <i>X</i> )	7	INFO	
Report whether an arbitrator is found or not	6	INFO	<p>There are seven different possible outcomes when seeking an arbitrator:</p> <ul style="list-style-type: none"> <li>• Management server restarts arbitration thread [state=<i>X</i>]</li> <li>• Prepare arbitrator node <i>X</i> [ticket=<i>Y</i>]</li> <li>• Receive arbitrator node <i>X</i> [ticket=<i>Y</i>]</li> <li>• Started arbitrator node <i>X</i> [ticket=<i>Y</i>]</li> </ul>

			<ul style="list-style-type: none"> <li>• Lost arbitrator node <i>X</i> - process failure [state=<i>Y</i>]</li> <li>• Lost arbitrator node <i>X</i> - process exit [state=<i>Y</i>]</li> <li>• Lost arbitrator node <i>X</i> &lt;error msg&gt; [state=<i>Y</i>]</li> </ul>
--	--	--	---

**STATISTICS Events**

The following events are of a statistical nature. They provide information such as numbers of transactions and other operations, amount of data sent or received by individual nodes, and memory usage.

Event	Priority	Severity Level	Description
Report job scheduling statistics	9	INFO	Mean internal job scheduling statistics
Sent number of bytes	9	INFO	Mean number of bytes sent to node <i>X</i>
Received # of bytes	9	INFO	Mean number of bytes received from node <i>X</i>
Report transaction statistics	8	INFO	Numbers of: transactions, commits, reads, simple reads, writes, concurrent operations, attribute information, and aborts
Report operations	8	INFO	Number of operations
Report table create	7	INFO	
Memory usage	5	INFO	Data and index memory usage (80%, 90%, and 100%)

**ERROR Events**

These events relate to Cluster errors and warnings. The presence of one or more of these generally indicates that a major malfunction or failure has occurred.

Event	Priority	Severity	Description
Dead due to missed heartbeat	8	ALERT	Node <i>X</i> declared “dead” due to missed heartbeat
Transporter errors	2	ERROR	
Transporter warnings	8	WARNING	
Missed heartbeats	8	WARNING	Node <i>X</i> missed heartbeat # <i>Y</i>
General warning events	2	WARNING	

**INFO Events**

These events provide general information about the state of the cluster and activities associated with Cluster maintenance, such as logging and heartbeat transmission.

Event	Priority	Severity	Description
Sent heartbeat	12	INFO	Heartbeat sent to node X
Create log bytes	11	INFO	Log part, log file, MB
General information events	2	INFO	

### 15.7.3.3. Using CLUSTERLOG STATISTICS

The NDB management client's `CLUSTERLOG STATISTICS` command can provide a number of useful statistics in its output. The following statistics are reported by the transaction coordinator:

Statistic	Description (Number of...)
<code>Trans. Count</code>	Transactions attempted with this node as coordinator
<code>Commit Count</code>	Transactions committed with this node as coordinator
<code>Read Count</code>	Primary key reads (all)
<code>Simple Read Count</code>	Primary key reads reading the latest committed value
<code>Write Count</code>	Primary key writes (includes all <code>INSERT</code> , <code>UPDATE</code> , and <code>DELETE</code> operations)
<code>AttrInfoCount</code>	Data words used to describe all reads and writes received
<code>Concurrent Operations</code>	All concurrent operations ongoing at the moment the report is taken
<code>Abort Count</code>	Transactions with this node as coordinator that were aborted
<code>Scans</code>	Scans (all)
<code>Range Scans</code>	Index scans

The `ndbd` process has a scheduler that runs in an infinite loop. During each loop scheduler performs the following tasks:

1. Read any incoming messages from sockets into a job buffer.
2. Check whether there are any timed messages to be executed; if so, put these into the job buffer as well.
3. Execute (in a loop) any messages in the job buffer.
4. Send any distributed messages that were generated by executing the messages in the job buffer.
5. Wait for any new incoming messages.

The number of loops executed in the third step is reported as the `Mean Loop Counter`. This statistic increases in size as the utilisation of the TCP/IP buffer improves. You can use this to monitor performance as you add new processes to the cluster.

The `Mean send size` and `Mean receive size` statistics allow you to gauge the efficiency of writes and reads (respectively) between nodes. These values are given in bytes. Higher values mean a lower cost per byte sent or received; the maximum is 64k.

To generate a report of all cluster log statistics, you can use the following command in the NDB management client:

```
ndb_mgm> ALL CLUSTERLOG STATISTICS=15
```

## 15.7.4. Single-User Mode

Single-user mode allows the database administrator to restrict access to the database system to a single MySQL server (SQL node). When entering single-user mode, all connections to all other MySQL servers are closed gracefully and all running transactions are aborted. No new transactions are allowed to be started.

Once the cluster has entered single-user mode, only the designated SQL node is granted access to the database.

You can use the `ALL STATUS` command to see when the cluster has entered single-user mode.

Example:

```
NDB> ENTER SINGLE USER MODE 5
```

After this command has executed and the cluster has entered single-user mode, the SQL node whose node ID is 5 becomes the cluster's only permitted user.

The node specified in the preceding command must be a MySQL Server node; An attempt to specify any other type of node will be rejected.

**Note:** When the preceding command is invoked, all transactions running on the designated node are aborted, the connection is closed, and the server must be restarted.

The command `EXIT SINGLE USER MODE` changes the state of the cluster's data nodes from single-user mode to normal mode. MySQL Servers waiting for a connection (that is, for the cluster to become ready and available), are again permitted to connect. The MySQL Server denoted as the single-user SQL node continues to run (if still connected) during and after the state change.

Example:

```
NDB> EXIT SINGLE USER MODE
```

There are two recommended ways to handle a node failure when running in single-user mode:

- Method 1:
  1. Finish all single-user mode transactions
  2. Issue the `EXIT SINGLE USER MODE` command
  3. Restart the cluster's data nodes

- Method 2:

Restart database nodes prior to entering single-user mode.

## 15.8. On-line Backup of MySQL Cluster

This section describes how to create a backup and how to restore the database from a backup at a later time.

## 15.8.1. Cluster Backup Concepts

A backup is a snapshot of the database at a given time. The backup consists of three main parts:

- **Metadata:** the names and definitions of all database tables
- **Table records:** the data actually stored in the database tables at the time that the backup was made
- **Transaction log:** a sequential record telling how and when data was stored in the database

Each of these parts is saved on all nodes participating in the backup. During backup, each node saves these three parts into three files on disk:

- `BACKUP-backup_id.node_id.ctl`

A control file containing control information and metadata. Each node saves the same table definitions (for all tables in the cluster) to its own version of this file.

- `BACKUP-backup_id-0.node_id.data`

A data file containing the table records, which are saved on a per-fragment basis. That is, different nodes save different fragments during the backup. The file saved by each node starts with a header that states the tables to which the records belong. Following the list of records there is a footer containing a checksum for all records.

- `BACKUP-backup_id.node_id.log`

A log file containing records of committed transactions. Only transactions on tables stored in the backup are stored in the log. Nodes involved in the backup save different records because different nodes host different database fragments.

In the listing above, *backup\_id* stands for the backup identifier and *node\_id* is the unique identifier for the node creating the file.

## 15.8.2. Using The Management Client to Create a Backup

Before starting a backup, make sure that the cluster is properly configured for performing one. (See [Section 15.8.4, “Configuration for Cluster Backup”](#).)

Creating a backup using the management client involves the following steps:

1. Start the management client (`ndb_mgm`).
2. Execute the command `START BACKUP`.
3. The management client will reply with the message `Start of backup ordered`. This means that the management client has submitted the request to the cluster, but has not yet received any response.
4. The management client will reply `Backup backup_id started`, where *backup\_id* is the unique identifier for this particular backup. (This identifier will also be saved in the cluster log, if it has not been configured otherwise.) This means that the cluster has received and processed the backup request. It does *not* mean that the backup has finished.

5. The management client will signal that the backup is finished with the message `Backup backup_id completed`.

Cluster backups are created by default in the `BACKUP` subdirectory of the `DataDir` on each data node. This can be overridden for one or more data nodes individually, or for all cluster data nodes in the `config.ini` file using the `BackupDataDir` configuration parameter as discussed in [Identifying Data Nodes](#). The backup files created for a backup with a given `backup_id` are stored in a subdirectory named `BACKUP-backup_id` in the backup directory.

To abort a backup that is already in progress:

1. Start the management client.
2. Execute the command `ABORT BACKUP backup_id`. The number `backup_id` is the identifier of the backup that was included in the response of the management client when the backup was started (in the message `Backup backup_id started`).
3. The management client will acknowledge the abort request with `Abort of backup backup_id ordered`; note that it has received no actual response to this request yet.
4. After the backup has been aborted, the management client will report `Backup backup_id has been aborted for reason XYZ`. This means that the cluster has terminated the backup and that all files related to this backup have been removed from the cluster filesystem.

It is also possible to abort a backup in progress from the system shell using this command:

```
shell> ndb_mgm -e "ABORT BACKUP backup_id"
```

**Note:** If there is no backup with ID `backup_id` running when it is aborted, the management client makes no explicit response. However, the fact that an invalid abort command was sent is indicated in the cluster log.

### 15.8.3. How to Restore a Cluster Backup

The cluster restoration program is implemented as a separate command-line utility `ndb_restore`, which can normally be found in the MySQL `bin` directory. This program reads the files created as a result of the backup and inserts the stored information into the database. `ndb_restore` must be executed once for each set of backup files — that is, once for each data node in the cluster at the time that the backup was created.

**Important:** In order to use `ndb_restore`, the cluster must be running in single user mode. See [Section 15.7.4, “Single-User Mode”](#).

Typical options for this utility are shown here:

```
ndb_restore [-c connectstring] -n node_id [-m] -b backup_id -r /path/to/backup/files
```

The `-c` option is used to specify a connectstring which tells `ndb_restore` where to locate the cluster management server. (See [Section 15.4.4.2, “The Cluster connectstring”](#), for information on connectstrings.) If this option is not used, then `ndb_restore` attempts to connect to a management server on `localhost:1186`. This utility acts as a cluster API node, and so requires a free connection “slot” to connect to the cluster management server. This means that there must be at least one `[API]` section that can be used by it in the cluster `config.ini` file. It is a good idea to keep at least one empty `[API]` section in `config.ini` that is not being used for a MySQL server or for an application for this reason (see [Section 15.4.4.6, “Defining SQL and Other API Nodes”](#)). `ndb_restore` can also employ

an unused `[MYSQLD]` section in the `config.ini` file for this purpose.

You can verify that `ndb_restore` is connected to the cluster by using the `SHOW` command in the `ndb_mgm` management client. You can also accomplish this from a system shell, as shown here:

```
shell> ndb_mgm -e "SHOW"
```

`-n` is used to specify the node ID of the data node on which the backups were taken.

The first time you run the `ndb_restore` restoration program, you also need to restore the metadata. In other words, you must re-create the database tables — this can be done by running it with the `-m` option. Note that the cluster should have an empty database when starting to restore a backup. (In other words, you should start `ndbd` with `--initial` prior to performing the restore.)

The `-b` option is used to specify the ID or sequence number of the backup, and is the same number shown by the management client in the `Backup backup_id completed` message displayed upon completion of a backup. (See [Section 15.8.2, “Using The Management Client to Create a Backup”](#).)

The `-r` option is required, and is used to tell `ndb_restore` the directory where it can find the backup files. **Important:** When restoring cluster backups, you must be sure to restore all data nodes from backups having the same backup ID.

It is possible to restore a backup to a database with a different configuration than it was created from. For example, suppose that a backup with backup ID `12`, created in a cluster with two database nodes having the node IDs `2` and `3`, is to be restored to a cluster with four nodes. Then `ndb_restore` must be run twice — once for each database node in the cluster where the backup was taken. However, `ndb_restore` cannot always restore backups made from a cluster running one version of MySQL to a cluster running a different MySQL version. See [Section 15.5.2, “Cluster Upgrade and Downgrade Compatibility”](#), for more information.

**Note:** For rapid restoration, the data may be restored in parallel, provided that there is a sufficient number of cluster connections available. However, the data files must always be applied before the logs.

A complete listing of options available for this program is shown in the following table:

Long Form	Short Form	Description	Default Value
<code>--backup-id</code>	<code>-b</code>	Backup sequence ID	<code>0</code>
<code>--backup_path</code>	<i>None</i>	Path to backup files	<code>./</code>
<code>-char-acter-sets-dir</code>	<i>None</i>	Specify the directory where character set information can be found	<i>None</i>
<code>--connect, -connectstring, or -ndb-connectstring</code>	<code>-c</code> or <code>-C</code>	Set the connectstring in <i>hos</i>	<i>None</i>

		<code>port</code> ] format	
<code>--core-file</code>	<i>None</i>	Write a core file in the event of an error	<code>TRUE</code>
<code>--debug</code>	<code>-#</code>	Output debug log	<code>d:t:0,/tmp/ndb_restore.trace</code>
<code>--help</code> or <code>--usage</code>	<code>-?</code>	Display help message with available options and current values, then exit	[N/A]
<code>--ndb-mgmd-host</code>	<i>None</i>	Set the host and port in <code>host[:port]</code> format for the management server to connect to; this is the same as <code>-connect</code> , <code>--connectstring</code> , or <code>--ndb-connectstring</code> , but without a way to specify the <code>nodeid</code>	<i>None</i>
<code>-ndb-nodegroup-map</code>	<code>-z</code>	Specifies a nodegroup map — <i>Syntax</i> : list of ( <code>source_nodegroup</code> , <code>destination_nodegroup</code> )	<i>None</i>
<code>--ndb-nodeid</code>	<i>None</i>	Specify a node ID for the <code>ndb_restore</code> process	<code>0</code>
<code>-ndb-optimized-node-selection</code>	<i>None</i>	Optimize selection of nodes for transactions	<code>TRUE</code>
<code>--ndb-shm</code>	<i>None</i>	Use shared memory connections when available	<code>FALSE</code>
<code>--nodeid</code>	<code>-n</code>	Use backup files from node with the specified ID	<code>0</code>
<code>--parallelism</code>	<code>-p</code>	Set from 1 to 1024 parallel transactions to be used during the restoration process	<code>128</code>
<code>--print</code>	<i>None</i>	Print data and log to <code>stdout</code>	<code>FALSE</code>
<code>--print_data</code>	<i>None</i>	Print data to <code>stdout</code>	<code>FALSE</code>
<code>--print_log</code>	<i>None</i>	Print log to <code>stdout</code>	<code>FALSE</code>
<code>--print_meta</code>	<i>None</i>	Print metadata to <code>stdout</code>	<code>FALSE</code>
<code>--restore_data</code>	<code>-r</code>	Restore data and logs	<code>FALSE</code>
<code>--restore_meta</code>	<code>-m</code>	Restore table metadata	<code>FALSE</code>
<code>--version</code>	<code>-V</code>	Output version information and exit	[N/A]

## 15.8.4. Configuration for Cluster Backup

Four configuration parameters are essential for backup:

- `BackupDataBufferSize`

The amount of memory used to buffer data before it is written to disk.

- `BackupLogBufferSize`  
The amount of memory used to buffer log records before these are written to disk.
- `BackupMemory`  
The total memory allocated in a database node for backups. This should be the sum of the memory allocated for the backup data buffer and the backup log buffer.
- `BackupWriteSize`  
The default size of blocks written to disk. This applies for both the backup data buffer and the backup log buffer.
- `BackupMaxWriteSize`  
The maximum size of blocks written to disk. This applies for both the backup data buffer and the backup log buffer.

More detailed information about these parameters can be found in [Backup Parameters](#).

## 15.8.5. Backup Troubleshooting

If an error code is returned when issuing a backup request, the most likely cause is insufficient memory or disk space. You should check that there is enough memory allocated for the backup. **Important:** If you have set `BackupDataBufferSize` and `BackupLogBufferSize` and their sum is greater than 4MB, then you must also set `BackupMemory` as well. See [BackupMemory](#).

You should also make sure that there is sufficient space on the hard drive partition of the backup target.

**NDB** does not support repeatable reads, which can cause problems with the restoration process. Although the backup process is “hot”, restoring a MySQL Cluster from backup is not a 100% “hot” process. This is due to the fact that, for the duration of the restore process, running transactions get non-repeatable reads from the restored data. This means that the state of the data is inconsistent while the restore is in progress.

## 15.9. Cluster Utility Programs

This section discusses the MySQL Cluster utility programs that can be found in the `mysql/bin` directory. Each of these — except for `ndb_size.pl` and `ndb_error_reporter` — is a standalone binary that can be used from a system shell, and that does not need to connect to a MySQL server (nor even requires that a MySQL server be connected to the cluster).

These utilities can also serve as examples for writing your own applications using the **NDB** API. The source code for most of these programs may be found in the `ndb/tools` directory of the MySQL 4.1 tree (see [Section 2.9, “MySQL Installation Using a Source Distribution”](#)). The **NDB** API is not covered in this manual; please refer to the [NDB API Guide](http://dev.mysql.com/doc//ndbapi/en/) [http://dev.mysql.com/doc//ndbapi/en/] for information about this API.

All of the **NDB** utilities are listed here with brief descriptions:

- `ndb_delete_all`: Deletes all rows from a given table.

- `ndb_desc`: Lists all properties of an `NDB` table.
- `ndb_drop_index`: Drops the specified index from an `NDB` table.
- `ndb_drop_table`: Drops an `NDB` table.
- `ndb_error_reporter`: Can be used to gather information useful for diagnosing problems with the cluster.
- `ndb_mgm`: This is the MySQL Cluster management client, which is discussed in [Section 15.7.2, “Commands in the Management Client”](#).
- `ndb_print_backup_file`: Prints diagnostic information obtained from cluster backup files.
- `ndb_print_schema_file`: Prints diagnostic information obtained from cluster schema files.
- `ndb_print_sys_file`: Prints diagnostic information obtained from cluster system files.
- `ndb_restore`: This utility is used to restore a cluster from backup. See [Section 15.8.3, “How to Restore a Cluster Backup”](#), for more information.
- `ndb_select_all`: Prints all rows from an `NDB` table.
- `ndb_select_count`: Gets the number of rows in one or more `NDB` tables.
- `ndb_show_tables`: Shows all `NDB` tables anywhere in the cluster.
- `ndb_size.pl`: Examines all the tables in a given non-Cluster database and calculates the amount of storage each would require if it were converted to use the `NDB` storage engine.
- `ndb_waiter`: Reports on the status of cluster data nodes in a manner similar to that of the management client command `ALL STATUS`.

Most of these utilities need to connect to a Cluster management server in order to function. The exceptions are `ndb_size.pl` (see below), and the following utilities which access a cluster data node filesystem and so need to be run on a data node host:

- `ndb_print_backup_file`
- `ndb_print_schema_file`
- `ndb_print_sys_file`

`ndb_size.pl` is a Perl script which is also intended to be used from the shell; however it is a MySQL application and must be able to connect to a MySQL server. See [Section 15.9.12, “ndb\\_size.pl”](#), for additional requirements for using this script.

`ndb_error_reporter` is also a Perl script. It is used to gather cluster data node and management node logs together into a tarball to submit along with a bug report. It can use `ssh` or `scp` to access the node filesystems remotely.

Additional information about each of these utilities (except for `ndb_mgm` and `ndb_restore`) can be found in the sections that follow.

**Note:** All of these utilities (except for `ndb_size.pl`) can use the options discussed in [Section 15.6.5, “Command Options for MySQL Cluster Processes”](#). Additional options specific to each utility program are discussed in the individual program listings.

The order in which these options are used is generally not important. For example, all of these commands produce exactly the same output:

- `ndb_desc -c localhost fish -d test`
- `ndb_desc fish -c localhost -d test`
- `ndb_desc -d test fish -c localhost`

## 15.9.1. `ndb_delete_all`

**Description:** Deletes all rows from the given NDB table. In some cases, this can be much faster than `DELETE` or even `TRUNCATE`.

**Usage:**

```
ndb_delete_all -c connect_string tbl_name -d db_name
```

This deletes all rows from the table named `tbl_name` in the database named `db_name`. It is exactly equivalent to executing `TRUNCATE db_name.tbl_name` in MySQL.

**Additional Options:**

- `-t, --transactional`

Use of this option causes the delete operation to be performed as a single transaction.

**Warning:** With very large tables, this using this option may cause the number of operations available to the cluster to be exceeded.

## 15.9.2. `ndb_desc`

**Description:** Provides a detailed description of one or more NDB tables.

**Usage:**

```
ndb_desc -c connect_string tbl_name -d db_name
```

**Sample Output:**

MySQL table creation and population statements:

```
USE test;

CREATE TABLE fish (
  id INT(11) NOT NULL AUTO_INCREMENT,
  name VARCHAR(20),

  PRIMARY KEY pk (id),
  UNIQUE KEY uk (name)
) ENGINE=NDBCLUSTER;

INSERT INTO fish VALUES
  ('','guppy'), ('','tuna'), ('','shark'),
  ('','manta ray'), ('','grouper'), ('','puffer');
```

Output from `ndb_desc`:

```
shell> ./ndb_desc -c localhost fish -d test -p
-- fish --
Version: 16777221
Fragment type: 5
K Value: 6
Min load factor: 78
Max load factor: 80
Temporary table: no
Number of attributes: 2
Number of primary keys: 1
Length of frm data: 268
Row Checksum: 1
Row GCI: 1
TableStatus: Retrieved
-- Attributes --
id Int PRIMARY KEY DISTRIBUTION KEY AT=FIXED ST=MEMORY
name Varchar(20;latin1_swedish_ci) NULL AT=SHORT_VAR ST=MEMORY

-- Indexes --
PRIMARY KEY(id) - UniqueHashIndex
uk(name) - OrderedIndex
PRIMARY(id) - OrderedIndex
uk$unique(name) - UniqueHashIndex

-- Per partition info --
Partition  Row count  Commit count  Frag fixed memory  Frag var sized memory
2          2          2             65536              327680
1          2          2             65536              327680
3          2          2             65536              327680

NDBT_ProgramExit: 0 - OK
```

**Additional Options:**

- `-p, --extra-partition-info`  
Prints additional information about the table's partitions.
- Information about multiple tables can be obtained in a single invocation of `ndb_desc` by using their names, separated by spaces. All of the tables must be in the same database.

### 15.9.3. `ndb_drop_index`

**Description:** Drops the specified index from an NDB table. *It is recommended that you use this utility only as an example for writing NDB API applications* — see the Warning later in this section for details.

**Usage:**

```
ndb_drop_index -c connect_string table_name index -d db_name
```

The statement shown above drops the index named `index` from the `table` in the `database`.

**Additional Options:** None that are specific to this application.

**Warning:** Operations performed on Cluster table indexes using the NDB API are not visible to MySQL and make the table unusable by a MySQL server. If you use this program to drop an index, then try to access the table from an SQL node, an error results, as shown here:

```
shell> ./ndb_drop_index -c localhost dogs ix -d ctest1
Dropping index dogs/idx...OK

NDBT_ProgramExit: 0 - OK

shell> ./mysql -u jon -p ctest1
```

```

Enter password: *****
Reading table information for completion of table and column names
You can turn off this feature to get a quicker startup with -A

Welcome to the MySQL monitor.  Commands end with ; or \g.
Your MySQL connection id is 7 to server version: 5.1.12-beta-20060817

Type 'help;' or '\h' for help. Type '\c' to clear the buffer.

mysql> SHOW TABLES;
+-----+
| Tables_in_ctest1 |
+-----+
| a                 |
| bt1               |
| bt2               |
| dogs              |
| employees         |
| fish              |
+-----+
6 rows in set (0.00 sec)

mysql> SELECT * FROM dogs;
ERROR 1296 (HY000): Got error 4243 'Index not found' from NDBCLUSTER

```

In such a case, your *only* option for making the table available to MySQL again is to drop the table and re-create it. You can use either the SQL statement `DROP TABLE` or the `ndb_drop_table` utility (see [Section 15.9.4, “ndb\\_drop\\_table”](#)) to drop the table.

## 15.9.4. `ndb_drop_table`

**Description:** Drops the specified NDB table. (If you try to use this on a table created with a storage engine other than NDB, it fails with the error 723: No such table exists.) This operation is extremely fast — in some cases, it can be an order of magnitude faster than using `DROP TABLE` on an NDB table from MySQL.

**Usage:**

```
ndb_drop_table -c connect_string tbl_name -d db_name
```

**Additional Options:** None.

## 15.9.5. `ndb_error_reporter`

**Description:** Creates an archive from data node and management node logfiles that can be used to help diagnose bugs or other problems with a cluster. *It is highly recommended that you make use of this utility when filing reports of bugs in MySQL Cluster.*

**Usage:**

```
ndb_error_reporter path/to/config-file [username] [--fs]
```

This utility is intended for use on a management node host, and requires the path to the management host configuration file (`config.ini`). Optionally, you can supply the name of a user that is able to access the cluster's data nodes via SSH, in order to copy the data node logfiles. `ndb_error_reporter` then includes all of these files in archive that is created in the same directory in which it is run. The archive is named `ndb_error_report_YYYYMMDDHHMMSS.tar.bz2`, where `YYYYMMDDHHMMSS` is a date-time string.

If the `--fs` is used, then the data node filesystems are also copied to the management host and included in the archive that is produced by this script. As data node filesystems can be extremely large even after being compressed, we ask that you please do *not* send archives created using this option to MySQL AB unless you are specifically requested to do so.

## 15.9.6. `ndb_print_backup_file`

**Description:** Obtains diagnostic information from a cluster backup file.

**Usage:**

```
ndb_print_backup_file file_name
```

*file\_name* is the name of a cluster backup file. This can be any of the files (`.Data`, `.ctl`, or `.log` file) found in a cluster backup directory. These files are found in the data node's backup directory under the subdirectory `BACKUP-#`, where `#` is the sequence number for the backup. For more information about cluster backup files and their contents, see [Section 15.8.1, “Cluster Backup Concepts”](#).

Like `ndb_print_schema_file` and `ndb_print_sys_file` (and unlike most of the other NDB utilities that are intended to be run on a management server host or to connect to a management server) `ndb_print_backup_file` must be run on a cluster data node, since it accesses the data node filesystem directly. Because it does not make use of the management server, this utility can be used when the management server is not running, and even when the cluster has been completely shut down.

**Additional Options:** None.

## 15.9.7. `ndb_print_schema_file`

**Description:** Obtains diagnostic information from a cluster schema file.

**Usage:**

```
ndb_print_schema_file file_name
```

*file\_name* is the name of a cluster schema file.

Like `ndb_print_backup_file` and `ndb_print_sys_file` (and unlike most of the other NDB utilities that are intended to be run on a management server host or to connect to a management server) `ndb_print_schema_file` must be run on a cluster data node, since it accesses the data node filesystem directly. Because it does not make use of the management server, this utility can be used when the management server is not running, and even when the cluster has been completely shut down.

**Additional Options:** None.

## 15.9.8. `ndb_print_sys_file`

**Description:** Obtains diagnostic information from a cluster system file.

**Usage:**

```
ndb_print_sys_file file_name
```

*file\_name* is the name of a cluster system file (sysfile). Cluster system files are located in a data node's data directory (`DataDir`); the path under this directory to system files matches the pattern `ndb_#_fs/D#/DBDIH/P#.sysfile`. In each case, the `#` represents a number (not necessarily the same number).

Like `ndb_print_backup_file` and `ndb_print_schema_file` (and unlike most of the other NDB utilities that are intended to be run on a management server host or to connect to a management server) `ndb_print_sys_file` must be run on a cluster data node, since it accesses the data node filesystem directly. Because it does not make use of the management server, this utility can be used when the management server is not running, and even when the cluster has been completely shut down.

**Additional Options:** None.

### 15.9.9. `ndb_select_all`

**Description:** Prints all rows from an NDB table to `stdout`.

**Usage:**

```
ndb_select_all -c connect_string tbl_name -d db_name [> file_name]
```

**Additional Options:**

- `-l lock_type, --lock=lock_type`

Employs a lock when reading the table. Possible values for `lock_type` are:

- 0: Read lock
- 1: Read lock with hold
- 2: Exclusive read lock

There is no default value for this option.

- `-o index_name, --order=index_name`

Orders the output according to the index named `index_name`. Note that this is the name of an index, not of a column, and that the index must have been explicitly named when created.

- `-z, --descending`

Sorts the output in descending order. This option can be used only in conjunction with the `-o` (`--order`) option.

- `--header=FALSE`

Excludes column headers from the output.

- `-x, --useHexFormat`

Causes all numeric values to be displayed in hexadecimal format. This does not affect the output of numerals contained in strings or datetime values.

`-D character, --delimiter=character`

Causes the `character` to be used as a column delimiter. Only table data columns are separated by this delimiter.

The default delimiter is the tab character.

- `--rowid`

Adds a `ROWID` column providing information about the fragments in which rows are stored.

- `--gci`

Adds a column to the output showing the global checkpoint at which each row was last updated. See [Section 15.13, “MySQL Cluster Glossary”](#), and [Section 15.7.3.2, “Log Events”](#), for more informa-

tion about checkpoints.

- `-t, --tupscan`

Scan the table in the order of the tuples.

- `--nodata`

Causes any table data to be omitted.

### Sample Output:

Output from a MySQL `SELECT` statement:

```
mysql> SELECT * FROM ctest1.fish;
+----+-----+
| id | name  |
+----+-----+
| 3  | shark |
| 6  | puffer|
| 2  | tuna  |
| 4  | manta ray|
| 5  | grouper|
| 1  | guppy |
+----+-----+
6 rows in set (0.04 sec)
```

Output from the equivalent invocation of `ndb_select_all`:

```
shell> ./ndb_select_all -c localhost fish -d ctest1
id      name
3       [shark]
6       [puffer]
2       [tuna]
4       [manta ray]
5       [grouper]
1       [guppy]
6 rows returned

NDBT_ProgramExit: 0 - OK
```

Note that all string values are enclosed by square brackets (“[...]”) in the output of `ndb_select_all`. For a further example, consider the table created and populated as shown here:

```
CREATE TABLE dogs (
  id INT(11) NOT NULL AUTO_INCREMENT,
  name VARCHAR(25) NOT NULL,
  breed VARCHAR(50) NOT NULL,
  PRIMARY KEY pk (id),
  KEY ix (name)
)
ENGINE=NDB;

INSERT INTO dogs VALUES
  ('', 'Lassie', 'collie'),
  ('', 'Scooby-Doo', 'Great Dane'),
  ('', 'Rin-Tin-Tin', 'German Shepherd'),
  ('', 'Rosscoe', 'Mutt');
```

This demonstrates the use of several additional `ndb_select_all` options:

```
shell> ./ndb_select_all -d ctest1 dogs -o ix -z --gci
GCI      id name      breed
834461  2 [Scooby-Doo] [Great Dane]
834878  4 [Rosscoe]    [Mutt]
834463  3 [Rin-Tin-Tin] [German Shepherd]
835657  1 [Lassie]     [Collie]
4 rows returned
```

```
NDBT_ProgramExit: 0 - OK
```

## 15.9.10. `ndb_select_count`

**Description:** Prints the number of rows in one or more NDB table. With a single table, the result is equivalent to that obtained by using the MySQL statement `SELECT COUNT(*) FROM tbl_name`.

**Usage:**

```
ndb_select_count [-c connect_string] -ddb_name tbl_name[, tbl_name2[, ...]]
```

**Additional Options:** None that are specific to this application. However, you can obtain row counts from multiple tables in the same database by listing the table names separated by spaces when invoking this command, as shown under **Sample Output**.

**Sample Output:**

```
shell> ./ndb_select_count -c localhost -d ctest1 fish dogs
6 records in table fish
4 records in table dogs
NDBT_ProgramExit: 0 - OK
```

## 15.9.11. `ndb_show_tables`

**Description:** Displays a list of all NDB database objects in the cluster. By default, this includes not only both user-created tables and NDB system tables, but NDB-specific indexes, and internal triggers, as well.

**Usage:**

```
ndb_show_tables [-c connect_string]
```

**Additional Options:**

- `-l, --loops`

Specifies the number of times the utility should execute. This is 1 when this option is not specified, but if you do use the option, you must supply an integer argument for it.

- `-p, --parsable`

Using this option causes the output to be in a format suitable for use with `LOAD DATA INFILE`.

- `-t, --type`

Can be used to restrict the output to one type of object, specified by an integer type code as shown here:

- **1:** System table
- **2:** User-created table
- **3:** Unique hash index

Any other value causes all NDB database objects to be listed (the default).

- `-u, --unqualified`

If specified, this causes unqualified object names to be displayed.

**Note:** Only user-created Cluster tables may be accessed from MySQL; system tables such as `SYSTAB_0` are not visible to `mysqld`. However, you can examine the contents of system tables using NDB API applications such as `ndb_select_all` (see [Section 15.9.9, “ndb\\_select\\_all”](#)).

## 15.9.12. `ndb_size.pl`

**Description:** This is a Perl script that can be used to estimate the amount of space that would be required by a MySQL database if it were converted to use the `NDBCluster` storage engine. Unlike the other utilities discussed in this section, it does not require access to a MySQL Cluster (in fact, there is no reason for it to do so). However, it does need to access the MySQL server on which the database to be tested resides.

### Requirements:

- A running MySQL server. The server instance does not have to provide support for MySQL Cluster.
- A working installation of Perl.
- The `DBI` and `HTML::Template` modules, both of which can be obtained from CPAN if they are not already part of your Perl installation. (Many Linux and other operating system distribution provide their own packages for one or both of these libraries.)
- The `ndb_size.tpl` template file, which you should be able to find in the `share/mysql` directory of your MySQL installation. This file should be copied or moved into the same directory as `ndb_size.pl` — if it is not there already — before running the script.
- A MySQL user account having the necessary privileges. If you do not wish to use an existing account, then creating one using `GRANT USAGE ON db_name.*` — where `db_name` is the name of the database to be examined — is sufficient for this purpose.

`ndb_size.pl` and `ndb_size.tpl` can also be found in the MySQL sources in `storage/ndb/tools`. If these files are not present in your MySQL installation, you can obtain them from the [MySQLForge project page](http://forge.mysql.com/projects/view.php?id=88) [http://forge.mysql.com/projects/view.php?id=88].

### Usage:

```
perl ndb_size.pl db_name hostname username password > file_name.html
```

The command shown connects to the MySQL server at `hostname` using the account of the user `username` having the password `password`, analyses all of the tables in database `db_name`, and generates a report in HTML format which is directed to the file `file_name.html`. (Without the redirection, the output is sent to `stdout`.) This figure shows partial sample output as viewed in a Web browser:

## MySQL Cluster analysis for world

This is an automated analysis of the DBI:mysql:database=world;host=192.168.0.176 database for migration into MySQL Cluster. No warranty is made to the accuracy of the information.

This information should be valid for MySQL 4.1 and 5.0. Since 5.1 is not a final release yet, the numbers should be used as a guide only.

### Parameter Settings

**NOTE** the configuration parameters below do not take into account system tables and other requirements.

Parameter	4.1	5.0	5.1
DataMemory (kb)	544	544	544
IndexMemory (kb)	192	136	136
MaxNoOfTables	3	3	3
MaxNoOfAttributes	24	24	24
MaxNoOfOrderedIndexes	3	3	3
MaxNoOfUniqueHashIndexes	3	3	3
MaxNoOfTriggers	12	12	12

### Memory usage because of parameters

Usage is in kilobytes. Actual usage will vary as you should set the parameters larger than those listed in the table above.

Parameter	4.1	5.0	5.1
Attributes	5	5	5
Tables	60	60	60
OrderedIndexes	30	30	30
UniqueHashIndexes	45	45	45

### Table List

- [City](#)
- [Country](#)
- [CountryLanguage](#)

#### City

Column	Type	Size	Key	4.1 NDB Size	5.0 NDB Size	5.1 NDB Size
ID	int	11	PR1	4	4	4
District	char	20		20	20	20
Name	char	35		36	36	36
Population	int	11		4	4	4
CountryCode	char	3		4	4	4

### Indexes

We assume that indexes are ORDERED (not created USING HASH). If order is not required, 10 bytes of data memory can be saved per row if the index is created USING HASH

Index	Type	Columns	4.1 IdxMem	5.0 IdxMem	5.1 IdxMem	4.1 DatMem	5.0 DatMem	5.1 DatMem
PRIMARY	BTREE	ID	29	25	25	10	10	10

### DataMemory Usage

	4.1	5.0	5.1
Row Overhead	16	16	16
Column DataMemory/Row	68	68	68
Index DataMemory/Row	10	10	10
Total DataMemory/Row	94	94	94
Rows per 32 kb page	347	347	347
Current number of rows	4079	4079	4079
Total DataMemory (kb)	384	384	384

### IndexMemory Usage

	4.1	5.0	5.1
IndexMemory/Row	29	25	25
Rows per 8kb page	282	327	327
Current number of rows	4079	4079	4079
Total IndexMemory (kb)	120	104	104

The output from this script includes:

- Minimum values for the `DataMemory`, `IndexMemory`, `MaxNoOfTables`, `MaxNoOfAttributes`, `MaxNoOfOrderedIndexes`, `MaxNoOfUniqueHashIndexes`, and `MaxNoOfTriggers` configuration parameters required to accommodate the tables analysed.
- Memory requirements for all of the tables, attributes, ordered indexes, and unique hash indexes defined in the database.
- The `IndexMemory` and `DataMemory` required per table and table row.

### 15.9.13. `ndb_waiter`

**Description:** Repeatedly (each 100 milliseconds) prints out the status of all cluster data nodes until either the cluster reaches a given status or the `--timeout` limit is exceeded, then exits. By default, it waits for the cluster to achieve `STARTED` status, in which all nodes have started and connected to the cluster. This can be overridden using the `--no-contact` and `--not-started` options (see [Additional Options](#)).

The node states reported by this utility are as follows:

- `NO_CONTACT`: The node cannot be contacted.
- `UNKNOWN`: The node can be contacted, but its status is not yet known. Usually, this means that the node has received a `START` or `RESTART` command from the management server, but has not yet acted on it.
- `NOT_STARTED`: The node has stopped, but remains in contact with the cluster. This is seen when restarting the node using the management client's `RESTART` command.
- `STARTING`: The node's `ndbd` process has started, but the node has not yet joined the cluster.
- `STARTED`: The node is operational, and has joined the cluster.
- `SHUTTING_DOWN`: The node is shutting down.
- `SINGLE USER MODE`: This is shown for all cluster data nodes when the cluster is in single user mode.

**Usage:**

```
ndb_waiter [-c connect_string]
```

**Additional Options:**

- `-n, --no-contact`

Instead of waiting for the `STARTED` state, `ndb_waiter` continues running until the cluster reaches `NO_CONTACT` status before exiting.

- `--not-started`

Instead of waiting for the `STARTED` state, `ndb_waiter` continues running until the cluster reaches `NOT_STARTED` status before exiting.

- `-t, --timeout=#`

Time to wait. The program exits if the desired state is not achieved within this number of seconds. The default is 120 seconds (1200 reporting cycles).

### Sample Output:

Shown here is the output from `ndb_waiter` when run against a 4-node cluster in which two nodes have been shut down and then started again manually. Duplicate reports (indicated by “...”) are omitted.

```
shell> ./ndb_waiter -c localhost

Connecting to mgmsrv at (localhost)
State node 1 STARTED
State node 2 NO_CONTACT
State node 3 STARTED
State node 4 NO_CONTACT
Waiting for cluster enter state STARTED

...

State node 1 STARTED
State node 2 UNKNOWN
State node 3 STARTED
State node 4 NO_CONTACT
Waiting for cluster enter state STARTED

...

State node 1 STARTED
State node 2 STARTING
State node 3 STARTED
State node 4 NO_CONTACT
Waiting for cluster enter state STARTED

...

State node 1 STARTED
State node 2 STARTING
State node 3 STARTED
State node 4 UNKNOWN
Waiting for cluster enter state STARTED

...

State node 1 STARTED
State node 2 STARTING
State node 3 STARTED
State node 4 STARTING
Waiting for cluster enter state STARTED

...

State node 1 STARTED
State node 2 STARTED
State node 3 STARTED
State node 4 STARTING
Waiting for cluster enter state STARTED

...

State node 1 STARTED
State node 2 STARTED
State node 3 STARTED
State node 4 STARTED
Waiting for cluster enter state STARTED

NDBT_ProgramExit: 0 - OK
```

**Note:** If no connectstring is specified, then `ndb_waiter` tries to connect to a management on `localhost`, and reports `Connecting to mgmsrv at (null)`.

## 15.10. Using High-Speed Interconnects with MySQL Cluster

Even before design of [NDB Cluster](#) began in 1996, it was evident that one of the major problems to be encountered in building parallel databases would be communication between the nodes in the network. For this reason, [NDB Cluster](#) was designed from the very beginning to allow for the use of a number of different data transport mechanisms. In this Manual, we use the term *transporter* for these.

The MySQL Cluster codebase includes support for four different transporters:

- *TCP/IP using 100 Mbps or gigabit Ethernet*, as discussed in [Section 15.4.4.7, “Cluster TCP/IP Connections”](#).
- *Direct (machine-to-machine) TCP/IP*; although this transporter uses the same TCP/IP protocol as mentioned in the previous item, it requires setting up the hardware differently and is configured differently as well. For this reason, it is considered a separate transport mechanism for MySQL Cluster. See [Section 15.4.4.8, “TCP/IP Connections Using Direct Connections”](#), for details.
- *Shared memory (SHM)*. For more information about SHM, see [Section 15.4.4.9, “Shared-Memory Connections”](#).
- *Scalable Coherent Interface (SCI)*, as described in the next section of this chapter, [Section 15.4.4.10, “SCI Transport Connections”](#).

Most users today employ TCP/IP over Ethernet because it is ubiquitous. TCP/IP is also by far the best-tested transporter for use with MySQL Cluster.

We are working to make sure that communication with the `ndbd` process is made in “chunks” that are as large as possible because this benefits all types of data transmission.

For users who desire it, it is also possible to use cluster interconnects to enhance performance even further. There are two ways to achieve this: Either a custom transporter can be designed to handle this case, or you can use socket implementations that bypass the TCP/IP stack to one extent or another. We have experimented with both of these techniques using the SCI (Scalable Coherent Interface) technology developed by [Dolphin](http://www.dolphinics.com/) [http://www.dolphinics.com/].

### 15.10.1. Configuring MySQL Cluster to use SCI Sockets

In this section, we show how to adapt a cluster configured for normal TCP/IP communication to use SCI Sockets instead. This documentation is based on SCI Sockets version 2.3.0 as of 01 October 2004.

#### Prerequisites

Any machines with which you wish to use SCI Sockets must be equipped with SCI cards.

It is possible to use SCI Sockets with any version of MySQL Cluster. No special builds are needed because it uses normal socket calls which are already available in MySQL Cluster. However, SCI Sockets are currently supported only on the Linux 2.4 and 2.6 kernels. SCI Transporters have been tested successfully on additional operating systems although we have verified these only with Linux 2.4 to date.

There are essentially four requirements for SCI Sockets:

- Building the SCI Socket libraries.
- Installation of the SCI Socket kernel libraries.

- Installation of one or two configuration files.
- The SCI Socket kernel library must be enabled either for the entire machine or for the shell where the MySQL Cluster processes are started.

This process needs to be repeated for each machine in the cluster where you plan to use SCI Sockets for inter-node communication.

Two packages need to be retrieved to get SCI Sockets working:

- The source code package containing the DIS support libraries for the SCI Sockets libraries.
- The source code package for the SCI Socket libraries themselves.

Currently, these are available only in source code format. The latest versions of these packages at the time of this writing were available as (respectively) `DIS_GPL_2_5_0_SEP_10_2004.tar.gz` and `SCI_SOCKET_2_3_0_OKT_01_2004.tar.gz`. You should be able to find these (or possibly newer versions) at <http://www.dolphinics.no/support/downloads.html>.

### Package Installation

Once you have obtained the library packages, the next step is to unpack them into appropriate directories, with the SCI Sockets library unpacked into a directory below the DIS code. Next, you need to build the libraries. This example shows the commands used on Linux/x86 to perform this task:

```
shell> tar xzf DIS_GPL_2_5_0_SEP_10_2004.tar.gz
shell> cd DIS_GPL_2_5_0_SEP_10_2004/src/
shell> tar xzf ../../SCI_SOCKET_2_3_0_OKT_01_2004.tar.gz
shell> cd ../adm/bin/Linux_pkgs
shell> ./make_PSB_66_release
```

It is possible to build these libraries for some 64-bit processors. To build the libraries for Opteron CPUs using the 64-bit extensions, run `make_PSB_66_X86_64_release` rather than `make_PSB_66_release`. If the build is made on an Itanium machine, you should use `make_PSB_66_IA64_release`. The X86-64 variant should work for Intel EM64T architectures but this has not yet (to our knowledge) been tested.

Once the build process is complete, the compiled libraries will be found in a zipped tar file with a name along the lines of `DIS-<operating-system>-time-date`. It is now time to install the package in the proper place. In this example we will place the installation in `/opt/DIS`. (**Note:** You will most likely need to run the following as the system `root` user.)

```
shell> cp DIS_Linux_2.4.20-8_181004.tar.gz /opt/
shell> cd /opt
shell> tar xzf DIS_Linux_2.4.20-8_181004.tar.gz
shell> mv DIS_Linux_2.4.20-8_181004 DIS
```

### Network Configuration

Now that all the libraries and binaries are in their proper place, we need to ensure that the SCI cards have proper node IDs within the SCI address space.

It is also necessary to decide on the network structure before proceeding. There are three types of network structures which can be used in this context:

- A simple one-dimensional ring

- One or more SCI switches with one ring per switch port
- A two- or three-dimensional torus.

Each of these topologies has its own method for providing node IDs. We discuss each of them in brief.

A simple ring uses node IDs which are non-zero multiples of 4: 4, 8, 12,...

The next possibility uses SCI switches. An SCI switch has 8 ports, each of which can support a ring. It is necessary to make sure that different rings use different node ID spaces. In a typical configuration, the first port uses node IDs below 64 (4 – 60), the next 64 node IDs (68 – 124) are assigned to the next port, and so on, with node IDs 452 – 508 being assigned to the eighth port.

Two- and three-dimensional torus network structures take into account where each node is located in each dimension, incrementing by 4 for each node in the first dimension, by 64 in the second dimension, and (where applicable) by 1024 in the third dimension. See [Dolphin's Web site](http://www.dolphinics.com/support/index.html) [http://www.dolphinics.com/support/index.html] for more thorough documentation.

In our testing we have used switches, although most large cluster installations use 2- or 3-dimensional torus structures. The advantage provided by switches is that, with dual SCI cards and dual switches, it is possible to build with relative ease a redundant network where the average failover time on the SCI network is on the order of 100 microseconds. This is supported by the SCI transporter in MySQL Cluster and is also under development for the SCI Socket implementation.

Failover for the 2D/3D torus is also possible but requires sending out new routing indexes to all nodes. However, this requires only 100 milliseconds or so to complete and should be acceptable for most high-availability cases.

By placing cluster data nodes properly within the switched architecture, it is possible to use 2 switches to build a structure whereby 16 computers can be interconnected and no single failure can hinder more than one of them. With 32 computers and 2 switches it is possible to configure the cluster in such a manner that no single failure can cause the loss of more than two nodes; in this case, it is also possible to know which pair of nodes is affected. Thus, by placing the two nodes in separate node groups, it is possible to build a “safe” MySQL Cluster installation.

To set the node ID for an SCI card use the following command in the `/opt/DIS/sbin` directory. In this example, `-c 1` refers to the number of the SCI card (this is always 1 if there is only 1 card in the machine); `-a 0` refers to adapter 0; and `68` is the node ID:

```
shell> ./sciconfig -c 1 -a 0 -n 68
```

If you have multiple SCI cards in the same machine, you can determine which card has which slot by issuing the following command (again we assume that the current working directory is `/opt/DIS/sbin`):

```
shell> ./sciconfig -c 1 -gsn
```

This will give you the SCI card's serial number. Then repeat this procedure with `-c 2`, and so on, for each card in the machine. Once you have matched each card with a slot, you can set node IDs for all cards.

After the necessary libraries and binaries are installed, and the SCI node IDs are set, the next step is to set up the mapping from hostnames (or IP addresses) to SCI node IDs. This is done in the SCI sockets configuration file, which should be saved as `/etc/sci/scisock.conf`. In this file, each SCI node ID is mapped through the proper SCI card to the hostname or IP address that it is to communicate with. Here is a very simple example of such a configuration file:

```
#host      #nodeId
alpha      8
beta       12
192.168.10.20 16
```

It is also possible to limit the configuration so that it applies only to a subset of the available ports for these hosts. An additional configuration file `/etc/sci/scisock_opt.conf` can be used to accomplish this, as shown here:

```
#-key          -type      -values
EnablePortsByDefault  yes
EnablePort          tcp         2200
DisablePort         tcp         2201
EnablePortRange      tcp         2202 2219
DisablePortRange     tcp         2220 2231
```

## Driver Installation

With the configuration files in place, the drivers can be installed.

First, the low-level drivers and then the SCI socket driver need to be installed:

```
shell> cd DIS/sbin/
shell> ./drv-install add PSB66
shell> ./scisocket-install add
```

If desired, the installation can be checked by invoking a script which verifies that all nodes in the SCI socket configuration files are accessible:

```
shell> cd /opt/DIS/sbin/
shell> ./status.sh
```

If you discover an error and need to change the SCI socket configuration, it is necessary to use `ksocket-etconfig` to accomplish this task:

```
shell> cd /opt/DIS/util
shell> ./ksocketconfig -f
```

## Testing the Setup

To ensure that SCI sockets are actually being used, you can employ the `latency_bench` test program. Using this utility's server component, clients can connect to the server to test the latency of the connection. Determining whether SCI is enabled should be fairly simple from observing the latency. (**Note:** Before using `latency_bench`, it is necessary to set the `LD_PRELOAD` environment variable as shown later in this section.)

To set up a server, use the following:

```
shell> cd /opt/DIS/bin/socket
shell> ./latency_bench -server
```

To run a client, use `latency_bench` again, except this time with the `-client` option:

```
shell> cd /opt/DIS/bin/socket
shell> ./latency_bench -client server_hostname
```

SCI socket configuration should now be complete and MySQL Cluster ready to use both SCI Sockets and the SCI transporter (see [Section 15.4.4.10, "SCI Transport Connections"](#)).

## Starting the Cluster

The next step in the process is to start MySQL Cluster. To enable usage of SCI Sockets it is necessary to set the environment variable `LD_PRELOAD` before starting `ndbd`, `mysqld`, and `ndb_mgmd`. This variable should point to the kernel library for SCI Sockets.

To start `ndbd` in a bash shell, do the following:

```
bash-shell> export LD_PRELOAD=/opt/DIS/lib/libkscisock.so
bash-shell> ndbd
```

In a `tcsh` environment the same thing can be accomplished with:

```
tcsh-shell> setenv LD_PRELOAD=/opt/DIS/lib/libkscisock.so
tcsh-shell> ndbd
```

**Note:** MySQL Cluster can use only the kernel variant of SCI Sockets.

## 15.10.2. Understanding the Impact of Cluster Interconnects

The `ndbd` process has a number of simple constructs which are used to access the data in a MySQL Cluster. We have created a very simple benchmark to check the performance of each of these and the effects which various interconnects have on their performance.

There are four access methods:

- **Primary key access**

This is access of a record through its primary key. In the simplest case, only one record is accessed at a time, which means that the full cost of setting up a number of TCP/IP messages and a number of costs for context switching are borne by this single request. In the case where multiple primary key accesses are sent in one batch, those accesses share the cost of setting up the necessary TCP/IP messages and context switches. If the TCP/IP messages are for different destinations, additional TCP/IP messages need to be set up.

- **Unique key access**

Unique key accesses are similar to primary key accesses, except that a unique key access is executed as a read on an index table followed by a primary key access on the table. However, only one request is sent from the MySQL Server, and the read of the index table is handled by `ndbd`. Such requests also benefit from batching.

- **Full table scan**

When no indexes exist for a lookup on a table, a full table scan is performed. This is sent as a single request to the `ndbd` process, which then divides the table scan into a set of parallel scans on all cluster `ndbd` processes. In future versions of MySQL Cluster, an SQL node will be able to filter some of these scans.

- **Range scan using ordered index**

When an ordered index is used, it performs a scan in the same manner as the full table scan, except that it scans only those records which are in the range used by the query transmitted by the MySQL server (SQL node). All partitions are scanned in parallel when all bound index attributes include all attributes in the partitioning key.

To check the base performance of these access methods, we have developed a set of benchmarks. One such benchmark, `testReadPerf`, tests simple and batched primary and unique key accesses. This

benchmark also measures the setup cost of range scans by issuing scans returning a single record. There is also a variant of this benchmark which uses a range scan to fetch a batch of records.

In this way, we can determine the cost of both a single key access and a single record scan access, as well as measure the impact of the communication media used, on base access methods.

In our tests, we ran the base benchmarks for both a normal transporter using TCP/IP sockets and a similar setup using SCI sockets. The figures reported in the following table are for small accesses of 20 records per access. The difference between serial and batched access decreases by a factor of 3 to 4 when using 2KB records instead. SCI Sockets were not tested with 2KB records. Tests were performed on a cluster with 2 data nodes running on 2 dual-CPU machines equipped with AMD MP1900+ processors.

Access Type	TCP/IP Sockets	SCI Socket
Serial pk access	400 microseconds	160 microseconds
Batched pk access	28 microseconds	22 microseconds
Serial uk access	500 microseconds	250 microseconds
Batched uk access	70 microseconds	36 microseconds
Indexed eq-bound	1250 microseconds	750 microseconds
Index range	24 microseconds	12 microseconds

We also performed another set of tests to check the performance of SCI Sockets *vis-à-vis* that of the SCI transporter, and both of these as compared with the TCP/IP transporter. All these tests used primary key accesses either serially and multi-threaded, or multi-threaded and batched.

The tests showed that SCI sockets were about 100% faster than TCP/IP. The SCI transporter was faster in most cases compared to SCI sockets. One notable case occurred with many threads in the test program, which showed that the SCI transporter did not perform very well when used for the `mysqld` process.

Our overall conclusion was that, for most benchmarks, using SCI sockets improves performance by approximately 100% over TCP/IP, except in rare instances when communication performance is not an issue. This can occur when scan filters make up most of processing time or when very large batches of primary key accesses are achieved. In that case, the CPU processing in the `ndbd` processes becomes a fairly large part of the overhead.

Using the SCI transporter instead of SCI Sockets is only of interest in communicating between `ndbd` processes. Using the SCI transporter is also only of interest if a CPU can be dedicated to the `ndbd` process because the SCI transporter ensures that this process will never go to sleep. It is also important to ensure that the `ndbd` process priority is set in such a way that the process does not lose priority due to running for an extended period of time, as can be done by locking processes to CPUs in Linux 2.6. If such a configuration is possible, the `ndbd` process will benefit by 10–70% as compared with using SCI sockets. (The larger figures will be seen when performing updates and probably on parallel scan operations as well.)

There are several other optimized socket implementations for computer clusters, including Myrinet, Gigabit Ethernet, Infiniband and the VIA interface. We have tested MySQL Cluster so far only with SCI sockets. See [Section 15.10.1, “Configuring MySQL Cluster to use SCI Sockets”](#) for information on how to set up SCI sockets using ordinary TCP/IP for MySQL Cluster.

## 15.11. Known Limitations of MySQL Cluster

In this section, we provide a list of known limitations in MySQL Cluster releases in the 4.1.x series compared to features available when using the `MyISAM` and `InnoDB` storage engines. Currently, there are no plans to address these in coming releases of MySQL 4.1; however, we will attempt to supply fixes for these issues in subsequent release series. If you check the “Cluster” category in the MySQL

bugs database at <http://bugs.mysql.com>, you can find known bugs which (if marked “4.1”) we intend to correct in upcoming releases of MySQL 4.1.

The list here is intended to be complete with respect to the conditions just set forth. You can report any discrepancies that you encounter to the MySQL bugs database using the instructions given in [Section 1.8, “How to Report Bugs or Problems”](#). If we do not plan to fix the problem in MySQL 4.1, we will add it to the list.

- **Noncompliance in syntax** (resulting in errors when running existing applications):
  - Temporary tables are not supported.
  - Not all charsets and collations are supported; see [Section D.5.14, “Changes in MySQL Cluster-4.1.6 \(10 October 2004\)”](#), for a list of those that are supported.
  - There are no prefix indexes; only entire fields can be indexed.
  - Text indexes are not supported. That is, you cannot create indexes on columns of any of the [TEXT](#) datatypes, nor does the [NDB](#) storage engine support [FULLTEXT](#) indexes (these are supported by [MyISAM](#) only). However, you can index [CHAR](#) or [VARCHAR](#) columns of [NDB](#) tables.
  - A [BIT](#) column cannot be a primary key, unique key, or index, nor can it be part of a composite primary key, unique key, or index.
  - Geometry datatypes ([WKT](#) and [WKB](#)) are not supported.
  - [INSERT IGNORE](#) is supported only for primary keys, but not for unique keys. One possible workaround is to remove the constraint by dropping the unique index, perform any inserts, and then add the unique index again. ([Bug#17431](#) [<http://bugs.mysql.com/17431>])
- **Non-compliance in limits or behavior** (may result in errors when running existing applications):
  - **Error Reporting:**
    - A duplicate key error returns the error message ERROR 23000: Can't write; duplicate key in table '*tbl\_name*'.
    - Like other MySQL storage engines, the [NDB](#) storage engine can handle a maximum of one [AUTO\\_INCREMENT](#) column per table. However, in the case of a Cluster table with no explicit primary key, an [AUTO\\_INCREMENT](#) column is automatically defined and used as a “hidden” primary key. For this reason, you cannot define a table that has an explicit [AUTO\\_INCREMENT](#) column unless that column is also declared using the [PRIMARY KEY](#) option.  
  
Attempting to create a table with an [AUTO\\_INCREMENT](#) column that is not the table's primary key, and using the [NDB](#) storage engine, fails with an error.
  - **Transaction Handling:**
    - [NDB Cluster](#) supports only the [READ COMMITTED](#) transaction isolation level.
    - There is no partial rollback of transactions. A duplicate key or similar error results in a rollback of the entire transaction.
    - **Important:** If a [SELECT](#) from a Cluster table includes a [BLOB](#), [TEXT](#), or [VARCHAR](#)

column, the `READ COMMITTED` transaction isolation level is converted to a read with read lock. This is done to guarantee consistency, due to the fact that parts of the values stored in columns of these types are actually read from a separate table.

- As noted elsewhere in this chapter, MySQL Cluster does not handle large transactions well; it is better to perform a number of small transactions with a few operations each than to attempt a single large transaction containing a great many operations.

Among other considerations, large transactions require very large amounts of memory. Because of this, the transactional behaviour of a number of MySQL statements is effected as described in the following list:

- `TRUNCATE` is not transactional when used on `NDB` tables. If a `TRUNCATE` fails to empty the table, then it must be re-run until it is successful.
- `DELETE FROM` (even with no `WHERE` clause) *is* transactional. For tables containing a great many rows, you may find that performance is improved by using several `DELETE FROM ... LIMIT ...` statements to “chunk” the delete operation. If the objective is to empty the table, then you may wish to use `TRUNCATE` instead.
- `LOAD DATA INFILE` is not transactional. During such an operation the `NDB` engine can and does commit at will.

`LOAD DATA FROM MASTER` is not supported in MySQL Cluster.

- When copying a table as part of an `ALTER TABLE`, the creation of the copy is non-transactional. (In any case, this operation is rolled back when the copy is deleted.)
- **Node Start, Stop, or Restart:** Starting, stopping, or restarting a node may give rise to temporary errors causing some transactions to fail. These include the following cases:
  - When first starting a node, it is possible that you may see Error 1204 Temporary failure, distribution changed and similar temporary errors.
  - The stopping or failure of any data node can result in a number of different node failure errors. (However, there should be no aborted transactions when performing a planned shutdown of the cluster.)

In either of these cases, any errors that are generated must be handled within the application. This should be done by retrying the transaction.

- A number of hard limits exist which are configurable, but available main memory in the cluster sets limits. See the complete list of configuration parameters in [Section 15.4.4, “Configuration File”](#). Most configuration parameters can be upgraded online. These hard limits include:
  - Database memory size and index memory size (`DataMemory` and `IndexMemory`, respectively).

`DataMemory` is allocated as 32KB pages. As each `DataMemory` page is used, it is assigned to a specific table; once allocated, this memory cannot be freed except by dropping the table.

See [Section 15.4.4.5, “Defining Data Nodes”](#), for further information about `DataMemory` and `IndexMemory`.

- The maximum number of operations that can be performed per transaction is set using the

configuration parameters `MaxNoOfConcurrentOperations` and `MaxNoOfLocalOperations`. Note that bulk loading, `TRUNCATE TABLE`, and `ALTER TABLE` are handled as special cases by running multiple transactions, and so are not subject to this limitation.

- Different limits related to tables and indexes. For example, the maximum number of ordered indexes per table is determined by `MaxNoOfOrderedIndexes`.

- Database names, table names and attribute names cannot be as long in `NDB` tables as with other table handlers. Attribute names are truncated to 31 characters, and if not unique after truncation give rise to errors. Database names and table names can total a maximum of 122 characters. (That is, the maximum length for an `NDB Cluster` table name is 122 characters less the number of characters in the name of the database of which that table is a part.)

- All Cluster table rows are of fixed length. This means (for example) that if a table has one or more `VARCHAR` fields containing only relatively small values, more memory and disk space is required when using the `NDB` storage engine than would be the case for the same table and data using the `MyISAM` engine. (In other words, in the case of a `VARCHAR` column, the column requires the same amount of storage as a `CHAR` column of the same size.)
- The maximum number of metadata objects is limited to 1600, including database tables, system tables, indexes and `BLOBs`.
- The maximum number of attributes per table is limited to 128.
- The maximum permitted size of any one row is 8KB. Note that each `BLOB` or `TEXT` column contributes a maximum of 256 bytes towards this total.
- The maximum number of attributes per key is 32.

- **Unsupported features** (do not cause errors, but are not supported or enforced):

- The foreign key construct is ignored, just as it is in `MyISAM` tables.
- Savepoints and rollbacks to savepoints are ignored as in `MyISAM`.
- `OPTIMIZE` operations are not supported.
- `LOAD TABLE ... FROM MASTER` is not supported.

- **Performance and limitation-related issues:**

- The query cache is disabled, since it is not invalidated if an update occurs on a different MySQL server.
- There are query performance issues due to sequential access to the `NDB` storage engine; it is also relatively more expensive to do many range scans than it is with either `MyISAM` or `InnoDB`.
- The `Records in range` statistic is not supported, resulting in non-optimal query plans in some cases. Employ `USE INDEX` or `FORCE INDEX` as a workaround.
- Unique hash indexes created with `USING HASH` cannot be used for accessing a table if `NULL` is given as part of the key.
- MySQL Cluster does not support durable commits on disk. Commits are replicated, but there is

no guarantee that logs are flushed to disk on commit.

- `SQL_LOG_BIN` has no effect on data operations; however, it is supported for schema operations.

MySQL Cluster cannot produce a binlog for tables having `BLOB` columns but no primary key.

Only the following schema operations are logged in a cluster binlog which is *not* on the `mysqld` executing the statement:

- `CREATE TABLE`
- `ALTER TABLE`
- `DROP TABLE`
- `CREATE DATABASE`
- `DROP DATABASE`
- `ndbd` searches only the default path (typically `/usr/local/mysql/share/mysql/charsets`) for character sets. Thus, it is not possible to install MySQL with Cluster support in a different path (in the case of the `.tar.gz` archives, other than `/usr/local/mysql`) if character sets that are not compiled into the MySQL Server need to be used.

• **Missing features:**

- The only supported isolation level is `READ COMMITTED`. (InnoDB supports `READ COMMITTED`, `READ UNCOMMITTED`, `REPEATABLE READ`, and `SERIALIZABLE`.) See [Section 15.8.5, “Backup Troubleshooting”](#), for information on how this can affect backup and restore of Cluster databases.
- No durable commits on disk. Commits are replicated, but there is no guarantee that logs are flushed to disk on commit.

• **Problems relating to multiple MySQL servers** (not relating to `MyISAM` or `InnoDB`):

- `ALTER TABLE` is not fully locking when running multiple MySQL servers (no distributed table lock).
- MySQL replication will not work correctly if updates are done on multiple MySQL servers. However, if the database partitioning scheme is done at the application level and no transactions take place across these partitions, replication can be made to work.
- Autodiscovery of databases is not supported for multiple MySQL servers accessing the same MySQL Cluster. However, autodiscovery of tables is supported in such cases. What this means is that after a database named `db_name` is created or imported using one MySQL server, you should issue a `CREATE DATABASE db_name` statement on each additional MySQL server that accesses the same MySQL Cluster. Once this has been done for a given MySQL server, that server should be able to detect the database tables without error.
- DDL operations are not node failure safe. If a node fails while trying to perform one of these (such as `CREATE TABLE` or `ALTER TABLE`), the data dictionary is locked and no further DDL statements can be executed without restarting the cluster.

---

• **Issues exclusive to MySQL Cluster** (not related to [MyISAM](#) or [InnoDB](#)):

- All machines used in the cluster must have the same architecture. That is, all machines hosting nodes must be either big-endian or little-endian, and you cannot use a mixture of both. For example, you cannot have a management node running on a PowerPC which directs a data node that is running on an x86 machine. This restriction does not apply to machines simply running `mysql` or other clients that may be accessing the cluster's SQL nodes.
- It is also not possible to perform a Cluster backup and restore between different architectures. For example, you cannot back up a cluster running on a big-endian platform and then restore from that backup to a cluster running on a little-endian system. ([Bug#19255](#) [<http://bugs.mysql.com/19255>])
- It is not possible to make online schema changes such as those accomplished using `ALTER TABLE` or `CREATE INDEX`, as the `NDB Cluster` engine does not support autodiscovery of such changes. (However, you can import or create a table that uses a different storage engine, and then convert it to `NDB` using `ALTER TABLE tbl_name ENGINE=NDBCLUSTER`. In such a case, you must issue a `FLUSH TABLES` statement to force the cluster to pick up the change.)
- Online adding or dropping of nodes is not possible (the cluster must be restarted in such cases).
- While it is possible to run multiple cluster processes concurrently on a single host, it is not always advisable to do so for reasons of performance and high availability, as well as other considerations. In particular, we do not in MySQL 4.1 support for production use any MySQL Cluster deployment in which more than one `ndbd` process is run on a single physical machine.

We may support multiple data nodes per host in a future MySQL release, following additional testing. However, in MySQL 4.1, such configurations can be considered experimental only.

• When using multiple management servers:

- You must give nodes explicit IDs in connectstrings because automatic allocation of node IDs does not work across multiple management servers.
- You must take extreme care to have the same configurations for all management servers. No special checks for this are performed by the cluster.
- Prior to MySQL 4.1.15, all data nodes had to be restarted after bringing up the cluster in order for the management nodes to be able to see one another.

(See [Bug#12307](#) [<http://bugs.mysql.com/12307>] and [Bug#13070](#) [<http://bugs.mysql.com/13070>] for more information.)

- Multiple network addresses per data node are not supported. Use of these is liable to cause problems: In the event of a data node failure, an SQL node waits for confirmation that the data node went down but never receives it because another route to that data node remains open. This can effectively make the cluster inoperable.

It is possible to use multiple network hardware interfaces (such as Ethernet cards) for a single data node, but these must be bound to the same address. This also means that it not possible to use more than one `[TCP]` section per connection in the `config.ini` file. See [Section 15.4.4.7, “Cluster TCP/IP Connections”](#), for more information.

- The maximum number of data nodes is 48.
- The total maximum number of nodes in a MySQL Cluster is 63. This number includes all SQL nodes (MySQL Servers), API nodes (applications accessing the cluster other than MySQL serv-

ers), data nodes, and management servers.

## 15.12. MySQL Cluster FAQ

This section answers questions that are often asked about MySQL Cluster.

- *What does “NDB” mean?*

This stands for “**N**etwork **D**atabase.”

- *What's the difference in using Cluster vs using replication?*

In a replication setup, a master MySQL server updates one or more slaves. Transactions are committed sequentially, and a slow transaction can cause the slave to lag behind the master. This means that if the master fails, it is possible that the slave might not have recorded the last few transactions. If a transaction-safe engine such as [InnoDB](#) is being used, a transaction will either be complete on the slave or not applied at all, but replication does not guarantee that all data on the master and the slave will be consistent at all times. In MySQL Cluster, all data nodes are kept in synchrony, and a transaction committed by any one data node is committed for all data nodes. In the event of a data node failure, all remaining data nodes remain in a consistent state.

In short, whereas standard MySQL replication is asynchronous, MySQL Cluster is synchronous.

We have implemented (asynchronous) replication for Cluster in MySQL 5.1. This includes the capability to replicate both between two clusters, and from a MySQL cluster to a non-Cluster MySQL server. However, we do not plan to backport this functionality to MySQL 4.1.

- *Do I need to do any special networking to run Cluster? (How do computers in a cluster communicate?)*

MySQL Cluster is intended to be used in a high-bandwidth environment, with computers connecting via TCP/IP. Its performance depends directly upon the connection speed between the cluster's computers. The minimum connectivity requirements for Cluster include a typical 100-megabit Ethernet network or the equivalent. We recommend you use gigabit Ethernet whenever available.

The faster SCI protocol is also supported, but requires special hardware. See [Section 15.10, “Using High-Speed Interconnects with MySQL Cluster”](#), for more information about SCI.

- *How many computers do I need to run a cluster, and why?*

A minimum of three computers is required to run a viable cluster. However, the minimum **recommended** number of computers in a MySQL Cluster is four: one each to run the management and SQL nodes, and two computers to serve as data nodes. The purpose of the two data nodes is to provide redundancy; the management node must run on a separate machine to guarantee continued arbitration services in the event that one of the data nodes fails.

- *What do the different computers do in a cluster?*

A MySQL Cluster has both a physical and logical organization, with computers being the physical elements. The logical or functional elements of a cluster are referred to as *nodes*, and a computer housing a cluster node is sometimes referred to as a *cluster host*. There are three types of nodes, each

corresponding to a specific role within the cluster. These are:

- **Management node (MGM node):** Provides management services for the cluster as a whole, including startup, shutdown, backups, and configuration data for the other nodes. The management node server is implemented as the application `ndb_mgmd`; the management client used to control MySQL Cluster via the MGM node is `ndb_mgm`.
- **Data node:** Stores and replicates data. Data node functionality is handled by an instance of the NDB data node process `ndbd`.
- **SQL node:** This is simply an instance of MySQL Server (`mysqld`) that is built with support for the `NDB Cluster` storage engine and started with the `--ndb-cluster` option to enable the engine.

- *With which operating systems can I use Cluster?*

MySQL Cluster is supported on most Unix-like operating systems, including Linux, Mac OS X, Solaris, BSD, HP-UX, AIX, and IRIX, among others, as well as Novell Netware. Cluster is not supported for Windows at this time. However, we are working to add Cluster support for other platforms, including Windows, and our goal is to offer MySQL Cluster on all platforms for which MySQL itself is supported.

For more detailed information concerning the level of support which is offered for MySQL Cluster on various operating system versions, OS distributions, and hardware platforms, please refer to <http://www.mysql.com/support/supportedplatforms.html>.

- *What are the hardware requirements for running MySQL Cluster?*

Cluster should run on any platform for which NDB-enabled binaries are available. Naturally, faster CPUs and more memory will improve performance, and 64-bit CPUs will likely be more effective than 32-bit processors. There must be sufficient memory on machines used for data nodes to hold each node's share of the database (see *How much RAM do I Need?* for more information). Nodes can communicate via a standard TCP/IP network and hardware. For SCI support, special networking hardware is required.

- *How much RAM do I need? Is it possible to use disk memory at all?*

In MySQL-4.1, Cluster is in-memory only. This means that all table data (including indexes) is stored in RAM. Therefore, if your data takes up 1GB of space and you want to replicate it once in the cluster, you need 2GB of memory to do so (1 GB per replica). This is in addition to the memory required by the operating system and any applications running on the cluster computers.

If a data node's memory usage exceeds what is available in RAM, then the system will attempt to use swap space up to the limit set for `DataMemory`. However, this will at best result in severely degraded performance, and may cause the node to be dropped due to slow response time (missed heartbeats). We do not recommend on relying on disk swapping in a production environment for this reason. In any case, once the `DataMemory` limit is reached, any operations requiring additional memory (such as inserts) will fail.

(We have implemented disk data storage for MySQL Cluster in MySQL 5.1, but we have no plans to add this capability in MySQL 4.1.)

You can use the following formula for obtaining a rough estimate of how much RAM is needed for each data node in the cluster:

```
(SizeofDatabase × NumberOfReplicas × 1.1 ) / NumberOfDataNodes
```

To calculate the memory requirements more exactly requires determining, for each table in the cluster database, the storage space required per row (see [Section 11.5, “Data Type Storage Requirements”](#), for details), and multiplying this by the number of rows. You must also remember to account for any column indexes as follows:

- Each primary key or hash index created for an `NDBCluster` table requires 21–25 bytes per record. These indexes use `IndexMemory`.
- Each ordered index requires 10 bytes storage per record, using `DataMemory`.
- Creating a primary key or unique index also creates an ordered index, unless this index is created with `USING HASH`. In other words:
  - A primary key or unique index on a Cluster table normally takes up 31 to 35 bytes per record.
  - However, if the primary key or unique index is created with `USING HASH`, then it requires only 21 to 25 bytes per record.

Note that creating MySQL Cluster tables with `USING HASH` for all primary keys and unique indexes will generally cause table updates to run more quickly — in some cases by as much as 20 to 30 percent faster than updates on tables where `USING HASH` was not used in creating primary and unique keys. This is due to the fact that less memory is required (because no ordered indexes are created), and that less CPU must be utilized (because fewer indexes must be read and possibly updated). However, it also means that queries that could otherwise use range scans must be satisfied by other means, which can result in slower selects.

When calculating Cluster memory requirements, you may find useful the `ndb_size.pl` utility which is available on [MySQLForge](http://forge.mysql.com/projects/view.php?id=88) [http://forge.mysql.com/projects/view.php?id=88]. This Perl script connects to a current MySQL (non-Cluster) database and creates a report on how much space that database would require if it used the `NDBCluster` storage engine. For more information, see [Section 15.9.12, “ndb\\_size.pl”](#).

It is especially important to keep in mind that *every MySQL Cluster table must have a primary key*. The `NDB` storage engine creates a primary key automatically if none is defined, and this primary key is created without `USING HASH`.

There is no easy way to determine exactly how much memory is being used for storage of Cluster indexes at any given time; however, warnings are written to the Cluster log when 80% of available `DataMemory` or `IndexMemory` is in use, and again when use reaches 85%, 90%, and so on.

We often see questions from users who report that, when they are trying to populate a Cluster database, the loading process terminates prematurely and an error message like this one is observed:

```
ERROR 1114: The table 'my_cluster_table' is full
```

When this occurs, the cause is very likely to be that your setup does not provide sufficient RAM for all table data and all indexes, *including the primary key required by the `NDB` storage engine and automatically created in the event that the table definition does not include the definition of a primary key*.

It is also worth noting that all data nodes should have the same amount of RAM, as no data node in a cluster can use more memory than the least amount available to any individual data node. In other words, if there are three computers hosting Cluster data nodes, with two of these having 3GB of RAM available to store Cluster data, and one having only 1GB RAM, then each data node can devote only 1GB to clustering.

- *Because MySQL Cluster uses TCP/IP, does that mean I can run it over the Internet, with one or more nodes in a remote location?*

It is very doubtful in any case that a cluster would perform reliably under such conditions, as MySQL Cluster was designed and implemented with the assumption that it would be run under conditions guaranteeing dedicated high-speed connectivity such as that found in a LAN setting using 100 Mbps or gigabit Ethernet (preferably the latter). We neither test nor warrant its performance using anything slower than this.

Also, it is extremely important to keep in mind that communications between the nodes in a MySQL Cluster are not secure; they are neither encrypted nor safeguarded by any other protective mechanism. The most secure configuration for a cluster is in a private network behind a firewall, with no direct access to any Cluster data or management nodes from outside. (For SQL nodes, you should take the same precautions as you would with any other instance of the MySQL server.)

- *Do I have to learn a new programming or query language to use Cluster?*

No. Although some specialized commands are used to manage and configure the cluster itself, only standard (My)SQL queries and commands are required for the following operations:

- Creating, altering, and dropping tables
- Inserting, updating, and deleting table data
- Creating, changing, and dropping primary and unique indexes
- Configuring and managing SQL nodes (MySQL servers)

- *How do I find out what an error or warning message means when using Cluster?*

There are two ways in which this can be done:

- From within the `mysql` client, use `SHOW ERRORS` or `SHOW WARNINGS` immediately upon being notified of the error or warning condition. Errors and warnings also be displayed in MySQL Query Browser.
- From a system shell prompt, use `pererror --ndb error_code`.

- *Is MySQL Cluster transaction-safe? What isolation levels are supported?*

*Yes:* For tables created with the `NDB` storage engine, transactions are supported. In MySQL 4.1, Cluster supports only the `READ COMMITTED` transaction isolation level.

- *What storage engines are supported by MySQL Cluster?*

Clustering in MySQL is supported only by the `NDB` storage engine. That is, in order for a table to be shared between nodes in a cluster, it must be created using `ENGINE=NDB` (or `ENGINE=NDBCLUSTER`, which is equivalent).

It is possible to create tables using other storage engines (such as `MyISAM` or `InnoDB`) on a MySQL server being used for clustering, but these non-`NDB` tables will **not** participate in the cluster; they are local to the individual MySQL server instance on which they are created.

- *Which versions of the MySQL software support Cluster? Do I have to compile from source?*

Cluster is supported in the MySQL-max binaries from version 4.1.3 onward. You can determine whether your server has NDB support using either the `SHOW VARIABLES LIKE 'have_%%'` or `SHOW ENGINES` statement. (See [Section 5.3](#), “The `mysqld-max` Extended MySQL Server”, for more information.)

Linux users, please note that NDB is *not* included in the 4.1.x RPMs; you should use the binaries supplied as `.tar.gz` archives from <http://dev.mysql.com/downloads/> instead. You can also obtain NDB support by compiling the `-max` binaries from source, but it is not necessary to do so simply to use MySQL Cluster. To download the latest binary, RPM, or source distribution in the MySQL 4.1 series, visit <http://dev.mysql.com/downloads/mysql/4.1.html>.

- *In the event of a catastrophic failure — say, for instance, the whole city loses power **and** my UPS fails — would I lose all my data?*

All committed transactions are logged. Therefore, although it is possible that some data could be lost in the event of a catastrophe, this should be quite limited. Data loss can be further reduced by minimizing the number of operations per transaction. (It is not a good idea to perform large numbers of operations per transaction in any case.)

- *Is it possible to use `FULLTEXT` indexes with Cluster?*

`FULLTEXT` indexing is not currently supported by the NDB storage engine, or by any storage engine other than `MyISAM`. We are working to add this capability in a future release.

- *Can I run multiple nodes on a single computer?*

It is possible but not advisable. One of the chief reasons to run a cluster is to provide redundancy. To enjoy the full benefits of this redundancy, each node should reside on a separate machine. If you place multiple nodes on a single machine and that machine fails, you lose all of those nodes. Given that MySQL Cluster can be run on commodity hardware loaded with a low-cost (or even no-cost) operating system, the expense of an extra machine or two is well worth it to safeguard mission-critical data. It also worth noting that the requirements for a cluster host running a management node are minimal. This task can be accomplished with a 200 MHz Pentium CPU and sufficient RAM for the operating system plus a small amount of overhead for the `ndb_mgmd` and `ndb_mgm` processes.

It is acceptable to run multiple cluster data nodes on a single host for learning about MySQL Cluster, or for testing purposes; however, this is not supported for production use.

- *Can I add nodes to a cluster without restarting it?*

Not at present. A simple restart is all that is required for adding new MGM or SQL nodes to a Cluster. When adding data nodes the process is more complex, and requires the following steps:

1. Make a complete backup of all Cluster data.
2. Completely shut down the cluster and all cluster node processes.
3. Restart the cluster, using the `--initial` startup option.
4. Restore all cluster data from the backup.

In a future MySQL Cluster release series, we hope to implement a “hot” reconfiguration capability for MySQL Cluster to minimize (if not eliminate) requirements for restarting the cluster when adding new nodes. However, this is not planned for the MySQL 4.1 release series.

- *Are there any limitations that I should be aware of when using Cluster?*

NDB tables in MySQL 4.1 are subject to the following limitations:

- Temporary tables are not supported; a `CREATE TEMPORARY TABLE` statement using `ENGINE=NDB` or `ENGINE=NDBCLUSTER` fails with an error.
- Not all character sets and collations are supported. (For a complete listing of those that are supported, see [Section D.5.14, “Changes in MySQL Cluster-4.1.6 \(10 October 2004\)”](#)).
- `FULLTEXT` indexes and index prefixes are not supported. Only complete columns may be indexed.
- Spatial data types are not supported. See [Chapter 16, \*Spatial Extensions\*](#).
- Only complete rollbacks for transactions are supported. Partial rollbacks and rollbacks to savepoints are not supported.
- The maximum number of attributes allowed per table is 128, and attribute names cannot be any longer than 31 characters. For each table, the maximum combined length of the table and database names is 122 characters.
- The maximum size for a table row is 8 kilobytes, not counting `BLOB` values. There is no set limit for the number of rows per table. Table size limits depend on a number of factors, in particular on the amount of RAM available to each data node.
- The `NDB` engine does not support foreign key constraints. As with `MyISAM` tables, these are ignored.
- Query caching is not supported.

For additional information on Cluster limitations, see [Section 15.11, “Known Limitations of MySQL Cluster”](#).

- *How do I import an existing MySQL database into a cluster?*

You can import databases into MySQL Cluster much as you would with any other version of MySQL. Other than the limitation mentioned in the previous question, the only other special requirement is that any tables to be included in the cluster must use the `NDB` storage engine. This means that the tables must be created with `ENGINE=NDB` or `ENGINE=NDBCLUSTER`. It is also possible to convert existing tables using other storage engines to `NDB Cluster` using `ALTER TABLE`, but requires an additional workaround. See [Section 15.11, “Known Limitations of MySQL Cluster”](#), for details.

- *How do cluster nodes communicate with one another?*

Cluster nodes can communicate via any of three different protocols: TCP/IP, SHM (shared memory), and SCI (Scalable Coherent Interface). Where available, SHM is used by default between nodes residing on the same cluster host. SCI is a high-speed (1 gigabit per second and higher), high-availability protocol used in building scalable multi-processor systems; it requires special hardware and drivers. See [Section 15.10, “Using High-Speed Interconnects with MySQL Cluster”](#), for more about using SCI as a transport mechanism in MySQL Cluster.

- *What is an “arbiter”?*

If one or more nodes in a cluster fail, it is possible that not all cluster nodes will be able to “see” one another. In fact, it is possible that two sets of nodes might become isolated from one another in a network partitioning, also known as a “split brain” scenario. This type of situation is undesirable because each set of nodes tries to behave as though it is the entire cluster.

When cluster nodes go down, there are two possibilities. If more than 50% of the remaining nodes can communicate with each other, we have what is sometimes called a “majority rules” situation, and this set of nodes is considered to be the cluster. The arbitrator comes into play when there is an even number of nodes: in such cases, the set of nodes to which the arbitrator belongs is considered to be the cluster, and nodes not belonging to this set are shut down.

The preceding information is somewhat simplified. A more complete explanation taking into account node groups follows:

When all nodes in at least one node group are alive, network partitioning is not an issue, because no one portion of the cluster can form a functional cluster. The real problem arises when no single node group has all its nodes alive, in which case network partitioning (the “split-brain” scenario) becomes possible. Then an arbitrator is required. All cluster nodes recognize the same node as the arbitrator, which is normally the management server; however, it is possible to configure any of the MySQL Servers in the cluster to act as the arbitrator instead. The arbitrator accepts the first set of cluster nodes to contact it, and tells the remaining set to shut down. Arbitrator selection is controlled by the `ArbitrationRank` configuration parameter for MySQL Server and management server nodes. (See [Section 15.4.4.4, “Defining the Management Server”](#), for details.) It should also be noted that the role of arbitrator does not in and of itself impose any heavy demands upon the host so designated, and thus the arbitrator host does not need to be particularly fast or to have extra memory especially for this purpose.

- *What data types are supported by MySQL Cluster?*

MySQL Cluster supports all of the usual MySQL data types, with the exception of those associated with MySQL's spatial extensions. (See [Chapter 16, \*Spatial Extensions\*](#).) In addition, there are some differences with regard to indexes when used with NDB tables. **Note:** MySQL Cluster tables (that is, tables created with `ENGINE=NDBCLUSTER`) have only fixed-width rows. This means that (for example) each record containing a `VARCHAR(255)` column will require space for 255 characters (as required for the character set and collation being used for the table), regardless of the actual number of characters stored therein. This issue is expected to be fixed in a future MySQL release series.

See [Section 15.11, “Known Limitations of MySQL Cluster”](#), for more information about these issues.

- *How do I start and stop MySQL Cluster?*

It is necessary to start each node in the cluster separately, in the following order:

1. Start the management node with the `ndb_mgmd` command.
2. Start each data node with the `ndbd` command.
3. Start each MySQL server (SQL node) using `mysqld_safe --user=mysql &`.

Each of these commands must be run from a system shell on the machine housing the affected node. You can verify the cluster is running by starting the MGM management client `ndb_mgm` on the machine housing the MGM node.

- *What happens to cluster data when the cluster is shut down?*

The data held in memory by the cluster's data nodes is written to disk, and is reloaded in memory the next time that the cluster is started.

To shut down the cluster, enter the following command in a shell on the machine hosting the MGM node:

```
shell> ndb_mgm -e shutdown
```

This causes the `ndb_mgm`, `ndb_mgm`, and any `ndbd` processes to terminate gracefully. MySQL servers running as Cluster SQL nodes can be stopped using `mysqladmin shutdown`.

For more information, see [Section 15.7.2, “Commands in the Management Client”](#), and [Section 15.3.6, “Safe Shutdown and Restart”](#).

- *Is it helpful to have more than one management node for a cluster?*

It can be helpful as a fail-safe. Only one MGM node controls the cluster at any given time, but it is possible to configure one MGM as primary, and one or more additional management nodes to take over in the event that the primary MGM node fails.

- *Can I mix different kinds of hardware and operating systems in a Cluster?*

Yes, so long as all machines and operating systems have the same endianness (all big-endian or all little-endian). It is also possible to use different MySQL Cluster releases on different nodes. However, we recommend this be done only as part of a rolling upgrade procedure.

- *Can I run two data nodes on a single host? Two SQL nodes?*

Yes, it is possible to do this. In the case of multiple data nodes, each node must use a different data directory. If you want to run multiple SQL nodes on one machine, each instance of `mysqld` must use a different TCP/IP port. However, running more than one node of a given type per machine is not supported for production use.

- *Can I use hostnames with MySQL Cluster?*

Yes, it is possible to use DNS and DHCP for cluster hosts. However, if your application requires “five nines” availability, we recommend using fixed IP addresses. Making communication between Cluster hosts dependent on services such as DNS and DHCP introduces additional points of failure, and the fewer of these, the better.

## 15.13. MySQL Cluster Glossary

The following terms are useful to an understanding of MySQL Cluster or have specialized meanings when used in relation to it.

- **Cluster:**

In its generic sense, a cluster is a set of computers functioning as a unit and working together to accomplish a single task.

### **NDB Cluster:**

This is the storage engine used in MySQL to implement data storage, retrieval, and management distributed among several computers.

### **MySQL Cluster:**

This refers to a group of computers working together using the **NDB** storage engine to support a distributed MySQL database in a *shared-nothing architecture* using *in-memory storage*.

- **Configuration files:**

Text files containing directives and information regarding the cluster, its hosts, and its nodes. These are read by the cluster's management nodes when the cluster is started. See [Section 15.4.4, “Configuration File”](#), for details.

- **Backup:**

A complete copy of all cluster data, transactions and logs, saved to disk or other long-term storage.

- **Restore:**

Returning the cluster to a previous state, as stored in a backup.

- **Checkpoint:**

Generally speaking, when data is saved to disk, it is said that a checkpoint has been reached. More specific to Cluster, it is a point in time where all committed transactions are stored on disk. With regard to the **NDB** storage engine, there are two types of checkpoints which work together to ensure that a consistent view of the cluster's data is maintained:

- **Local Checkpoint (LCP):**

This is a checkpoint that is specific to a single node; however, LCP's take place for all nodes in the cluster more or less concurrently. An LCP involves saving all of a node's data to disk, and so usually occurs every few minutes. The precise interval varies, and depends upon the amount of data stored by the node, the level of cluster activity, and other factors.

- **Global Checkpoint (GCP):**

A GCP occurs every few seconds, when transactions for all nodes are synchronized and the redo-log is flushed to disk.

- **Cluster host:**

A computer making up part of a MySQL Cluster. A cluster has both a *physical* structure and a *logical* structure. Physically, the cluster consists of a number of computers, known as *cluster hosts* (or more simply as *hosts*). See also **Node** and **Node group** below.

- **Node:**

This refers to a logical or functional unit of MySQL Cluster, and is sometimes also referred to as a *cluster node*. In the context of MySQL Cluster, we use the term “node” to indicate a *process* rather than a physical component of the cluster. There are three node types required to implement a working MySQL Cluster:

- **Management (MGM) nodes:**

Manages the other nodes within the MySQL Cluster. It provides configuration data to the other nodes; starts and stops nodes; handles network partitioning; creates backups and restores from them, and so forth.

- **SQL (MySQL server) nodes:**

Instances of MySQL Server which serve as front ends to data kept in the cluster's **data nodes**. Clients desiring to store, retrieve, or update data can access an SQL node just as they would any other MySQL Server, employing the usual authentication methods and API's; the underlying distribution of data between node groups is transparent to users and applications. SQL nodes access the cluster's databases as a whole without regard to the data's distribution across different data nodes or cluster hosts.

- **Data nodes:**

These nodes store the actual data. Table data fragments are stored in a set of node groups; each node group stores a different subset of the table data. Each of the nodes making up a node group stores a replica of the fragment for which that node group is responsible. Currently, a single cluster can support up to 48 data nodes total.

It is possible for more than one node to co-exist on a single machine. (In fact, it is even possible to set up a complete cluster on one machine, although one would almost certainly *not* want to do this in a production environment.) It may be helpful to remember that, when working with MySQL Cluster, the term *host* refers to a physical component of the cluster whereas a *node* is a logical or functional component (that is, a process).

**Note Regarding Terms:** In older versions of the MySQL Cluster documentation, data nodes were sometimes referred to as “database nodes”. The term “storage nodes” has also been used. In addition, SQL nodes were sometimes known as “client nodes”. This older terminology has been deprecated to minimize confusion, and for this reason should be avoided. They are also often referred to as “API nodes” — an SQL node is actually an API node that provides an SQL interface to the cluster.

- **Node group:**

A set of data nodes. All data nodes in a node group contain the same data (fragments), and all nodes in a single group should reside on different hosts. It is possible to control which nodes belong to which node groups.

For more information, see [Section 15.2.1, “MySQL Cluster Nodes, Node Groups, Replicas, and Partitions”](#).

- **Node failure:**

MySQL Cluster is not solely dependent upon the functioning of any single node making up the cluster; the cluster can continue to run if one or more nodes fail. The precise number of node failures that a given cluster can tolerate depends upon the number of nodes and the cluster's configuration.

- **Node restart:**

The process of restarting a failed cluster node.

- **Initial node restart:**

The process of starting a cluster node with its filesystem removed. This is sometimes used in the course of software upgrades and in other special circumstances.

- **System crash (or system failure):**

This can occur when so many cluster nodes have failed that the cluster's state can no longer be guaranteed.

- **System restart:**

The process of restarting the cluster and reinitializing its state from disk logs and checkpoints. This is required after either a planned or an unplanned shutdown of the cluster.

- **Fragment:**

A portion of a database table; in the [NDB](#) storage engine, a table is broken up into and stored as a number of fragments. A fragment is sometimes also called a “partition”; however, “fragment” is the preferred term. Tables are fragmented in MySQL Cluster in order to facilitate load balancing

between machines and nodes.

- **Replica:**

Under the [NDB](#) storage engine, each table fragment has number of replicas stored on other data nodes in order to provide redundancy. Currently, there may be up four replicas per fragment.

- **Transporter:**

A protocol providing data transfer between nodes. MySQL Cluster currently supports four different types of transporter connections:

- **TCP/IP**

This is, of course, the familiar network protocol that underlies HTTP, FTP (and so on) on the Internet. TCP/IP can be used for both local and remote connections.

- **SCI**

**Scalable Coherent Interface** is a high-speed protocol used in building multiprocessor systems and parallel-processing applications. Use of SCI with MySQL Cluster requires specialized hardware, as discussed in [Section 15.10.1, “Configuring MySQL Cluster to use SCI Sockets”](#). For a basic introduction to SCI, see [this essay at dolphinics.com](http://www.dolphinics.com) [<http://www.dolphinics.com/corporate/scitech.html>].

- **SHM**

Unix-style **shared memory** segments. Where supported, SHM is used automatically to connect nodes running on the same host. The [Unix man page for shmop\(2\)](#) [<http://www.scit.wlv.ac.uk/cgi-bin/mansec?2+shmop>] is a good place to begin obtaining additional information about this topic.

**Note:** The cluster transporter is internal to the cluster. Applications using MySQL Cluster communicate with SQL nodes just as they do with any other version of MySQL Server (via TCP/IP, or through the use of Unix socket files or Windows named pipes). Queries can be sent and results retrieved using the standard MySQL client APIs.

- **NDB:**

This stands for **Network Database**, and refers to the storage engine used to enable MySQL Cluster. The [NDB](#) storage engine supports all the usual MySQL data types and SQL statements, and is ACID-compliant. This engine also provides full support for transactions (commits and rollbacks).

- **shared-nothing architecture:**

The ideal architecture for a MySQL Cluster. In a true shared-nothing setup, each node runs on a separate host. The advantage such an arrangement is that there no single host or node can act as single point of failure or as a performance bottle neck for the system as a whole.

- **In-memory storage:**

All data stored in each data node is kept in memory on the node's host computer. For each data node in the cluster, you must have available an amount of RAM equal to the size of the database times the number of replicas, divided by the number of data nodes. Thus, if the database takes up 1GB of memory, and you want to set up the cluster with four replicas and eight data nodes, a minimum of 500MB memory will be required per node. Note that this is in addition to any requirements for the operating system and any other applications that might be running on the host.

- **Table:**

As is usual in the context of a relational database, the term “table” denotes a set of identically structured records. In MySQL Cluster, a database table is stored in a data node as a set of fragments, each of which is replicated on additional data nodes. The set of data nodes replicating the same fragment or set of fragments is referred to as a *node group*.

- **Cluster programs:**

These are command-line programs used in running, configuring, and administering MySQL Cluster. They include both server daemons:

- `ndbd`:

The data node daemon (runs a data node process)

- `ndb_mgmd`:

The management server daemon (runs a management server process)

and client programs:

- `ndb_mgm`:

The management client (provides an interface for executing management commands)

- `ndb_waiter`:

Used to verify status of all nodes in a cluster

- `ndb_restore`:

Restores cluster data from backup

For more about these programs and their uses, see [Section 15.6, “Process Management in MySQL Cluster”](#).

- **Event log:**

MySQL Cluster logs events by category (startup, shutdown, errors, checkpoints, and so on), priority, and severity. A complete listing of all reportable events may be found in [Section 15.7.3, “Event Reports Generated in MySQL Cluster”](#). Event logs are of two types:

- **Cluster log:**

Keeps a record of all desired reportable events for the cluster as a whole.

- **Node log:**

A separate log which is also kept for each individual node.

Under normal circumstances, it is necessary and sufficient to keep and examine only the cluster log. The node logs need be consulted only for application development and debugging purposes.

---

# Chapter 16. Spatial Extensions

MySQL 4.1 introduces spatial extensions to allow the generation, storage, and analysis of geographic features. Currently, these features are available for [MyISAM](#) tables only.

This chapter covers the following topics:

- The basis of these spatial extensions in the OpenGIS geometry model
- Data formats for representing spatial data
- How to use spatial data in MySQL
- Use of indexing for spatial data
- MySQL differences from the OpenGIS specification

## Additional resources

- The Open Geospatial Consortium publishes the *OpenGIS® Simple Features Specifications For SQL*, a document that proposes several conceptual ways for extending an SQL RDBMS to support spatial data. This specification is available from the OGC Web site at <http://www.opengis.org/docs/99-049.pdf>.
- If you have questions or concerns about the use of the spatial extensions to MySQL, you can discuss them in the GIS forum: <http://forums.mysql.com/list.php?23>.

## 16.1. Introduction to MySQL Spatial Support

MySQL implements spatial extensions following the specification of the Open Geospatial Consortium (OGC). This is an international consortium of more than 250 companies, agencies, and universities participating in the development of publicly available conceptual solutions that can be useful with all kinds of applications that manage spatial data. The OGC maintains a Web site at <http://www.opengis.org/>.

In 1997, the Open Geospatial Consortium published the *OpenGIS® Simple Features Specifications For SQL*, a document that proposes several conceptual ways for extending an SQL RDBMS to support spatial data. This specification is available from the OGC Web site at <http://www.opengis.org/docs/99-049.pdf>. It contains additional information relevant to this chapter.

MySQL implements a subset of the **SQL with Geometry Types** environment proposed by OGC. This term refers to an SQL environment that has been extended with a set of geometry types. A geometry-valued SQL column is implemented as a column that has a geometry type. The specification describe a set of SQL geometry types, as well as functions on those types to create and analyze geometry values.

A **geographic feature** is anything in the world that has a location. A feature can be:

- An entity. For example, a mountain, a pond, a city.
- A space. For example, a postcode area, the tropics.
- A definable location. For example, a crossroad, as a particular place where two streets intersect.

Some documents use the term **geospatial feature** to refer to geographic features.

**Geometry** is another word that denotes a geographic feature. Originally the word **geometry** meant measurement of the earth. Another meaning comes from cartography, referring to the geometric features that cartographers use to map the world.

This chapter uses all of these terms synonymously: **geographic feature**, **geospatial feature**, **feature**, or **geometry**. Here, the term most commonly used is **geometry**, defined as *a point or an aggregate of points representing anything in the world that has a location*.

## 16.2. The OpenGIS Geometry Model

The set of geometry types proposed by OGC's **SQL with Geometry Types** environment is based on the **OpenGIS Geometry Model**. In this model, each geometric object has the following general properties:

- It is associated with a Spatial Reference System, which describes the coordinate space in which the object is defined.
- It belongs to some geometry class.

### 16.2.1. The Geometry Class Hierarchy

The geometry classes define a hierarchy as follows:

- `Geometry` (non-instantiable)
  - `Point` (instantiable)
  - `Curve` (non-instantiable)
    - `LineString` (instantiable)
      - `Line`
      - `LinearRing`
  - `Surface` (non-instantiable)
    - `Polygon` (instantiable)
- `GeometryCollection` (instantiable)
  - `MultiPoint` (instantiable)
  - `MultiCurve` (non-instantiable)
    - `MultiLineString` (instantiable)
  - `MultiSurface` (non-instantiable)
    - `MultiPolygon` (instantiable)

It is not possible to create objects in non-instantiable classes. It is possible to create objects in instantiable classes. All classes have properties, and instantiable classes may also have assertions (rules that

define valid class instances).

`Geometry` is the base class. It is an abstract class. The instantiable subclasses of `Geometry` are restricted to zero-, one-, and two-dimensional geometric objects that exist in two-dimensional coordinate space. All instantiable geometry classes are defined so that valid instances of a geometry class are topologically closed (that is, all defined geometries include their boundary).

The base `Geometry` class has subclasses for `Point`, `Curve`, `Surface`, and `GeometryCollection`:

- `Point` represents zero-dimensional objects.
- `Curve` represents one-dimensional objects, and has subclass `LineString`, with sub-subclasses `Line` and `LinearRing`.
- `Surface` is designed for two-dimensional objects and has subclass `Polygon`.
- `GeometryCollection` has specialized zero-, one-, and two-dimensional collection classes named `MultiPoint`, `MultiLineString`, and `MultiPolygon` for modeling geometries corresponding to collections of `Points`, `LineStrings`, and `Polygons`, respectively. `MultiCurve` and `MultiSurface` are introduced as abstract superclasses that generalize the collection interfaces to handle `Curves` and `Surfaces`.

`Geometry`, `Curve`, `Surface`, `MultiCurve`, and `MultiSurface` are defined as non-instantiable classes. They define a common set of methods for their subclasses and are included for extensibility.

`Point`, `LineString`, `Polygon`, `GeometryCollection`, `MultiPoint`, `MultiLineString`, and `MultiPolygon` are instantiable classes.

## 16.2.2. Class `Geometry`

`Geometry` is the root class of the hierarchy. It is a non-instantiable class but has a number of properties that are common to all geometry values created from any of the `Geometry` subclasses. These properties are described in the following list. Particular subclasses have their own specific properties, described later.

### Geometry Properties

A geometry value has the following properties:

- Its **type**. Each geometry belongs to one of the instantiable classes in the hierarchy.
- Its **SRID**, or Spatial Reference Identifier. This value identifies the geometry's associated Spatial Reference System that describes the coordinate space in which the geometry object is defined.

In MySQL, the SRID value is just an integer associated with the geometry value. All calculations are done assuming Euclidean (planar) geometry.

- Its **coordinates** in its Spatial Reference System, represented as double-precision (eight-byte) numbers. All non-empty geometries include at least one pair of (X,Y) coordinates. Empty geometries contain no coordinates.

Coordinates are related to the SRID. For example, in different coordinate systems, the distance between two objects may differ even when objects have the same coordinates, because the distance on the **planar** coordinate system and the distance on the **geocentric** system (coordinates on the Earth's surface) are different things.

- Its **interior**, **boundary**, and **exterior**.

Every geometry occupies some position in space. The exterior of a geometry is all space not occupied by the geometry. The interior is the space occupied by the geometry. The boundary is the interface between the geometry's interior and exterior.

- Its **MBR** (Minimum Bounding Rectangle), or Envelope. This is the bounding geometry, formed by the minimum and maximum (X,Y) coordinates:

```
((MINX MINY, MAXX MINY, MAXX MAXY, MINX MAXY, MINX MINY))
```

- Whether the value is **simple** or **non-simple**. Geometry values of types ([LineString](#), [MultiPoint](#), [MultiLineString](#)) are either simple or non-simple. Each type determines its own assertions for being simple or non-simple.
- Whether the value is **closed** or **not closed**. Geometry values of types ([LineString](#), [MultiString](#)) are either closed or not closed. Each type determines its own assertions for being closed or not closed.
- Whether the value is **empty** or **non-empty**. A geometry is empty if it does not have any points. Exterior, interior, and boundary of an empty geometry are not defined (that is, they are represented by a [NULL](#) value). An empty geometry is defined to be always simple and has an area of 0.
- Its **dimension**. A geometry can have a dimension of -1, 0, 1, or 2:
  - -1 for an empty geometry.
  - 0 for a geometry with no length and no area.
  - 1 for a geometry with non-zero length and zero area.
  - 2 for a geometry with non-zero area.

[Point](#) objects have a dimension of zero. [LineString](#) objects have a dimension of 1. [Polygon](#) objects have a dimension of 2. The dimensions of [MultiPoint](#), [MultiLineString](#), and [MultiPolygon](#) objects are the same as the dimensions of the elements they consist of.

## 16.2.3. Class [Point](#)

A [Point](#) is a geometry that represents a single location in coordinate space.

### [Point](#) Examples

- Imagine a large-scale map of the world with many cities. A [Point](#) object could represent each city.
- On a city map, a [Point](#) object could represent a bus stop.

### [Point](#) Properties

- X-coordinate value.
- Y-coordinate value.
- [Point](#) is defined as a zero-dimensional geometry.

- The boundary of a `Point` is the empty set.

## 16.2.4. Class `Curve`

A `Curve` is a one-dimensional geometry, usually represented by a sequence of points. Particular subclasses of `Curve` define the type of interpolation between points. `Curve` is a non-instantiable class.

### `Curve` Properties

- A `Curve` has the coordinates of its points.
- A `Curve` is defined as a one-dimensional geometry.
- A `Curve` is simple if it does not pass through the same point twice.
- A `Curve` is closed if its start point is equal to its endpoint.
- The boundary of a closed `Curve` is empty.
- The boundary of a non-closed `Curve` consists of its two endpoints.
- A `Curve` that is simple and closed is a `LinearRing`.

## 16.2.5. Class `LineString`

A `LineString` is a `Curve` with linear interpolation between points.

### `LineString` Examples

- On a world map, `LineString` objects could represent rivers.
- In a city map, `LineString` objects could represent streets.

### `LineString` Properties

- A `LineString` has coordinates of segments, defined by each consecutive pair of points.
- A `LineString` is a `Line` if it consists of exactly two points.
- A `LineString` is a `LinearRing` if it is both closed and simple.

## 16.2.6. Class `Surface`

A `Surface` is a two-dimensional geometry. It is a non-instantiable class. Its only instantiable subclass is `Polygon`.

### `Surface` Properties

- A `Surface` is defined as a two-dimensional geometry.

- The OpenGIS specification defines a simple [Surface](#) as a geometry that consists of a single “patch” that is associated with a single exterior boundary and zero or more interior boundaries.
- The boundary of a simple [Surface](#) is the set of closed curves corresponding to its exterior and interior boundaries.

### 16.2.7. Class [Polygon](#)

A [Polygon](#) is a planar [Surface](#) representing a multisided geometry. It is defined by a single exterior boundary and zero or more interior boundaries, where each interior boundary defines a hole in the [Polygon](#).

#### [Polygon](#) Examples

- On a region map, [Polygon](#) objects could represent forests, districts, and so on.

#### [Polygon](#) Assertions

- The boundary of a [Polygon](#) consists of a set of [LinearRing](#) objects (that is, [LineString](#) objects that are both simple and closed) that make up its exterior and interior boundaries.
- A [Polygon](#) has no rings that cross. The rings in the boundary of a [Polygon](#) may intersect at a [Point](#), but only as a tangent.
- A [Polygon](#) has no lines, spikes, or punctures.
- A [Polygon](#) has an interior that is a connected point set.
- A [Polygon](#) may have holes. The exterior of a [Polygon](#) with holes is not connected. Each hole defines a connected component of the exterior.

The preceding assertions make a [Polygon](#) a simple geometry.

### 16.2.8. Class [GeometryCollection](#)

A [GeometryCollection](#) is a geometry that is a collection of one or more geometries of any class.

All the elements in a [GeometryCollection](#) must be in the same Spatial Reference System (that is, in the same coordinate system). There are no other constraints on the elements of a [GeometryCollection](#), although the subclasses of [GeometryCollection](#) described in the following sections may restrict membership. Restrictions may be based on:

- Element type (for example, a [MultiPoint](#) may contain only [Point](#) elements)
- Dimension
- Constraints on the degree of spatial overlap between elements

### 16.2.9. Class [MultiPoint](#)

A [MultiPoint](#) is a geometry collection composed of [Point](#) elements. The points are not connected

or ordered in any way.

#### **MultiPoint Examples**

- On a world map, a `MultiPoint` could represent a chain of small islands.
- On a city map, a `MultiPoint` could represent the outlets for a ticket office.

#### **MultiPoint Properties**

- A `MultiPoint` is a zero-dimensional geometry.
- A `MultiPoint` is simple if no two of its `Point` values are equal (have identical coordinate values).
- The boundary of a `MultiPoint` is the empty set.

### 16.2.10. Class `MultiCurve`

A `MultiCurve` is a geometry collection composed of `Curve` elements. `MultiCurve` is a non-instantiable class.

#### **MultiCurve Properties**

- A `MultiCurve` is a one-dimensional geometry.
- A `MultiCurve` is simple if and only if all of its elements are simple; the only intersections between any two elements occur at points that are on the boundaries of both elements.
- A `MultiCurve` boundary is obtained by applying the “mod 2 union rule” (also known as the “odd-even rule”): A point is in the boundary of a `MultiCurve` if it is in the boundaries of an odd number of `MultiCurve` elements.
- A `MultiCurve` is closed if all of its elements are closed.
- The boundary of a closed `MultiCurve` is always empty.

### 16.2.11. Class `MultiLineString`

A `MultiLineString` is a `MultiCurve` geometry collection composed of `LineString` elements.

#### **MultiLineString Examples**

- On a region map, a `MultiLineString` could represent a river system or a highway system.

### 16.2.12. Class `MultiSurface`

A `MultiSurface` is a geometry collection composed of surface elements. `MultiSurface` is a non-instantiable class. Its only instantiable subclass is `MultiPolygon`.

#### **MultiSurface Assertions**

- Two `MultiSurface` surfaces have no interiors that intersect.
- Two `MultiSurface` elements have boundaries that intersect at most at a finite number of points.

### 16.2.13. Class `MultiPolygon`

A `MultiPolygon` is a `MultiSurface` object composed of `Polygon` elements.

#### `MultiPolygon` Examples

- On a region map, a `MultiPolygon` could represent a system of lakes.

#### `MultiPolygon` Assertions

- A `MultiPolygon` has no two `Polygon` elements with interiors that intersect.
- A `MultiPolygon` has no two `Polygon` elements that cross (crossing is also forbidden by the previous assertion), or that touch at an infinite number of points.
- A `MultiPolygon` may not have cut lines, spikes, or punctures. A `MultiPolygon` is a regular, closed point set.
- A `MultiPolygon` that has more than one `Polygon` has an interior that is not connected. The number of connected components of the interior of a `MultiPolygon` is equal to the number of `Polygon` values in the `MultiPolygon`.

#### `MultiPolygon` Properties

- A `MultiPolygon` is a two-dimensional geometry.
- A `MultiPolygon` boundary is a set of closed curves (`LineString` values) corresponding to the boundaries of its `Polygon` elements.
- Each `Curve` in the boundary of the `MultiPolygon` is in the boundary of exactly one `Polygon` element.
- Every `Curve` in the boundary of an `Polygon` element is in the boundary of the `MultiPolygon`.

## 16.3. Supported Spatial Data Formats

This section describes the standard spatial data formats that are used to represent geometry objects in queries. They are:

- Well-Known Text (WKT) format
- Well-Known Binary (WKB) format

Internally, MySQL stores geometry values in a format that is not identical to either WKT or WKB format.

### 16.3.1. Well-Known Text (WKT) Format

The Well-Known Text (WKT) representation of Geometry is designed to exchange geometry data in ASCII form.

Examples of WKT representations of geometry objects:

- A [Point](#):

```
POINT(15 20)
```

Note that point coordinates are specified with no separating comma.

- A [LineString](#) with four points:

```
LINESTRING(0 0, 10 10, 20 25, 50 60)
```

Note that point coordinate pairs are separated by commas.

- A [Polygon](#) with one exterior ring and one interior ring:

```
POLYGON((0 0,10 0,10 10,0 10,0 0),(5 5,7 5,7 7,5 7, 5 5))
```

- A [MultiPoint](#) with three [Point](#) values:

```
MULTIPOINT(0 0, 20 20, 60 60)
```

- A [MultiLineString](#) with two [LineString](#) values:

```
MULTILINESTRING((10 10, 20 20), (15 15, 30 15))
```

- A [MultiPolygon](#) with two [Polygon](#) values:

```
MULTIPOLYGON(((0 0,10 0,10 10,0 10,0 0)),((5 5,7 5,7 7,5 7, 5 5)))
```

- A [GeometryCollection](#) consisting of two [Point](#) values and one [LineString](#):

```
GEOMETRYCOLLECTION(POINT(10 10), POINT(30 30), LINESTRING(15 15, 20 20))
```

A Backus-Naur grammar that specifies the formal production rules for writing WKT values can be found in the OpenGIS specification document referenced near the beginning of this chapter.

### 16.3.2. Well-Known Binary (WKB) Format

The Well-Known Binary (WKB) representation for geometric values is defined by the OpenGIS specification. It is also defined in the ISO *SQL/MM Part 3: Spatial* standard.

WKB is used to exchange geometry data as binary streams represented by [BLOB](#) values containing geometric WKB information.

WKB uses one-byte unsigned integers, four-byte unsigned integers, and eight-byte double-precision numbers (IEEE 754 format). A byte is eight bits.

For example, a WKB value that corresponds to [POINT\(1 1\)](#) consists of this sequence of 21 bytes

(each represented here by two hex digits):

```
010100000000000000000000F03F000000000000F03F
```

The sequence may be broken down into these components:

```
Byte order : 01
WKB type   : 01000000
X          : 00000000000000F03F
Y          : 00000000000000F03F
```

Component representation is as follows:

- The byte order may be either 0 or 1 to indicate little-endian or big-endian storage. The little-endian and big-endian byte orders are also known as Network Data Representation (NDR) and External Data Representation (XDR), respectively.
- The WKB type is a code that indicates the geometry type. Values from 1 through 7 indicate [Point](#), [LineString](#), [Polygon](#), [MultiPoint](#), [MultiLineString](#), [MultiPolygon](#), and [GeometryCollection](#).
- A [Point](#) value has X and Y coordinates, each represented as a double-precision value.

WKB values for more complex geometry values are represented by more complex data structures, as detailed in the OpenGIS specification.

## 16.4. Creating a Spatially Enabled MySQL Database

This section describes the data types you can use for representing spatial data in MySQL, and the functions available for creating and retrieving spatial values.

### 16.4.1. MySQL Spatial Data Types

MySQL has data types that correspond to OpenGIS classes. Some of these types hold single geometry values:

- [GEOMETRY](#)
- [POINT](#)
- [LINESTRING](#)
- [POLYGON](#)

[GEOMETRY](#) can store geometry values of any type. The other single-value types ([POINT](#), [LINESTRING](#), and [POLYGON](#)) restrict their values to a particular geometry type.

The other data types hold collections of values:

- [MULTIPOINT](#)
- [MULTILINESTRING](#)
- [MULTIPOLYGON](#)

- `GEOMETRYCOLLECTION`

`GEOMETRYCOLLECTION` can store a collection of objects of any type. The other collection types (`MULTIPOINT`, `MULTILINESTRING`, `MULTIPOLYGON`, and `GEOMETRYCOLLECTION`) restrict collection members to those having a particular geometry type.

## 16.4.2. Creating Spatial Values

This section describes how to create spatial values using Well-Known Text and Well-Known Binary functions that are defined in the OpenGIS standard, and using MySQL-specific functions.

### 16.4.2.1. Creating Geometry Values Using WKT Functions

MySQL provides a number of functions that take as input parameters a Well-Known Text representation and, optionally, a spatial reference system identifier (SRID). They return the corresponding geometry.

`GeomFromText()` accepts a WKT of any geometry type as its first argument. An implementation also provides type-specific construction functions for construction of geometry values of each geometry type.

- `GeomCollFromText(wkt[,srid]), GeometryCollectionFromText(wkt[,srid])`

Constructs a `GEOMETRYCOLLECTION` value using its WKT representation and SRID.

- `GeomFromText(wkt[,srid]), GeometryFromText(wkt[,srid])`

Constructs a geometry value of any type using its WKT representation and SRID.

- `LineFromText(wkt[,srid]), LineStringFromText(wkt[,srid])`

Constructs a `LINestring` value using its WKT representation and SRID.

- `MLineFromText(wkt[,srid]), MultiLineStringFromText(wkt[,srid])`

Constructs a `MULTILINESTRING` value using its WKT representation and SRID.

- `MPointFromText(wkt[,srid]), MultiPointFromText(wkt[,srid])`

Constructs a `MULTIPOINT` value using its WKT representation and SRID.

- `MPolyFromText(wkt[,srid]), MultiPolygonFromText(wkt[,srid])`

Constructs a `MULTIPOLYGON` value using its WKT representation and SRID.

- `PointFromText(wkt[,srid])`

Constructs a `POINT` value using its WKT representation and SRID.

- `PolyFromText(wkt[,srid]), PolygonFromText(wkt[,srid])`

Constructs a `POLYGON` value using its WKT representation and SRID.

The OpenGIS specification also defines the following optional functions, which MySQL does not implement. These functions construct `Polygon` or `MultiPolygon` values based on the WKT representation of a collection of rings or closed `LineString` values. These values may intersect.

- `BdMPolyFromText(wkt, srid)`

Constructs a `MultiPolygon` value from a `MultiLineString` value in WKT format containing an arbitrary collection of closed `LineString` values.

- `BdPolyFromText(wkt, srid)`

Constructs a `Polygon` value from a `MultiLineString` value in WKT format containing an arbitrary collection of closed `LineString` values.

### 16.4.2.2. Creating Geometry Values Using WKB Functions

MySQL provides a number of functions that take as input parameters a `BLOB` containing a Well-Known Binary representation and, optionally, a spatial reference system identifier (SRID). They return the corresponding geometry.

`GeomFromWKB()` accepts a WKB of any geometry type as its first argument. An implementation also provides type-specific construction functions for construction of geometry values of each geometry type.

- `GeomCollFromWKB(wkb[, srid]), GeometryCollectionFromWKB(wkb[, srid])`

Constructs a `GEOMETRYCOLLECTION` value using its WKB representation and SRID.

- `GeomFromWKB(wkb[, srid]), GeometryFromWKB(wkb[, srid])`

Constructs a geometry value of any type using its WKB representation and SRID.

- `LineFromWKB(wkb[, srid]), LineStringFromWKB(wkb[, srid])`

Constructs a `LINESTRING` value using its WKB representation and SRID.

- `MLineFromWKB(wkb[, srid]), MultiLineStringFromWKB(wkb[, srid])`

Constructs a `MULTILINESTRING` value using its WKB representation and SRID.

- `MPointFromWKB(wkb[, srid]), MultiPointFromWKB(wkb[, srid])`

Constructs a `MULTIPOINT` value using its WKB representation and SRID.

- `MPolyFromWKB(wkb[, srid]), MultiPolygonFromWKB(wkb[, srid])`

Constructs a `MULTIPOLYGON` value using its WKB representation and SRID.

- `PointFromWKB(wkb[, srid])`

Constructs a `POINT` value using its WKB representation and SRID.

- `PolyFromWKB(wkb[, srid]), PolygonFromWKB(wkb[, srid])`

Constructs a `POLYGON` value using its WKB representation and SRID.

The OpenGIS specification also describes optional functions for constructing `Polygon` or `MultiPolygon` values based on the WKB representation of a collection of rings or closed `LineString` values. These values may intersect. MySQL does not implement these functions:

- `BdMPolyFromWKB(wkb, srid)`

Constructs a `MultiPolygon` value from a `MultiLineString` value in WKB format containing an arbitrary collection of closed `LineString` values.

- `BdPolyFromWKB(wkb,srid)`

Constructs a `Polygon` value from a `MultiLineString` value in WKB format containing an arbitrary collection of closed `LineString` values.

### 16.4.2.3. Creating Geometry Values Using MySQL-Specific Functions

MySQL provides a set of useful non-standard functions for creating geometry WKB representations. The functions described in this section are MySQL extensions to the OpenGIS specification. The results of these functions are `BLOB` values containing WKB representations of geometry values with no SRID. The results of these functions can be substituted as the first argument for any function in the `GeomFromWKB()` function family.

- `GeometryCollection(g1,g2,...)`

Constructs a WKB `GeometryCollection`. If any argument is not a well-formed WKB representation of a geometry, the return value is `NULL`.

- `LineString(pt1,pt2,...)`

Constructs a WKB `LineString` value from a number of WKB `Point` arguments. If any argument is not a WKB `Point`, the return value is `NULL`. If the number of `Point` arguments is less than two, the return value is `NULL`.

- `MultiLineString(ls1,ls2,...)`

Constructs a WKB `MultiLineString` value using WKB `LineString` arguments. If any argument is not a WKB `LineString`, the return value is `NULL`.

- `MultiPoint(pt1,pt2,...)`

Constructs a WKB `MultiPoint` value using WKB `Point` arguments. If any argument is not a WKB `Point`, the return value is `NULL`.

- `MultiPolygon(poly1,poly2,...)`

Constructs a WKB `MultiPolygon` value from a set of WKB `Polygon` arguments. If any argument is not a WKB `Polygon`, the return value is `NULL`.

- `Point(x,y)`

Constructs a WKB `Point` using its coordinates.

- `Polygon(ls1,ls2,...)`

Constructs a WKB `Polygon` value from a number of WKB `LineString` arguments. If any argument does not represent the WKB of a `LinearRing` (that is, not a closed and simple `LineString`) the return value is `NULL`.

### 16.4.3. Creating Spatial Columns

MySQL provides a standard way of creating spatial columns for geometry types, for example, with

`CREATE TABLE` or `ALTER TABLE`. Currently, spatial columns are supported only for `MyISAM` tables.

- Use the `CREATE TABLE` statement to create a table with a spatial column:

```
CREATE TABLE geom (g GEOMETRY);
```

- Use the `ALTER TABLE` statement to add or drop a spatial column to or from an existing table:

```
ALTER TABLE geom ADD pt POINT;
ALTER TABLE geom DROP pt;
```

## 16.4.4. Populating Spatial Columns

After you have created spatial columns, you can populate them with spatial data.

Values should be stored in internal geometry format, but you can convert them to that format from either Well-Known Text (WKT) or Well-Known Binary (WKB) format. The following examples demonstrate how to insert geometry values into a table by converting WKT values into internal geometry format:

- Perform the conversion directly in the `INSERT` statement:

```
INSERT INTO geom VALUES (GeomFromText('POINT(1 1)'));
SET @g = 'POINT(1 1)';
INSERT INTO geom VALUES (GeomFromText(@g));
```

- Perform the conversion prior to the `INSERT`:

```
SET @g = GeomFromText('POINT(1 1)');
INSERT INTO geom VALUES (@g);
```

The following examples insert more complex geometries into the table:

```
SET @g = 'LINESTRING(0 0,1 1,2 2)';
INSERT INTO geom VALUES (GeomFromText(@g));

SET @g = 'POLYGON((0 0,10 0,10 10,0 10,0 0),(5 5,7 5,7 7,5 7, 5 5))';
INSERT INTO geom VALUES (GeomFromText(@g));

SET @g =
'GEOMETRYCOLLECTION(POINT(1 1),LINESTRING(0 0,1 1,2 2,3 3,4 4))';
INSERT INTO geom VALUES (GeomFromText(@g));
```

The preceding examples all use `GeomFromText()` to create geometry values. You can also use type-specific functions:

```
SET @g = 'POINT(1 1)';
INSERT INTO geom VALUES (PointFromText(@g));

SET @g = 'LINESTRING(0 0,1 1,2 2)';
INSERT INTO geom VALUES (LineStringFromText(@g));

SET @g = 'POLYGON((0 0,10 0,10 10,0 10,0 0),(5 5,7 5,7 7,5 7, 5 5))';
INSERT INTO geom VALUES (PolygonFromText(@g));

SET @g =
'GEOMETRYCOLLECTION(POINT(1 1),LINESTRING(0 0,1 1,2 2,3 3,4 4))';
INSERT INTO geom VALUES (GeomCollFromText(@g));
```

Note that if a client application program wants to use WKB representations of geometry values, it is responsible for sending correctly formed WKB in queries to the server. However, there are several ways of satisfying this requirement. For example:

- Inserting a `POINT(1 1)` value with hex literal syntax:

```
mysql> INSERT INTO geom VALUES
-> (GeomFromWKB(0x010100000000000000000000F03F000000000000F03F));
```

- An ODBC application can send a WKB representation, binding it to a placeholder using an argument of `BLOB` type:

```
INSERT INTO geom VALUES (GeomFromWKB(?))
```

Other programming interfaces may support a similar placeholder mechanism.

- In a C program, you can escape a binary value using `mysql_real_escape_string()` and include the result in a query string that is sent to the server. See [Section 17.2.3.51](#), “`mysql_real_escape_string()`”.

## 16.4.5. Fetching Spatial Data

Geometry values stored in a table can be fetched in internal format. You can also convert them into WKT or WKB format.

- Fetching spatial data in internal format:

Fetching geometry values using internal format can be useful in table-to-table transfers:

```
CREATE TABLE geom2 (g GEOMETRY) SELECT g FROM geom;
```

- Fetching spatial data in WKT format:

The `AsText()` function converts a geometry from internal format into a WKT string.

```
SELECT AsText(g) FROM geom;
```

- Fetching spatial data in WKB format:

The `AsBinary()` function converts a geometry from internal format into a `BLOB` containing the WKB value.

```
SELECT AsBinary(g) FROM geom;
```

## 16.5. Analyzing Spatial Information

After populating spatial columns with values, you are ready to query and analyze them. MySQL provides a set of functions to perform various operations on spatial data. These functions can be grouped into four major categories according to the type of operation they perform:

- Functions that convert geometries between various formats
-

- Functions that provide access to qualitative or quantitative properties of a geometry
- Functions that describe relations between two geometries
- Functions that create new geometries from existing ones

Spatial analysis functions can be used in many contexts, such as:

- Any interactive SQL program, such as `mysql` or MySQL Query Browser
- Application programs written in any language that supports a MySQL client API

## 16.5.1. Geometry Format Conversion Functions

MySQL supports the following functions for converting geometry values between internal format and either WKT or WKB format:

- `AsBinary(g)`

Converts a value in internal geometry format to its WKB representation and returns the binary result.

```
SELECT AsBinary(g) FROM geom;
```

- `AsText(g)`

Converts a value in internal geometry format to its WKT representation and returns the string result.

```
mysql> SET @g = 'LineString(1 1,2 2,3 3)';
mysql> SELECT AsText(GeomFromText(@g));
+-----+
| AsText(GeomFromText(@g)) |
+-----+
| LINESTRING(1 1,2 2,3 3) |
+-----+
```

- `GeomFromText(wkt [, srid])`

Converts a string value from its WKT representation into internal geometry format and returns the result. A number of type-specific functions are also supported, such as `PointFromText()` and `LineFromText()`. See [Section 16.4.2.1, “Creating Geometry Values Using WKT Functions”](#).

- `GeomFromWKB(wkb [, srid])`

Converts a binary value from its WKB representation into internal geometry format and returns the result. A number of type-specific functions are also supported, such as `PointFromWKB()` and `LineFromWKB()`. See [Section 16.4.2.2, “Creating Geometry Values Using WKB Functions”](#).

## 16.5.2. Geometry Functions

Each function that belongs to this group takes a geometry value as its argument and returns some quantitative or qualitative property of the geometry. Some functions restrict their argument type. Such functions return `NULL` if the argument is of an incorrect geometry type. For example, `Area()` returns `NULL` if the object type is neither `Polygon` nor `MultiPolygon`.

### 16.5.2.1. General Geometry Functions

The functions listed in this section do not restrict their argument and accept a geometry value of any type.

- `Dimension(g)`

Returns the inherent dimension of the geometry value *g*. The result can be -1, 0, 1, or 2. The meaning of these values is given in [Section 16.2.2, “Class Geometry”](#).

```
mysql> SELECT Dimension(GeomFromText('LineString(1 1,2 2)'));
+-----+
| Dimension(GeomFromText('LineString(1 1,2 2)')) |
+-----+
| 1 |
+-----+
```

- `Envelope(g)`

Returns the Minimum Bounding Rectangle (MBR) for the geometry value *g*. The result is returned as a `Polygon` value.

The polygon is defined by the corner points of the bounding box:

```
POLYGON((MINX MINY, MAXX MINY, MAXX MAXY, MINX MAXY, MINX MINY))
```

```
mysql> SELECT AsText(Envelope(GeomFromText('LineString(1 1,2 2)')));
+-----+
| AsText(Envelope(GeomFromText('LineString(1 1,2 2)'))) |
+-----+
| POLYGON((1 1,2 1,2 2,1 2,1 1)) |
+-----+
```

- `GeometryType(g)`

Returns as a string the name of the geometry type of which the geometry instance *g* is a member. The name corresponds to one of the instantiable `Geometry` subclasses.

```
mysql> SELECT GeometryType(GeomFromText('POINT(1 1)'));
+-----+
| GeometryType(GeomFromText('POINT(1 1)')) |
+-----+
| POINT |
+-----+
```

- `SRID(g)`

Returns an integer indicating the Spatial Reference System ID for the geometry value *g*.

In MySQL, the SRID value is just an integer associated with the geometry value. All calculations are done assuming Euclidean (planar) geometry.

```
mysql> SELECT SRID(GeomFromText('LineString(1 1,2 2)',101));
+-----+
| SRID(GeomFromText('LineString(1 1,2 2)',101)) |
+-----+
| 101 |
+-----+
```

The OpenGIS specification also defines the following functions, which MySQL does not implement:

- `Boundary(g)`

Returns a geometry that is the closure of the combinatorial boundary of the geometry value *g*.

- `IsEmpty(g)`

Returns 1 if the geometry value *g* is the empty geometry, 0 if it is not empty, and -1 if the argument is `NULL`. If the geometry is empty, it represents the empty point set.

- `IsSimple(g)`

Currently, this function is a placeholder and should not be used. If implemented, its behavior will be as described in the next paragraph.

Returns 1 if the geometry value *g* has no anomalous geometric points, such as self-intersection or self-tangency. `IsSimple()` returns 0 if the argument is not simple, and -1 if it is `NULL`.

The description of each instantiable geometric class given earlier in the chapter includes the specific conditions that cause an instance of that class to be classified as not simple. (See [Section 16.2.1](#), “The Geometry Class Hierarchy”.)

## 16.5.2.2. Point Functions

A `Point` consists of X and Y coordinates, which may be obtained using the following functions:

- `X(p)`

Returns the X-coordinate value for the point *p* as a double-precision number.

```
mysql> SET @pt = 'Point(56.7 53.34)';
mysql> SELECT X(GeomFromText(@pt));
+-----+
| X(GeomFromText(@pt)) |
+-----+
|                    56.7 |
+-----+
```

- `Y(p)`

Returns the Y-coordinate value for the point *p* as a double-precision number.

```
mysql> SET @pt = 'Point(56.7 53.34)';
mysql> SELECT Y(GeomFromText(@pt));
+-----+
| Y(GeomFromText(@pt)) |
+-----+
|                    53.34 |
+-----+
```

## 16.5.2.3. LineString Functions

A `LineString` consists of `Point` values. You can extract particular points of a `LineString`, count the number of points that it contains, or obtain its length.

- `EndPoint(ls)`

Returns the `Point` that is the endpoint of the `LineString` value *ls*.

```
mysql> SET @ls = 'LineString(1 1,2 2,3 3)';
mysql> SELECT AsText(EndPoint(GeomFromText(@ls)));
+-----+
| AsText(EndPoint(GeomFromText(@ls))) |
+-----+
| POINT(3 3) |
+-----+
```

- `GLength(ls)`

Returns as a double-precision number the length of the `LineString` value `ls` in its associated spatial reference.

```
mysql> SET @ls = 'LineString(1 1,2 2,3 3)';
mysql> SELECT GLength(GeomFromText(@ls));
+-----+
| GLength(GeomFromText(@ls)) |
+-----+
| 2.8284271247462 |
+-----+
```

`GLength()` is a non-standard name. It corresponds to the OpenGIS `Length()` function.

- `NumPoints(ls)`

Returns the number of `Point` objects in the `LineString` value `ls`.

```
mysql> SET @ls = 'LineString(1 1,2 2,3 3)';
mysql> SELECT NumPoints(GeomFromText(@ls));
+-----+
| NumPoints(GeomFromText(@ls)) |
+-----+
| 3 |
+-----+
```

- `PointN(ls,N)`

Returns the `N`-th `Point` in the `LineString` value `ls`. Points are numbered beginning with 1.

```
mysql> SET @ls = 'LineString(1 1,2 2,3 3)';
mysql> SELECT AsText(PointN(GeomFromText(@ls),2));
+-----+
| AsText(PointN(GeomFromText(@ls),2)) |
+-----+
| POINT(2 2) |
+-----+
```

- `StartPoint(ls)`

Returns the `Point` that is the start point of the `LineString` value `ls`.

```
mysql> SET @ls = 'LineString(1 1,2 2,3 3)';
mysql> SELECT AsText(StartPoint(GeomFromText(@ls)));
+-----+
| AsText(StartPoint(GeomFromText(@ls))) |
+-----+
| POINT(1 1) |
+-----+
```

The OpenGIS specification also defines the following function, which MySQL does not implement:

- `IsRing(ls)`

Returns 1 if the `LineString` value `ls` is closed (that is, its `StartPoint()` and `EndPoint()` values are the same) and is simple (does not pass through the same point more than once). Returns 0 if `ls` is not a ring, and -1 if it is `NULL`.

### 16.5.2.4. MultiLineString Functions

- `GLength(mls)`

Returns as a double-precision number the length of the `MultiLineString` value `mls`. The length of `mls` is equal to the sum of the lengths of its elements.

```
mysql> SET @mls = 'MultiLineString((1 1,2 2,3 3),(4 4,5 5))';
mysql> SELECT GLength(GeomFromText(@mls));
+-----+
| GLength(GeomFromText(@mls)) |
+-----+
| 4.2426406871193 |
+-----+
```

`GLength()` is a non-standard name. It corresponds to the OpenGIS `Length()` function.

- `IsClosed(mls)`

Returns 1 if the `MultiLineString` value `mls` is closed (that is, the `StartPoint()` and `EndPoint()` values are the same for each `LineString` in `mls`). Returns 0 if `mls` is not closed, and -1 if it is `NULL`.

```
mysql> SET @mls = 'MultiLineString((1 1,2 2,3 3),(4 4,5 5))';
mysql> SELECT IsClosed(GeomFromText(@mls));
+-----+
| IsClosed(GeomFromText(@mls)) |
+-----+
| 0 |
+-----+
```

### 16.5.2.5. Polygon Functions

- `Area(poly)`

Returns as a double-precision number the area of the `Polygon` value `poly`, as measured in its spatial reference system.

```
mysql> SET @poly = 'Polygon((0 0,0 3,3 0,0 0),(1 1,1 2,2 1,1 1))';
mysql> SELECT Area(GeomFromText(@poly));
+-----+
| Area(GeomFromText(@poly)) |
+-----+
| 4 |
+-----+
```

- `ExteriorRing(poly)`

Returns the exterior ring of the `Polygon` value `poly` as a `LineString`.

```
mysql> SET @poly =
-> 'Polygon((0 0,0 3,3 3,3 0,0 0),(1 1,1 2,2 2,2 1,1 1))';
mysql> SELECT AsText(ExteriorRing(GeomFromText(@poly)));
+-----+
| AsText(ExteriorRing(GeomFromText(@poly))) |
+-----+
```

```
+-----+
| LINESTRING(0 0,0 3,3 3,3 0,0 0) |
+-----+
```

- `InteriorRingN(poly,N)`

Returns the *N*-th interior ring for the `Polygon` value *poly* as a `LineString`. Rings are numbered beginning with 1.

```
mysql> SET @poly =
-> 'Polygon((0 0,0 3,3 3,3 0,0 0),(1 1,1 2,2 2,2 1,1 1))';
mysql> SELECT AsText(InteriorRingN(GeomFromText(@poly),1));
+-----+
| AsText(InteriorRingN(GeomFromText(@poly),1)) |
+-----+
| LINESTRING(1 1,1 2,2 2,2 1,1 1) |
+-----+
```

- `NumInteriorRings(poly)`

Returns the number of interior rings in the `Polygon` value *poly*.

```
mysql> SET @poly =
-> 'Polygon((0 0,0 3,3 3,3 0,0 0),(1 1,1 2,2 2,2 1,1 1))';
mysql> SELECT NumInteriorRings(GeomFromText(@poly));
+-----+
| NumInteriorRings(GeomFromText(@poly)) |
+-----+
| 1 |
+-----+
```

### 16.5.2.6. MultiPolygon Functions

- `Area(mpoly)`

Returns as a double-precision number the area of the `MultiPolygon` value *mpoly*, as measured in its spatial reference system.

```
mysql> SET @mpoly =
-> 'MultiPolygon(((0 0,0 3,3 3,3 0,0 0),(1 1,1 2,2 2,2 1,1 1)))';
mysql> SELECT Area(GeomFromText(@mpoly));
+-----+
| Area(GeomFromText(@mpoly)) |
+-----+
| 8 |
+-----+
```

The OpenGIS specification also defines the following functions, which MySQL does not implement:

- `Centroid(mpoly)`

Returns the mathematical centroid for the `MultiPolygon` value *mpoly* as a `Point`. The result is not guaranteed to be on the `MultiPolygon`.

- `PointOnSurface(mpoly)`

Returns a `Point` value that is guaranteed to be on the `MultiPolygon` value *mpoly*.

### 16.5.2.7. GeometryCollection Functions

- `GeometryN(gc,N)`

Returns the *N*-th geometry in the `GeometryCollection` value *gc*. Geometries are numbered beginning with 1.

```
mysql> SET @gc = 'GeometryCollection(Point(1 1),LineString(2 2, 3 3))';
mysql> SELECT AsText(GeometryN(GeomFromText(@gc),1));
+-----+
| AsText(GeometryN(GeomFromText(@gc),1)) |
+-----+
| POINT(1 1)                             |
+-----+
```

- `NumGeometries(gc)`

Returns the number of geometries in the `GeometryCollection` value *gc*.

```
mysql> SET @gc = 'GeometryCollection(Point(1 1),LineString(2 2, 3 3))';
mysql> SELECT NumGeometries(GeomFromText(@gc));
+-----+
| NumGeometries(GeomFromText(@gc)) |
+-----+
| 2                                 |
+-----+
```

## 16.5.3. Functions That Create New Geometries from Existing Ones

### 16.5.3.1. Geometry Functions That Produce New Geometries

[Section 16.5.2, “Geometry Functions”](#), discusses several functions that construct new geometries from existing ones. See that section for descriptions of these functions:

- `Envelope(g)`
- `StartPoint(ls)`
- `EndPoint(ls)`
- `PointN(ls,N)`
- `ExteriorRing(poly)`
- `InteriorRingN(poly,N)`
- `GeometryN(gc,N)`

### 16.5.3.2. Spatial Operators

OpenGIS proposes a number of other functions that can produce geometries. They are designed to implement spatial operators.

These functions are not implemented in MySQL. They may appear in future releases.

- `Buffer(g,d)`  
Returns a geometry that represents all points whose distance from the geometry value *g* is less than or equal to a distance of *d*.
- `ConvexHull(g)`  
Returns a geometry that represents the convex hull of the geometry value *g*.
- `Difference(g1,g2)`  
Returns a geometry that represents the point set difference of the geometry value *g1* with *g2*.
- `Intersection(g1,g2)`  
Returns a geometry that represents the point set intersection of the geometry values *g1* with *g2*.
- `SymDifference(g1,g2)`  
Returns a geometry that represents the point set symmetric difference of the geometry value *g1* with *g2*.
- `Union(g1,g2)`  
Returns a geometry that represents the point set union of the geometry values *g1* and *g2*.

## 16.5.4. Functions for Testing Spatial Relations Between Geometric Objects

The functions described in these sections take two geometries as input parameters and return a qualitative or quantitative relation between them.

## 16.5.5. Relations on Geometry Minimal Bounding Rectangles (MBRs)

MySQL provides several functions that test relations between minimal bounding rectangles of two geometries *g1* and *g2*. The return values 1 and 0 indicate true and false, respectively.

- `MBRContains(g1,g2)`  
Returns 1 or 0 to indicate whether the Minimum Bounding Rectangle of *g1* contains the Minimum Bounding Rectangle of *g2*.  

```
mysql> SET @g1 = GeomFromText('Polygon((0 0,0 3,3 3,3 0,0 0))');
mysql> SET @g2 = GeomFromText('Point(1 1)');
mysql> SELECT MBRContains(@g1,@g2), MBRContains(@g2,@g1);
```

MBRContains(@g1,@g2)	MBRContains(@g2,@g1)
1	0
- `MBRDisjoint(g1,g2)`  
Returns 1 or 0 to indicate whether the Minimum Bounding Rectangles of the two geometries *g1* and *g2* are disjoint (do not intersect).

- `MBREqual(g1,g2)`  
Returns 1 or 0 to indicate whether the Minimum Bounding Rectangles of the two geometries *g1* and *g2* are the same.
- `MBRIntersects(g1,g2)`  
Returns 1 or 0 to indicate whether the Minimum Bounding Rectangles of the two geometries *g1* and *g2* intersect.
- `MBROverlaps(g1,g2)`  
Returns 1 or 0 to indicate whether the Minimum Bounding Rectangles of the two geometries *g1* and *g2* overlap.
- `MBRTouches(g1,g2)`  
Returns 1 or 0 to indicate whether the Minimum Bounding Rectangles of the two geometries *g1* and *g2* touch.
- `MBRWithin(g1,g2)`  
Returns 1 or 0 to indicate whether the Minimum Bounding Rectangle of *g1* is within the Minimum Bounding Rectangle of *g2*.

```
mysql> SET @g1 = GeomFromText('Polygon((0 0,0 3,3 3,3 0,0 0))');
mysql> SET @g2 = GeomFromText('Polygon((0 0,0 5,5 5,5 0,0 0))');
mysql> SELECT MBRWithin(@g1,@g2), MBRWithin(@g2,@g1);
```

MBRWithin(@g1,@g2)	MBRWithin(@g2,@g1)
1	0

## 16.5.6. Functions That Test Spatial Relationships Between Geometries

The OpenGIS specification defines the following functions. They test the relationship between two geometry values *g1* and *g2*.

Currently, MySQL does not implement these functions according to the specification. Those that are implemented return the same result as the corresponding MBR-based functions. This includes functions in the following list other than `Distance()` and `Related()`.

These functions may be implemented in future releases with full support for spatial analysis, not just MBR-based support.

The return values 1 and 0 indicate true and false, respectively.

- `Contains(g1,g2)`  
Returns 1 or 0 to indicate whether *g1* completely contains *g2*.
- `Crosses(g1,g2)`  
Returns 1 if *g1* spatially crosses *g2*. Returns `NULL` if *g1* is a `Polygon` or a `MultiPolygon`, or if *g2* is a `Point` or a `MultiPoint`. Otherwise, returns 0.

The term *spatially crosses* denotes a spatial relation between two given geometries that has the following properties:

- The two geometries intersect
- Their intersection results in a geometry that has a dimension that is one less than the maximum dimension of the two given geometries
- Their intersection is not equal to either of the two given geometries
- `Disjoint(g1,g2)`  
Returns 1 or 0 to indicate whether *g1* is spatially disjoint from (does not intersect) *g2*.
- `Distance(g1,g2)`  
Returns as a double-precision number the shortest distance between any two points in the two geometries.
- `Equals(g1,g2)`  
Returns 1 or 0 to indicate whether *g1* is spatially equal to *g2*.
- `Intersects(g1,g2)`  
Returns 1 or 0 to indicate whether *g1* spatially intersects *g2*.
- `Overlaps(g1,g2)`  
Returns 1 or 0 to indicate whether *g1* spatially overlaps *g2*. The term *spatially overlaps* is used if two geometries intersect and their intersection results in a geometry of the same dimension but not equal to either of the given geometries.
- `Related(g1,g2,pattern_matrix)`  
Returns 1 or 0 to indicate whether the spatial relationship specified by *pattern\_matrix* exists between *g1* and *g2*. Returns -1 if the arguments are `NULL`. The pattern matrix is a string. Its specification will be noted here if this function is implemented.
- `Touches(g1,g2)`  
Returns 1 or 0 to indicate whether *g1* spatially touches *g2*. Two geometries *spatially touch* if the interiors of the geometries do not intersect, but the boundary of one of the geometries intersects either the boundary or the interior of the other.
- `Within(g1,g2)`  
Returns 1 or 0 to indicate whether *g1* is spatially within *g2*.

## 16.6. Optimizing Spatial Analysis

Search operations in non-spatial databases can be optimized using indexes. This is true for spatial databases as well. With the help of a great variety of multi-dimensional indexing methods that have previously been designed, it is possible to optimize spatial searches. The most typical of these are:

- Point queries that search for all objects that contain a given point

- Region queries that search for all objects that overlap a given region

MySQL uses **R-Trees with quadratic splitting** to index spatial columns. A spatial index is built using the MBR of a geometry. For most geometries, the MBR is a minimum rectangle that surrounds the geometries. For a horizontal or a vertical linestring, the MBR is a rectangle degenerated into the linestring. For a point, the MBR is a rectangle degenerated into the point.

## 16.6.1. Creating Spatial Indexes

MySQL can create spatial indexes using syntax similar to that for creating regular indexes, but extended with the `SPATIAL` keyword. Currently, spatial columns that are indexed must be declared `NOT NULL`. The following examples demonstrate how to create spatial indexes:

- With `CREATE TABLE`:

```
CREATE TABLE geom (g GEOMETRY NOT NULL, SPATIAL INDEX(g));
```

- With `ALTER TABLE`:

```
ALTER TABLE geom ADD SPATIAL INDEX(g);
```

- With `CREATE INDEX`:

```
CREATE SPATIAL INDEX sp_index ON geom (g);
```

To drop spatial indexes, use `ALTER TABLE` or `DROP INDEX`:

- With `ALTER TABLE`:

```
ALTER TABLE geom DROP INDEX g;
```

- With `DROP INDEX`:

```
DROP INDEX sp_index ON geom;
```

Example: Suppose that a table `geom` contains more than 32,000 geometries, which are stored in the column `g` of type `GEOMETRY`. The table also has an `AUTO_INCREMENT` column `fid` for storing object ID values.

```
mysql> DESCRIBE geom;
+-----+-----+-----+-----+-----+-----+
| Field | Type      | Null | Key | Default | Extra          |
+-----+-----+-----+-----+-----+-----+
| fid   | int(11)   |      | PRI | NULL    | auto_increment |
| g     | geometry  |      |     |         |                |
+-----+-----+-----+-----+-----+-----+
2 rows in set (0.00 sec)

mysql> SELECT COUNT(*) FROM geom;
+-----+
| count(*) |
+-----+
| 32376    |
+-----+
1 row in set (0.00 sec)
```

To add a spatial index on the column `g`, use this statement:

```
mysql> ALTER TABLE geom ADD SPATIAL INDEX(g);
Query OK, 32376 rows affected (4.05 sec)
Records: 32376 Duplicates: 0 Warnings: 0
```

## 16.6.2. Using a Spatial Index

The optimizer investigates whether available spatial indexes can be involved in the search for queries that use a function such as `MBRContains()` or `MBRWithin()` in the `WHERE` clause. The following query finds all objects that are in the given rectangle:

```
mysql> SET @poly =
-> 'Polygon((30000 15000,31000 15000,31000 16000,30000 16000,30000 15000))';
mysql> SELECT fid,AsText(g) FROM geom WHERE
-> MBRContains(GeomFromText(@poly),g);
```

fid	AsText(g)
21	LINESTRING(30350.4 15828.8,30350.6 15845,30333.8 15845,30 ...
22	LINESTRING(30350.6 15871.4,30350.6 15887.8,30334 15887.8, ...
23	LINESTRING(30350.6 15914.2,30350.6 15930.4,30334 15930.4, ...
24	LINESTRING(30290.2 15823,30290.2 15839.4,30273.4 15839.4, ...
25	LINESTRING(30291.4 15866.2,30291.6 15882.4,30274.8 15882. ...
26	LINESTRING(30291.6 15918.2,30291.6 15934.4,30275 15934.4, ...
249	LINESTRING(30337.8 15938.6,30337.8 15946.8,30320.4 15946. ...
1	LINESTRING(30250.4 15129.2,30248.8 15138.4,30238.2 15136. ...
2	LINESTRING(30220.2 15122.8,30217.2 15137.8,30207.6 15136. ...
3	LINESTRING(30179 15114.4,30176.6 15129.4,30167 15128,3016 ...
4	LINESTRING(30155.2 15121.4,30140.4 15118.6,30142 15109,30 ...
5	LINESTRING(30192.4 15085,30177.6 15082.2,30179.2 15072.4, ...
6	LINESTRING(30244 15087,30229 15086.2,30229.4 15076.4,3024 ...
7	LINESTRING(30200.6 15059.4,30185.6 15058.6,30186 15048.8, ...
10	LINESTRING(30179.6 15017.8,30181 15002.8,30190.8 15003.6, ...
11	LINESTRING(30154.2 15000.4,30168.6 15004.8,30166 15014.2, ...
13	LINESTRING(30105 15065.8,30108.4 15050.8,30118 15053,3011 ...
154	LINESTRING(30276.2 15143.8,30261.4 15141,30263 15131.4,30 ...
155	LINESTRING(30269.8 15084,30269.4 15093.4,30258.6 15093,30 ...
157	LINESTRING(30128.2 15011,30113.2 15010.2,30113.6 15000.4, ...

```
20 rows in set (0.00 sec)
```

Use `EXPLAIN` to check the way this query is executed:

```
mysql> SET @poly =
-> 'Polygon((30000 15000,31000 15000,31000 16000,30000 16000,30000 15000))';
mysql> EXPLAIN SELECT fid,AsText(g) FROM geom WHERE
-> MBRContains(GeomFromText(@poly),g)\G
***** 1. row *****
      id: 1
  select_type: SIMPLE
        table: geom
         type: range
possible_keys: g
          key: g
         key_len: 32
          ref: NULL
         rows: 50
      Extra: Using where
1 row in set (0.00 sec)
```

Check what would happen without a spatial index:

```
mysql> SET @poly =
-> 'Polygon((30000 15000,31000 15000,31000 16000,30000 16000,30000 15000))';
mysql> EXPLAIN SELECT fid,AsText(g) FROM g IGNORE INDEX (g) WHERE
-> MBRContains(GeomFromText(@poly),g)\G
***** 1. row *****
      id: 1
  select_type: SIMPLE
        table: geom
         type: ALL
```

```
possible_keys: NULL
  key: NULL
  key_len: NULL
  ref: NULL
  rows: 32376
  Extra: Using where
1 row in set (0.00 sec)
```

Executing the `SELECT` statement without the spatial index yields the same result but causes the execution time to rise from 0.00 seconds to 0.46 seconds:

```
mysql> SET @poly =
-> 'Polygon((30000 15000,31000 15000,31000 16000,30000 16000,30000 15000))';
mysql> SELECT fid,AsText(g) FROM geom IGNORE INDEX (g) WHERE
-> MBRContains(GeomFromText(@poly),g);
```

fid	AsText(g)
1	LINESTRING(30250.4 15129.2,30248.8 15138.4,30238.2 15136. ...
2	LINESTRING(30220.2 15122.8,30217.2 15137.8,30207.6 15136. ...
3	LINESTRING(30179 15114.4,30176.6 15129.4,30167 15128,3016 ...
4	LINESTRING(30155.2 15121.4,30140.4 15118.6,30142 15109,30 ...
5	LINESTRING(30192.4 15085,30177.6 15082.2,30179.2 15072.4, ...
6	LINESTRING(30244 15087,30229 15086.2,30229.4 15076.4,3024 ...
7	LINESTRING(30200.6 15059.4,30185.6 15058.6,30186 15048.8, ...
10	LINESTRING(30179.6 15017.8,30181 15002.8,30190.8 15003.6, ...
11	LINESTRING(30154.2 15000.4,30168.6 15004.8,30166 15014.2, ...
13	LINESTRING(30105 15065.8,30108.4 15050.8,30118 15053,3011 ...
21	LINESTRING(30350.4 15828.8,30350.6 15845,30333.8 15845,30 ...
22	LINESTRING(30350.6 15871.4,30350.6 15887.8,30334 15887.8, ...
23	LINESTRING(30350.6 15914.2,30350.6 15930.4,30334 15930.4, ...
24	LINESTRING(30290.2 15823,30290.2 15839.4,30273.4 15839.4, ...
25	LINESTRING(30291.4 15866.2,30291.6 15882.4,30274.8 15882. ...
26	LINESTRING(30291.6 15918.2,30291.6 15934.4,30275 15934.4, ...
154	LINESTRING(30276.2 15143.8,30261.4 15141,30263 15131.4,30 ...
155	LINESTRING(30269.8 15084,30269.4 15093.4,30258.6 15093,30 ...
157	LINESTRING(30128.2 15011,30113.2 15010.2,30113.6 15000.4, ...
249	LINESTRING(30337.8 15938.6,30337.8 15946.8,30320.4 15946. ...

```
20 rows in set (0.46 sec)
```

In future releases, spatial indexes may also be used for optimizing other functions. See [Section 16.5.4](#), “Functions for Testing Spatial Relations Between Geometric Objects”.

## 16.7. MySQL Conformance and Compatibility

MySQL does not yet implement the following GIS features:

- Additional Metadata Views

OpenGIS specifications propose several additional metadata views. For example, a system view named `GEOMETRY_COLUMNS` contains a description of geometry columns, one row for each geometry column in the database.

- The OpenGIS function `Length()` on `LineString` and `MultiLineString` currently should be called in MySQL as `GLength()`

The problem is that there is an existing SQL function `Length()` that calculates the length of string values, and sometimes it is not possible to distinguish whether the function is called in a textual or spatial context. We need either to solve this somehow, or decide on another function name.

---

# Chapter 17. APIs and Libraries

This chapter describes the APIs available for MySQL, where to get them, and how to use them. The C API is the most extensively covered, because it was developed by the MySQL team, and is the basis for most of the other APIs. This chapter also covers the `libmysqld` library (the embedded server), as well as some programs that are useful for application developers.

## 17.1. libmysqld, the Embedded MySQL Server Library

### 17.1.1. Overview of the Embedded MySQL Server Library

The embedded MySQL server library makes it possible to run a full-featured MySQL server inside a client application. The main benefits are increased speed and more simple management for embedded applications.

The embedded server library is based on the client/server version of MySQL, which is written in C/C++. Consequently, the embedded server also is written in C/C++. There is no embedded server available in other languages.

The API is identical for the embedded MySQL version and the client/server version. To change an old threaded application to use the embedded library, you normally only have to add calls to the following functions:

Function	When to Call
<code>mysql_server_init()</code>	Should be called before any other MySQL function is called, preferably early in the <code>main()</code> function.
<code>mysql_server_end()</code>	Should be called before your program exits.
<code>mysql_thread_init()</code>	Should be called in each thread you create that accesses MySQL.
<code>mysql_thread_end()</code>	Should be called before calling <code>pthread_exit()</code>

Then you must link your code with `libmysqld.a` instead of `libmysqlclient.a`.

The `mysql_server_XXX()` functions are also included in `libmysqlclient.a` to allow you to change between the embedded and the client/server version by just linking your application with the right library. See [Section 17.2.12.1, “mysql\\_server\\_init\(\)”](#).

One difference between the embedded server and the standalone server is that for the embedded server, authentication for connections is disabled by default. To use authentication for the embedded server, specify the `--with-embedded-privilege-control` option when you invoke `configure` to configure your MySQL distribution. This option is available as of MySQL 4.1.3.

### 17.1.2. Compiling Programs with `libmysqld`

To get a `libmysqld` library you should configure MySQL with the `--with-embedded-server` option. See [Section 2.9.2, “Typical configure Options”](#).

When you link your program with `libmysqld`, you must also include the system-specific `pthread` libraries and some libraries that the MySQL server uses. You can get the full list of libraries by executing `mysql_config --libmysqld-libs`.

The correct flags for compiling and linking a threaded program must be used, even if you do not directly call any thread functions in your code.

To compile a C program to include the necessary files to embed the MySQL server library into a compiled version of a program, use the GNU C compiler (`gcc`). The compiler will need to know where to find various files and need instructions on how to compile the program. The following example shows how a program could be compiled from the command line:

```
gcc mysql_test.c -o mysql_test -lz \  
`/usr/local/mysql/bin/mysql_config --include --libmysqld-libs`
```

Immediately following the `gcc` command is the name of the uncompiled C program file. After it, the `-o` option is given to indicate that the file name that follows is the name that the compiler is to give to the output file, the compiled program. The next line of code tells the compiler to obtain the location of the include files and libraries and other settings for the system on which it's compiled. Because of a problem with `mysql_config`, the option `-lz` (for compression) is added here. The `mysql_config` piece is contained in backticks, not single quotes.

### 17.1.3. Restrictions When Using the Embedded MySQL Server

The embedded server has the following limitations:

- No support for `ISAM` tables. (This is done mainly to make the library smaller.)
- No user-defined functions (UDFs).
- No stack trace on core dump.
- No internal RAID support. (This is not normally needed as most current operating systems support big files.)
- You cannot set this up as a master or a slave (no replication).
- Very large result sets may be unusable on low memory systems.
- You cannot connect to an embedded server from an outside process with sockets or TCP/IP. However, you can connect to an intermediate application, which in turn can connect to an embedded server on the behalf of a remote client or outside process.

Some of these limitations can be changed by editing the `mysql_embed.h` include file and recompiling MySQL.

### 17.1.4. Options with the Embedded Server

Any options that may be given with the `mysqld` server daemon, may be used with an embedded server library. Server options may be given in an array as an argument to the `mysql_server_init()`, which initializes the server. They also may be given in an option file like `my.cnf`. To specify an option file for a C program, use the `--defaults-file` option as one of the elements of the second argument of the `mysql_server_init()` function. See [Section 17.2.12.1](#), “`mysql_server_init()`”, for more information on the `mysql_server_init()` function.

Using option files can make it easier to switch between a client/server application and one where MySQL is embedded. Put common options under the `[server]` group. These are read by both MySQL versions. Client/server-specific options should go under the `[mysqld]` section. Put options

specific to the embedded MySQL server library in the [ [embedded](#) ] section. Options specific to applications go under section labeled [ [ApplicationName\\_SERVER](#) ]. See [Section 4.3.2, “Using Option Files”](#).

## 17.1.5. Embedded Server Examples

These two example programs should work without any changes on a Linux or FreeBSD system. For other operating systems, minor changes are needed, mostly with file paths. These examples are designed to give enough details for you to understand the problem, without the clutter that is a necessary part of a real application. The first example is very straightforward. The second example is a little more advanced with some error checking. The first is followed by a command-line entry for compiling the program. The second is followed by a GNUmake file that may be used for compiling instead.

### Example 1

`test1_libmysqld.c`

```
#include <stdio.h>
#include <stdlib.h>
#include <stdarg.h>
#include "mysql.h"

MYSQL *mysql;
MYSQL_RES *results;
MYSQL_ROW record;

static char *server_options[] = { "mysql_test", "--defaults-file=my.cnf", NULL };
int num_elements = sizeof(server_options)/ sizeof(char *);

static char *server_groups[] = { "libmysqld_server", "libmysqld_client", NULL };

int main(void)
{
    mysql_server_init(num_elements, server_options, server_groups);
    mysql = mysql_init(NULL);
    mysql_options(mysql, MYSQL_READ_DEFAULT_GROUP, "libmysqld_client");
    mysql_options(mysql, MYSQL_OPT_USE_EMBEDDED_CONNECTION, NULL);

    mysql_real_connect(mysql, NULL, NULL, NULL, "database1", 0, NULL, 0);

    mysql_query(mysql, "SELECT column1, column2 FROM table1");

    results = mysql_store_result(mysql);

    while((record = mysql_fetch_row(results))) {
        printf("%s - %s \n", record[0], record[1]);
    }

    mysql_free_result(results);
    mysql_close(mysql);
    mysql_server_end();

    return 0;
}
```

Here is the command line for compiling the above program:

```
gcc test1_libmysqld.c -o test1_libmysqld -lz \
`/usr/local/mysql/bin/mysql_config --include --libmysqld-libs`
```

### Example 2

To try out the example, create a `test2_libmysqld` directory at the same level as the MySQL source directory. Save the `test2_libmysqld.c` source and the [GNUmakefile](#) in the directory, and run GNU `make` from inside the `test2_libmysqld` directory.

`test2_libmysqld.c`

```
/*
```

```

* A simple example client, using the embedded MySQL server library
*/

#include <mysql.h>
#include <stdarg.h>
#include <stdio.h>
#include <stdlib.h>

MYSQL *db_connect(const char *dbname);
void db_disconnect(MYSQL *db);
void db_do_query(MYSQL *db, const char *query);

const char *server_groups[] = {
    "test2_libmysqld_SERVER", "embedded", "server", NULL
};

int
main(int argc, char **argv)
{
    MYSQL *one, *two;

    /* mysql_server_init() must be called before any other mysql
     * functions.
     *
     * You can use mysql_server_init(0, NULL, NULL), and it
     * initializes the server using groups = {
     *     "server", "embedded", NULL
     * }.
     *
     * In your $HOME/.my.cnf file, you probably want to put:
     [test2_libmysqld_SERVER]
     language = /path/to/source/of/mysql/sql/share/english
     *
     * You could, of course, modify argc and argv before passing
     * them to this function. Or you could create new ones in any
     * way you like. But all of the arguments in argv (except for
     * argv[0], which is the program name) should be valid options
     * for the MySQL server.
     *
     * If you link this client against the normal mysqlclient
     * library, this function is just a stub that does nothing.
     */
    mysql_server_init(argc, argv, (char **)server_groups);

    one = db_connect("test");
    two = db_connect(NULL);

    db_do_query(one, "SHOW TABLE STATUS");
    db_do_query(two, "SHOW DATABASES");

    mysql_close(two);
    mysql_close(one);

    /* This must be called after all other mysql functions */
    mysql_server_end();

    exit(EXIT_SUCCESS);
}

static void
die(MYSQL *db, char *fmt, ...)
{
    va_list ap;
    va_start(ap, fmt);

objects := $(patsubst %c,%o,$(sources))
targets := $(basename $(sources))

all: $(targets)

clean:
    rm -f $(targets) $(objects) *.core
```

## 17.1.6. Licensing the Embedded Server

We encourage everyone to promote free software by releasing code under the GPL or a compatible license. For those who are not able to do this, another option is to purchase a commercial license for the MySQL code from MySQL AB. For details, please see <http://www.mysql.com/company/legal/licensing/>.

## 17.2. MySQL C API

The C API code is distributed with MySQL. It is included in the `mysqlclient` library and allows C programs to access a database.

Many of the clients in the MySQL source distribution are written in C. If you are looking for examples that demonstrate how to use the C API, take a look at these clients. You can find these in the `clients` directory in the MySQL source distribution.

Most of the other client APIs (all except Connector/J and Connector/NET) use the `mysqlclient` library to communicate with the MySQL server. This means that, for example, you can take advantage of many of the same environment variables that are used by other client programs, because they are referenced from the library. See [Chapter 8, Client and Utility Programs](#), for a list of these variables.

The client has a maximum communication buffer size. The size of the buffer that is allocated initially (16KB) is automatically increased up to the maximum size (the maximum is 16MB). Because buffer sizes are increased only as demand warrants, simply increasing the default maximum limit does not in itself cause more resources to be used. This size check is mostly a check for erroneous statements and communication packets.

The communication buffer must be large enough to contain a single SQL statement (for client-to-server traffic) and one row of returned data (for server-to-client traffic). Each thread's communication buffer is dynamically enlarged to handle any query or row up to the maximum limit. For example, if you have `BLOB` values that contain up to 16MB of data, you must have a communication buffer limit of at least 16MB (in both server and client). The client's default maximum is 16MB, but the default maximum in the server is 1MB. You can increase this by changing the value of the `max_allowed_packet` parameter when the server is started. See [Section 7.5.2, "Tuning Server Parameters"](#).

The MySQL server shrinks each communication buffer to `net_buffer_length` bytes after each query. For clients, the size of the buffer associated with a connection is not decreased until the connection is closed, at which time client memory is reclaimed.

For programming with threads, see [Section 17.2.15, "How to Make a Threaded Client"](#). For creating a standalone application which includes the "server" and "client" in the same program (and does not communicate with an external MySQL server), see [Section 17.1, "libmysqld, the Embedded MySQL Server Library"](#).

### 17.2.1. C API Data types

- `MYSQL`

This structure represents a handle to one database connection. It is used for almost all MySQL functions. You should not try to make a copy of a `MYSQL` structure. There is no guarantee that such a copy will be usable.

- `MYSQL_RES`

This structure represents the result of a query that returns rows (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`). The information returned from a query is called the *result set* in the remainder of this section.

- `MYSQL_ROW`

This is a type-safe representation of one row of data. It is currently implemented as an array of counted byte strings. (You cannot treat these as null-terminated strings if field values may contain binary data, because such values may contain null bytes internally.) Rows are obtained by calling `mysql_fetch_row()`.

- `MYSQL_FIELD`

This structure contains information about a field, such as the field's name, type, and size. Its members are described in more detail here. You may obtain the `MYSQL_FIELD` structures for each field by calling `mysql_fetch_field()` repeatedly. Field values are not part of this structure; they are contained in a `MYSQL_ROW` structure.

- `MYSQL_FIELD_OFFSET`

This is a type-safe representation of an offset into a MySQL field list. (Used by `mysql_field_seek()`.) Offsets are field numbers within a row, beginning at zero.

- `my_ulonglong`

The type used for the number of rows and for `mysql_affected_rows()`, `mysql_num_rows()`, and `mysql_insert_id()`. This type provides a range of 0 to `1.84e19`.

On some systems, attempting to print a value of type `my_ulonglong` does not work. To print such a value, convert it to `unsigned long` and use a `%lu` print format. Example:

```
printf ("Number of rows: %lu\n", (unsigned long) mysql_num_rows(result));
```

- `my_bool`

A boolean type, for values that are true (non-zero) or false (zero).

The `MYSQL_FIELD` structure contains the members listed here:

- `char * name`

The name of the field, as a null-terminated string. If the field was given an alias with an `AS` clause, the value of `name` is the alias.

- `char * org_name`

The name of the field, as a null-terminated string. Aliases are ignored. This member was added in MySQL 4.1.0.

- `char * table`

The name of the table containing this field, if it isn't a calculated field. For calculated fields, the `table` value is an empty string. If the table was given an alias with an `AS` clause, the value of `table` is the alias.

- `char * org_table`

The name of the table, as a null-terminated string. Aliases are ignored. This member was added in MySQL 4.1.0.

- `char * db`

The name of the database that the field comes from, as a null-terminated string. If the field is a calculated field, `db` is an empty string. This member was added in MySQL 4.1.0.

- `char * catalog`

The catalog name. This value is always `"def"`. This member was added in MySQL 4.1.1.

- `char * def`

The default value of this field, as a null-terminated string. This is set only if you use `mysql_list_fields()`.

- `unsigned long length`

The width of the field, as specified in the table definition.

- `unsigned long max_length`

The maximum width of the field for the result set (the length of the longest field value for the rows actually in the result set). If you use `mysql_store_result()` or `mysql_list_fields()`, this contains the maximum length for the field. If you use `mysql_use_result()`, the value of this variable is zero.

- `unsigned int name_length`

The length of `name`. This member was added in MySQL 4.1.0.

- `unsigned int org_name_length`

The length of `org_name`. This member was added in MySQL 4.1.0.

- `unsigned int table_length`

The length of `table`. This member was added in MySQL 4.1.0.

- `unsigned int org_table_length`

The length of `org_table`. This member was added in MySQL 4.1.0.

- `unsigned int db_length`

The length of `db`. This member was added in MySQL 4.1.0.

- `unsigned int catalog_length`

The length of `catalog`. This member was added in MySQL 4.1.1.

- `unsigned int def_length`

The length of `def`. This member was added in MySQL 4.1.0.

- `unsigned int flags`

Different bit-flags for the field. The `flags` value may have zero or more of the following bits set:

Flag Value	Flag Description
<code>NOT_NULL_FLAG</code>	Field can't be <code>NULL</code>
<code>PRI_KEY_FLAG</code>	Field is part of a primary key
<code>UNIQUE_KEY_FLAG</code>	Field is part of a unique key
<code>MULTIPLE_KEY_FLAG</code>	Field is part of a non-unique key
<code>UNSIGNED_FLAG</code>	Field has the <code>UNSIGNED</code> attribute
<code>ZEROFILL_FLAG</code>	Field has the <code>ZEROFILL</code> attribute
<code>BINARY_FLAG</code>	Field has the <code>BINARY</code> attribute
<code>AUTO_INCREMENT_FLAG</code>	Field has the <code>AUTO_INCREMENT</code> attribute
<code>ENUM_FLAG</code>	Field is an <code>ENUM</code> (deprecated)
<code>SET_FLAG</code>	Field is a <code>SET</code> (deprecated)
<code>BLOB_FLAG</code>	Field is a <code>BLOB</code> or <code>TEXT</code> (deprecated)
<code>TIMESTAMP_FLAG</code>	Field is a <code>TIMESTAMP</code> (deprecated)

Use of the `BLOB_FLAG`, `ENUM_FLAG`, `SET_FLAG`, and `TIMESTAMP_FLAG` flags is deprecated because they indicate the type of a field rather than an attribute of its type. It is preferable to test `field->type` against `MYSQL_TYPE_BLOB`, `MYSQL_TYPE_ENUM`, `MYSQL_TYPE_SET`, or `MYSQL_TYPE_TIMESTAMP` instead.

The following example illustrates a typical use of the `flags` value:

```
if (field->flags & NOT_NULL_FLAG)
    printf("Field can't be null\n");
```

You may use the following convenience macros to determine the boolean status of the `flags` value:

Flag Status	Description
<code>IS_NOT_NULL(flags)</code>	True if this field is defined as <code>NOT NULL</code>
<code>IS_PRI_KEY(flags)</code>	True if this field is a primary key
<code>IS_BLOB(flags)</code>	True if this field is a <code>BLOB</code> or <code>TEXT</code> (deprecated; test <code>field-&gt;type</code> instead)

- `unsigned int decimals`

The number of decimals for numeric fields.

- `unsigned int charsetnr`

The character set number for the field. This member was added in MySQL 4.1.0.

- `enum enum_field_types type`

The type of the field. The `type` value may be one of the `MYSQL_TYPE_` symbols shown in the following table. Before MySQL 4.1, the symbol names begin with `FIELD_TYPE_` rather than `MYSQL_TYPE_`. The older types still are recognized for backward compatibility.

Type Value	Type Description
<code>MYSQL_TYPE_TINY</code>	TINYINT field
<code>MYSQL_TYPE_SHORT</code>	SMALLINT field
<code>MYSQL_TYPE_LONG</code>	INTEGER field
<code>MYSQL_TYPE_INT24</code>	MEDIUMINT field
<code>MYSQL_TYPE_LONGLONG</code>	BIGINT field
<code>MYSQL_TYPE_DECIMAL</code>	DECIMAL or NUMERIC field
<code>MYSQL_TYPE_FLOAT</code>	FLOAT field
<code>MYSQL_TYPE_DOUBLE</code>	DOUBLE or REAL field
<code>MYSQL_TYPE_TIMESTAMP</code>	TIMESTAMP field
<code>MYSQL_TYPE_DATE</code>	DATE field
<code>MYSQL_TYPE_TIME</code>	TIME field
<code>MYSQL_TYPE_DATETIME</code>	DATETIME field
<code>MYSQL_TYPE_YEAR</code>	YEAR field
<code>MYSQL_TYPE_STRING</code>	CHAR or BINARY field
<code>MYSQL_TYPE_VAR_STRING</code>	VARCHAR or VARBINARY field
<code>MYSQL_TYPE_BLOB</code>	BLOB or TEXT field (use <code>max_length</code> to determine the maximum length)
<code>MYSQL_TYPE_SET</code>	SET field
<code>MYSQL_TYPE_ENUM</code>	ENUM field
<code>MYSQL_TYPE_GEOMETRY</code>	Spatial field (MySQL 4.1.0 and up)
<code>MYSQL_TYPE_NULL</code>	NULL-type field
<code>MYSQL_TYPE_CHAR</code>	Deprecated; use <code>MYSQL_TYPE_TINY</code> instead

You can use the `IS_NUM()` macro to test whether a field has a numeric type. Pass the `type` value to `IS_NUM()` and it evaluates to TRUE if the field is numeric:

```
if (IS_NUM(field->type))
    printf("Field is numeric\n");
```

To distinguish between binary and non-binary data for string data types, check whether the `charsetnr` value is 63. If so, the character set is `binary`, which indicates binary rather than non-binary data. This is how to distinguish between `BINARY` and `CHAR`, `VARBINARY` and `VARCHAR`, and `BLOB` and `TEXT`.

## 17.2.2. C API Function Overview

The functions available in the C API are summarized here and described in greater detail in a later section. See [Section 17.2.3, “C API Function Descriptions”](#).

Function	Description
<code>mysql_affected_rows()</code>	Returns the number of rows changed/deleted/inserted by the last <code>UP-</code>

	DATE, DELETE, or INSERT query.
<code>mysql_autocommit()</code>	Toggles autocommit mode on/off.
<code>mysql_change_user()</code>	Changes user and database on an open connection.
<code>mysql_close()</code>	Closes a server connection.
<code>mysql_commit()</code>	Commits the transaction.
<code>mysql_connect()</code>	Connects to a MySQL server. This function is deprecated; use <code>mysql_real_connect()</code> instead.
<code>mysql_create_db()</code>	Creates a database. This function is deprecated; use the SQL statement <code>CREATE DATABASE</code> instead.
<code>mysql_data_seek()</code>	Seeks to an arbitrary row number in a query result set.
<code>mysql_debug()</code>	Does a <code>DEBUG_PUSH</code> with the given string.
<code>mysql_drop_db()</code>	Drops a database. This function is deprecated; use the SQL statement <code>DROP DATABASE</code> instead.
<code>mysql_dump_debug_info()</code>	Makes the server write debug information to the log.
<code>mysql_eof()</code>	Determines whether the last row of a result set has been read. This function is deprecated; <code>mysql_errno()</code> or <code>mysql_error()</code> may be used instead.
<code>mysql_errno()</code>	Returns the error number for the most recently invoked MySQL function.
<code>mysql_error()</code>	Returns the error message for the most recently invoked MySQL function.
<code>mysql_escape_string()</code>	Escapes special characters in a string for use in an SQL statement.
<code>mysql_fetch_field()</code>	Returns the type of the next table field.
<code>mysql_fetch_field_direct()</code>	Returns the type of a table field, given a field number.
<code>mysql_fetch_fields()</code>	Returns an array of all field structures.
<code>mysql_fetch_lengths()</code>	Returns the lengths of all columns in the current row.
<code>mysql_fetch_row()</code>	Fetches the next row from the result set.
<code>mysql_field_seek()</code>	Puts the column cursor on a specified column.
<code>mysql_field_count()</code>	Returns the number of result columns for the most recent statement.
<code>mysql_field_tell()</code>	Returns the position of the field cursor used for the last <code>mysql_fetch_field()</code> .
<code>mysql_free_result()</code>	Frees memory used by a result set.
<code>mysql_get_client_info()</code>	Returns client version information as a string.
<code>mysql_get_client_version()</code>	Returns client version information as an integer.
<code>mysql_get_host_info()</code>	Returns a string describing the connection.
<code>mysql_get_server_version()</code>	Returns version number of server as an integer (new in 4.1).
<code>mysql_get_proto_info()</code>	Returns the protocol version used by the connection.
<code>mysql_get_server_info()</code>	Returns the server version number.
<code>mysql_info()</code>	Returns information about the most recently executed query.
<code>mysql_init()</code>	Gets or initializes a <code>MYSQL</code> structure.
<code>mysql_insert_id()</code>	Returns the ID generated for an <code>AUTO_INCREMENT</code> column by the previous query.
<code>mysql_kill()</code>	Kills a given thread.
<code>mysql_library_end()</code>	Finalize MySQL C API library.

<code>mysql_library_init()</code>	Initialize MySQL C API library.
<code>mysql_list_dbs()</code>	Returns database names matching a simple regular expression.
<code>mysql_list_fields()</code>	Returns field names matching a simple regular expression.
<code>mysql_list_processes()</code>	Returns a list of the current server threads.
<code>mysql_list_tables()</code>	Returns table names matching a simple regular expression.
<code>mysql_more_results()</code>	Checks whether any more results exist.
<code>mysql_next_result()</code>	Returns/initiates the next result in multiple-statement executions.
<code>mysql_num_fields()</code>	Returns the number of columns in a result set.
<code>mysql_num_rows()</code>	Returns the number of rows in a result set.
<code>mysql_options()</code>	Sets connect options for <code>mysql_connect()</code> .
<code>mysql_ping()</code>	Checks whether the connection to the server is working, reconnecting as necessary.
<code>mysql_query()</code>	Executes an SQL query specified as a null-terminated string.
<code>mysql_real_connect()</code>	Connects to a MySQL server.
<code>mysql_real_escape_string()</code>	Escapes special characters in a string for use in an SQL statement, taking into account the current character set of the connection.
<code>mysql_real_query()</code>	Executes an SQL query specified as a counted string.
<code>mysql_refresh()</code>	Flush or reset tables and caches.
<code>mysql_reload()</code>	Tells the server to reload the grant tables.
<code>mysql_rollback()</code>	Rolls back the transaction.
<code>mysql_row_seek()</code>	Seeks to a row offset in a result set, using value returned from <code>mysql_row_tell()</code> .
<code>mysql_row_tell()</code>	Returns the row cursor position.
<code>mysql_select_db()</code>	Selects a database.
<code>mysql_server_end()</code>	Finalize embedded server library.
<code>mysql_server_init()</code>	Initialize embedded server library.
<code>mysql_set_local_infile_default()</code>	Set the <code>LOAD DATA LOCAL INFILE</code> handler callbacks to their default values.
<code>mysql_set_local_infile_handler()</code>	Install application-specific <code>LOAD DATA LOCAL INFILE</code> handler callbacks.
<code>mysql_set_server_option()</code>	Sets an option for the connection (like <code>multi-statements</code> ).
<code>mysql_sqlstate()</code>	Returns the SQLSTATE error code for the last error.
<code>mysql_shutdown()</code>	Shuts down the database server.
<code>mysql_stat()</code>	Returns the server status as a string.
<code>mysql_store_result()</code>	Retrieves a complete result set to the client.
<code>mysql_thread_id()</code>	Returns the current thread ID.
<code>mysql_thread_safe()</code>	Returns 1 if the clients are compiled as thread-safe.
<code>mysql_use_result()</code>	Initiates a row-by-row result set retrieval.
<code>mysql_warning_count()</code>	Returns the warning count for the previous SQL statement.

Application programs should use this general outline for interacting with MySQL:

1. Initialize the MySQL library by calling `mysql_library_init()`. The library can be either the

`mysqlclient` C client library or the `mysqld` embedded server library, depending on whether the application was linked with the `-libmysqlclient` or `-libmysqld` flag.

2. Initialize a connection handler by calling `mysql_init()` and connect to the server by calling `mysql_real_connect()`.
3. Issue SQL statements and process their results. (The following discussion provides more information about how to do this.)
4. Close the connection to the MySQL server by calling `mysql_close()`.
5. End use of the MySQL library by calling `mysql_library_end()`.

The purpose of calling `mysql_library_init()` and `mysql_library_end()` is to provide proper initialization and finalization of the MySQL library. For applications that are linked with the client library, they provide improved memory management. If you don't call `mysql_library_end()`, a block of memory remains allocated. (This does not increase the amount of memory used by the application, but some memory leak detectors will complain about it.) For applications that are linked with the embedded server, these calls start and stop the server.

`mysql_library_init()` and `mysql_library_end()` are available as of MySQL 4.1.10. These are actually `#define` symbols that make them equivalent to `mysql_server_init()` and `mysql_server_end()`, but the names more clearly indicate that they should be called when beginning and ending use of a MySQL library no matter whether the application uses the `mysqlclient` or `mysqld` library. For older versions of MySQL, you can call `mysql_server_init()` and `mysql_server_end()` instead.

In a non-multi-threaded environment, the call to `mysql_library_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, a race condition is possible if `mysql_library_init()` is invoked by `mysql_init()` in a multi-threaded environment: `mysql_library_init()` is not thread-safe, so it should be called prior to any other client library call.

To connect to the server, call `mysql_init()` to initialize a connection handler, then call `mysql_real_connect()` with that handler (along with other information such as the hostname, username, and password). Upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1`. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up. When you are done with the connection, call `mysql_close()` to terminate it.

While a connection is active, the client may send SQL statements to the server using `mysql_query()` or `mysql_real_query()`. The difference between the two is that `mysql_query()` expects the query to be specified as a null-terminated string whereas `mysql_real_query()` expects a counted string. If the string contains binary data (which may include null bytes), you must use `mysql_real_query()`.

For each non-`SELECT` query (for example, `INSERT`, `UPDATE`, `DELETE`), you can find out how many rows were changed (affected) by calling `mysql_affected_rows()`.

For `SELECT` queries, you retrieve the selected rows as a result set. (Note that some statements are `SELECT`-like in that they return rows. These include `SHOW`, `DESCRIBE`, and `EXPLAIN`. They should be treated the same way as `SELECT` statements.)

There are two ways for a client to process result sets. One way is to retrieve the entire result set all at once by calling `mysql_store_result()`. This function acquires from the server all the rows returned by the query and stores them in the client. The second way is for the client to initiate a row-by-row result set retrieval by calling `mysql_use_result()`. This function initializes the retrieval, but does not actually get any rows from the server.

In both cases, you access rows by calling `mysql_fetch_row()`. With `mysql_store_result()`, `mysql_fetch_row()` accesses rows that have previously been fetched from the server. With `mysql_use_result()`, `mysql_fetch_row()` actually retrieves the row from the server. Information about the size of the data in each row is available by calling `mysql_fetch_lengths()`.

After you are done with a result set, call `mysql_free_result()` to free the memory used for it.

The two retrieval mechanisms are complementary. Client programs should choose the approach that is most appropriate for their requirements. In practice, clients tend to use `mysql_store_result()` more commonly.

An advantage of `mysql_store_result()` is that because the rows have all been fetched to the client, you not only can access rows sequentially, you can move back and forth in the result set using `mysql_data_seek()` or `mysql_row_seek()` to change the current row position within the result set. You can also find out how many rows there are by calling `mysql_num_rows()`. On the other hand, the memory requirements for `mysql_store_result()` may be very high for large result sets and you are more likely to encounter out-of-memory conditions.

An advantage of `mysql_use_result()` is that the client requires less memory for the result set because it maintains only one row at a time (and because there is less allocation overhead, `mysql_use_result()` can be faster). Disadvantages are that you must process each row quickly to avoid tying up the server, you don't have random access to rows within the result set (you can only access rows sequentially), and you don't know how many rows are in the result set until you have retrieved them all. Furthermore, you **must** retrieve all the rows even if you determine in mid-retrieval that you've found the information you were looking for.

The API makes it possible for clients to respond appropriately to statements (retrieving rows only as necessary) without knowing whether the statement is a `SELECT`. You can do this by calling `mysql_store_result()` after each `mysql_query()` (or `mysql_real_query()`). If the result set call succeeds, the statement was a `SELECT` and you can read the rows. If the result set call fails, call `mysql_field_count()` to determine whether a result was actually to be expected. If `mysql_field_count()` returns zero, the statement returned no data (indicating that it was an `INSERT`, `UPDATE`, `DELETE`, and so forth), and was not expected to return rows. If `mysql_field_count()` is non-zero, the statement should have returned rows, but didn't. This indicates that the statement was a `SELECT` that failed. See the description for `mysql_field_count()` for an example of how this can be done.

Both `mysql_store_result()` and `mysql_use_result()` allow you to obtain information about the fields that make up the result set (the number of fields, their names and types, and so forth). You can access field information sequentially within the row by calling `mysql_fetch_field()` repeatedly, or by field number within the row by calling `mysql_fetch_field_direct()`. The current field cursor position may be changed by calling `mysql_field_seek()`. Setting the field cursor affects subsequent calls to `mysql_fetch_field()`. You can also get information for fields all at once by calling `mysql_fetch_fields()`.

For detecting and reporting errors, MySQL provides access to error information by means of the `mysql_errno()` and `mysql_error()` functions. These return the error code or error message for the most recently invoked function that can succeed or fail, allowing you to determine when an error occurred and what it was.

### 17.2.3. C API Function Descriptions

In the descriptions here, a parameter or return value of `NULL` means `NULL` in the sense of the C programming language, not a MySQL `NULL` value.

Functions that return a value generally return a pointer or an integer. Unless specified otherwise, functions returning a pointer return a non-`NULL` value to indicate success or a `NULL` value to indicate an error, and functions returning an integer return zero to indicate success or non-zero to indicate an error.

Note that “non-zero” means just that. Unless the function description says otherwise, do not test against a value other than zero:

```
if (result)                /* correct */
    ... error ...

if (result < 0)            /* incorrect */
    ... error ...

if (result == -1)         /* incorrect */
    ... error ...
```

When a function returns an error, the **Errors** subsection of the function description lists the possible types of errors. You can find out which of these occurred by calling `mysql_errno()`. A string representation of the error may be obtained by calling `mysql_error()`.

### 17.2.3.1. `mysql_affected_rows()`

```
my_ulonglong mysql_affected_rows(MYSQL *mysql)
```

#### Description

Returns the number of rows changed by the last `UPDATE`, deleted by the last `DELETE` or inserted by the last `INSERT` statement. May be called immediately after `mysql_query()` for `UPDATE`, `DELETE`, or `INSERT` statements. For `SELECT` statements, `mysql_affected_rows()` works like `mysql_num_rows()`.

#### Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE` statement, no rows matched the `WHERE` clause in the query or that no query has yet been executed. -1 indicates that the query returned an error or that, for a `SELECT` query, `mysql_affected_rows()` was called prior to calling `mysql_store_result()`. Because `mysql_affected_rows()` returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

#### Errors

None.

#### Example

```
mysql_query(&mysql, "UPDATE products SET cost=cost*1.25 WHERE group=10");
printf("%ld products updated", (long) mysql_affected_rows(&mysql));
```

If you specify the flag `CLIENT_FOUND_ROWS` when connecting to `mysqld`, `mysql_affected_rows()` returns the number of rows matched by the `WHERE` statement for `UPDATE` statements. Otherwise, it returns the number of rows actually changed.

Note that when you use a `REPLACE` command, `mysql_affected_rows()` returns 2 if the new row replaced an old row, because in this case, one row was inserted after the duplicate was deleted.

If you use `INSERT ... ON DUPLICATE KEY UPDATE` to insert a row, `mysql_affected_rows()` returns 1 if the row is inserted as a new row and 2 if an existing row is updated.

### 17.2.3.2. `mysql_autocommit()`

```
my_bool mysql_autocommit(MYSQL *mysql, my_bool mode)
```

**Description**

Sets autocommit mode on if `mode` is 1, off if `mode` is 0.

This function was added in MySQL 4.1.0.

**Return Values**

Zero if successful. Non-zero if an error occurred.

**Errors**

None.

### 17.2.3.3. `mysql_change_user()`

```
my_bool mysql_change_user(MYSQL *mysql, const char *user, const char
*password, const char *db)
```

**Description**

Changes the user and causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

This function was introduced in MySQL 3.23.3.

`mysql_change_user()` fails if the connected user cannot be authenticated or doesn't have permission to use the database. In this case, the user and database are not changed.

The `db` parameter may be set to `NULL` if you don't want to have a default database.

Starting from MySQL 4.0.6 this command always performs a `ROLLBACK` of any active transactions, closes all temporary tables, unlocks all locked tables and resets the state as if one had done a new connect. This happens even if the user didn't change.

**Return Values**

Zero for success. Non-zero if an error occurred.

**Errors**

The same that you can get from `mysql_real_connect()`.

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`

An unknown error occurred.

- `ER_UNKNOWN_COM_ERROR`

The MySQL server doesn't implement this command (probably an old server).

- `ER_ACCESS_DENIED_ERROR`

The user or password was wrong.

- `ER_BAD_DB_ERROR`

The database didn't exist.

- `ER_DBACCESS_DENIED_ERROR`

The user did not have access rights to the database.

- `ER_WRONG_DB_NAME`

The database name was too long.

#### Example

```
if (mysql_change_user(&mysql, "user", "password", "new_database"))
{
    fprintf(stderr, "Failed to change user. Error: %s\n",
            mysql_error(&mysql));
}
```

### 17.2.3.4. `mysql_character_set_name()`

```
const char *mysql_character_set_name(MYSQL *mysql)
```

#### Description

Returns the default character set for the current connection.

#### Return Values

The default character set

#### Errors

None.

### 17.2.3.5. `mysql_close()`

```
void mysql_close(MYSQL *mysql)
```

#### Description

Closes a previously opened connection. `mysql_close()` also deallocates the connection handle pointed to by `mysql` if the handle was allocated automatically by `mysql_init()` or `mysql_connect()`.

#### Return Values

None.

**Errors**

None.

### 17.2.3.6. `mysql_commit()`

```
my_bool mysql_commit(MYSQL *mysql)
```

**Description**

Commits the current transaction.

This function was added in MySQL 4.1.0.

**Return Values**

Zero if successful. Non-zero if an error occurred.

**Errors**

None.

### 17.2.3.7. `mysql_connect()`

```
MYSQL *mysql_connect(MYSQL *mysql, const char *host, const char *user,  
const char *passwd)
```

**Description**

This function is deprecated. It is preferable to use `mysql_real_connect()` instead.

`mysql_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_connect()` must complete successfully before you can execute any of the other API functions, with the exception of `mysql_get_client_info()`.

The meanings of the parameters are the same as for the corresponding parameters for `mysql_real_connect()` with the difference that the connection parameter may be `NULL`. In this case, the C API allocates memory for the connection structure automatically and frees it when you call `mysql_close()`. The disadvantage of this approach is that you can't retrieve an error message if the connection fails. (To get error information from `mysql_errno()` or `mysql_error()`, you must provide a valid `MYSQL` pointer.)

**Return Values**

Same as for `mysql_real_connect()`.

**Errors**

Same as for `mysql_real_connect()`.

### 17.2.3.8. `mysql_create_db()`

```
int mysql_create_db(MYSQL *mysql, const char *db)
```

**Description**

Creates the database named by the `db` parameter.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `CREATE DATABASE` statement instead.

### Return Values

Zero if the database was created successfully. Non-zero if an error occurred.

### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### Example

```
if(mysql_create_db(&mysql, "my_database"))
{
    fprintf(stderr, "Failed to create new database. Error: %s\n",
            mysql_error(&mysql));
}
```

## 17.2.3.9. `mysql_data_seek()`

```
void mysql_data_seek(MYSQL_RES *result, my_ulonglong offset)
```

### Description

Seeks to an arbitrary row in a query result set. The `offset` value is a row number and should be in the range from 0 to `mysql_num_rows(result)-1`.

This function requires that the result set structure contains the entire result of the query, so `mysql_data_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

### Return Values

None.

### Errors

None.

## 17.2.3.10. `mysql_debug()`

```
void mysql_debug(const char *debug)
```

**Description**

Does a `DEBUG_PUSH` with the given string. `mysql_debug()` uses the Fred Fish debug library. To use this function, you must compile the client library to support debugging. See [Section E.1, “Debugging a MySQL Server”](#), and [Section E.2, “Debugging a MySQL Client”](#).

**Return Values**

None.

**Errors**

None.

**Example**

The call shown here causes the client library to generate a trace file in `/tmp/client.trace` on the client machine:

```
mysql_debug("d:t:O,/tmp/client.trace");
```

### 17.2.3.11. `mysql_drop_db()`

```
int mysql_drop_db(MYSQL *mysql, const char *db)
```

**Description**

Drops the database named by the `db` parameter.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `DROP DATABASE` statement instead.

**Return Values**

Zero if the database was dropped successfully. Non-zero if an error occurred.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

**Example**

```
if(mysql_drop_db(&mysql, "my_database"))
    fprintf(stderr, "Failed to drop the database: Error: %s\n",
            mysql_error(&mysql));
```

### 17.2.3.12. `mysql_dump_debug_info()`

```
int mysql_dump_debug_info(MYSQL *mysql)
```

#### Description

Instructs the server to write some debug information to the log. For this to work, the connected user must have the `SUPER` privilege.

#### Return Values

Zero if the command was successful. Non-zero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### 17.2.3.13. `mysql_eof()`

```
my_bool mysql_eof(MYSQL_RES *result)
```

#### Description

This function is deprecated. `mysql_errno()` or `mysql_error()` may be used instead.

`mysql_eof()` determines whether the last row of a result set has been read.

If you acquire a result set from a successful call to `mysql_store_result()`, the client receives the entire set in one operation. In this case, a `NULL` return from `mysql_fetch_row()` always means the end of the result set has been reached and it is unnecessary to call `mysql_eof()`. When used with `mysql_store_result()`, `mysql_eof()` always returns true.

On the other hand, if you use `mysql_use_result()` to initiate a result set retrieval, the rows of the set are obtained from the server one by one as you call `mysql_fetch_row()` repeatedly. Because an error may occur on the connection during this process, a `NULL` return value from `mysql_fetch_row()` does not necessarily mean the end of the result set was reached normally. In this case, you can use `mysql_eof()` to determine what happened. `mysql_eof()` returns a non-zero value if the end of the result set was reached and zero if an error occurred.

Historically, `mysql_eof()` predates the standard MySQL error functions `mysql_errno()` and `mysql_error()`. Because those error functions provide the same information, their use is preferred over `mysql_eof()`, which is deprecated. (In fact, they provide more information, because `mysql_eof()` returns only a boolean value whereas the error functions indicate a reason for the error when one occurs.)

### Return Values

Zero if no error occurred. Non-zero if the end of the result set has been reached.

### Errors

None.

### Example

The following example shows how you might use `mysql_eof()`:

```
mysql_query(&mysql, "SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(!mysql_eof(result)) // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

However, you can achieve the same effect with the standard MySQL error functions:

```
mysql_query(&mysql, "SELECT * FROM some_table");
result = mysql_use_result(&mysql);
while((row = mysql_fetch_row(result)))
{
    // do something with data
}
if(mysql_errno(&mysql)) // mysql_fetch_row() failed due to an error
{
    fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
}
```

## 17.2.3.14. `mysql_errno()`

```
unsigned int mysql_errno(MYSQL *mysql)
```

### Description

For the connection specified by `mysql`, `mysql_errno()` returns the error code for the most recently invoked API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix B, Error Codes and Messages](#).

Note that some functions like `mysql_fetch_row()` don't set `mysql_errno()` if they succeed.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_errno()` if they succeed.

MySQL-specific error numbers returned by `mysql_errno()` differ from SQLSTATE values returned by `mysql_sqlstate()`. For example, the `mysql` client program displays errors using the following format, where 1146 is the `mysql_errno()` value and '42S02' is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

### Return Values

An error code value for the last `mysql_xxx()` call, if it failed. zero means no error occurred.

### Errors

None.

## 17.2.3.15. `mysql_error()`

```
const char *mysql_error(MYSQL *mysql)
```

### Description

For the connection specified by `mysql`, `mysql_error()` returns a null-terminated string containing the error message for the most recently invoked API function that failed. If a function didn't fail, the return value of `mysql_error()` may be the previous error or an empty string to indicate no error.

A rule of thumb is that all functions that have to ask the server for information reset `mysql_error()` if they succeed.

For functions that reset `mysql_errno()`, the following two tests are equivalent:

```
if(mysql_errno(&mysql))
{
    // an error occurred
}

if(mysql_error(&mysql)[0] != '\0')
{
    // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages. See [Section 5.10.2, “Setting the Error Message Language”](#).

### Return Values

A null-terminated character string that describes the error. An empty string if no error occurred.

### Errors

None.

## 17.2.3.16. `mysql_escape_string()`

You should use `mysql_real_escape_string()` instead!

This function is identical to `mysql_real_escape_string()` except that `mysql_real_escape_string()` takes a connection handler as its first argument and escapes the string according to the current character set. `mysql_escape_string()` does not take a connection argument and does not respect the current character set.

## 17.2.3.17. `mysql_fetch_field()`

```
MYSQL_FIELD *mysql_fetch_field(MYSQL_RES *result)
```

### Description

Returns the definition of one column of a result set as a `MYSQL_FIELD` structure. Call this function repeatedly to retrieve information about all columns in the result set. `mysql_fetch_field()` returns `NULL` when no more fields are left.

`mysql_fetch_field()` is reset to return information about the first field each time you execute a new `SELECT` query. The field returned by `mysql_fetch_field()` is also affected by calls to `mysql_field_seek()`.

If you've called `mysql_query()` to perform a `SELECT` on a table but have not called `mysql_store_result()`, MySQL returns the default blob length (8KB) if you call `mysql_fetch_field()` to ask for the length of a `BLOB` field. (The 8KB size is chosen because MySQL doesn't know the maximum length for the `BLOB`. This should be made configurable sometime.) Once you've retrieved the result set, `field->max_length` contains the length of the largest value for this column in the specific query.

### Return Values

The `MYSQL_FIELD` structure for the current column. `NULL` if no columns are left.

### Errors

None.

### Example

```
MYSQL_FIELD *field;

while((field = mysql_fetch_field(result)))
{
    printf("field name %s\n", field->name);
}
```

## 17.2.3.18. `mysql_fetch_field_direct()`

```
MYSQL_FIELD *mysql_fetch_field_direct(MYSQL_RES *result, unsigned int
fieldnr)
```

### Description

Given a field number `fieldnr` for a column within a result set, returns that column's field definition as a `MYSQL_FIELD` structure. You may use this function to retrieve the definition for an arbitrary column. The value of `fieldnr` should be in the range from 0 to `mysql_num_fields(result)-1`.

### Return Values

The `MYSQL_FIELD` structure for the specified column.

### Errors

None.

### Example

```
unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *field;

num_fields = mysql_num_fields(result);
for(i = 0; i < num_fields; i++)
{
```

```

    field = mysql_fetch_field_direct(result, i);
    printf("Field %u is %s\n", i, field->name);
}

```

### 17.2.3.19. `mysql_fetch_fields()`

```
MYSQL_FIELD *mysql_fetch_fields(MYSQL_RES *result)
```

#### Description

Returns an array of all `MYSQL_FIELD` structures for a result set. Each structure provides the field definition for one column of the result set.

#### Return Values

An array of `MYSQL_FIELD` structures for all columns of a result set.

#### Errors

None.

#### Example

```

unsigned int num_fields;
unsigned int i;
MYSQL_FIELD *fields;

num_fields = mysql_num_fields(result);
fields = mysql_fetch_fields(result);
for(i = 0; i < num_fields; i++)
{
    printf("Field %u is %s\n", i, fields[i].name);
}

```

### 17.2.3.20. `mysql_fetch_lengths()`

```
unsigned long *mysql_fetch_lengths(MYSQL_RES *result)
```

#### Description

Returns the lengths of the columns of the current row within a result set. If you plan to copy field values, this length information is also useful for optimization, because you can avoid calling `strlen()`. In addition, if the result set contains binary data, you **must** use this function to determine the size of the data, because `strlen()` returns incorrect results for any field containing null characters.

The length for empty columns and for columns containing `NULL` values is zero. To see how to distinguish these two cases, see the description for `mysql_fetch_row()`.

#### Return Values

An array of unsigned long integers representing the size of each column (not including any terminating null characters). `NULL` if an error occurred.

#### Errors

`mysql_fetch_lengths()` is valid only for the current row of the result set. It returns `NULL` if you call it before calling `mysql_fetch_row()` or after retrieving all rows in the result.

#### Example

```
MYSQL_ROW row;
```

```

unsigned long *lengths;
unsigned int num_fields;
unsigned int i;

row = mysql_fetch_row(result);
if (row)
{
    num_fields = mysql_num_fields(result);
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)
    {
        printf("Column %u is %lu bytes in length.\n", i, lengths[i]);
    }
}

```

### 17.2.3.21. `mysql_fetch_row()`

`MYSQL_ROW mysql_fetch_row(MYSQL_RES *result)`

#### Description

Retrieves the next row of a result set. When used after `mysql_store_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve. When used after `mysql_use_result()`, `mysql_fetch_row()` returns `NULL` when there are no more rows to retrieve or if an error occurred.

The number of values in the row is given by `mysql_num_fields(result)`. If `row` holds the return value from a call to `mysql_fetch_row()`, pointers to the values are accessed as `row[0]` to `row[mysql_num_fields(result)-1]`. `NULL` values in the row are indicated by `NULL` pointers.

The lengths of the field values in the row may be obtained by calling `mysql_fetch_lengths()`. Empty fields and fields containing `NULL` both have length 0; you can distinguish these by checking the pointer for the field value. If the pointer is `NULL`, the field is `NULL`; otherwise, the field is empty.

#### Return Values

A `MYSQL_ROW` structure for the next row. `NULL` if there are no more rows to retrieve or if an error occurred.

#### Errors

Note that error is not reset between calls to `mysql_fetch_row()`

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

#### Example

```

MYSQL_ROW row;
unsigned int num_fields;
unsigned int i;

num_fields = mysql_num_fields(result);
while ((row = mysql_fetch_row(result)))
{
    unsigned long *lengths;
    lengths = mysql_fetch_lengths(result);
    for(i = 0; i < num_fields; i++)

```

```

{
    printf("[%.*s] ", (int) lengths[i], row[i] ? row[i] : "NULL");
}
printf("\n");
}

```

### 17.2.3.22. `mysql_field_count()`

```
unsigned int mysql_field_count(MYSQL *mysql)
```

If you are using a version of MySQL earlier than 3.22.24, you should use `unsigned int mysql_num_fields(MYSQL *mysql)` instead.

#### Description

Returns the number of columns for the most recent query on the connection.

The normal use of this function is when `mysql_store_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a non-empty result. This allows the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may be done.

See [Section 17.2.13.1, “Why `mysql\_store\_result\(\)` Sometimes Returns `NULL` After `mysql\_query\(\)` Returns Success”](#).

#### Return Values

An unsigned integer representing the number of columns in a result set.

#### Errors

None.

#### Example

```

MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else // mysql_store_result() returned nothing; should it have?
    {
        if(mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
        else // mysql_store_result() should have returned data
        {
            fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
    }
}

```

An alternative is to replace the `mysql_field_count(&mysql)` call with `mysql_errno(&mysql)`. In this case, you are checking directly for an error from `mysql_store_result()` rather than inferring from the value of `mysql_field_count()` whether the statement was a `SELECT`.

### 17.2.3.23. `mysql_field_seek()`

```
MYSQL_FIELD_OFFSET mysql_field_seek(MYSQL_RES *result,  
MYSQL_FIELD_OFFSET offset)
```

#### Description

Sets the field cursor to the given offset. The next call to `mysql_fetch_field()` retrieves the field definition of the column associated with that offset.

To seek to the beginning of a row, pass an `offset` value of zero.

#### Return Values

The previous value of the field cursor.

#### Errors

None.

### 17.2.3.24. `mysql_field_tell()`

```
MYSQL_FIELD_OFFSET mysql_field_tell(MYSQL_RES *result)
```

#### Description

Returns the position of the field cursor used for the last `mysql_fetch_field()`. This value can be used as an argument to `mysql_field_seek()`.

#### Return Values

The current offset of the field cursor.

#### Errors

None.

### 17.2.3.25. `mysql_free_result()`

```
void mysql_free_result(MYSQL_RES *result)
```

#### Description

Frees the memory allocated for a result set by `mysql_store_result()`, `mysql_use_result()`, `mysql_list_dbs()`, and so forth. When you are done with a result set, you must free the memory it uses by calling `mysql_free_result()`.

Do not attempt to access a result set after freeing it.

#### Return Values

None.

**Errors**

None.

**17.2.3.26. `mysql_get_client_info()`**

```
const char *mysql_get_client_info(void)
```

**Description**

Returns a string that represents the client library version.

**Return Values**

A character string that represents the MySQL client library version.

**Errors**

None.

**17.2.3.27. `mysql_get_client_version()`**

```
unsigned long mysql_get_client_version(void)
```

**Description**

Returns an integer that represents the client library version. The value has the format `XYZZ` where `X` is the major version, `YY` is the release level, and `ZZ` is the version number within the release level. For example, a value of `40102` represents a client library version of `4.1.2`.

This function was added in MySQL 4.0.16.

**Return Values**

An integer that represents the MySQL client library version.

**Errors**

None.

**17.2.3.28. `mysql_get_host_info()`**

```
const char *mysql_get_host_info(MYSQL *mysql)
```

**Description**

Returns a string describing the type of connection in use, including the server hostname.

**Return Values**

A character string representing the server hostname and the connection type.

**Errors**

None.

**17.2.3.29. `mysql_get_proto_info()`**

```
unsigned int mysql_get_proto_info(MYSQL *mysql)
```

**Description**

Returns the protocol version used by current connection.

**Return Values**

An unsigned integer representing the protocol version used by the current connection.

**Errors**

None.

### 17.2.3.30. `mysql_get_server_info()`

```
const char *mysql_get_server_info(MYSQL *mysql)
```

**Description**

Returns a string that represents the server version number.

**Return Values**

A character string that represents the server version number.

**Errors**

None.

### 17.2.3.31. `mysql_get_server_version()`

```
unsigned long mysql_get_server_version(MYSQL *mysql)
```

**Description**

Returns the version number of the server as an integer.

This function was added in MySQL 4.1.0.

**Return Values**

A number that represents the MySQL server version in this format:

```
major_version*10000 + minor_version *100 + sub_version
```

For example, 4.1.2 is returned as 40102.

This function is useful in client programs for quickly determining whether some version-specific server capability exists.

**Errors**

None.

### 17.2.3.32. `mysql_hex_string()`

```
unsigned long mysql_hex_string(char *to, const char *from, unsigned
```

---

long length)

### Description

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 9.1.1, “Strings”](#).

The string in `from` is encoded to hexadecimal format, with each character encoded as two hexadecimal digits. The result is placed in `to` and a terminating null byte is appended.

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. When `mysql_hex_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

The return value can be placed into an SQL statement using either `0xvalue` or `X'value'` format. However, the return value does not include the `0x` or `X'...`. The caller must supply whichever of those is desired.

`mysql_hex_string()` was added in MySQL 4.0.23 and 4.1.8.

### Example

```
char query[1000],*end;

end = strmov(query,"INSERT INTO test_table values(");
end = strmov(end,"0x");
end += mysql_hex_string(end,"What's this",11);
end = strmov(end,"0x");
end += mysql_hex_string(end,"binary data: \0\r\n",16);
*end++ = '\0';

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\n",
            mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

### Return Values

The length of the value placed into `to`, not including the terminating null character.

### Errors

None.

## 17.2.3.33. `mysql_info()`

```
const char *mysql_info(MYSQL *mysql)
```

### Description

Retrieves a string providing information about the most recently executed query, but only for the statements listed here. For other statements, `mysql_info()` returns `NULL`. The format of the string varies depending on the type of query, as described here. The numbers are illustrative only; the string contains values appropriate for the query.

- `INSERT INTO ... SELECT ...`

String format: Records: 100 Duplicates: 0 Warnings: 0

- `INSERT INTO ... VALUES (...),(...),(...)`...

String format: Records: 3 Duplicates: 0 Warnings: 0

- `LOAD DATA INFILE ...`

String format: Records: 1 Deleted: 0 Skipped: 0 Warnings: 0

- `ALTER TABLE`

String format: Records: 3 Duplicates: 0 Warnings: 0

- `UPDATE`

String format: Rows matched: 40 Changed: 40 Warnings: 0

Note that `mysql_info()` returns a non-NULL value for `INSERT ... VALUES` only for the multiple-row form of the statement (that is, only if multiple value lists are specified).

#### Return Values

A character string representing additional information about the most recently executed query. `NULL` if no information is available for the query.

#### Errors

None.

### 17.2.3.34. `mysql_init()`

```
MYSQL *mysql_init(MYSQL *mysql)
```

#### Description

Allocates or initializes a `MYSQL` object suitable for `mysql_real_connect()`. If `mysql` is a `NULL` pointer, the function allocates, initializes, and returns a new object. Otherwise, the object is initialized and the address of the object is returned. If `mysql_init()` allocates a new object, it is freed when `mysql_close()` is called to close the connection.

#### Return Values

An initialized `MYSQL*` handle. `NULL` if there was insufficient memory to allocate a new object.

#### Errors

In case of insufficient memory, `NULL` is returned.

### 17.2.3.35. `mysql_insert_id()`

```
my_ulonglong mysql_insert_id(MYSQL *mysql)
```

#### Description

Returns the value generated for an `AUTO_INCREMENT` column by the previous `INSERT` or `UPDATE` statement. Use this function after you have performed an `INSERT` statement into a table that contains an

`AUTO_INCREMENT` field.

More precisely, `mysql_insert_id()` is updated under these conditions:

- `INSERT` statements that store a value into an `AUTO_INCREMENT` column. This is true whether the value is automatically generated by storing the special values `NULL` or `0` into the column, or is an explicit non-special value.
- In the case of a multiple-row `INSERT` statement, `mysql_insert_id()` returns the **first** automatically generated `AUTO_INCREMENT` value; if no such value is generated, it returns the last **last** explicit value inserted into the `AUTO_INCREMENT` column.
- `INSERT` statements that generate an `AUTO_INCREMENT` value by inserting `LAST_INSERT_ID(expr)` into any column.
- `INSERT` statements that generate an `AUTO_INCREMENT` value by updating any column to `LAST_INSERT_ID(expr)`.
- The value of `mysql_insert_id()` is not affected by statements such as `SELECT` that return a result set.
- If the previous statement returned an error, the value of `mysql_insert_id()` is undefined.

Note that `mysql_insert_id()` returns `0` if the previous statement does not use an `AUTO_INCREMENT` value. If you need to save the value for later, be sure to call `mysql_insert_id()` immediately after the statement that generates the value.

The value of `mysql_insert_id()` is affected only by statements issued within the current client connection. It is not affected by statements issued by other clients.

See [Section 12.9.3, “Information Functions”](#).

Also note that the value of the SQL `LAST_INSERT_ID()` function always contains the most recently generated `AUTO_INCREMENT` value, and is not reset between statements because the value of that function is maintained in the server. Another difference is that `LAST_INSERT_ID()` is not updated if you set an `AUTO_INCREMENT` column to a specific non-special value.

The reason for the difference between `LAST_INSERT_ID()` and `mysql_insert_id()` is that `LAST_INSERT_ID()` is made easy to use in scripts while `mysql_insert_id()` tries to provide a little more exact information of what happens to the `AUTO_INCREMENT` column.

### Return Values

Described in the preceding discussion.

### Errors

None.

## 17.2.3.36. `mysql_kill()`

```
int mysql_kill(MYSQL *mysql, unsigned long pid)
```

### Description

Asks the server to kill the thread specified by `pid`.

### Return Values

Zero for success. Non-zero if an error occurred.

### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### 17.2.3.37. `mysql_library_end()`

```
void mysql_library_end(void)
```

#### Description

This is a synonym for the `mysql_server_end()` function. It was added in MySQL 4.1.10.

See [Section 17.2.2, “C API Function Overview”](#), for usage information.

### 17.2.3.38. `mysql_library_init()`

```
int mysql_library_init(int argc, char **argv, char **groups)
```

#### Description

This is a synonym for the `mysql_server_init()` function. It was added in MySQL 4.1.10.

See [Section 17.2.2, “C API Function Overview”](#), for usage information.

### 17.2.3.39. `mysql_list_dbs()`

```
MYSQL_RES *mysql_list_dbs(MYSQL *mysql, const char *wild)
```

#### Description

Returns a result set consisting of database names on the server that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters ‘%’ or ‘\_’, or may be a `NULL` pointer to match all databases. Calling `mysql_list_dbs()` is similar to executing the query `SHOW databases [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

#### Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

**17.2.3.40. `mysql_list_fields()`**

```
MYSQL_RES *mysql_list_fields(MYSQL *mysql, const char *table, const char *wild)
```

**Description**

Returns a result set consisting of field names in the given table that match the simple regular expression specified by the *wild* parameter. *wild* may contain the wildcard characters '%' or '\_', or may be a `NULL` pointer to match all fields. Calling `mysql_list_fields()` is similar to executing the query `SHOW COLUMNS FROM tbl_name [LIKE wild]`.

Note that it's recommended that you use `SHOW COLUMNS FROM tbl_name` instead of `mysql_list_fields()`.

You must free the result set with `mysql_free_result()`.

**Return Values**

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 17.2.3.41. `mysql_list_processes()`

```
MYSQL_RES *mysql_list_processes(MYSQL *mysql)
```

#### Description

Returns a result set describing the current server threads. This is the same kind of information as that reported by `mysqladmin processlist` or a `SHOW PROCESSLIST` query.

You must free the result set with `mysql_free_result()`.

#### Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 17.2.3.42. `mysql_list_tables()`

```
MYSQL_RES *mysql_list_tables(MYSQL *mysql, const char *wild)
```

#### Description

Returns a result set consisting of table names in the current database that match the simple regular expression specified by the `wild` parameter. `wild` may contain the wildcard characters `'%'` or `'_'`, or may be a `NULL` pointer to match all tables. Calling `mysql_list_tables()` is similar to executing the query `SHOW tables [LIKE wild]`.

You must free the result set with `mysql_free_result()`.

#### Return Values

A `MYSQL_RES` result set for success. `NULL` if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### 17.2.3.43. `mysql_more_results()`

```
my_bool mysql_more_results(MYSQL *mysql)
```

#### Description

Returns true if more results exist from the currently executed query, and the application must call `mysql_next_result()` to fetch the results.

This function was added in MySQL 4.1.0.

#### Return Values

`TRUE` (1) if more results exist. `FALSE` (0) if no more results exist.

In most cases, you can call `mysql_next_result()` instead to test whether more results exist and initiate retrieval if so.

See [Section 17.2.9, “C API Handling of Multiple Statement Execution”](#), and [Section 17.2.3.44, “`mysql\_next\_result\(\)`”](#).

#### Errors

None.

### 17.2.3.44. `mysql_next_result()`

```
int mysql_next_result(MYSQL *mysql)
```

#### Description

If more query results exist, `mysql_next_result()` reads the next query results and returns the status back to application.

You must call `mysql_free_result()` for the preceding query if it returned a result set.

After calling `mysql_next_result()` the state of the connection is as if you had called `mysql_real_query()` or `mysql_query()` for the next query. This means that you can call `mysql_store_result()`, `mysql_warning_count()`, `mysql_affected_rows()`, and so forth.

If `mysql_next_result()` returns an error, no other statements are executed and there are no more

results to fetch.

For an example that shows how to use `mysql_next_result()`, see [Section 17.2.9, “C API Handling of Multiple Statement Execution”](#). See [Section 17.2.9, “C API Handling of Multiple Statement Execution”](#).

This function was added in MySQL 4.1.0.

### Return Values

Return Value	Description
0	Successful and there are more results
-1	Successful and there are no more results
>0	An error occurred

### Errors

- [CR\\_COMMANDS\\_OUT\\_OF\\_SYNC](#)  
Commands were executed in an improper order. For example if you didn't call `mysql_use_result()` for a previous result set.
- [CR\\_SERVER\\_GONE\\_ERROR](#)  
The MySQL server has gone away.
- [CR\\_SERVER\\_LOST](#)  
The connection to the server was lost during the query.
- [CR\\_UNKNOWN\\_ERROR](#)  
An unknown error occurred.

### 17.2.3.45. `mysql_num_fields()`

```
unsigned int mysql_num_fields(MYSQL_RES *result)
```

Or:

```
unsigned int mysql_num_fields(MYSQL *mysql)
```

The second form doesn't work on MySQL 3.22.24 or newer. To pass a `MYSQL*` argument, you must use `unsigned int mysql_field_count(MYSQL *mysql)` instead.

#### Description

Returns the number of columns in a result set.

Note that you can get the number of columns either from a pointer to a result set or to a connection handle. You would use the connection handle if `mysql_store_result()` or `mysql_use_result()` returned `NULL` (and thus you have no result set pointer). In this case, you can call `mysql_field_count()` to determine whether `mysql_store_result()` should have produced a non-empty result. This allows the client program to take proper action without knowing whether the query was a `SELECT` (or `SELECT`-like) statement. The example shown here illustrates how this may

be done.

See [Section 17.2.13.1, “Why `mysql\_store\_result\(\)` Sometimes Returns NULL After `mysql\_query\(\)` Returns Success”](#).

### Return Values

An unsigned integer representing the number of columns in a result set.

### Errors

None.

### Example

```
MYSQL_RES *result;
unsigned int num_fields;
unsigned int num_rows;

if (mysql_query(&mysql, query_string))
{
    // error
}
else // query succeeded, process any data returned by it
{
    result = mysql_store_result(&mysql);
    if (result) // there are rows
    {
        num_fields = mysql_num_fields(result);
        // retrieve rows, then call mysql_free_result(result)
    }
    else // mysql_store_result() returned nothing; should it have?
    {
        if (mysql_errno(&mysql))
        {
            fprintf(stderr, "Error: %s\n", mysql_error(&mysql));
        }
        else if (mysql_field_count(&mysql) == 0)
        {
            // query does not return data
            // (it was not a SELECT)
            num_rows = mysql_affected_rows(&mysql);
        }
    }
}
```

An alternative (if you know that your query should have returned a result set) is to replace the `mysql_errno(&mysql)` call with a check whether `mysql_field_count(&mysql)` is = 0. This happens only if something went wrong.

## 17.2.3.46. `mysql_num_rows()`

```
my_ulonglong mysql_num_rows(MYSQL_RES *result)
```

### Description

Returns the number of rows in the result set.

The use of `mysql_num_rows()` depends on whether you use `mysql_store_result()` or `mysql_use_result()` to return the result set. If you use `mysql_store_result()`, `mysql_num_rows()` may be called immediately. If you use `mysql_use_result()`, `mysql_num_rows()` does not return the correct value until all the rows in the result set have been retrieved.

### Return Values

The number of rows in the result set.

**Errors**

None.

**17.2.3.47. `mysql_options()`**

```
int mysql_options(MYSQL *mysql, enum mysql_option option, const char *arg)
```

**Description**

Can be used to set extra connect options and affect behavior for a connection. This function may be called multiple times to set several options.

`mysql_options()` should be called after `mysql_init()` and before `mysql_connect()` or `mysql_real_connect()`.

The `option` argument is the option that you want to set; the `arg` argument is the value for the option. If the option is an integer, then `arg` should point to the value of the integer.

Possible option values:

Option	Argument Type	Function
<code>MYSQL_INIT_COMMAND</code>	<code>char *</code>	Command to execute when connecting to the MySQL server. Will automatically be re-executed when reconnecting.
<code>MYSQL_OPT_COMPRESS</code>	Not used	Use the compressed client/server protocol.
<code>MYSQL_OPT_CONNECT_TIMEOUT</code>	<code>unsigned int *</code>	Connect timeout in seconds.
<code>MYSQL_OPT_GUESS_CONNECTION</code>	Not used	For an application linked against <code>libmysqld</code> , this allows the library to “guess” whether to use the embedded server or a remote server. “Guess” means that if the hostname is set and is not <code>localhost</code> , it uses a remote server. This behavior is the default. <code>MYSQL_OPT_USE_EMBEDDED_CONNECTION</code> and <code>MYSQL_OPT_USE_REMOTE_CONNECTION</code> can be used to override it. This option is ignored for applications linked against <code>libmysqlclient</code> . Available starting in 4.1.1.
<code>MYSQL_OPT_LOCAL_INFILE</code>	optional pointer to <code>uint</code>	If no pointer is given or if pointer points to an <code>unsigned int != 0</code> the command <code>LOAD LOCAL INFILE</code> is enabled.
<code>MYSQL_OPT_NAMED_PIPE</code>	Not used	Use named pipes to connect to a MySQL server on NT.
<code>MYSQL_OPT_PROTOCOL</code>	<code>unsigned int *</code>	Type of protocol to use. Should be one of the enum values of <code>mysql_protocol_type</code> defined in <code>mysql.h</code> . Added in 4.1.0.

<code>MYSQL_OPT_READ_TIMEOUT</code>	<code>unsigned int *</code>	Timeout for reads from server (works currently only on Windows on TCP/IP connections). Added in 4.1.1.
<code>MYSQL_OPT_SET_CLIENT_IP</code>	<code>char *</code>	For an application linked against <code>libmysqld</code> (with <code>libmysqld</code> compiled with authentication support), this means that the user is considered to have connected from the specified IP address (specified as a string) for authentication purposes. This option is ignored for applications linked against <code>libmysqlclient</code> . Added in 4.1.1.
<code>MYSQL_OPT_USE_EMBEDDED_CONNECTION</code>	Not used	For an application linked against <code>libmysqld</code> , this forces the use of the embedded server for the connection. This option is ignored for applications linked against <code>libmysqlclient</code> . Added in 4.1.1.
<code>MYSQL_OPT_USE_REMOTE_CONNECTION</code>	Not used	For an application linked against <code>libmysqld</code> , this forces the use of a remote server for the connection. This option is ignored for applications linked against <code>libmysqlclient</code> . Added in 4.1.1.
<code>MYSQL_OPT_USE_RESULT</code>	Not used	This option is available beginning with MySQL 4.1.1, but is unused.
<code>MYSQL_OPT_WRITE_TIMEOUT</code>	<code>unsigned int *</code>	Timeout for writes to server (works currently only on Windows on TCP/IP connections). Added in 4.1.1.
<code>MYSQL_READ_DEFAULT_FILE</code>	<code>char *</code>	Read options from the named option file instead of from <code>my.cnf</code> .
<code>MYSQL_READ_DEFAULT_GROUP</code>	<code>char *</code>	Read options from the named group from <code>my.cnf</code> or the file specified with <code>MYSQL_READ_DEFAULT_FILE</code> .
<code>MYSQL_REPORT_DATA_TRUNCATION</code>	<code>my_bool *</code>	Enable or disable reporting of data truncation errors for prepared statements via <code>MYSQL_BIND.error</code> . (Default: disabled.)
<code>MYSQL_SECURE_AUTH</code>	<code>my_bool*</code>	Whether to connect to a server that does not support the improved password hashing available beginning in MySQL 4.1.1. This option was added in MySQL 4.1.1.
<code>MYSQL_SET_CHARSET_DIR</code>	<code>char*</code>	The pathname to the directory that contains character set definition files.
<code>MYSQL_SET_CHARSET_NAME</code>	<code>char*</code>	The name of the character set to use as the default character set.
<code>MYSQL_SHARED_MEMORY_BASE_NAME</code>	<code>char*</code>	Named of shared-memory object for communication to server. Should be same as the option <code>-shared-memory-base-name</code>

		used for the <code>mysqld</code> server you want to connect to. Added in 4.1.0.
--	--	---

Note that the `client` group is always read if you use `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP`.

The specified group in the option file may contain the following options:

Option	Description
<code>connect-timeout</code>	Connect timeout in seconds. On Linux this timeout is also used for waiting for the first answer from the server.
<code>compress</code>	Use the compressed client/server protocol.
<code>database</code>	Connect to this database if no database was specified in the connect command.
<code>debug</code>	Debug options.
<code>disable-local-infile</code>	Disable use of <code>LOAD DATA LOCAL</code> .
<code>host</code>	Default hostname.
<code>init-command</code>	Command to execute when connecting to MySQL server. Will automatically be re-executed when reconnecting.
<code>interactive-timeout</code>	Same as specifying <code>CLIENT_INTERACTIVE</code> to <code>mysql_real_connect()</code> . See <a href="#">Section 17.2.3.50</a> , “ <code>mysql_real_connect()</code> ”.
<code>local-infile[=(0 1)]</code>	If no argument or argument <code>!= 0</code> then enable use of <code>LOAD DATA LOCAL</code> .
<code>max_allowed_packet</code>	Max size of packet client can read from server.
<code>multi-results</code>	Allow multiple result sets from multiple-statement executions or stored procedures. Added in 4.1.1.
<code>multi-statements</code>	Allow the client to send multiple statements in a single string (separated by ‘;’). Added in 4.1.9.
<code>password</code>	Default password.
<code>pipe</code>	Use named pipes to connect to a MySQL server on NT.
<code>protocol={TCP SOCKET PIPE MEMORY}</code>	The protocol to use when connecting to the server. (Added in MySQL 4.1)
<code>port</code>	Default port number.
<code>return-found-rows</code>	Tell <code>mysql_info()</code> to return found rows instead of updated rows when using <code>UPDATE</code> .
<code>shared-memory-base-name=me</code>	Shared-memory name to use to connect to server (default is “MYSQL”). Added in MySQL 4.1.
<code>socket</code>	Default socket file.
<code>user</code>	Default user.

Note that `timeout` has been replaced by `connect-timeout`, but `timeout` still works for a while.

For more information about option files, see [Section 4.3.2](#), “Using Option Files”.

**Return Values**

Zero for success. Non-zero if you used an unknown option.

**Example**

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql,MYSQL_OPT_COMPRESS,0);
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"odbc");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr,"Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

This code requests the client to use the compressed client/server protocol and read the additional options from the `odbc` section in the `my.cnf` file.

**17.2.3.48. `mysql_ping()`**

```
int mysql_ping(MYSQL *mysql)
```

**Description**

Checks whether the connection to the server is working. If the connection has gone down, an automatic reconnection is attempted.

This function can be used by clients that remain idle for a long while, to check whether the server has closed the connection and reconnect if necessary.

**Return Values**

Zero if the connection to the server is alive. Non-zero if an error occurred. A non-zero return does not indicate whether the MySQL server itself is down; the connection might be broken for other reasons such as network problems.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

**17.2.3.49. `mysql_query()`**

```
int mysql_query(MYSQL *mysql, const char *query)
```

**Description**

Executes the SQL query pointed to by the null-terminated string `query`. Normally, the string must con-

---

sist of a single SQL statement and you should not add a terminating semicolon (;) or \g to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 17.2.9, “C API Handling of Multiple Statement Execution”](#).

`mysql_query()` cannot be used for queries that contain binary data; you should use `mysql_real_query()` instead. (Binary data may contain the '\0' character, which `mysql_query()` interprets as the end of the query string.)

If you want to know whether the query should return a result set, you can use `mysql_field_count()` to check for this. See [Section 17.2.3.22, “mysql\\_field\\_count\(\)”](#).

### Return Values

Zero if the query was successful. Non-zero if an error occurred.

### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

## 17.2.3.50. `mysql_real_connect()`

```
MYSQL *mysql_real_connect(MYSQL *mysql, const char *host, const char *user, const char *passwd, const char *db, unsigned int port, const char *unix_socket, unsigned long client_flag)
```

### Description

`mysql_real_connect()` attempts to establish a connection to a MySQL database engine running on `host`. `mysql_real_connect()` must complete successfully before you can execute any other API functions that require a valid `MYSQL` connection handle structure.

The parameters are specified as follows:

- The first parameter should be the address of an existing `MYSQL` structure. Before calling `mysql_real_connect()` you must call `mysql_init()` to initialize the `MYSQL` structure. You can change a lot of connect options with the `mysql_options()` call. See [Section 17.2.3.47, “mysql\\_options\(\)”](#).
- The value of `host` may be either a hostname or an IP address. If `host` is `NULL` or the string "localhost", a connection to the local host is assumed. If the OS supports sockets (Unix) or named pipes (Windows), they are used instead of TCP/IP to connect to the server.
- The `user` parameter contains the user's MySQL login ID. If `user` is `NULL` or the empty string "",

the current user is assumed. Under Unix, this is the current login name. Under Windows ODBC, the current username must be specified explicitly. See the MyODBC section of [Chapter 18, Connectors](#).

- The `passwd` parameter contains the password for `user`. If `passwd` is `NULL`, only entries in the `user` table for the user that have a blank (empty) password field are checked for a match. This allows the database administrator to set up the MySQL privilege system in such a way that users get different privileges depending on whether they have specified a password.

**Note:** Do not attempt to encrypt the password before calling `mysql_real_connect()`; password encryption is handled automatically by the client API.

- `db` is the database name. If `db` is not `NULL`, the connection sets the default database to this value.
- If `port` is not 0, the value is used as the port number for the TCP/IP connection. Note that the `host` parameter determines the type of the connection.
- If `unix_socket` is not `NULL`, the string specifies the socket or named pipe that should be used. Note that the `host` parameter determines the type of the connection.
- The value of `client_flag` is usually 0, but can be set to a combination of the following flags to enable certain features:

Flag Name	Flag Description
<code>CLIENT_COMPRESS</code>	Use compression protocol.
<code>CLIENT_FOUND_ROWS</code>	Return the number of found (matched) rows, not the number of changed rows.
<code>CLIENT_IGNORE_SPACE</code>	Allow spaces after function names. Makes all functions names reserved words.
<code>CLIENT_INTERACTIVE</code>	Allow <code>interactive_timeout</code> seconds (instead of <code>wait_timeout</code> seconds) of inactivity before closing the connection. The client's session <code>wait_timeout</code> variable is set to the value of the session <code>interactive_timeout</code> variable.
<code>CLIENT_LOCAL_FILES</code>	Enable <code>LOAD DATA LOCAL</code> handling.
<code>CLIENT_MULTI_STATEMENTS</code>	Tell the server that the client may send multiple statements in a single string (separated by <code>;</code> ). If this flag is not set, multiple-statement execution is disabled. See the note following this table for more information about this flag. Added in MySQL 4.1.
<code>CLIENT_MULTI_RESULTS</code>	Tell the server that the client can handle multiple result sets from multiple-statement executions or stored procedures. This is automatically set if <code>CLIENT_MULTI_STATEMENTS</code> is set. See the note following this table for more information about this flag. Added in MySQL 4.1.
<code>CLIENT_NO_SCHEMA</code>	Don't allow the <code>db_name.tbl_name.col_name</code> syntax. This is for ODBC. It causes the parser to generate an error if you use that syntax, which is useful for trapping bugs in some ODBC programs.
<code>CLIENT_ODBC</code>	The client is an ODBC client. This changes <code>mysqld</code> to be more ODBC-friendly.
<code>CLIENT_SSL</code>	Use SSL (encrypted protocol). This option should not be set by application programs; it is set internally in the client library. Instead, use <code>mysql_ssl_set()</code> before calling <code>mysql_real_connect()</code> .

If you enable `CLIENT_MULTI_STATEMENTS` or `CLIENT_MULTI_RESULTS`, you should process the result for every call to `mysql_query()` or `mysql_real_query()` by using a loop that calls

`mysql_next_result()` to determine whether there are more results. For an example, see [Section 17.2.9, “C API Handling of Multiple Statement Execution”](#).

For some parameters, it is possible to have the value taken from an option file rather than from an explicit value in the `mysql_real_connect()` call. To do this, call `mysql_options()` with the `MYSQL_READ_DEFAULT_FILE` or `MYSQL_READ_DEFAULT_GROUP` option before calling `mysql_real_connect()`. Then, in the `mysql_real_connect()` call, specify the “no-value” value for each parameter to be read from an option file:

- For `host`, specify a value of `NULL` or the empty string (`" "`).
- For `user`, specify a value of `NULL` or the empty string.
- For `passwd`, specify a value of `NULL`. (For the password, a value of the empty string in the `mysql_real_connect()` call cannot be overridden in an option file, because the empty string indicates explicitly that the MySQL account must have an empty password.)
- For `db`, specify a value of `NULL` or the empty string.
- For `port`, specify a value of 0.
- For `unix_socket`, specify a value of `NULL`.

If no value is found in an option file for a parameter, its default value is used as indicated in the descriptions given earlier in this section.

### Return Values

A `MYSQL*` connection handle if the connection was successful, `NULL` if the connection was unsuccessful. For a successful connection, the return value is the same as the value of the first parameter.

### Errors

- `CR_CONN_HOST_ERROR`  
Failed to connect to the MySQL server.
- `CR_CONNECTION_ERROR`  
Failed to connect to the local MySQL server.
- `CR_IPSOCK_ERROR`  
Failed to create an IP socket.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_SOCKET_CREATE_ERROR`  
Failed to create a Unix socket.
- `CR_UNKNOWN_HOST`  
Failed to find the IP address for the hostname.
- `CR_VERSION_ERROR`

A protocol mismatch resulted from attempting to connect to a server with a client library that uses a different protocol version. This can happen if you use a very old client library to connect to a new server that wasn't started with the `--old-protocol` option.

- `CR_NAMEDPIPEOPEN_ERROR`

Failed to create a named pipe on Windows.

- `CR_NAMEDPIPEWAIT_ERROR`

Failed to wait for a named pipe on Windows.

- `CR_NAMEDPIPESETSTATE_ERROR`

Failed to get a pipe handler on Windows.

- `CR_SERVER_LOST`

If `connect_timeout > 0` and it took longer than `connect_timeout` seconds to connect to the server or if the server died while executing the `init-command`.

### Example

```
MYSQL mysql;

mysql_init(&mysql);
mysql_options(&mysql,MYSQL_READ_DEFAULT_GROUP,"your_prog_name");
if (!mysql_real_connect(&mysql,"host","user","passwd","database",0,NULL,0))
{
    fprintf(stderr,"Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}
```

By using `mysql_options()` the MySQL library reads the `[client]` and `[your_prog_name]` sections in the `my.cnf` file which ensures that your program works, even if someone has set up MySQL in some non-standard way.

Note that upon connection, `mysql_real_connect()` sets the `reconnect` flag (part of the `MYSQL` structure) to a value of `1`. A value of `1` for this flag indicates that if a statement cannot be performed because of a lost connection, to try reconnecting to the server before giving up.

## 17.2.3.51. `mysql_real_escape_string()`

```
unsigned long mysql_real_escape_string(MYSQL *mysql, char *to, const
char *from, unsigned long length)
```

Note that `mysql` must be a valid, open connection. This is needed because the escaping depends on the character set in use by the server.

### Description

This function is used to create a legal SQL string that you can use in an SQL statement. See [Section 9.1.1, “Strings”](#).

The string in `from` is encoded to an escaped SQL string, taking into account the current character set of the connection. The result is placed in `to` and a terminating null byte is appended. Characters encoded are `NUL` (ASCII 0), `'\n'`, `'\r'`, `'\'`, `'\''`, `'\"'`, and Control-Z (see [Section 9.1, “Literal Values”](#)). (Strictly speaking, MySQL requires only that backslash and the quote character used to quote the string in the query be escaped. This function quotes the other characters to make them easier to read in log files.)

The string pointed to by `from` must be `length` bytes long. You must allocate the `to` buffer to be at least `length*2+1` bytes long. (In the worst case, each character may need to be encoded as using two bytes, and you need room for the terminating null byte.) When `mysql_real_escape_string()` returns, the contents of `to` is a null-terminated string. The return value is the length of the encoded string, not including the terminating null character.

If you need to change the character set of the connection, you should use the `mysql_set_character_set()` function rather than executing a `SET NAMES` (or `SET CHARACTER SET`) statement. `mysql_set_character_set()` works like `SET NAMES` but also affects the character set used by `mysql_real_escape_string()`, which `SET NAMES` does not.

### Example

```
char query[1000],*end;

end = strmov(query,"INSERT INTO test_table values(");
*end++ = '\\';
end += mysql_real_escape_string(&mysql, end,"What's this",11);
*end++ = '\\';
*end++ = ',';
*end++ = '\\';
end += mysql_real_escape_string(&mysql, end,"binary data: \\0\\r\\n",16);
*end++ = '\\';
*end++ = ')';

if (mysql_real_query(&mysql,query,(unsigned int) (end - query)))
{
    fprintf(stderr, "Failed to insert row, Error: %s\\n",
            mysql_error(&mysql));
}
```

The `strmov()` function used in the example is included in the `mysqlclient` library and works like `strcpy()` but returns a pointer to the terminating null of the first parameter.

### Return Values

The length of the value placed into `to`, not including the terminating null character.

### Errors

None.

## 17.2.3.52. `mysql_real_query()`

```
int mysql_real_query(MYSQL *mysql, const char *query, unsigned long
length)
```

### Description

Executes the SQL query pointed to by `query`, which should be a string `length` bytes long. Normally, the string must consist of a single SQL statement and you should not add a terminating semicolon (`;`) or `\g` to the statement. If multiple-statement execution has been enabled, the string can contain several statements separated by semicolons. See [Section 17.2.9, “C API Handling of Multiple Statement Execution”](#).

You **must** use `mysql_real_query()` rather than `mysql_query()` for queries that contain binary data, because binary data may contain the `\0` character. In addition, `mysql_real_query()` is faster than `mysql_query()` because it does not call `strlen()` on the query string.

If you want to know whether the query should return a result set, you can use `mysql_field_count()` to check for this. See [Section 17.2.3.22, “mysql\\_field\\_count\(\)”](#).

**Return Values**

Zero if the query was successful. Non-zero if an error occurred.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

**17.2.3.53. `mysql_refresh()`**

```
int mysql_refresh(MYSQL *mysql, unsigned int options)
```

**Description**

This function flushes tables or caches, or resets replication server information. The connected user must have the `RELOAD` privilege.

The `options` argument is a bit mask composed from any combination of the following values. Multiple values can be OR'ed together to perform multiple operations with a single call.

- `REFRESH_GRANT`  
Refresh the grant tables, like `FLUSH PRIVILEGES`.
- `REFRESH_LOG`  
Flush the logs, like `FLUSH LOGS`.
- `REFRESH_TABLES`  
Flush the table cache, like `FLUSH TABLES`.
- `REFRESH_HOSTS`  
Flush the host cache, like `FLUSH HOSTS`.
- `REFRESH_STATUS`  
Reset status variables, like `FLUSH STATUS`.
- `REFRESH_THREADS`  
Flush the thread cache.

- `REFRESH_SLAVE`

On a slave replication server, reset the master server information and restart the slave, like `RESET SLAVE`.

- `REFRESH_MASTER`

On a master replication server, remove the binary log files listed in the binary log index and truncate the index file, like `RESET MASTER`.

### Return Values

Zero for success. Non-zero if an error occurred.

### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

## 17.2.3.54. `mysql_reload()`

```
int mysql_reload(MYSQL *mysql)
```

### Description

Asks the MySQL server to reload the grant tables. The connected user must have the `RELOAD` privilege.

This function is deprecated. It is preferable to use `mysql_query()` to issue an SQL `FLUSH PRIVILEGES` statement instead.

### Return Values

Zero for success. Non-zero if an error occurred.

### Errors

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 17.2.3.55. `mysql_rollback()`

```
my_bool mysql_rollback(MYSQL *mysql)
```

#### **Description**

Rolls back the current transaction.

This function was added in MySQL 4.1.0.

#### **Return Values**

Zero if successful. Non-zero if an error occurred.

#### **Errors**

None.

### 17.2.3.56. `mysql_row_seek()`

```
MYSQL_ROW_OFFSET mysql_row_seek(MYSQL_RES *result, MYSQL_ROW_OFFSET  
offset)
```

#### **Description**

Sets the row cursor to an arbitrary row in a query result set. The `offset` value is a row offset that should be a value returned from `mysql_row_tell()` or from `mysql_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_row_seek()` may be used only in conjunction with `mysql_store_result()`, not with `mysql_use_result()`.

#### **Return Values**

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_row_seek()`.

#### **Errors**

None.

### 17.2.3.57. `mysql_row_tell()`

```
MYSQL_ROW_OFFSET mysql_row_tell(MYSQL_RES *result)
```

#### **Description**

Returns the current position of the row cursor for the last `mysql_fetch_row()`. This value can be used as an argument to `mysql_row_seek()`.

You should use `mysql_row_tell()` only after `mysql_store_result()`, not after `mysql_use_result()`.

**Return Values**

The current offset of the row cursor.

**Errors**

None.

### 17.2.3.58. `mysql_select_db()`

```
int mysql_select_db(MYSQL *mysql, const char *db)
```

**Description**

Causes the database specified by `db` to become the default (current) database on the connection specified by `mysql`. In subsequent queries, this database is the default for table references that do not include an explicit database specifier.

`mysql_select_db()` fails unless the connected user can be authenticated as having permission to use the database.

**Return Values**

Zero for success. Non-zero if an error occurred.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### 17.2.3.59. `mysql_set_character_set()`

```
int mysql_set_character_set(MYSQL *mysql, char *csname)
```

**Description**

This function is used to set the default character set for the current connection. The string `csname` specifies a valid character set name. The connection collation becomes the default collation of the character

set. This function works like the `SET NAMES` statement, but also sets the value of `mysql->charset`, and thus affects the character set used by `mysql_real_escape_string()`

This function was added in MySQL 4.1.13.

### Return Values

Zero for success. Non-zero if an error occurred.

### Example

```
MYSQL mysql;

mysql_init(&mysql);
if (!mysql_real_connect(&mysql, "host", "user", "passwd", "database", 0, NULL, 0))
{
    fprintf(stderr, "Failed to connect to database: Error: %s\n",
            mysql_error(&mysql));
}

if (!mysql_set_character_set(&mysql, "utf8"))
{
    printf("New client character set: %s\n", mysql_character_set_name(&mysql));
}
```

## 17.2.3.60. `mysql_set_local_infile_default()`

```
void
mysql_set_local_infile_default(MYSQL *mysql);
```

### Description

Sets the `LOAD LOCAL DATA INFILE` handler callback functions to the defaults used internally by the C client library. The library calls this function automatically if `mysql_set_local_infile_handler()` has not been called or does not supply valid functions for each of its callbacks.

The `mysql_set_local_infile_default()` function was added in MySQL 4.1.2.

### Return Values

None.

### Errors

None.

## 17.2.3.61. `mysql_set_local_infile_handler()`

```
void
mysql_set_local_infile_handler(MYSQL *mysql,
                               int (*local_infile_init)(void **, const char *, void *),
                               int (*local_infile_read)(void *, char *, unsigned int),
                               void (*local_infile_end)(void *),
                               int (*local_infile_error)(void *, char*, unsigned int),
                               void *userdata);
```

### Description

This function installs callbacks to be used during the execution of `LOAD DATA LOCAL INFILE` statements. It enables application programs to exert control over local (client-side) datafile reading. The arguments are the connection handler, a set of pointers to callback functions, and a pointer to a data area that the callbacks can use to share information.

To use `mysql_set_local_infile_handler()`, you must write the following callback functions:

```
int
local_infile_init(void **ptr, const char *filename, void *userdata);
```

The initialization function. This is called once to do any setup necessary, open the datafile, allocate data structures, and so forth. The first `void**` argument is a pointer to a pointer. You can set the pointer (that is, `*ptr`) to a value that will be passed to each of the other callbacks (as a `void*`). The callbacks can use this pointed-to value to maintain state information. The `userdata` argument is the same value that is passed to `mysql_set_local_infile_handler()`.

The initialization function should return zero for success, non-zero for an error.

```
int
local_infile_read(void *ptr, char *buf, unsigned int buf_len);
```

The data-reading function. This is called repeatedly to read the data file. `buf` points to the buffer where the read data should be stored, and `buf_len` is the maximum number of bytes that the callback can read and store in the buffer. (It can read fewer bytes, but should not read more.)

The return value is the number of bytes read, or zero when no more data could be read (this indicates EOF). Return a value less than zero if an error occurs.

```
void
local_infile_end(void *ptr)
```

The termination function. This is called once after `local_infile_read()` has returned zero (EOF) or an error. This function should deallocate any memory allocated by `local_infile_init()` and perform any other cleanup necessary. It is invoked even if the initialization function returns an error.

```
int
local_infile_error(void *ptr, char *error_msg, unsigned int error_msg_len);
```

The error-handling function. This is called to get a textual error message to return to the user in case any of your other functions returns an error. `error_msg` points to the buffer into which the message should be written, and `error_msg_len` is the length of the buffer. The message should be written as a null-terminated string, so the message can be at most `error_msg_len-1` bytes long.

The return value is the error number.

Typically, the other callbacks store the error message in the data structure pointed to by `ptr`, so that `local_infile_error()` can copy the message from there into `error_msg`.

After calling `mysql_set_local_infile_handler()` in your C code and passing pointers to your callback functions, you can then issue a `LOAD DATA LOCAL INFILE` statement (for example, by using `mysql_query()`). The client library automatically invokes your callbacks. The filename specified in `LOAD DATA LOCAL INFILE` will be passed as the second parameter to the `local_infile_init()` callback.

The `mysql_set_local_infile_handler()` function was added in MySQL 4.1.2.

## Return Values

None.

## Errors

None.

### 17.2.3.62. `mysql_set_server_option()`

```
int mysql_set_server_option(MYSQL *mysql, enum enum_mysql_set_option option)
```

#### Description

Enables or disables an option for the connection. `option` can have one of the following values:

<code>MYSQL_OPTION_MULTI_STATEMENTS_ON</code>	Enable multiple-statement support.
<code>MYSQL_OPTION_MULTI_STATEMENTS_OFF</code>	Disable multiple-statement support.

If you enable multiple-statement support, you should retrieve results from calls to `mysql_query()` or `mysql_real_query()` by using a loop that calls `mysql_next_result()` to determine whether there are more results. For an example, see [Section 17.2.9, “C API Handling of Multiple Statement Execution”](#).

Enabling multiple-statement support with `MYSQL_OPTION_MULTI_STATEMENTS_ON` does not have quite the same effect as enabling it by passing the `CLIENT_MULTI_STATEMENTS` flag to `mysql_real_connect()`: `CLIENT_MULTI_STATEMENTS` also enables `CLIENT_MULTI_RESULTS`.

This function was added in MySQL 4.1.1.

#### Return Values

Zero for success. Non-zero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `ER_UNKNOWN_COM_ERROR`  
The server didn't support `mysql_set_server_option()` (which is the case that the server is older than 4.1.1) or the server didn't support the option one tried to set.

### 17.2.3.63. `mysql_shutdown()`

```
int mysql_shutdown(MYSQL *mysql, enum mysql_enum_shutdown_level shutdown_level)
```

## Description

Asks the database server to shut down. The connected user must have `SHUTDOWN` privileges. The `shutdown_level` argument was added in MySQL 4.1.3. MySQL 4.1 supports only one type of shutdown; `shutdown_level` must be equal to `SHUTDOWN_DEFAULT`. Additional shutdown levels are planned to make it possible to choose the desired level. Dynamically linked executables which have been compiled with older versions of the `libmysqlclient` headers and call `mysql_shutdown()` need to be used with the old `libmysqlclient` dynamic library.

The shutdown process is described in [Section 5.2.6, “The Shutdown Process”](#).

## Return Values

Zero for success. Non-zero if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### 17.2.3.64. `mysql_sqlstate()`

```
const char *mysql_sqlstate(MYSQL *mysql)
```

#### Description

Returns a null-terminated string containing the SQLSTATE error code for the last error. The error code consists of five characters. `'00000'` means “no error.” The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, \*Error Codes and Messages\*](#).

SQLSTATE values returned by `mysql_sqlstate()` differ from MySQL-specific error numbers returned by `mysql_errno()`. For example, the `mysql` client program displays errors using the following format, where `1146` is the `mysql_errno()` value and `'42S02'` is the corresponding `mysql_sqlstate()` value:

```
shell> SELECT * FROM no_such_table;  
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

Not all MySQL error numbers are mapped to SQLSTATE error codes. The value `'HY000'` (general error) is used for unmapped error numbers.

This function was added in MySQL 4.1.1.

#### Return Values

A null-terminated character string containing the SQLSTATE error code.

**See Also**

See [Section 17.2.3.14](#), “`mysql_errno()`”, [Section 17.2.3.15](#), “`mysql_error()`”, and [Section 17.2.7.26](#), “`mysql_stmt_sqlstate()`”.

### 17.2.3.65. `mysql_ssl_set()`

```
int mysql_ssl_set(MYSQL *mysql, const char *key, const char *cert,
const char *ca, const char *capath, const char *cipher)
```

**Description**

`mysql_ssl_set()` is used for establishing secure connections using SSL. It must be called before `mysql_real_connect()`.

`mysql_ssl_set()` does nothing unless OpenSSL support is enabled in the client library.

`mysql` is the connection handler returned from `mysql_init()`. The other parameters are specified as follows:

- `key` is the pathname to the key file.
- `cert` is the pathname to the certificate file.
- `ca` is the pathname to the certificate authority file.
- `capath` is the pathname to a directory that contains trusted SSL CA certificates in pem format.
- `cipher` is a list of allowable ciphers to use for SSL encryption.

Any unused SSL parameters may be given as `NULL`.

**Return Values**

This function always returns 0. If SSL setup is incorrect, `mysql_real_connect()` returns an error when you attempt to connect.

### 17.2.3.66. `mysql_stat()`

```
const char *mysql_stat(MYSQL *mysql)
```

**Description**

Returns a character string containing information similar to that provided by the `mysqladmin status` command. This includes uptime in seconds and the number of running threads, questions, reloads, and open tables.

**Return Values**

A character string describing the server status. `NULL` if an error occurred.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_SERVER_LOST`

The connection to the server was lost during the query.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### 17.2.3.67. `mysql_store_result()`

```
MYSQL_RES *mysql_store_result(MYSQL *mysql)
```

#### Description

You must call `mysql_store_result()` or `mysql_use_result()` for every query that successfully retrieves data (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`, `CHECK TABLE`, and so forth).

You don't have to call `mysql_store_result()` or `mysql_use_result()` for other queries, but it does not do any harm or cause any notable performance degradation if you call `mysql_store_result()` in all cases. You can detect if the query didn't have a result set by checking if `mysql_store_result()` returns 0 (more about this later on).

If you want to know whether the query should return a result set, you can use `mysql_field_count()` to check for this. See [Section 17.2.3.22, “mysql\\_field\\_count\(\)”](#).

`mysql_store_result()` reads the entire result of a query to the client, allocates a `MYSQL_RES` structure, and places the result into this structure.

`mysql_store_result()` returns a null pointer if the query didn't return a result set (if the query was, for example, an `INSERT` statement).

`mysql_store_result()` also returns a null pointer if reading of the result set failed. You can check whether an error occurred by checking if `mysql_error()` returns a non-empty string, if `mysql_errno()` returns non-zero, or if `mysql_field_count()` returns zero.

An empty result set is returned if there are no rows returned. (An empty result set differs from a null pointer as a return value.)

Once you have called `mysql_store_result()` and got a result back that isn't a null pointer, you may call `mysql_num_rows()` to find out how many rows are in the result set.

You can call `mysql_fetch_row()` to fetch rows from the result set, or `mysql_row_seek()` and `mysql_row_tell()` to obtain or set the current row position within the result set.

You must call `mysql_free_result()` once you are done with the result set.

See [Section 17.2.13.1, “Why mysql\\_store\\_result\(\) Sometimes Returns NULL After mysql\\_query\(\) Returns Success”](#).

#### Return Values

A `MYSQL_RES` result structure with the results. `NULL` if an error occurred.

### Errors

`mysql_store_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### 17.2.3.68. `mysql_thread_id()`

```
unsigned long mysql_thread_id(MYSQL *mysql)
```

#### Description

Returns the thread ID of the current connection. This value can be used as an argument to `mysql_kill()` to kill the thread.

If the connection is lost and you reconnect with `mysql_ping()`, the thread ID changes. This means you should not get the thread ID and store it for later. You should get it when you need it.

#### Return Values

The thread ID of the current connection.

#### Errors

None.

### 17.2.3.69. `mysql_use_result()`

```
MYSQL_RES *mysql_use_result(MYSQL *mysql)
```

#### Description

You must call `mysql_store_result()` or `mysql_use_result()` for every query that successfully retrieves data (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`).

`mysql_use_result()` initiates a result set retrieval but does not actually read the result set into the client like `mysql_store_result()` does. Instead, each row must be retrieved individually by mak-

ing calls to `mysql_fetch_row()`. This reads the result of a query directly from the server without storing it in a temporary table or local buffer, which is somewhat faster and uses much less memory than `mysql_store_result()`. The client allocates memory only for the current row and a communication buffer that may grow up to `max_allowed_packet` bytes.

On the other hand, you shouldn't use `mysql_use_result()` if you are doing a lot of processing for each row on the client side, or if the output is sent to a screen on which the user may type a ^S (stop scroll). This ties up the server and prevent other threads from updating any tables from which the data is being fetched.

When using `mysql_use_result()`, you must execute `mysql_fetch_row()` until a `NULL` value is returned, otherwise, the unfetched rows are returned as part of the result set for your next query. The C API gives the error `Commands out of sync; you can't run this command now` if you forget to do this!

You may not use `mysql_data_seek()`, `mysql_row_seek()`, `mysql_row_tell()`, `mysql_num_rows()`, or `mysql_affected_rows()` with a result returned from `mysql_use_result()`, nor may you issue other queries until `mysql_use_result()` has finished. (However, after you have fetched all the rows, `mysql_num_rows()` accurately returns the number of rows fetched.)

You must call `mysql_free_result()` once you are done with the result set.

When using the `libmysqld` embedded server, the memory benefits are essentially lost because memory usage incrementally increases with each row retrieved until `mysql_free_result()` is called.

### Return Values

A `MYSQL_RES` result structure. `NULL` if an error occurred.

### Errors

`mysql_use_result()` resets `mysql_error()` and `mysql_errno()` if it succeeds.

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

## 17.2.3.70. `mysql_warning_count()`

```
unsigned int mysql_warning_count(MYSQL *mysql)
```

**Description**

Returns the number of warnings generated during execution of the previous SQL statement.

This function was added in MySQL 4.1.0.

**Return Values**

The warning count.

**Errors**

None.

## 17.2.4. C API Prepared Statements

As of MySQL 4.1, the client/server protocol provides for the use of prepared statements. This capability uses the `MYSQL_STMT` statement handler data structure returned by the `mysql_stmt_init()` initialization function. Prepared execution is an efficient way to execute a statement more than once. The statement is first parsed to prepare it for execution. Then it is executed one or more times at a later time, using the statement handle returned by the initialization function.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Prepared statements might not provide a performance increase in some situations. For best results, test your application both with prepared and non-prepared statements and choose whichever yields best performance.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

The following statements can be used as prepared statements: `CREATE TABLE`, `DELETE`, `DO`, `INSERT`, `REPLACE`, `SELECT`, `SET`, `UPDATE`, and most `SHOW` statements. Other statements are not yet supported.

## 17.2.5. C API Prepared Statement Data types

**Note:** Some incompatible changes were made in MySQL 4.1.2. See [Section 17.2.7, “C API Prepared Statement Function Descriptions”](#), for details.

Prepared statements mainly use the `MYSQL_STMT` and `MYSQL_BIND` data structures. A third structure, `MYSQL_TIME`, is used to transfer temporal data.

- `MYSQL_STMT`

This structure represents a prepared statement. A statement is created by calling `mysql_stmt_init()`, which returns a statement handle (that is, a pointer to a `MYSQL_STMT`). The handle is used for all subsequent statement-related functions until you close it with `mysql_stmt_close()`.

The `MYSQL_STMT` structure has no members that are for application use. Also, you should not try to make a copy of a `MYSQL_STMT` structure. There is no guarantee that such a copy will be usable.

Multiple statement handles can be associated with a single connection. The limit on the number of

handles depends on the available system resources.

- `MYSQL_BIND`

This structure is used both for statement input (data values sent to the server) and output (result values returned from the server). For input, it is used with `mysql_stmt_bind_param()` to bind parameter data values to buffers for use by `mysql_stmt_execute()`. For output, it is used with `mysql_stmt_bind_result()` to bind result set buffers for use in fetching rows with `mysql_stmt_fetch()`.

To use a `MYSQL_BIND` structure, you should zero its contents to initialize it, and then set its members appropriately. For example, to declare and initialize an array of three `MYSQL_BIND` structures, use this code:

```
MYSQL_BIND  bind[3];
memset(bind, 0, sizeof(bind));
```

The `MYSQL_BIND` structure contains the following members for use by application programs. Each is used both for input and for output, although sometimes for different purposes depending on the direction of data transfer.

- `enum enum_field_types buffer_type`

The type of the buffer. The allowable `buffer_type` values are listed later in this section. For input, `buffer_type` indicates what type of value you are binding to a statement parameter. For output, it indicates what type of value you expect to receive in a result buffer.

- `void *buffer`

For input, this is a pointer to the buffer in which a statement parameter's data value is stored. For output, it is a pointer to the buffer in which to return a result set column value. For numeric data types, `buffer` should point to a variable of the proper C type. (If you are associating the variable with a column that has the `UNSIGNED` attribute, the variable should be an `unsigned` C type. Indicate whether the variable is signed or unsigned by using the `is_unsigned` member, described later in this list.) For date and time data types, `buffer` should point to a `MYSQL_TIME` structure. For character and binary string data types, `buffer` should point to a character buffer.

- `unsigned long buffer_length`

The actual size of `*buffer` in bytes. This indicates the maximum amount of data that can be stored in the buffer. For character and binary C data, the `buffer_length` value specifies the length of `*buffer` when used with `mysql_stmt_bind_param()`, or the maximum number of data bytes that can be fetched into the buffer when used with `mysql_stmt_bind_result()`.

- `unsigned long *length`

A pointer to an `unsigned long` variable that indicates the actual number of bytes of data stored in `*buffer`. `length` is used for character or binary C data. For input parameter data binding, `length` points to an `unsigned long` variable that indicates the length of the parameter value stored in `*buffer`; this is used by `mysql_stmt_execute()`. For output value binding, `mysql_stmt_fetch()` places the length of the column value that is returned into the variable that `length` points to.

`length` is ignored for numeric and temporal data types because the length of the data value is determined by the `buffer_type` value.

- `my_bool *is_null`

This member points to a `my_bool` variable that is true if a value is `NULL`, false if it is not `NULL`. For input, set `*is_null` to true to indicate that you are passing a `NULL` value as a statement parameter. For output, this value is set to true after you fetch a row if the result set column value returned from the statement is `NULL`.

`is_null` is a pointer to a boolean rather than a boolean scalar so that it can be used in the following way:

- If your data values are always `NULL`, use `MYSQL_TYPE_NULL` to bind the column.
- If your data values are always `NOT NULL`, set `is_null = (my_bool*) 0`.
- In all other cases, you should set `is_null` to the address of a `my_bool` variable and change that variable's value appropriately between executions to indicate whether data values are `NULL` or `NOT NULL`.

- `my_bool is_unsigned`

This member is used for integer types. (These correspond to the `MYSQL_TYPE_TINY`, `MYSQL_TYPE_SHORT`, `MYSQL_TYPE_LONG`, and `MYSQL_TYPE_LONGLONG` type codes.) `is_unsigned` should be set to true for unsigned types and false for signed types.

- `MYSQL_TIME`

This structure is used to send and receive `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` data directly to and from the server. This is done by setting the `buffer_type` member of a `MYSQL_BIND` structure to one of the temporal types, and setting the `buffer` member to point to a `MYSQL_TIME` structure.

The `MYSQL_TIME` structure contains the following members:

- `unsigned int year`

The year.

- `unsigned int month`

The month of the year.

- `unsigned int day`

The day of the month.

- `unsigned int hour`

The hour of the day.

- `unsigned int minute`

The minute of the hour.

- `unsigned int second`

The second of the minute.

- `my_bool neg`

A boolean flag to indicate whether the time is negative.

- `unsigned long second_part`

The fractional part of the second. This member currently is unused.

Only those parts of a `MYSQL_TIME` structure that apply to a given type of temporal value are used: The `year`, `month`, and `day` elements are used for `DATE`, `DATETIME`, and `TIMESTAMP` values. The `hour`, `minute`, and `second` elements are used for `TIME`, `DATETIME`, and `TIMESTAMP` values. See [Section 17.2.10, “C API Handling of Date and Time Values”](#).

The following table shows the allowable values that may be specified in the `buffer_type` member of `MYSQL_BIND` structures. The table also shows those SQL types that correspond most closely to each `buffer_type` value, and, for numeric and temporal types, the corresponding recommended C type.

The types are “recommended” because implicit type conversion may be performed in both directions. The `buffer_type` value controls the conversion that will be performed. For example, to fetch a SQL `MEDIUMINT` column value, you can specify a `buffer_type` value of `MYSQL_TYPE_LONG` and use a C variable of type `int` as the destination buffer. If you fetch a numeric column with a value of 255 into a `char[4]` character array, specify a `buffer_type` value of `MYSQL_TYPE_STRING` and the resulting value in the array will be a 4-byte string containing `'255\0'`.

To distinguish between binary and non-binary data for string data types, check whether the `charsetnr` value of the result set metadata is 63. If so, the character set is `binary`, which indicates binary rather than non-binary data. This is how to distinguish between `BINARY` and `CHAR`, `VARBINARY` and `VARCHAR`, and `BLOB` and `TEXT`.

<code>buffer_type</code> Value	SQL Type	Recommended C Type
<code>MYSQL_TYPE_TINY</code>	<code>TINYINT</code>	<code>unsigned char</code>
<code>MYSQL_TYPE_SHORT</code>	<code>SMALLINT</code>	<code>short int</code>
<code>MYSQL_TYPE_LONG</code>	<code>INT</code>	<code>int</code>
<code>MYSQL_TYPE_LONGLONG</code>	<code>BIGINT</code>	<code>long long int</code>
<code>MYSQL_TYPE_FLOAT</code>	<code>FLOAT</code>	<code>float</code>
<code>MYSQL_TYPE_DOUBLE</code>	<code>DOUBLE</code>	<code>double</code>
<code>MYSQL_TYPE_TIME</code>	<code>TIME</code>	<code>MYSQL_TIME</code>
<code>MYSQL_TYPE_DATE</code>	<code>DATE</code>	<code>MYSQL_TIME</code>
<code>MYSQL_TYPE_DATETIME</code>	<code>DATETIME</code>	<code>MYSQL_TIME</code>
<code>MYSQL_TYPE_TIMESTAMP</code>	<code>TIMESTAMP</code>	<code>MYSQL_TIME</code>
<code>MYSQL_TYPE_STRING</code>	<code>CHAR/BINARY</code>	<code>char[]</code>
<code>MYSQL_TYPE_VAR_STRING</code>	<code>VARCHAR/VARBINARY</code>	<code>char[]</code>
<code>MYSQL_TYPE_TINY_BLOB</code>	<code>TINYBLOB/TINYTEXT</code>	<code>char[]</code>
<code>MYSQL_TYPE_BLOB</code>	<code>BLOB/TEXT</code>	<code>char[]</code>
<code>MYSQL_TYPE_MEDIUM_BLOB</code>	<code>MEDIUMBLOB/MEDIUMTEXT</code>	<code>char[]</code>
<code>MYSQL_TYPE_LONG_BLOB</code>	<code>LOB/LOBTEXT</code>	<code>char[]</code>

## 17.2.6. C API Prepared Statement Function Overview

**Note:** Some incompatible changes were made in MySQL 4.1.2. See [Section 17.2.7, “C API Prepared Statement Function Descriptions”](#), for details.

The functions available for prepared statement processing are summarized here and described in greater detail in a later section. See [Section 17.2.7, “C API Prepared Statement Function Descriptions”](#).

Function	Description
<a href="#">mysql_stmt_affected_rows()</a>	Returns the number of rows changes, deleted, or inserted by prepared <a href="#">UPDATE</a> , <a href="#">DELETE</a> , or <a href="#">INSERT</a> statement.
<a href="#">mysql_stmt_attr_get()</a>	Get value of an attribute for a prepared statement.
<a href="#">mysql_stmt_attr_set()</a>	Sets an attribute for a prepared statement.
<a href="#">mysql_stmt_bind_param()</a>	Associates application data buffers with the parameter markers in a prepared SQL statement.
<a href="#">mysql_stmt_bind_result()</a>	Associates application data buffers with columns in the result set.
<a href="#">mysql_stmt_close()</a>	Frees memory used by prepared statement.
<a href="#">mysql_stmt_data_seek()</a>	Seeks to an arbitrary row number in a statement result set.
<a href="#">mysql_stmt_errno()</a>	Returns the error number for the last statement execution.
<a href="#">mysql_stmt_error()</a>	Returns the error message for the last statement execution.
<a href="#">mysql_stmt_execute()</a>	Executes the prepared statement.
<a href="#">mysql_stmt_fetch()</a>	Fetches the next row of data from the result set and returns data for all bound columns.
<a href="#">mysql_stmt_fetch_column()</a>	Fetch data for one column of the current row of the result set.
<a href="#">mysql_stmt_field_count()</a>	Returns the number of result columns for the most recent statement.
<a href="#">mysql_stmt_free_result()</a>	Free the resources allocated to the statement handle.
<a href="#">mysql_stmt_init()</a>	Allocates memory for <a href="#">MYSQL_STMT</a> structure and initializes it.
<a href="#">mysql_stmt_insert_id()</a>	Returns the ID generated for an <a href="#">AUTO_INCREMENT</a> column by prepared statement.
<a href="#">mysql_stmt_num_rows()</a>	Returns total rows from the statement buffered result set.
<a href="#">mysql_stmt_param_count()</a>	Returns the number of parameters in a prepared SQL statement.
<a href="#">mysql_stmt_param_metadata()</a>	(Return parameter metadata in the form of a result set.) Currently, this function does nothing.
<a href="#">mysql_stmt_prepare()</a>	Prepares an SQL string for execution.
<a href="#">mysql_stmt_reset()</a>	Reset the statement buffers in the server.
<a href="#">mysql_stmt_result_metadata()</a>	Returns prepared statement metadata in the form of a result set.
<a href="#">mysql_stmt_row_seek()</a>	Seeks to a row offset in a statement result set, using value returned from <a href="#">mysql_stmt_row_tell()</a> .
<a href="#">mysql_stmt_row_tell()</a>	Returns the statement row cursor position.
<a href="#">mysql_stmt_send_long_data()</a>	Sends long data in chunks to server.
<a href="#">mysql_stmt_sqlstate()</a>	Returns the SQLSTATE error code for the last statement execution.
<a href="#">mysql_stmt_store_result()</a>	Retrieves the complete result set to the client.

Call [mysql\\_stmt\\_init\(\)](#) to create a statement handle, then [mysql\\_stmt\\_prepare](#) to prepare it, [mysql\\_stmt\\_bind\\_param\(\)](#) to supply the parameter data, and [mysql\\_stmt\\_execute\(\)](#) to execute the statement. You can repeat the [mysql\\_stmt\\_execute\(\)](#) by changing parameter values in the respective buffers supplied through [mysql\\_stmt\\_bind\\_param\(\)](#).

If the statement is a `SELECT` or any other statement that produces a result set, `mysql_stmt_prepare()` also returns the result set metadata information in the form of a `MYSQL_RES` result set through `mysql_stmt_result_metadata()`.

You can supply the result buffers using `mysql_stmt_bind_result()`, so that the `mysql_stmt_fetch()` automatically returns data to these buffers. This is row-by-row fetching.

You can also send the text or binary data in chunks to server using `mysql_stmt_send_long_data()`. See [Section 17.2.7.25](#), “`mysql_stmt_send_long_data()`”.

When statement execution has been completed, the statement handle must be closed using `mysql_stmt_close()` so that all resources associated with it can be freed.

If you obtained a `SELECT` statement's result set metadata by calling `mysql_stmt_result_metadata()`, you should also free the metadata using `mysql_free_result()`.

### Execution Steps

To prepare and execute a statement, an application follows these steps:

1. Create a prepared statement handle with `mysql_stmt_init()`. To prepare the statement on the server, call `mysql_stmt_prepare()` and pass it a string containing the SQL statement.
2. If the statement produces a result set, call `mysql_stmt_result_metadata()` to obtain the result set metadata. This metadata is itself in the form of result set, albeit a separate one from the one that contains the rows returned by the query. The metadata result set indicates how many columns are in the result and contains information about each column.
3. Set the values of any parameters using `mysql_stmt_bind_param()`. All parameters must be set. Otherwise, statement execution returns an error or produces unexpected results.
4. Call `mysql_stmt_execute()` to execute the statement.
5. If the statement produces a result set, bind the data buffers to use for retrieving the row values by calling `mysql_stmt_bind_result()`.
6. Fetch the data into the buffers row by row by calling `mysql_stmt_fetch()` repeatedly until no more rows are found.
7. Repeat steps 3 through 6 as necessary, by changing the parameter values and re-executing the statement.

When `mysql_stmt_prepare()` is called, the MySQL client/server protocol performs these actions:

- The server parses the statement and sends the okay status back to the client by assigning a statement ID. It also sends total number of parameters, a column count, and its metadata if it is a result set oriented statement. All syntax and semantics of the statement are checked by the server during this call.
- The client uses this statement ID for the further operations, so that the server can identify the statement from among its pool of statements.

When `mysql_stmt_execute()` is called, the MySQL client/server protocol performs these actions:

- The client uses the statement handle and sends the parameter data to the server.
- The server identifies the statement using the ID provided by the client, replaces the parameter markers with the newly supplied data, and executes the statement. If the statement produces a result set, the server sends the data back to the client. Otherwise, it sends an okay status and total number of rows changed, deleted, or inserted.

When `mysql_stmt_fetch()` is called, the MySQL client/server protocol performs these actions:

- The client reads the data from the packet row by row and places it into the application data buffers by doing the necessary conversions. If the application buffer type is same as that of the field type returned from the server, the conversions are straightforward.

If an error occurs, you can get the statement error code, error message, and SQLSTATE value using `mysql_stmt_errno()`, `mysql_stmt_error()`, and `mysql_stmt_sqlstate()`, respectively.

### Prepared Statement Logging

For prepared statements that are executed with the `mysql_stmt_prepare()` and `mysql_stmt_execute()` C API functions, the server writes `Prepare` and `Execute` lines to the general query log so that you can tell when statements are prepared and executed.

Suppose that you prepare and execute a statement as follows:

1. Call `mysql_stmt_prepare()` to prepare the statement string "`SELECT ?`".
2. Call `mysql_stmt_bind_param()` to bind the value `3` to the parameter in the prepared statement.
3. Call `mysql_stmt_execute()` to execute the prepared statement.

As a result of the preceding calls, the server writes the following lines to the general query log:

```
Prepare [1] SELECT ?
Execute [1] SELECT 3
```

Each `Prepare` and `Execute` line in the log is tagged with a `[N]` statement identifier so that you can keep track of which prepared statement is being logged. `N` is a positive integer. If there are multiple prepared statements active simultaneously for the client, `N` may be greater than 1. Each `Execute` lines shows a prepared statement after substitution of data values for `?` parameters.

Version notes: `Prepare` lines are displayed without `[N]` before MySQL 4.1.10. `Execute` lines are not displayed at all before MySQL 4.1.10.

## 17.2.7. C API Prepared Statement Function Descriptions

To prepare and execute queries, use the functions in the following sections.

**Note:** In MySQL 4.1.2, the names of several prepared statement functions were changed, as shown here:

Old Name	New Name
<code>mysql_bind_param()</code>	<code>mysql_stmt_bind_param()</code>

<code>mysql_bind_result()</code>	<code>mysql_stmt_bind_result()</code>
<code>mysql_prepare()</code>	<code>mysql_stmt_prepare()</code>
<code>mysql_execute()</code>	<code>mysql_stmt_execute()</code>
<code>mysql_fetch()</code>	<code>mysql_stmt_fetch()</code>
<code>mysql_fetch_column()</code>	<code>mysql_stmt_fetch_column()</code>
<code>mysql_param_count()</code>	<code>mysql_stmt_param_count()</code>
<code>mysql_param_result()</code>	<code>mysql_stmt_param_metadata()</code>
<code>mysql_get_metadata()</code>	<code>mysql_stmt_result_metadata()</code>
<code>mysql_send_long_data()</code>	<code>mysql_stmt_send_long_data()</code>

All functions that operate with a `MYSQL_STMT` structure begin with the prefix `mysql_stmt_`.

Also in 4.1.2, the signature of the `mysql_stmt_prepare()` function was changed to `int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *query, unsigned long length)`. To create a `MYSQL_STMT` handle, you should use the `mysql_stmt_init()` function.

### 17.2.7.1. `mysql_stmt_affected_rows()`

```
my_ulonglong mysql_stmt_affected_rows(MYSQL_STMT *stmt)
```

#### Description

Returns the total number of rows changed, deleted, or inserted by the last executed statement. May be called immediately after `mysql_stmt_execute()` for `UPDATE`, `DELETE`, or `INSERT` statements. For `SELECT` statements, `mysql_stmt_affected_rows()` works like `mysql_num_rows()`.

This function was added in MySQL 4.1.0.

#### Return Values

An integer greater than zero indicates the number of rows affected or retrieved. Zero indicates that no records were updated for an `UPDATE` statement, no rows matched the `WHERE` clause in the query, or that no query has yet been executed. -1 indicates that the query returned an error or that, for a `SELECT` query, `mysql_stmt_affected_rows()` was called prior to calling `mysql_stmt_store_result()`. Because `mysql_stmt_affected_rows()` returns an unsigned value, you can check for -1 by comparing the return value to `(my_ulonglong)-1` (or to `(my_ulonglong)~0`, which is equivalent).

See [Section 17.2.3.1, “mysql\\_affected\\_rows\(\)”](#), for additional information on the return value.

#### Errors

None.

#### Example

For the usage of `mysql_stmt_affected_rows()`, refer to the Example from [Section 17.2.7.10, “mysql\\_stmt\\_execute\(\)”](#).

### 17.2.7.2. `mysql_stmt_attr_get()`

```
int mysql_stmt_attr_get(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, void *arg)
```

**Description**

Can be used to get the current value for a statement attribute.

The `option` argument is the option that you want to get; the `arg` should point to a variable that should contain the option value. If the option is an integer, then `arg` should point to the value of the integer.

See `mysql_stmt_attr_set()` for a list of options and option types. See [Section 17.2.7.3](#), “`mysql_stmt_attr_set()`”.

**Note:** In MySQL 4.1, `mysql_stmt_attr_get()` uses `unsigned int *`, not `my_bool *`, for `STMT_ATTR_UPDATE_MAX_LENGTH`. This is corrected in MySQL 5.1.7.

This function was added in MySQL 4.1.2.

**Return Values**

0 if okay. Non-zero if `option` is unknown.

**Errors**

None.

### 17.2.7.3. `mysql_stmt_attr_set()`

```
int mysql_stmt_attr_set(MYSQL_STMT *stmt, enum enum_stmt_attr_type option, const void *arg)
```

**Description**

Can be used to affect behavior for a prepared statement. In MySQL 4.1, the `option` argument can take the single value `STMT_ATTR_UPDATE_MAX_LENGTH`; the `arg` argument is a pointer of type `my_bool *`. If `arg` points to the value 1, then the metadata `MYSQL_FIELD->max_length` in `mysql_stmt_store_result()` is updated when the prepared statement is executed.

**Note:** In MySQL 4.1, `mysql_stmt_attr_get()` uses `unsigned int *`, not `my_bool *`, for `STMT_ATTR_UPDATE_MAX_LENGTH`. This is corrected in MySQL 5.1.7.

This function was added in MySQL 4.1.2. Additional options are planned for this function in later versions of MySQL.

**Return Values**

0 if okay. Non-zero if `option` is unknown.

**Errors**

None.

### 17.2.7.4. `mysql_stmt_bind_param()`

```
my_bool mysql_stmt_bind_param(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

**Description**

`mysql_stmt_bind_param()` is used to bind data for the parameter markers in the SQL statement that was passed to `mysql_stmt_prepare()`. It uses `MYSQL_BIND` structures to supply the data. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain an element for each ‘?’ parameter marker that is present in the query.

Suppose that you prepare the following statement:

```
INSERT INTO mytbl VALUES(?, ?, ?)
```

When you bind the parameters, the array of `MYSQL_BIND` structures must contain three elements, and can be declared like this:

```
MYSQL_BIND bind[3];
```

The members of each `MYSQL_BIND` element that should be set are described in [Section 17.2.5, “C API Prepared Statement Data types”](#).

This function was added in MySQL 4.1.2.

### Return Values

Zero if the bind was successful. Non-zero if an error occurred.

### Errors

- `CR_INVALID_BUFFER_USE`  
Indicates if the bind is to supply the long data in chunks and if the buffer type is non string or binary.
- `CR_UNSUPPORTED_PARAM_TYPE`  
The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### Example

For the usage of `mysql_stmt_bind_param()`, refer to the Example from [Section 17.2.7.10, “mysql\\_stmt\\_execute\(\)”](#).

## 17.2.7.5. `mysql_stmt_bind_result()`

```
my_bool mysql_stmt_bind_result(MYSQL_STMT *stmt, MYSQL_BIND *bind)
```

### Description

`mysql_stmt_bind_result()` is used to associate (bind) columns in the result set to data buffers and length buffers. When `mysql_stmt_fetch()` is called to fetch data, the MySQL client/server protocol places the data for the bound columns into the specified buffers.

All columns must be bound to buffers prior to calling `mysql_stmt_fetch()`. `bind` is the address of an array of `MYSQL_BIND` structures. The client library expects the array to contain an element for each column of the result set. If you do not bind columns to `MYSQL_BIND` structures, `mysql_stmt_fetch()` simply ignores the data fetch. The buffers should be large enough to hold the

data values, because the protocol doesn't return data values in chunks.

A column can be bound or rebound at any time, even after a result set has been partially retrieved. The new binding takes effect the next time `mysql_stmt_fetch()` is called. Suppose that an application binds the columns in a result set and calls `mysql_stmt_fetch()`. The client/server protocol returns data in the bound buffers. Then suppose that the application binds the columns to a different set of buffers. The protocol does not place data into the newly bound buffers until the next call to `mysql_stmt_fetch()` occurs.

To bind a column, an application calls `mysql_stmt_bind_result()` and passes the type, address, and the address of the length buffer. The members of each `MYSQL_BIND` element that should be set are described in [Section 17.2.5, “C API Prepared Statement Data types”](#).

This function was added in MySQL 4.1.2.

### Return Values

Zero if the bind was successful. Non-zero if an error occurred.

### Errors

- `CR_UNSUPPORTED_PARAM_TYPE`

The conversion is not supported. Possibly the `buffer_type` value is illegal or is not one of the supported types.

- `CR_OUT_OF_MEMORY`

Out of memory.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### Example

For the usage of `mysql_stmt_bind_result()`, refer to the Example from [Section 17.2.7.11, “mysql\\_stmt\\_fetch\(\)”](#).

## 17.2.7.6. `mysql_stmt_close()`

```
my_bool mysql_stmt_close(MYSQL_STMT *)
```

### Description

Closes the prepared statement. `mysql_stmt_close()` also deallocates the statement handle pointed to by `stmt`.

If the current statement has pending or unread results, this function cancels them so that the next query can be executed.

This function was added in MySQL 4.1.0.

### Return Values

Zero if the statement was freed successfully. Non-zero if an error occurred.

### Errors

- `CR_SERVER_GONE_ERROR`

The MySQL server has gone away.

- `CR_UNKNOWN_ERROR`

An unknown error occurred.

### Example

For the usage of `mysql_stmt_close()`, refer to the Example from [Section 17.2.7.10](#), “`mysql_stmt_execute()`”.

### 17.2.7.7. `mysql_stmt_data_seek()`

```
void mysql_stmt_data_seek(MYSQL_STMT *stmt, my_ulonglong offset)
```

#### Description

Seeks to an arbitrary row in a statement result set. The `offset` value is a row number and should be in the range from 0 to `mysql_stmt_num_rows(stmt) - 1`.

This function requires that the statement result set structure contains the entire result of the last executed query, so `mysql_stmt_data_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

This function was added in MySQL 4.1.1.

#### Return Values

None.

#### Errors

None.

### 17.2.7.8. `mysql_stmt_errno()`

```
unsigned int mysql_stmt_errno(MYSQL_STMT *stmt)
```

#### Description

For the statement specified by `stmt`, `mysql_stmt_errno()` returns the error code for the most recently invoked statement API function that can succeed or fail. A return value of zero means that no error occurred. Client error message numbers are listed in the MySQL `errmsg.h` header file. Server error message numbers are listed in `mysqld_error.h`. Errors also are listed at [Appendix B, \*Error Codes and Messages\*](#).

This function was added in MySQL 4.1.0.

#### Return Values

An error code value. Zero if no error occurred.

#### Errors

None.

### 17.2.7.9. `mysql_stmt_error()`

```
const char *mysql_stmt_error(MYSQL_STMT *stmt)
```

#### Description

For the statement specified by `stmt`, `mysql_stmt_error()` returns a null-terminated string containing the error message for the most recently invoked statement API function that can succeed or fail. An empty string ( " ") is returned if no error occurred. This means the following two tests are equivalent:

```
if (mysql_stmt_errno(stmt))
{
    // an error occurred
}

if (mysql_stmt_error(stmt)[0])
{
    // an error occurred
}
```

The language of the client error messages may be changed by recompiling the MySQL client library. Currently, you can choose error messages in several different languages.

This function was added in MySQL 4.1.0.

#### Return Values

A character string that describes the error. An empty string if no error occurred.

#### Errors

None.

### 17.2.7.10. `mysql_stmt_execute()`

```
int mysql_stmt_execute(MYSQL_STMT *stmt)
```

#### Description

`mysql_stmt_execute()` executes the prepared query associated with the statement handle. The currently bound parameter marker values are sent to server during this call, and the server replaces the markers with this newly supplied data.

If the statement is an `UPDATE`, `DELETE`, or `INSERT`, the total number of changed, deleted, or inserted rows can be found by calling `mysql_stmt_affected_rows()`. If this is a statement such as `SELECT` that generates a result set, you must call `mysql_stmt_fetch()` to fetch the data prior to calling any other functions that result in query processing. For more information on how to fetch the results, refer to [Section 17.2.7.11](#), “`mysql_stmt_fetch()`”.

For statements that generate a result set, you can request that `mysql_stmt_execute()` open a cursor for the statement by calling `mysql_stmt_attr_set()` before executing the statement. If you execute a statement multiple times, `mysql_stmt_execute()` closes any open cursor before opening a new one.

This function was added in MySQL 4.1.2.

#### Return Values

Zero if execution was successful. Non-zero if an error occurred.

## Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

## Example

The following example demonstrates how to create and populate a table using `mysql_stmt_init()`, `mysql_stmt_prepare()`, `mysql_stmt_param_count()`, `mysql_stmt_bind_param()`, `mysql_stmt_execute()`, and `mysql_stmt_affected_rows()`. The `mysql` variable is assumed to be a valid connection handle.

```
#define STRING_SIZE 50

#define DROP_SAMPLE_TABLE "DROP TABLE IF EXISTS test_table"
#define CREATE_SAMPLE_TABLE "CREATE TABLE test_table(col1 INT,\
                                                    col2 VARCHAR(40),\
                                                    col3 SMALLINT,\
                                                    col4 TIMESTAMP)"

#define INSERT_SAMPLE "INSERT INTO test_table(col1,col2,col3) VALUES(?,?,?)"

MYSQL_STMT      *stmt;
MYSQL_BIND      bind[3];
my_ulonglong    affected_rows;

    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get the total number of affected rows */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 1): %lu\n",
        (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, " invalid affected rows by MySQL\n");
    exit(0);
}

```

```

/* Specify data values for second row, then re-execute the statement */
int_data= 1000;
strncpy(str_data, "The most popular Open Source database", STRING_SIZE);
str_length= strlen(str_data);
small_data= 1000;          /* smallint */
is_null= 0;                /* reset */

/* Execute the INSERT statement - 2*/
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, " mysql_stmt_execute, 2 failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get the total rows affected */
affected_rows= mysql_stmt_affected_rows(stmt);
fprintf(stdout, " total affected rows(insert 2): %lu\n",
        (unsigned long) affected_rows);

if (affected_rows != 1) /* validate affected rows */
{
    fprintf(stderr, " invalid affected rows by MySQL\n");
    exit(0);
}

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

```

**Note:** For complete examples on the use of prepared statement functions, refer to the file [tests/mysql\\_client\\_test.c](#). This file can be obtained from a MySQL source distribution or from the BitKeeper source repository.

### 17.2.7.11. `mysql_stmt_fetch()`

```
int mysql_stmt_fetch(MYSQL_STMT *stmt)
```

#### Description

`mysql_stmt_fetch()` returns the next row in the result set. It can be called only while the result set exists; that is, after a call to `mysql_stmt_execute()` that creates a result set or after `mysql_stmt_store_result()`, which is called after `mysql_stmt_execute()` to buffer the entire result set.

`mysql_stmt_fetch()` returns row data using the buffers bound by `mysql_stmt_bind_result()`. It returns the data in those buffers for all the columns in the current row set and the lengths are returned to the `length` pointer.

All columns must be bound by the application before calling `mysql_stmt_fetch()`.

If a fetched data value is a `NULL` value, the `*is_null` value of the corresponding `MYSQL_BIND` structure contains `TRUE` (1). Otherwise, the data and its length are returned in the `*buffer` and `*length` elements based on the buffer type specified by the application. Each numeric and temporal type has a fixed length, as listed in the following table. The length of the string types depends on the length of the actual data value, as indicated by `data_length`.

Type	Length
<code>MYSQL_TYPE_TINY</code>	1
<code>MYSQL_TYPE_SHORT</code>	2
<code>MYSQL_TYPE_LONG</code>	4

<code>MYSQL_TYPE_LONGLONG</code>	8
<code>MYSQL_TYPE_FLOAT</code>	4
<code>MYSQL_TYPE_DOUBLE</code>	8
<code>MYSQL_TYPE_TIME</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_DATE</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_DATETIME</code>	<code>sizeof(MYSQL_TIME)</code>
<code>MYSQL_TYPE_STRING</code>	<code>data_length</code>
<code>MYSQL_TYPE_BLOB</code>	<code>data_length</code>

This function was added in MySQL 4.1.2.

### Return Values

Return Value	Description
0	Successful, the data has been fetched to application data buffers.
1	Error occurred. Error code and message can be obtained by calling <code>mysql_stmt_errno()</code> and <code>mysql_stmt_error()</code> .
<code>MYSQL_NO_DATA</code>	No more rows/data exists
<code>MYSQL_DATA_TRUNCATED</code>	Data truncation occurred

`MYSQL_DATA_TRUNCATED` is not returned unless truncation reporting is enabled with `mysql_options()`. To determine which parameters were truncated when this value is returned, check the `error` members of the `MYSQL_BIND` parameter structures.

### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.
- `CR_UNSUPPORTED_PARAM_TYPE`  
The buffer type is `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, but the data type is not `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP`.

- All other unsupported conversion errors are returned from `mysql_stmt_bind_result()`.

### Example

The following example demonstrates how to fetch data from a table using `mysql_stmt_result_metadata()`, `mysql_stmt_bind_result()`, and `mysql_stmt_fetch()`. (This example expects to retrieve the two rows inserted by the example shown in [Section 17.2.7.10](#), “`mysql_stmt_execute()`”.) The `mysql` variable is assumed to be a valid connection handle.

```
#define STRING_SIZE 50

#define SELECT_SAMPLE "SELECT coll, col2, col3, col4 FROM test_table"

MYSQL_STMT *stmt;
MYSQL_BIND bind[4];
MYSQL_RES *prepare_meta_result;
MYSQL_TIME ts;
unsigned long length[4];
int param_count, column_count, row_count;
short small_data;
int int_data;
char str_data[STRING_SIZE];
my_bool is_null[4];

/* Prepare a SELECT query to fetch data from test_table */
stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(stmt, SELECT_SAMPLE, strlen(SELECT_SAMPLE)))
{
    fprintf(stderr, " mysql_stmt_prepare(), SELECT failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}
fprintf(stdout, " prepare, SELECT successful\n");

/* Get the parameter count from the statement */
param_count= mysql_stmt_param_count(stmt);
fprintf(stdout, " total parameters in SELECT: %d\n", param_count);

if (param_count != 0) /* validate parameter count */
{
    fprintf(stderr, " invalid parameter count returned by MySQL\n");
    exit(0);
}

/* Fetch result set meta information */
prepare_meta_result = mysql_stmt_result_metadata(stmt);
if (!prepare_meta_result)
{
    fprintf(stderr,
        " mysql_stmt_result_metadata(), returned no meta information\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

/* Get total columns in the query */
column_count= mysql_num_fields(prepare_meta_result);
fprintf(stdout, " total columns in SELECT statement: %d\n", column_count);

if (column_count != 4) /* validate column count */
{
    fprintf(stderr, " invalid column count returned by MySQL\n");
    exit(0);
}

/* Execute the SELECT query */
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, " mysql_stmt_execute(), failed\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}
```

```

}

/* Bind the result buffers for all 4 columns before fetching them */
memset(bind, 0, sizeof(bind));

/* INTEGER COLUMN */

    row_count++;
    fprintf(stdout, " row %d\n", row_count);

    /* column 1 */
    fprintf(stdout, " column1 (integer) : ");
    if (is_null[0])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %d(%ld)\n", int_data, length[0]);

    /* column 2 */
    fprintf(stdout, " column2 (string) : ");
    if (is_null[1])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %s(%ld)\n", str_data, length[1]);

    /* column 3 */
    fprintf(stdout, " column3 (smallint) : ");
    if (is_null[2])
        fprintf(stdout, " NULL\n");
    else
        fprintf(stdout, " %d(%ld)\n", small_data, length[2]);

    /* column 4 */
    fprintf(stdout, " column4 (timestamp): ");
    if (is_null[3])
        fprintf(stdout, " NULL\n");
}

```

```

else
    fprintf(stdout, " %04d-%02d-%02d %02d:%02d:%02d (%ld)\n",
              ts.year, ts.month, ts.day,
              ts.hour, ts.minute, ts.second,
              length[3]);
    fprintf(stdout, "\n");
}

/* Validate rows fetched */
fprintf(stdout, " total rows fetched: %d\n", row_count);
if (row_count != 2)
{
    fprintf(stderr, " MySQL failed to return all rows\n");
    exit(0);
}

/* Free the prepared result metadata */
mysql_free_result(prepare_meta_result);

/* Close the statement */
if (mysql_stmt_close(stmt))
{
    fprintf(stderr, " failed while closing the statement\n");
    fprintf(stderr, " %s\n", mysql_stmt_error(stmt));
    exit(0);
}

```

### 17.2.7.12. `mysql_stmt_fetch_column()`

```
int mysql_stmt_fetch_column(MYSQL_STMT *stmt, MYSQL_BIND *bind, unsigned int column, unsigned long offset)
```

#### Description

Fetch one column from the current result set row. `bind` provides the buffer where data should be placed. It should be set up the same way as for `mysql_stmt_bind_result()`. `column` indicates which column to fetch. The first column is numbered 0. `offset` is the offset within the data value at which to begin retrieving data. This can be used for fetching the data value in pieces. The beginning of the value is offset 0.

This function was added in MySQL 4.1.2.

#### Return Values

Zero if the value was fetched successfully. Non-zero if an error occurred.

#### Errors

- `CR_INVALID_PARAMETER_NO`  
Invalid column number.
- `CR_NO_DATA`  
The end of the result set has already been reached.

### 17.2.7.13. `mysql_stmt_field_count()`

```
unsigned int mysql_stmt_field_count(MYSQL_STMT *stmt)
```

#### Description

Returns the number of columns for the most recent statement for the statement handler. This value is zero for statements such as `INSERT` or `DELETE` that do not produce result sets.

`mysql_stmt_field_count()` can be called after you have prepared a statement by invoking `mysql_stmt_prepare()`.

This function was added in MySQL 4.1.3.

#### **Return Values**

An unsigned integer representing the number of columns in a result set.

#### **Errors**

None.

### **17.2.7.14. `mysql_stmt_free_result()`**

```
my_bool mysql_stmt_free_result(MYSQL_STMT *stmt)
```

#### **Description**

Releases memory associated with the result set produced by execution of the prepared statement. If there is a cursor open for the statement, `mysql_stmt_free_result()` closes it.

This function was added in MySQL 4.1.1.

#### **Return Values**

Zero if the result set was freed successfully. Non-zero if an error occurred.

#### **Errors**

### **17.2.7.15. `mysql_stmt_init()`**

```
MYSQL_STMT *mysql_stmt_init(MYSQL *mysql)
```

#### **Description**

Create a `MYSQL_STMT` handle. The handle should be freed with `mysql_stmt_close(MYSQL_STMT *)`.

This function was added in MySQL 4.1.2.

#### **Return values**

A pointer to a `MYSQL_STMT` structure in case of success. `NULL` if out of memory.

#### **Errors**

- `CR_OUT_OF_MEMORY`

Out of memory.

### **17.2.7.16. `mysql_stmt_insert_id()`**

```
my_ulonglong mysql_stmt_insert_id(MYSQL_STMT *stmt)
```

**Description**

Returns the value generated for an `AUTO_INCREMENT` column by the prepared `INSERT` or `UPDATE` statement. Use this function after you have executed prepared `INSERT` statement into a table which contains an `AUTO_INCREMENT` field.

See [Section 17.2.3.35](#), “`mysql_insert_id()`”, for more information.

This function was added in MySQL 4.1.2.

**Return Values**

Value for `AUTO_INCREMENT` column which was automatically generated or explicitly set during execution of prepared statement, or value generated by `LAST_INSERT_ID(expr)` function. Return value is undefined if statement does not set `AUTO_INCREMENT` value.

**Errors**

None.

**17.2.7.17. `mysql_stmt_num_rows()`**

```
my_ulonglong mysql_stmt_num_rows(MYSQL_STMT *stmt)
```

**Description**

Returns the number of rows in the result set.

The use of `mysql_stmt_num_rows()` depends on whether you used `mysql_stmt_store_result()` to buffer the entire result set in the statement handle.

If you use `mysql_stmt_store_result()`, `mysql_stmt_num_rows()` may be called immediately.

This function was added in MySQL 4.1.1.

**Return Values**

The number of rows in the result set.

**Errors**

None.

**17.2.7.18. `mysql_stmt_param_count()`**

```
unsigned long mysql_stmt_param_count(MYSQL_STMT *stmt)
```

**Description**

Returns the number of parameter markers present in the prepared statement.

This function was added in MySQL 4.1.2.

**Return Values**

An unsigned long integer representing the number of parameters in a statement.

**Errors**

None.

**Example**

For the usage of `mysql_stmt_param_count()`, refer to the Example from [Section 17.2.7.10](#), “`mysql_stmt_execute()`”.

### 17.2.7.19. `mysql_stmt_param_metadata()`

```
MYSQL_RES *mysql_stmt_param_metadata(MYSQL_STMT *stmt)
```

This function currently does nothing.

This function was added in MySQL 4.1.2.

**Description****Return Values****Errors**

### 17.2.7.20. `mysql_stmt_prepare()`

```
int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *query, unsigned long length)
```

**Description**

Given the statement handle returned by `mysql_stmt_init()`, prepares the SQL statement pointed to by the string `query` and returns a status value. The string length should be given by the `length` argument. The string must consist of a single SQL statement. You should not add a terminating semicolon (`;`) or `\g` to the statement.

The application can include one or more parameter markers in the SQL statement by embedding question mark (`?`) characters into the SQL string at the appropriate positions.

The markers are legal only in certain places in SQL statements. For example, they are allowed in the `VALUES()` list of an `INSERT` statement (to specify column values for a row), or in a comparison with a column in a `WHERE` clause to specify a comparison value. However, they are not allowed for identifiers (such as table or column names), or to specify both operands of a binary operator such as the `=` equal sign. The latter restriction is necessary because it would be impossible to determine the parameter type. In general, parameters are legal only in Data Manipulation Language (DML) statements, and not in Data Definition Language (DDL) statements.

The parameter markers must be bound to application variables using `mysql_stmt_bind_param()` before executing the statement.

This function was added in MySQL 4.1.2.

**Return Values**

Zero if the statement was prepared successfully. Non-zero if an error occurred.

**Errors**

- `CR_COMMANDS_OUT_OF_SYNC`

Commands were executed in an improper order.

- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

If the prepare operation was unsuccessful (that is, `mysql_stmt_prepare()` returns non-zero), the error message can be obtained by calling `mysql_stmt_error()`.

#### Example

For the usage of `mysql_stmt_prepare()`, refer to the Example from [Section 17.2.7.10](#), “`mysql_stmt_execute()`”.

### 17.2.7.21. `mysql_stmt_reset()`

```
my_bool mysql_stmt_reset(MYSQL_STMT *stmt)
```

#### Description

Reset the prepared statement on the client and server to state after prepare. This is mainly used to reset data sent with `mysql_stmt_send_long_data()`. Any open cursor for the statement is closed.

To re-prepare the statement with another query, use `mysql_stmt_prepare()`.

This function was added in MySQL 4.1.1.

#### Return Values

Zero if the statement was reset successfully. Non-zero if an error occurred.

#### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### 17.2.7.22. `mysql_stmt_result_metadata()`

```
MYSQL_RES *mysql_stmt_result_metadata(MYSQL_STMT *stmt)
```

#### Description

If a statement passed to `mysql_stmt_prepare()` is one that produces a result set, `mysql_stmt_result_metadata()` returns the result set metadata in the form of a pointer to a `MYSQL_RES` structure that can be used to process the meta information such as total number of fields and individual field information. This result set pointer can be passed as an argument to any of the field-based API functions that process result set metadata, such as:

- `mysql_num_fields()`
- `mysql_fetch_field()`
- `mysql_fetch_field_direct()`
- `mysql_fetch_fields()`
- `mysql_field_count()`
- `mysql_field_seek()`
- `mysql_field_tell()`
- `mysql_free_result()`

The result set structure should be freed when you are done with it, which you can do by passing it to `mysql_free_result()`. This is similar to the way you free a result set obtained from a call to `mysql_store_result()`.

The result set returned by `mysql_stmt_result_metadata()` contains only metadata. It does not contain any row results. The rows are obtained by using the statement handle with `mysql_stmt_fetch()`.

This function was added in MySQL 4.1.2.

#### Return Values

A `MYSQL_RES` result structure. `NULL` if no meta information exists for the prepared query.

#### Errors

- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

#### Example

For the usage of `mysql_stmt_result_metadata()`, refer to the Example from [Section 17.2.7.11](#),

`“mysql_stmt_fetch()”`.

### 17.2.7.23. `mysql_stmt_row_seek()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_seek(MYSQL_STMT *stmt,  
MYSQL_ROW_OFFSET offset)
```

#### Description

Sets the row cursor to an arbitrary row in a statement result set. The `offset` value is a row offset that should be a value returned from `mysql_stmt_row_tell()` or from `mysql_stmt_row_seek()`. This value is not a row number; if you want to seek to a row within a result set by number, use `mysql_stmt_data_seek()` instead.

This function requires that the result set structure contains the entire result of the query, so `mysql_stmt_row_seek()` may be used only in conjunction with `mysql_stmt_store_result()`.

This function was added in MySQL 4.1.1.

#### Return Values

The previous value of the row cursor. This value may be passed to a subsequent call to `mysql_stmt_row_seek()`.

#### Errors

None.

### 17.2.7.24. `mysql_stmt_row_tell()`

```
MYSQL_ROW_OFFSET mysql_stmt_row_tell(MYSQL_STMT *stmt)
```

#### Description

Returns the current position of the row cursor for the last `mysql_stmt_fetch()`. This value can be used as an argument to `mysql_stmt_row_seek()`.

You should use `mysql_stmt_row_tell()` only after `mysql_stmt_store_result()`.

This function was added in MySQL 4.1.1.

#### Return Values

The current offset of the row cursor.

#### Errors

None.

### 17.2.7.25. `mysql_stmt_send_long_data()`

```
my_bool mysql_stmt_send_long_data(MYSQL_STMT *stmt, unsigned int para-  
meter_number, const char *data, unsigned long length)
```

#### Description

Allows an application to send parameter data to the server in pieces (or “chunks”). This function can be called multiple times to send the parts of a character or binary data value for a column, which must be

one of the `TEXT` or `BLOB` data types.

`parameter_number` indicates which parameter to associate the data with. Parameters are numbered beginning with 0. `data` is a pointer to a buffer containing data to be sent, and `length` indicates the number of bytes in the buffer.

**Note:** The next `mysql_stmt_execute()` call ignores the bind buffer for all parameters that have been used with `mysql_stmt_send_long_data()` since last `mysql_stmt_execute()` or `mysql_stmt_reset()`.

If you want to reset/forget the sent data, you can do it with `mysql_stmt_reset()`. See [Section 17.2.7.21](#), “`mysql_stmt_reset()`”.

This function was added in MySQL 4.1.2.

### Return Values

Zero if the data is sent successfully to server. Non-zero if an error occurred.

### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

### Example

The following example demonstrates how to send the data for a `TEXT` column in chunks. It inserts the data value 'MySQL - The most popular Open Source database' into the `text_column` column. The `mysql` variable is assumed to be a valid connection handle.

```
#define INSERT_QUERY "INSERT INTO test_long_data(text_column) VALUES(?)"

MYSQL_BIND bind[1];
long        length;

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, "mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(stmt, INSERT_QUERY, strlen(INSERT_QUERY)))
{
    fprintf(stderr, "\nmysql_stmt_prepare(), INSERT failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}
memset(bind, 0, sizeof(bind));
bind[0].buffer_type= MYSQL_TYPE_STRING;
bind[0].length= &length;
```

```

bind[0].is_null= 0;

/* Bind the buffers */
if (mysql_stmt_bind_param(stmt, bind))
{
    fprintf(stderr, "\n param bind failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Supply data in chunks to server */
if (!mysql_stmt_send_long_data(stmt,0,"MySQL",5))
{
    fprintf(stderr, "\n send_long_data failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Supply the next piece of data */
if (!mysql_stmt_send_long_data(stmt,0," - The most popular Open Source database",40))
{
    fprintf(stderr, "\n send_long_data failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* Now, execute the query */
if (mysql_stmt_execute(stmt))
{
    fprintf(stderr, "\n mysql_stmt_execute failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

```

### 17.2.7.26. `mysql_stmt_sqlstate()`

```
const char *mysql_stmt_sqlstate(MYSQL_STMT *stmt)
```

#### Description

For the statement specified by `stmt`, `mysql_stmt_sqlstate()` returns a null-terminated string containing the SQLSTATE error code for the most recently invoked prepared statement API function that can succeed or fail. The error code consists of five characters. "00000" means "no error." The values are specified by ANSI SQL and ODBC. For a list of possible values, see [Appendix B, Error Codes and Messages](#).

Note that not all MySQL errors are yet mapped to SQLSTATE codes. The value "HY000" (general error) is used for unmapped errors.

This function was added to MySQL 4.1.1.

#### Return Values

A null-terminated character string containing the SQLSTATE error code.

### 17.2.7.27. `mysql_stmt_store_result()`

```
int mysql_stmt_store_result(MYSQL_STMT *stmt)
```

#### Description

You must call `mysql_stmt_store_result()` for every statement that successfully produces a result set (`SELECT`, `SHOW`, `DESCRIBE`, `EXPLAIN`), and only if you want to buffer the complete result set by the client, so that the subsequent `mysql_stmt_fetch()` call returns buffered data.

It is unnecessary to call `mysql_stmt_store_result()` for other statements, but if you do, it does

not harm or cause any notable performance problem. You can detect whether the statement produced a result set by checking if `mysql_stmt_result_metadata()` returns `NULL`. For more information, refer to [Section 17.2.7.22](#), “`mysql_stmt_result_metadata()`”.

**Note:** MySQL doesn't by default calculate `MYSQL_FIELD->max_length` for all columns in `mysql_stmt_store_result()` because calculating this would slow down `mysql_stmt_store_result()` considerably and most applications doesn't need `max_length`. If you want `max_length` to be updated, you can call `mysql_stmt_attr_set(MYSQL_STMT, STMT_ATTR_UPDATE_MAX_LENGTH, &flag)` to enable this. See [Section 17.2.7.3](#), “`mysql_stmt_attr_set()`”.

This function was added in MySQL 4.1.0.

### Return Values

Zero if the results are buffered successfully. Non-zero if an error occurred.

### Errors

- `CR_COMMANDS_OUT_OF_SYNC`  
Commands were executed in an improper order.
- `CR_OUT_OF_MEMORY`  
Out of memory.
- `CR_SERVER_GONE_ERROR`  
The MySQL server has gone away.
- `CR_SERVER_LOST`  
The connection to the server was lost during the query.
- `CR_UNKNOWN_ERROR`  
An unknown error occurred.

## 17.2.8. C API Prepared statement problems

Here follows a list of the currently known problems with prepared statements:

- `TIME`, `TIMESTAMP`, and `DATETIME` do not support parts of seconds (for example from `DATE_FORMAT()`).
- When converting an integer to string, `ZEROFILL` is honored with prepared statements in some cases where the MySQL server doesn't print the leading zeros. (For example, with `MIN(number-with-zerofill)`).
- When converting a floating point number to a string in the client, the rightmost digits of the converted value may differ slightly from those of the original value.
- *Prepared statements do not use the Query Cache, even in cases where a query does not contain any placeholders. See [Section 5.13.1](#), “How the Query Cache Operates”.*

## 17.2.9. C API Handling of Multiple Statement Execution

From version 4.1, MySQL supports the execution of multiple statements specified in a single query string. To use this capability with a given connection, you must specify the `CLIENT_MULTI_STATEMENTS` option in the flags parameter of `mysql_real_connect()` when opening the connection. You can also set this for an existing connection by calling `mysql_set_server_option(MYSQL_OPTION_MULTI_STATEMENTS_ON)`

By default, `mysql_query()` and `mysql_real_query()` return only the first query status and the subsequent queries status can be processed using `mysql_more_results()` and `mysql_next_result()`.

If you enable multiple-statement support, you should process the results from `mysql_query()` and `mysql_real_query()` within a loop that checks for more results. This is true even for statements such as `DROP TABLE` that return a result but not a result set. Failure to process the result this way may result in a dropped connection to the server.

```
/* Connect to server with option CLIENT_MULTI_STATEMENTS */
mysql_real_connect(..., CLIENT_MULTI_STATEMENTS);

/* Now execute multiple queries */
mysql_query(mysql, "DROP TABLE IF EXISTS test_table;\
                  CREATE TABLE test_table(id INT);\
                  INSERT INTO test_table VALUES(10);\
                  UPDATE test_table SET id=20 WHERE id=10;\
                  SELECT * FROM test_table;\
                  DROP TABLE test_table");

do
{
    /* Process all results */
    ...
    printf("total affected rows: %lld", mysql_affected_rows(mysql));
    ...
    if (!(result= mysql_store_result(mysql)))
    {
        printf(stderr, "Got fatal error processing query\n");
        exit(1);
    }
    process_result_set(result); /* client function */
    mysql_free_result(result);
} while (!mysql_next_result(mysql));
```

The multiple-statement capability can be used with `mysql_query()` or `mysql_real_query()`. It cannot be used with the prepared statement interface. Prepared statement handles are defined to work only with strings that contain a single statement.

## 17.2.10. C API Handling of Date and Time Values

The binary protocol available in MySQL 4.1 and above allows you to send and receive date and time values (`DATE`, `TIME`, `DATETIME`, and `TIMESTAMP`), using the `MYSQL_TIME` structure. The members of this structure are described in [Section 17.2.5, “C API Prepared Statement Data types”](#).

To send temporal data values, create a prepared statement using `mysql_stmt_prepare()`. Then, before calling `mysql_stmt_execute()` to execute the statement, use the following procedure to set up each temporal parameter:

1. In the `MYSQL_BIND` structure associated with the data value, set the `buffer_type` member to the type that indicates what kind of temporal value you're sending. For `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` values, set `buffer_type` to `MYSQL_TYPE_DATE`, `MYSQL_TYPE_TIME`, `MYSQL_TYPE_DATETIME`, or `MYSQL_TYPE_TIMESTAMP`, respectively.
2. Set the `buffer` member of the `MYSQL_BIND` structure to the address of the `MYSQL_TIME` structure in which you pass the temporal value.

- Fill in the members of the `MYSQL_TIME` structure that are appropriate for the type of temporal value to be passed.

Use `mysql_stmt_bind_param()` to bind the parameter data to the statement. Then you can call `mysql_stmt_execute()`.

To retrieve temporal values, the procedure is similar, except that you set the `buffer_type` member to the type of value you expect to receive, and the `buffer` member to the address of a `MYSQL_TIME` structure into which the returned value should be placed. Use `mysql_bind_results()` to bind the buffers to the statement after calling `mysql_stmt_execute()` and before fetching the results.

Here is a simple example that inserts `DATE`, `TIME`, and `TIMESTAMP` data. The `mysql` variable is assumed to be a valid connection handle.

```

MYSQL_TIME  ts;
MYSQL_BIND  bind[3];
MYSQL_STMT  *stmt;

strmov(query, "INSERT INTO test_table(date_field, time_field,
                                     timestamp_field) VALUES(?,?,?);

stmt = mysql_stmt_init(mysql);
if (!stmt)
{
    fprintf(stderr, " mysql_stmt_init(), out of memory\n");
    exit(0);
}
if (mysql_stmt_prepare(mysql, query, strlen(query)))
{
    fprintf(stderr, "\n mysql_stmt_prepare(), INSERT failed");
    fprintf(stderr, "\n %s", mysql_stmt_error(stmt));
    exit(0);
}

/* set up input buffers for all 3 parameters */
bind[0].buffer_type= MYSQL_TYPE_DATE;
bind[0].buffer= (char *)&ts;
bind[0].is_null= 0;
bind[0].length= 0;
...
bind[1]= bind[2]= bind[0];
...

mysql_stmt_bind_param(stmt, bind);

/* supply the data to be sent in the ts structure */
ts.year= 2002;
ts.month= 02;
ts.day= 03;

ts.hour= 10;
ts.minute= 45;
ts.second= 20;

mysql_stmt_execute(stmt);
..

```

## 17.2.11. C API Threaded Function Descriptions

You need to use the following functions when you want to create a threaded client. See [Section 17.2.15, “How to Make a Threaded Client”](#).

### 17.2.11.1. `my_init()`

```
void my_init(void)
```

**Description**

This function needs to be called once in the program before calling any MySQL function. This initializes some global variables that MySQL needs. If you are using a thread-safe client library, this also calls `mysql_thread_init()` for this thread.

This is automatically called by `mysql_init()`, `mysql_library_init()`, `mysql_server_init()`, and `mysql_connect()`.

**Return Values**

None.

**17.2.11.2. `mysql_thread_init()`**

```
my_bool mysql_thread_init(void)
```

**Description**

This function needs to be called for each created thread to initialize thread-specific variables.

This is automatically called by `my_init()` and `mysql_connect()`.

**Return Values**

Zero if successful. Non-zero if an error occurred.

**17.2.11.3. `mysql_thread_end()`**

```
void mysql_thread_end(void)
```

**Description**

This function needs to be called before calling `pthread_exit()` to free memory allocated by `mysql_thread_init()`.

Note that this function *is not invoked automatically by the client library*. It must be called explicitly to avoid a memory leak.

**Return Values**

None.

**17.2.11.4. `mysql_thread_safe()`**

```
unsigned int mysql_thread_safe(void)
```

**Description**

This function indicates whether the client is compiled as thread-safe.

**Return Values**

1 is the client is thread-safe, 0 otherwise.

**17.2.12. C API Embedded Server Function Descriptions**

If you want to allow your application to be linked against the embedded MySQL server library, you

must use the `mysql_server_init()` and `mysql_server_end()` functions. See [Section 17.1](#), “[libmysqld, the Embedded MySQL Server Library](#)”.

However, to provide improved memory management, even programs that are linked with `-lmysqlclient` rather than `-libmysqld` should include calls to begin and end use of the library. As of MySQL 4.1.10, the `mysql_library_init()` and `mysql_library_end()` functions can be used to do this. These actually are `#define` symbols that make them equivalent to `mysql_server_init()` and `mysql_server_end()`, but the names more clearly indicate that they should be called when beginning and ending use of a MySQL C API library no matter whether the application uses `libmysqlclient` or `libmysqld`. For more information, see [Section 17.2.2](#), “[C API Function Overview](#)”.

### 17.2.12.1. `mysql_server_init()`

```
int mysql_server_init(int argc, char **argv, char **groups)
```

#### Description

This function **must** be called once in the program using the embedded server before calling any other MySQL function. It starts the server and initializes any subsystems (`mysys`, `InnoDB`, and so forth) that the server uses. If this function is not called, the next call to `mysql_init()` executes `mysql_server_init()`.

In a non-multi-threaded environment, the call to `mysql_server_init()` may be omitted, because `mysql_init()` will invoke it automatically as necessary. However, a race condition is possible if `mysql_server_init()` is invoked by `mysql_init()` in a multi-threaded environment: `mysql_server_init()` is not thread-safe, so it should be called prior to any other client library call.

If you are using the `DEBUG` package that comes with MySQL, you should call `mysql_server_init()` after you have called `my_init()`.

The `argc` and `argv` arguments are analogous to the arguments to `main()`. The first element of `argv` is ignored (it typically contains the program name). For convenience, `argc` may be 0 (zero) if there are no command-line arguments for the server. `mysql_server_init()` makes a copy of the arguments so it's safe to destroy `argv` or `groups` after the call.

If you want to connect to an external server without starting the embedded server, you have to specify a negative value for `argc`.

The `NULL`-terminated list of strings in `groups` selects which groups in the option files are active. See [Section 4.3.2](#), “[Using Option Files](#)”. For convenience, `groups` may be `NULL`, in which case the `[server]` and `[embedded]` groups are active.

#### Example

```
#include <mysql.h>
#include <stdlib.h>

static char *server_args[] = {
    "this_program",          /* this string is not used */
    "--datadir=",
    "--key_buffer_size=32M"
};
static char *server_groups[] = {
    "embedded",
    "server",
    "this_program_SERVER",
    (char *)NULL
};

int main(void) {
    if (mysql_server_init(sizeof(server_args) / sizeof(char *),
```

```
        server_args, server_groups))
    exit(1);
/* Use any MySQL API functions here */
mysql_server_end();
return EXIT_SUCCESS;
}
```

**Return Values**

0 if okay, 1 if an error occurred.

### 17.2.12.2. `mysql_server_end()`

```
void mysql_server_end(void)
```

**Description**

This function **must** be called once in the program after all other MySQL functions. It shuts down the embedded server.

**Return Values**

None.

## 17.2.13. Common Questions and Problems When Using the C API

### 17.2.13.1. Why `mysql_store_result()` Sometimes Returns `NULL` After `mysql_query()` Returns Success

It is possible for `mysql_store_result()` to return `NULL` following a successful call to `mysql_query()`. When this happens, it means one of the following conditions occurred:

- There was a `malloc()` failure (for example, if the result set was too large).
- The data couldn't be read (an error occurred on the connection).
- The query returned no data (for example, it was an `INSERT`, `UPDATE`, or `DELETE`).

You can always check whether the statement should have produced a non-empty result by calling `mysql_field_count()`. If `mysql_field_count()` returns zero, the result is empty and the last query was a statement that does not return values (for example, an `INSERT` or a `DELETE`). If `mysql_field_count()` returns a non-zero value, the statement should have produced a non-empty result. See the description of the `mysql_field_count()` function for an example.

You can test for an error by calling `mysql_error()` or `mysql_errno()`.

### 17.2.13.2. What Results You Can Get from a Query

In addition to the result set returned by a query, you can also get the following information:

- `mysql_affected_rows()` returns the number of rows affected by the last query when doing an

[INSERT](#), [UPDATE](#), or [DELETE](#).

In MySQL 3.23, there is an exception when [DELETE](#) is used without a [WHERE](#) clause. In this case, the table is re-created as an empty table and [mysql\\_affected\\_rows\(\)](#) returns zero for the number of records affected. In MySQL 4.0 and later, [DELETE](#) always returns the correct number of rows deleted. For a fast re-create, use [TRUNCATE TABLE](#).

- [mysql\\_num\\_rows\(\)](#) returns the number of rows in a result set. With [mysql\\_store\\_result\(\)](#), [mysql\\_num\\_rows\(\)](#) may be called as soon as [mysql\\_store\\_result\(\)](#) returns. With [mysql\\_use\\_result\(\)](#), [mysql\\_num\\_rows\(\)](#) may be called only after you have fetched all the rows with [mysql\\_fetch\\_row\(\)](#).
- [mysql\\_insert\\_id\(\)](#) returns the ID generated by the last query that inserted a row into a table with an [AUTO\\_INCREMENT](#) index. See [Section 17.2.3.35](#), “[mysql\\_insert\\_id\(\)](#)”.
- Some queries ([LOAD DATA INFILE ...](#), [INSERT INTO ... SELECT ...](#), [UPDATE](#)) return additional information. The result is returned by [mysql\\_info\(\)](#). See the description for [mysql\\_info\(\)](#) for the format of the string that it returns. [mysql\\_info\(\)](#) returns a [NULL](#) pointer if there is no additional information.

### 17.2.13.3. How to Get the Unique ID for the Last Inserted Row

If you insert a record into a table that contains an [AUTO\\_INCREMENT](#) column, you can obtain the value stored into that column by calling the [mysql\\_insert\\_id\(\)](#) function.

You can check from your C applications whether a value was stored in an [AUTO\\_INCREMENT](#) column by executing the following code (which assumes that you've checked that the statement succeeded). It determines whether the query was an [INSERT](#) with an [AUTO\\_INCREMENT](#) index:

```
if ((result = mysql_store_result(&mysql)) == 0 &&
    mysql_field_count(&mysql) == 0 &&
    mysql_insert_id(&mysql) != 0)
{
    used_id = mysql_insert_id(&mysql);
}
```

For more information, see [Section 17.2.3.35](#), “[mysql\\_insert\\_id\(\)](#)”.

When a new [AUTO\\_INCREMENT](#) value has been generated, you can also obtain it by executing a [SELECT LAST\\_INSERT\\_ID\(\)](#) statement with [mysql\\_query\(\)](#) and retrieving the value from the result set returned by the statement.

For [LAST\\_INSERT\\_ID\(\)](#), the most recently generated ID is maintained in the server on a per-connection basis. It is not changed by another client. It is not even changed if you update another [AUTO\\_INCREMENT](#) column with a non-magic value (that is, a value that is not [NULL](#) and not 0).

If you want to use the ID that was generated for one table and insert it into a second table, you can use SQL statements like this:

```
INSERT INTO foo (auto,text)
VALUES(NULL,'text'); # generate ID by inserting NULL
INSERT INTO foo2 (id,text)
VALUES(LAST_INSERT_ID(),'text'); # use ID in second table
```

Note that [mysql\\_insert\\_id\(\)](#) returns the value stored into an [AUTO\\_INCREMENT](#) column, whether that value is automatically generated by storing [NULL](#) or 0 or was specified as an explicit value. [LAST\\_INSERT\\_ID\(\)](#) returns only automatically generated [AUTO\\_INCREMENT](#) values. If you store an explicit value other than [NULL](#) or 0, it does not affect the value returned by [LAST\\_INSERT\\_ID\(\)](#).

### 17.2.13.4. Problems Linking with the C API

When linking with the C API, the following errors may occur on some systems:

```
gcc -g -o client test.o -L/usr/local/lib/mysql -lmysqlclient -lsocket -lnsl
Undefined      first referenced
 symbol        in file
floor          /usr/local/lib/mysql/libmysqlclient.a(password.o)
ld: fatal: Symbol referencing errors. No output written to client
```

If this happens on your system, you must include the math library by adding `-lm` to the end of the compile/link line.

### 17.2.14. Building Client Programs

If you compile MySQL clients that you've written yourself or that you obtain from a third-party, they must be linked using the `-lmysqlclient -lz` options in the link command. You may also need to specify a `-L` option to tell the linker where to find the library. For example, if the library is installed in `/usr/local/mysql/lib`, use `-L/usr/local/mysql/lib -lmysqlclient -lz` in the link command.

For clients that use MySQL header files, you may need to specify an `-I` option when you compile them (for example, `-I/usr/local/mysql/include`), so that the compiler can find the header files.

To make it simpler to compile MySQL programs on Unix, we have provided the `mysql_config` script for you. See [Section 17.9.2, “mysql\\_config — Get Compile Options for Compiling Clients”](#).

You can use it to compile a MySQL client as follows:

```
CFG=/usr/local/mysql/bin/mysql_config
sh -c "gcc -o progname ` $CFG --cflags ` progname.c ` $CFG --libs `"
```

The `sh -c` is needed to get the shell not to treat the output from `mysql_config` as one word.

### 17.2.15. How to Make a Threaded Client

The client library is almost thread-safe. The biggest problem is that the subroutines in `net.c` that read from sockets are not interrupt safe. This was done with the thought that you might want to have your own alarm that can break a long read to a server. If you install interrupt handlers for the `SIGPIPE` interrupt, the socket handling should be thread-safe.

**Note:** Beginning with version 4.0.6, MySQL blocks `SIGPIPE` on the first call to `mysql_server_init()`, `mysql_init()`, or `mysql_connect()`. This is done to avoid aborting the program when a connection terminates. If you want to use your own `SIGPIPE` handler, you should first call `mysql_server_init()` and then install your handler.

In the older binaries we distribute on our Web site (<http://www.mysql.com/>), the client libraries are not normally compiled with the thread-safe option (the Windows binaries are by default compiled to be thread-safe). Newer binary distributions should have both a normal and a thread-safe client library.

To get a threaded client where you can interrupt the client from other threads and set timeouts when talking with the MySQL server, you should use the `-lmysys`, `-lmystrings`, and `-ldbug` libraries and the `net_serv.o` code that the server uses.

If you don't need interrupts or timeouts, you can just compile a thread-safe client library (`mysqlclient_r`) and use this. See [Section 17.2, “MySQL C API”](#). In this case, you don't have to worry about the `net_serv.o` object file or the other MySQL libraries.

When using a threaded client and you want to use timeouts and interrupts, you can make great use of the routines in the `thr_alarm.c` file. If you are using routines from the `mysys` library, the only thing you must remember is to call `my_init()` first! See [Section 17.2.11, “C API Threaded Function Descriptions”](#).

All functions except `mysql_real_connect()` are by default thread-safe. The following notes describe how to compile a thread-safe client library and use it in a thread-safe manner. (The notes below for `mysql_real_connect()` actually apply to `mysql_connect()` as well, but because `mysql_connect()` is deprecated, you should be using `mysql_real_connect()` anyway.)

To make `mysql_real_connect()` thread-safe, you must recompile the client library with this command:

```
shell> ./configure --enable-thread-safe-client
```

This creates a thread-safe client library `libmysqlclient_r`. (Assuming that your OS has a thread-safe `gethostbyname_r()` function.) This library is thread-safe per connection. You can let two threads share the same connection with the following caveats:

- Two threads can't send a query to the MySQL server at the same time on the same connection. In particular, you have to ensure that between a `mysql_query()` and `mysql_store_result()` no other thread is using the same connection.
- Many threads can access different result sets that are retrieved with `mysql_store_result()`.
- If you use `mysql_use_result`, you have to ensure that no other thread is using the same connection until the result set is closed. However, it really is best for threaded clients that share the same connection to use `mysql_store_result()`.
- If you want to use multiple threads on the same connection, you must have a mutex lock around your `mysql_query()` and `mysql_store_result()` call combination. Once `mysql_store_result()` is ready, the lock can be released and other threads may query the same connection.
- If you program with POSIX threads, you can use `pthread_mutex_lock()` and `pthread_mutex_unlock()` to establish and release a mutex lock.

You need to know the following if you have a thread that is calling MySQL functions which did not create the connection to the MySQL database:

When you call `mysql_init()` or `mysql_connect()`, MySQL creates a thread-specific variable for the thread that is used by the debug library (among other things).

If you call a MySQL function, before the thread has called `mysql_init()` or `mysql_connect()`, the thread does not have the necessary thread-specific variables in place and you are likely to end up with a core dump sooner or later.

To get things to work smoothly you have to do the following:

1. Call `my_init()` at the start of your program if it calls any other MySQL function before calling `mysql_real_connect()`.
2. Call `mysql_thread_init()` in the thread handler before calling any MySQL function.
3. In the thread, call `mysql_thread_end()` before calling `pthread_exit()`. This frees the memory used by MySQL thread-specific variables.

You may get some errors because of undefined symbols when linking your client with `libmysqlclient_r`. In most cases this is because you haven't included the thread libraries on the link/compile line.

## 17.3. MySQL PHP API

PHP is a server-side, HTML-embedded scripting language that may be used to create dynamic Web pages. It is available for most operating systems and Web servers, and can access most common databases, including MySQL. PHP may be run as a separate program or compiled as a module for use with the Apache Web server.

PHP actually provides two different MySQL API extensions:

- `mysql`: Available for PHP versions 4 and 5, this extension is intended for use with MySQL versions prior to MySQL 4.1. This extension does not support the improved authentication protocol used in MySQL 5.0, nor does it support prepared statements or multiple statements. If you wish to use this extension with MySQL 4.1, you will likely want to configure the MySQL server to use the `--old-passwords` option (see [Section A.2.3, “Client does not support authentication protocol”](#)). This extension is documented on the PHP Web site at <http://php.net/mysql>.
- `mysqli` - Stands for “MySQL, Improved”; this extension is available only in PHP 5. It is intended for use with MySQL 4.1.1 and later. This extension fully supports the enhanced authentication protocol used beginning with MySQL 4.1.1, as well as the Prepared Statements and Multiple Statements APIs. In addition, this extension provides an advanced, object-oriented programming interface. You can read the documentation for the `mysqli` extension at <http://php.net/mysqli>. A helpful article can be found at <http://www.zend.com/php5/articles/php5-mysqli.php>.

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, see [Section 17.3.2, “Enabling Both `mysql` and `mysqli` in PHP”](#).

The PHP distribution and documentation are available from the [PHP Web site](http://www.php.net/) [http://www.php.net/]. MySQL provides the `mysql` and `mysqli` extensions for the Windows operating system for MySQL versions as of 4.1.16 on <http://dev.mysql.com/downloads/connector/php/>. You can find information why you should preferably use the extensions provided by MySQL on that page.

### 17.3.1. Common Problems with MySQL and PHP

- `Error: Maximum Execution Time Exceeded`: This is a PHP limit; go into the `php.ini` file and set the maximum execution time up from 30 seconds to something higher, as needed. It is also not a bad idea to double the RAM allowed per script to 16MB instead of 8MB.
- `Fatal error: Call to unsupported or undefined function mysql_connect() in ...`: This means that your PHP version isn't compiled with MySQL support. You can either compile a dynamic MySQL module and load it into PHP or recompile PHP with built-in MySQL support. This process is described in detail in the PHP manual.
- `Error: Undefined reference to 'uncompress'`: This means that the client library is compiled with support for a compressed client/server protocol. The fix is to add `-lz` last when linking with `-libmysqlclient`.
- `Error: Client does not support authentication protocol`: This is most often encountered when trying to use the older `mysql` extension with MySQL 4.1.1 and later. Possible solutions are: downgrade to MySQL 4.0; switch to PHP 5 and the newer `mysqli` extension; or configure the MySQL server with `--old-passwords`. (See [Section A.2.3, “Client does not support authentication protocol”](#), for more information.)

Those with PHP4 legacy code can make use of a compatibility layer for the old and new MySQL libraries, such as this one: <http://www.coggeshall.org/oss/mysql2i>.

## 17.3.2. Enabling Both `mysql` and `mysqli` in PHP

If you're experiencing problems with enabling both the `mysql` and the `mysqli` extension when building PHP on Linux yourself, you should try the following procedure.

1. Configure PHP like this:

```
./configure --with-mysqli=/usr/bin/mysql_config --with-mysql=/usr
```

2. Edit the `Makefile` and search for a line that starts with `EXTRA_LIBS`. It might look like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
-lxml2 -lz -lm -lxml2 -lz -lm -lmysqlclient -lz -lcrypt -lnsl -lm
-lxml2 -lz -lm -lcrypt -lxml2 -lz -lm -lcrypt
```

Remove all duplicates, so that the line looks like this (all on one line):

```
EXTRA_LIBS = -lcrypt -lcrypt -lmysqlclient -lz -lresolv -lm -ldl -lnsl
-lxml2
```

3. Build and install PHP:

```
make
make install
```

## 17.4. MySQL Perl API

The Perl `DBI` module provides a generic interface for database access. You can write a DBI script that works with many different database engines without change. To use DBI, you must install the `DBI` module, as well as a DataBase Driver (DBD) module for each type of server you want to access. For MySQL, this driver is the `DBD::mysql` module.

Perl DBI is the recommended Perl interface. It replaces an older interface called `mysqlperl`, which should be considered obsolete.

Installation instructions for Perl DBI support are given in [Section 2.14, "Perl Installation Notes"](#).

DBI information is available at the command line, online, or in printed form:

- Once you have the `DBI` and `DBD::mysql` modules installed, you can get information about them at the command line with the `perldoc` command:

```
shell> perldoc DBI
shell> perldoc DBI::FAQ
shell> perldoc DBD::mysql
```

You can also use `pod2man`, `pod2html`, and so forth to translate this information into other formats.

- For online information about Perl DBI, visit the DBI Web site, <http://dbi.perl.org/>. That site hosts a general DBI mailing list. MySQL AB hosts a list specifically about `DBD::mysql`; see [Sec-](#)

tion 1.7.1, “MySQL Mailing Lists”.

- For printed information, the official DBI book is *Programming the Perl DBI* (Alligator Descartes and Tim Bunce, O'Reilly & Associates, 2000). Information about the book is available at the DBI Web site, <http://dbi.perl.org/>.

For information that focuses specifically on using DBI with MySQL, see *MySQL and Perl for the Web* (Paul DuBois, New Riders, 2001). This book's Web site is <http://www.kitebird.com/mysql-perl/>.

## 17.5. MySQL C++ API

`MySQL++` is a MySQL API for C++. Warren Young has taken over this project. More information can be found at <http://www.mysql.com/products/mysql++/>.

### 17.5.1. Borland C++

You can compile the MySQL Windows source with Borland C++ 5.02. (The Windows source includes only projects for Microsoft VC++, for Borland C++ you have to do the project files yourself.)

One known problem with Borland C++ is that it uses a different structure alignment than VC++. This means that you run into problems if you try to use the default `libmysql.dll` libraries (that were compiled using VC++) with Borland C++. To avoid this problem, only call `mysql_init()` with `NULL` as an argument, not a pre-allocated `MYSQL` structure.

## 17.6. MySQL Python API

`MySQLdb` provides MySQL support for Python, compliant with the Python DB API version 2.0. It can be found at <http://sourceforge.net/projects/mysql-python/>.

## 17.7. MySQL Tcl API

`MySQLtcl` is a simple API for accessing a MySQL database server from the Tcl programming language. It can be found at <http://www.xdobry.de/mysqltcl/>.

## 17.8. MySQL Eiffel Wrapper

Eiffel MySQL is an interface to the MySQL database server using the Eiffel programming language, written by Michael Ravits. It can be found at <http://efsa.sourceforge.net/archive/ravits/mysql.htm>.

## 17.9. MySQL Program Development Utilities

This section describes some utilities that you may find useful when developing MySQL programs.

- `msql2mysql`

A shell script that converts `mSQL` programs to MySQL. It doesn't handle every case, but it gives a good start when converting.

- `mysql_config`

A shell script that produces the option values needed when compiling MySQL programs.

## 17.9.1. `msql2mysql` — Convert mSQL Programs for Use with MySQL

Initially, the MySQL C API was developed to be very similar to that for the mSQL database system. Because of this, mSQL programs often can be converted relatively easily for use with MySQL by changing the names of the C API functions.

The `msql2mysql` utility performs the conversion of mSQL C API function calls to their MySQL equivalents. `msql2mysql` converts the input file in place, so make a copy of the original before converting it. For example, use `msql2mysql` like this:

```
shell> cp client-prog.c client-prog.c.orig
shell> msql2mysql client-prog.c
client-prog.c converted
```

Then examine `client-prog.c` and make any post-conversion revisions that may be necessary.

`msql2mysql` uses the `replace` utility to make the function name substitutions. See [Section 8.18](#), “`replace` — A String-Replacement Utility”.

## 17.9.2. `mysql_config` — Get Compile Options for Compiling Clients

`mysql_config` provides you with useful information for compiling your MySQL client and connecting it to MySQL.

`mysql_config` supports the following options:

- `--cflags`

Compiler flags to find include files and critical compiler flags and defines used when compiling the `libmysqlclient` library.

- `--include`

Compiler options to find MySQL include files. (Note that normally you would use `--cflags` instead of this option.)

- `--libmysqld-libs, --embedded`

Libraries and options required to link with the MySQL embedded server.

- `--libs`

Libraries and options required to link with the MySQL client library.

- `--libs_r`

Libraries and options required to link with the thread-safe MySQL client library.

- `--port`

The default TCP/IP port number, defined when configuring MySQL.

- `--socket`

The default Unix socket file, defined when configuring MySQL.

- `--version`

Version number for the MySQL distribution.

If you invoke `mysql_config` with no options, it displays a list of all options that it supports, and their values:

```
shell> mysql_config
Usage: /usr/local/mysql/bin/mysql_config [options]
Options:
--cflags      [-I/usr/local/mysql/include/mysql -mcpu=pentiumpro]
--include    [-I/usr/local/mysql/include/mysql]
--libs       [-L/usr/local/mysql/lib/mysql -lmysqlclient -lz
             -lcrypt -lnsl -lm -L/usr/lib -lssl -lcrypto]
--libs_r     [-L/usr/local/mysql/lib/mysql -lmysqlclient_r
             -lpthread -lz -lcrypt -lnsl -lm -lpthread]
--socket     [/tmp/mysql.sock]
--port       [3306]
--version    [4.0.16]
--libmysqld-libs [-L/usr/local/mysql/lib/mysql -lmysqld -lpthread -lz
                -lcrypt -lnsl -lm -lpthread -lrt]
```

You can use `mysql_config` within a command line to include the value that it displays for a particular option. For example, to compile a MySQL client program, use `mysql_config` as follows:

```
shell> CFG=/usr/local/mysql/bin/mysql_config
shell> sh -c "gcc -o progname ` $CFG --cflags ` progname.c ` $CFG --libs `"
```

When you use `mysql_config` this way, be sure to invoke it within backtick (``) characters. That tells the shell to execute it and substitute its output into the surrounding command.

---

# Chapter 18. Connectors

This chapter describes MySQL Connectors, drivers that provide connectivity to the MySQL server for client programs. There are currently five MySQL Connectors:

- Connector/ODBC provides driver support for connecting to a MySQL server using the Open Database Connectivity (ODBC) API. Support is available for ODBC connectivity from Windows, Unix and Mac OS X platforms.
- Connector/NET enables developers to create .NET applications that use data stored in a MySQL database. Connector/NET implement a fully-functional ADO.NET interface and provides support for use with ADO.NET aware tools. Applications that want to use Connector/NET can be written in any of the supported .NET languages.
- Connector/J provides driver support for connecting to MySQL from a Java application using the standard Java Database Connectivity (JDBC) API.
- Connector/MXJ is a tool that enables easy deployment and management of MySQL server and database through your Java application.
- Connector/PHP is a Windows-only connector for PHP that provides the `mysql` and `mysqli` extensions for use with MySQL 5.0.18 and later.

For information on connecting to a MySQL server using other languages and interfaces than those detailed above, including Perl, Python and PHP for other platforms and environments, please refer to the [Chapter 17, APIs and Libraries](#) chapter.

## 18.1. MySQL Connector/ODBC

The MySQL Connector/ODBC is the name for the family of MySQL ODBC drivers (also called MyODBC drivers) that provide access to a MySQL database using the industry standard Open Database Connectivity (ODBC) API. This reference covers Connector/ODBC 3.51, a version of the API that provides ODBC 3.5x compliant access to a MySQL database.

The manual for versions of MyODBC older than 3.51 can be located in the corresponding binary or source distribution.

For more information on the ODBC API standard and how to use it, refer to <http://www.microsoft.com/data/>.

The application development part of this reference assumes a good working knowledge of C, general DBMS knowledge, and finally, but not least, familiarity with MySQL. For more information about MySQL functionality and its syntax, refer to <http://dev.mysql.com/doc/>.

Typically, you need to install MyODBC only on Windows machines. For Unix and Mac OS X you can use the native MySQL network or named pipe to communicate with your MySQL database. You may need MyODBC for Unix or Mac OS X if you have an application that requires an ODBC interface to communicate with database.. Applications that require ODBC to communicate with MySQL include ColdFusion, Microsoft Office, and Filemaker Pro.

If you want to install the MyODBC connector on a Unix host, then you must also install an ODBC manager.

If you have questions that are not answered in this document, please send a mail message to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com).

## 18.1.1. Introduction to MyODBC

ODBC (Open Database Connectivity) provides a way for client programs to access a wide range of databases or data sources. ODBC is a standardized API that allows connections to SQL database servers. It was developed according to the specifications of the SQL Access Group and defines a set of function calls, error codes, and data types that can be used to develop database-independent applications. ODBC usually is used when database independence or simultaneous access to different data sources is required.

For more information about ODBC, refer to <http://www.microsoft.com/data/>.

### 18.1.1.1. MyODBC Versions

There are currently two version of MyODBC available:

- MyODBC 5.0, currently in beta status, has been designed to extend the functionality of the MyODBC 3.51 driver and incorporate full support for the functionality in the MySQL 5.0 server release, including stored procedures and views. Applications using MyODBC 3.51 will be compatible with MyODBC 5.0, while being able to take advantage of the new features. Features and functionality of the MyODBC 5.0 driver are not currently included in this guide.
- MyODBC 3.51 is the current release of the 32-bit ODBC driver, also known as the MySQL ODBC 3.51 driver. This version is enhanced compared to the older MyODBC 2.50 driver. It has support for ODBC 3.5x specification level 1 (complete core API + level 2 features) in order to continue to provide all functionality of ODBC for accessing MySQL.
- MyODBC 2.50 is the previous version of the 32-bit ODBC driver from MySQL AB that is based on ODBC 2.50 specification level 0 (with level 1 and 2 features). Information about the MyODBC 2.50 driver is included in this guide for the purposes of comparison only.

Note: From this section onward, the primary focus of this guide is the MyODBC 3.51 driver. More information about the MyODBC 2.50 driver in the documentation included in the installation packages for that version. If there is a specific issue (error or known problem) that only affects the 2.50 version, it may be included here for reference.

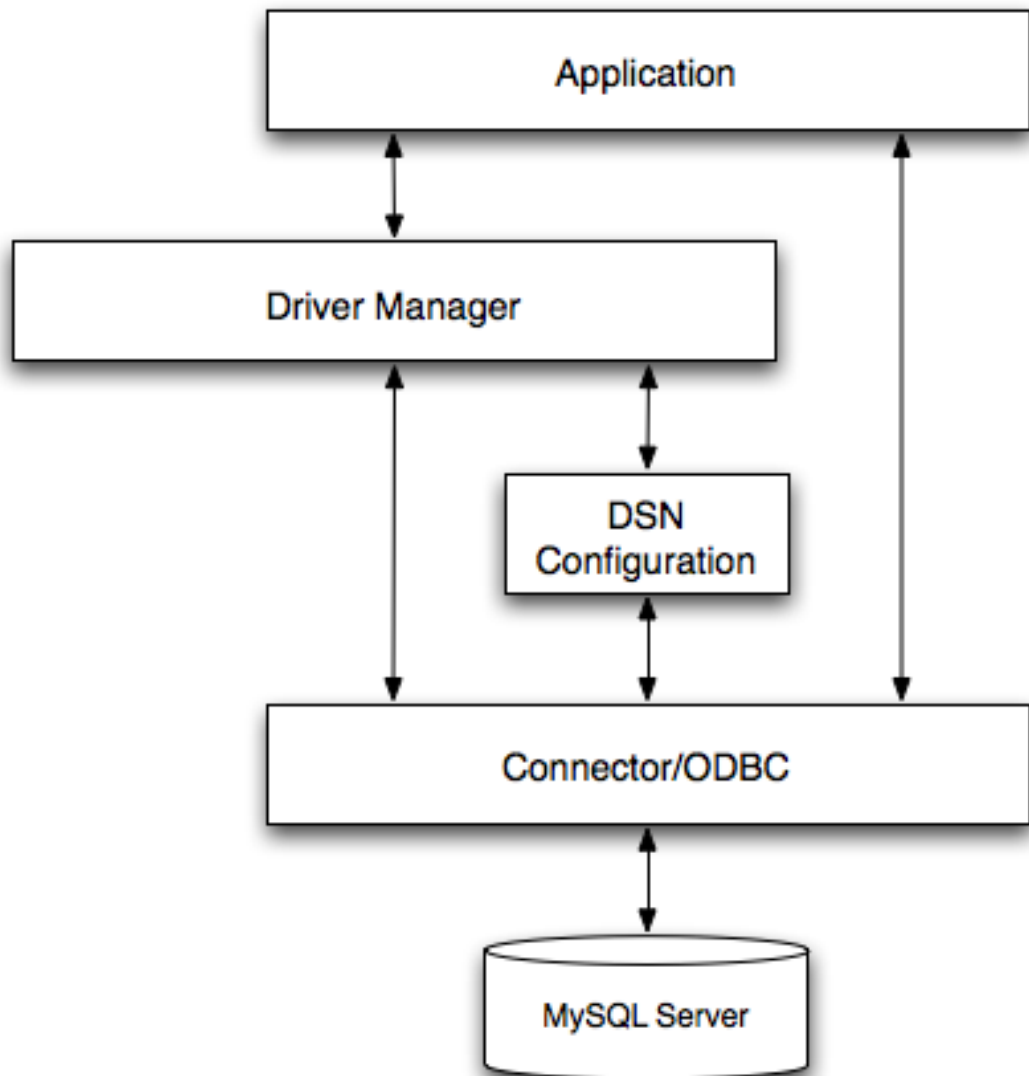

### 18.1.1.2. General Information About ODBC and MyODBC

Open Database Connectivity (ODBC) is a widely accepted application-programming interface (API) for database access. It is based on the Call-Level Interface (CLI) specifications from X/Open and ISO/IEC for database APIs and uses Structured Query Language (SQL) as its database access language.

A survey of ODBC functions supported by MyODBC is given at [Section 18.1.5.1, “MyODBC API Reference”](#). For general information about ODBC, see <http://www.microsoft.com/data/>.

#### 18.1.1.2.1. MyODBC Architecture

The MyODBC architecture is based on five components, as shown in the following diagram:

- **Application:**

The Application uses the ODBC API to access the data from the MySQL server. The ODBC API in turn uses the communicates with the Driver Manager. The Application communicates with the Driver Manager using the standard ODBC calls. The Application does not care where the data is stored, how it is stored, or even how the system is configured to access the data. It needs to know only the Data Source Name (DSN).

A number of tasks are common to all applications, no matter how they use ODBC. These tasks are:

- Selecting the MySQL server and connecting to it
- Submitting SQL statements for execution
- Retrieving results (if any)
- Processing errors

- Committing or rolling back the transaction enclosing the SQL statement
- Disconnecting from the MySQL server

Because most data access work is done with SQL, the primary tasks for applications that use ODBC are submitting SQL statements and retrieving any results generated by those statements.

- **Driver manager:**

The Driver Manager is a library that manages communication between application and driver or drivers. It performs the following tasks:

- Resolves Data Source Names (DSN). The DSN is a configuration string that identifies a given database driver, database, database host and optionally authentication information that enables an ODBC application to connect to a database using a standardized reference.

Because the database connectivity information is identified by the DSN, any ODBC compliant application can connect to the data source using the same DSN reference. This eliminates the need to separately configure each application that needs access to a given database; instead you instruct the application to use a pre-configured DSN.

- Loading and unloading of the driver required to access a specific database as defined within the DSN. For example, if you have configured a DSN that connects to a MySQL database then the driver manager will load the MyODBC driver to enable the ODBC API to communicate with the MySQL host.
- Processes ODBC function calls or passes them to the driver for processing.

- **MyODBC Driver:**

The MyODBC driver is a library that implements the functions supported by the ODBC API. It processes ODBC function calls, submits SQL requests to MySQL server, and returns results back to the application. If necessary, the driver modifies an application's request so that the request conforms to syntax supported by MySQL.

- **DSN Configuration:**

The ODBC configuration file stores the driver and database information required to connect to the server. It is used by the Driver Manager to determine which driver to be loaded according to the definition in the DSN. The driver uses this to read connection parameters based on the DSN specified. For more information, [Section 18.1.3, “MyODBC Configuration”](#).

- **MySQL Server:**

The MySQL database where the information is stored. The database is used as the source of the data (during queries) and the destination for data (during inserts and updates).

### 18.1.1.2.2. ODBC Driver Managers

An ODBC Driver Manager is a library that manages communication between the ODBC-aware application and any drivers. Its main functionality includes:

- Resolving Data Source Names (DSN).
- Driver loading and unloading.

- Processing ODBC function calls or passing them to the driver.

Both Windows and Mac OS X include ODBC driver managers with the operating system. Most ODBC Driver Manager implementations also include an administration application that makes the configuration of DSN and drivers easier. Examples and information on these managers, including Unix ODBC driver managers are listed below:

- Microsoft Windows ODBC Driver Manager (`odbc32.dll`), <http://www.microsoft.com/data/>.
- Mac OS X includes `ODBC Administrator`, a GUI application that provides a simpler configuration mechanism for the Unix iODBC Driver Manager. You can configure DSN and driver information either through ODBC Administrator or through the iODBC configuration files. This also means that you can test ODBC Administrator configurations using the `iodbctest` command. <http://www.apple.com>.
- `unixODBC` Driver Manager for Unix (`libodbc.so`). See <http://www.unixodbc.org>, for more information. The `unixODBC` Driver Manager includes the MyODBC driver 3.51 in the installation package, starting with version `unixODBC 2.1.2`.
- `iODBC` ODBC Driver Manager for Unix (`libiodbc.so`), see <http://www.iodbc.org>, for more information.

## 18.1.2. How to Install MyODBC

You can install the MyODBC drivers using two different methods, a binary installation and a source installation. The binary installation is the easiest and most straightforward method of installation. Using the source installation methods should only be necessary on platforms where a binary installation package is not available, or in situations where you want to customize or modify the installation process or MyODBC drivers before installation.

### 18.1.2.1. Where to Get MyODBC

MySQL AB distributes all its products under the General Public License (GPL). You can get a copy of the latest version of MyODBC binaries and sources from the MySQL AB Web site <http://dev.mysql.com/downloads/>.

For more information about MyODBC, visit <http://www.mysql.com/products/myodbc/>.

For more information about licensing, visit <http://www.mysql.com/company/legal/licensing/>.

### 18.1.2.2. Supported Platforms

MyODBC can be used on all major platforms supported by MySQL. You can install it on:

- Windows 95, 98, Me, NT, 2000, XP, and 2003
- All Unix-like Operating Systems, including: AIX, Amiga, BSDI, DEC, FreeBSD, HP-UX 10/11, Linux, NetBSD, OpenBSD, OS/2, SGI Irix, Solaris, SunOS, SCO OpenServer, SCO UnixWare, Tru64 Unix
- Mac OS X and Mac OS X Server

If a binary distribution is not available for a particular platform, see [Section 18.1.2.4, “Installing MyOD-](#)

[BC from a source distribution](#)", to build the driver from the original source code. You can contribute the binaries you create to MySQL by sending a mail message to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com), so that it becomes available for other users.

### 18.1.2.3. Installing MyODBC from a binary distribution

Using a binary distribution offers the most straightforward method for installing MyODBC. If you want more control over the driver, the installation location and or to customize elements of the driver you will need to build and install from the source. See the [Section 18.1.2.4, "Installing MyODBC from a source distribution"](#).

#### 18.1.2.3.1. Installing MyODBC from a Binary Distribution on Windows

Before installing the MyODBC drivers on Windows you should ensure that your Microsoft Data Access Components (MDAC) are up to date. You can obtain the latest version from the [Microsoft Data Access and Storage](http://www.microsoft.com/data/) [http://www.microsoft.com/data/] website.

There are three available distribution types to use when installing for Windows. The contents in each case are identical, it is only the installation method which is different.

- Zipped installer consists of a Zipped package containing a standalone installation application. To install from this package, you must unzip the installer, and then run the installation application. See [Section 18.1.2.3.1.1, "Installing the Windows MyODBC Driver using an installer"](#) to complete the installation.
- MSI installer, an installation file that can be used with the installer included in Windows 2000, Windows XP and Windows Server 2003. See [Section 18.1.2.3.1.1, "Installing the Windows MyODBC Driver using an installer"](#) to complete the installation.
- Zipped DLL package, containing the DLL files that need must be manually installed. See [Section 18.1.2.3.1.2, "Installing the Windows MyODBC Driver using the Zipped DLL package"](#) to complete the installation.

##### 18.1.2.3.1.1. Installing the Windows MyODBC Driver using an installer

The installer packages offer a very simple method for installing the MyODBC drivers. If you have downloaded the zipped installer then you must extract the installer application. The basic installation process is identical for both installers.

You should follow these steps to complete the installation:

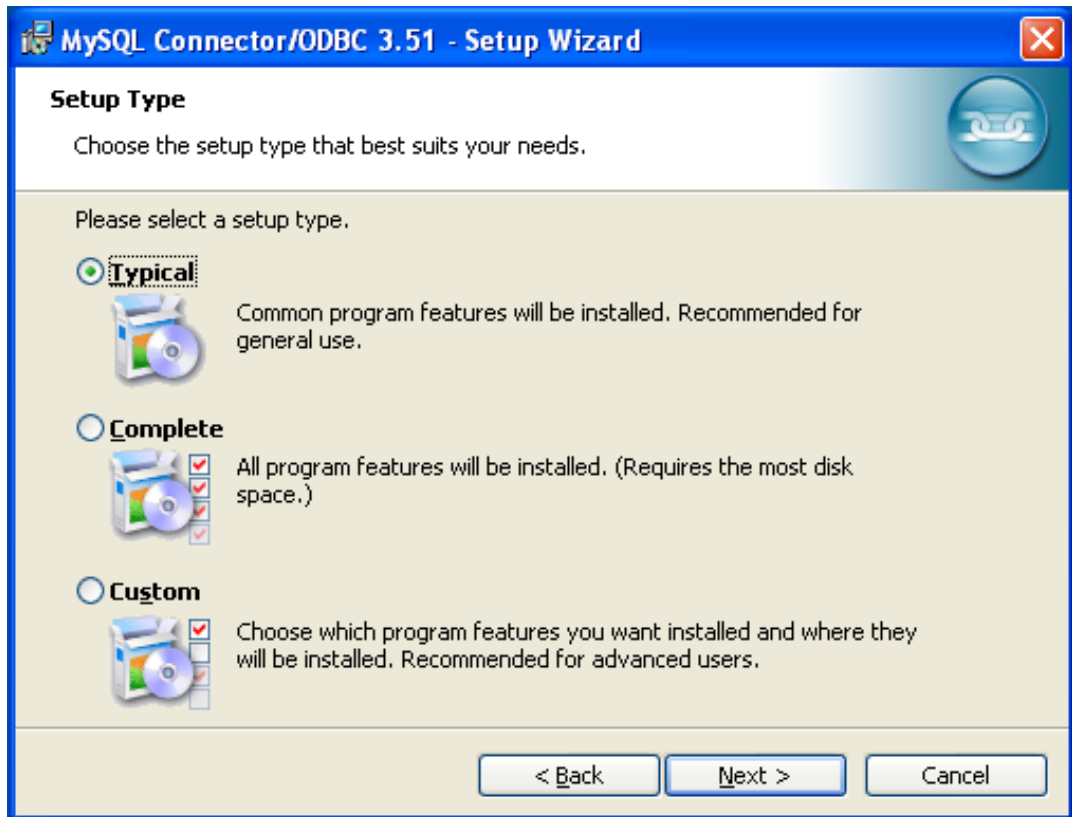

1. Double click on the standalone installer that you extracted, or the MSI file you downloaded.
2. The MySQL Connector/ODBC 3.51 - Setup Wizard will start. Click the [Next](#) button to begin the installation process.

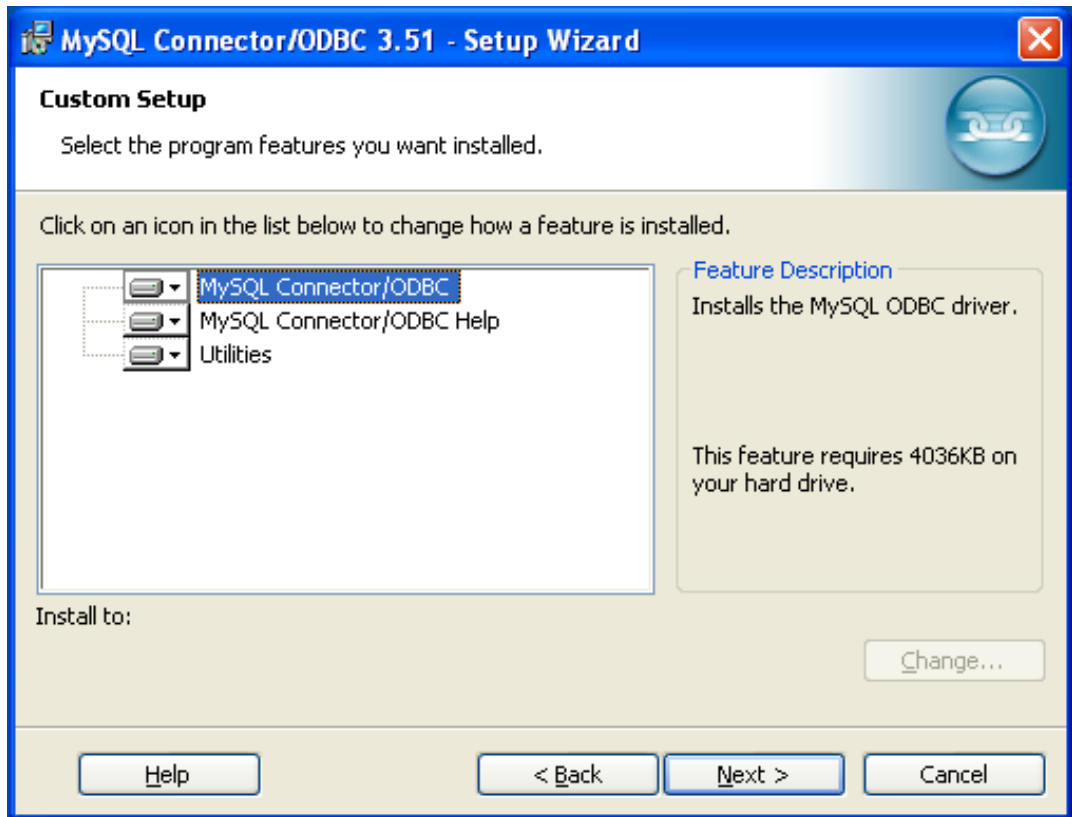

3. You will need to choose the installation type. The Typical installation provides the standard files you will need to connect to a MySQL database using ODBC. The Complete option installs all the available files, including debug and utility components. It is recommended you choose one of these two options to complete the installation. If choose one of these methods, click [Next](#) and then proceed to step 5.

You may also choose a Custom installation, which enables you to select the individual components that you want to install. You have chosen this method, click [Next](#) and then proceed to step 4.

4. If you have chosen a custom installation, use the popups to select which components to install and then click [Next](#) to install the necessary files.

5. Once the files have copied to your machine, the installation is complete. Click **Finish** to exit the installer.

Now the installation is complete, you can continue to configure your ODBC connections using [Section 18.1.3, “MyODBC Configuration”](#).

#### 18.1.2.3.1.2. Installing the Windows MyODBC Driver using the Zipped DLL package

If you have downloaded the Zipped DLL package then you must install the individual files required for MyODBC operation manually. Once you have unzipped the installation files, you can either perform this operation by hand, executing each statement individually, or you can use the included Batch file to perform an installation to the default locations.

To install using the Batch file:

1. Unzip the MyODBC Zipped DLL package.
2. Open a Command Prompt.
3. Change to the directory created when you unzipped the MyODBC Zipped DLL package.
4. Run `Install.bat`:

```
C:\> Install.bat
```

This will copy the necessary files into the default location, and then register the MyODBC driver with the Windows ODBC manager.

If you want to copy the files to an alternative location - for example, to run or test different versions of

the MyODBC driver on the same machine, then you must copy the files by hand. It is however not recommended to install these files in a non-standard location. To copy the files by hand to the default installation location use the following steps:

1. Unzip the MyODBC Zipped DLL package.
2. Open a Command Prompt.
3. Change to the directory created when you unzipped the MyODBC Zipped DLL package.
4. Copy the library files to a suitable directory. The default is to copy them into the default Windows system directory `\Windows\System32`:

```
C:\> copy lib\myodbc3s.dll \Windows\System32
C:\> copy lib\myodbc3s.lib \Windows\System32
C:\> copy lib\myodbc3.dll \Windows\System32
C:\> copy lib\myodbc3.lib \Windows\System32
```

5. Copy the MyODBC tools. These must be placed into a directory that is in the system `PATH`. The default is to install these into the Windows system directory `\Windows\System32`:

```
C:\> copy bin\myodbc3i.exe \Windows\System32
C:\> copy bin\myodbc3m.exe \Windows\System32
C:\> copy bin\myodbc3c.exe \Windows\System32
```

6. Optionally copy the help files. For these files to be accessible through the help system, they must be installed in the Windows system directory:

```
C:\> copy doc\*.hlp \Windows\System32
```

7. Finally, you must register the MyODBC driver with the ODBC manager:

```
C:\> myodbc3i -a -d -t"MySQL ODBC 3.51 Driver;\
DRIVER=myodbc3.dll;SETUP=myodbc3s.dll"
```

You must change the references to the DLL files and command location in the above statement if you have not installed these files into the default location.

### 18.1.2.3.1.3. Handling Installation Errors

On Windows, you may get the following error when trying to install the older MyODBC 2.50 driver:

```
An error occurred while copying C:\WINDOWS\SYSTEM\MFC30.DLL.
Restart Windows and try installing again (before running any
applications which use ODBC)
```

The reason for the error is that another application is currently using the ODBC system. Windows may not allow you to complete the installation. In most cases, you can continue by pressing `Ignore` to copy the rest of the MyODBC files and the final installation should still work. If it doesn't, the solution is to re-boot your computer in "safe mode." Choose safe mode by pressing `F8` just before your machine starts Windows during re-booting, install the MyODBC drivers, and re-boot to normal mode.

### 18.1.2.3.2. Installing MyODBC from a Binary Distribution on Unix

There are two methods available for installing MyODBC on Unix from a binary distribution. For most Unix environments you will need to use the tarball distribution. For Linux systems, there is also an RPM distribution available.

### 18.1.2.3.2.1. Installing MyODBC from a Binary Tarball Distribution

To install the driver from a tarball distribution (`.tar.gz` file), download the latest version of the driver for your operating system and follow these steps that demonstrate the process using the Linux version of the tarball:

```
shell> su root
shell> gunzip MyODBC-3.51.11-i686-pc-linux.tar.gz
shell> tar xvf MyODBC-3.51.11-i686-pc-linux.tar
shell> cd MyODBC-3.51.11-i686-pc-linux
```

Read the installation instructions in the `INSTALL-BINARY` file and execute these commands.

```
shell> cp libmyodbc* /usr/local/lib
shell> cp odbc.ini /usr/local/etc
shell> export ODBCINI=/usr/local/etc/odbc.ini
```

Then proceed on to [Section 18.1.3.4, “Configuring a MyODBC DSN on Unix”](#), to configure the DSN for MyODBC. For more information, refer to the `INSTALL-BINARY` file that comes with your distribution.

### 18.1.2.3.2.2. Installing MyODBC from an RPM Distribution

To install or upgrade MyODBC from an RPM distribution on Linux, simply download the RPM distribution of the latest version of MyODBC and follow the instructions below. Use `su root` to become `root`, then install the RPM file.

If you are installing for the first time:

```
shell> su root
shell> rpm -ivh MyODBC-3.51.12.i386.rpm
```

If the driver exists, upgrade it like this:

```
shell> su root
shell> rpm -Uvh MyODBC-3.51.12.i386.rpm
```

If there is any dependency error for MySQL client library, `libmysqlclient`, simply ignore it by supplying the `--nodeps` option, and then make sure the MySQL client shared library is in the path or set through `LD_LIBRARY_PATH`.

This installs the driver libraries and related documents to `/usr/local/lib` and `/usr/share/doc/MyODBC`, respectively. Proceed onto [Section 18.1.3.4, “Configuring a MyODBC DSN on Unix”](#).

To **uninstall** the driver, become `root` and execute an `rpm` command:

```
shell> su root
shell> rpm -e MyODBC
```

### 18.1.2.3.3. Installing MyODBC on Mac OS X

Mac OS X is based on the FreeBSD operating system, and you can normally use the MySQL network port for connecting to MySQL servers on other hosts. Installing the MyODBC driver enables you to connect to MySQL databases on any platform through the ODBC interface. You should only need to install the MyODBC driver when your application requires an ODBC interface. Applications that require or can use ODBC (and therefore the MyODBC driver) include ColdFusion, Filemaker Pro, 4th Dimension and many other applications.

Mac OS X includes its own ODBC manager, based on the [iODBC](#) manager. Mac OS X includes an administration tool that provides easier administration of ODBC drivers and configuration, updating the underlying [iODBC](#) configuration files.

#### 18.1.2.3.3.1. Installing the MyODBC Driver

You can install MyODBC on a Mac OS X or Mac OS X Server computer by using the binary distribution. The package is available as a compressed disk image ([.dmg](#)) file. To install MyODBC on your computer using this method, follow these steps:

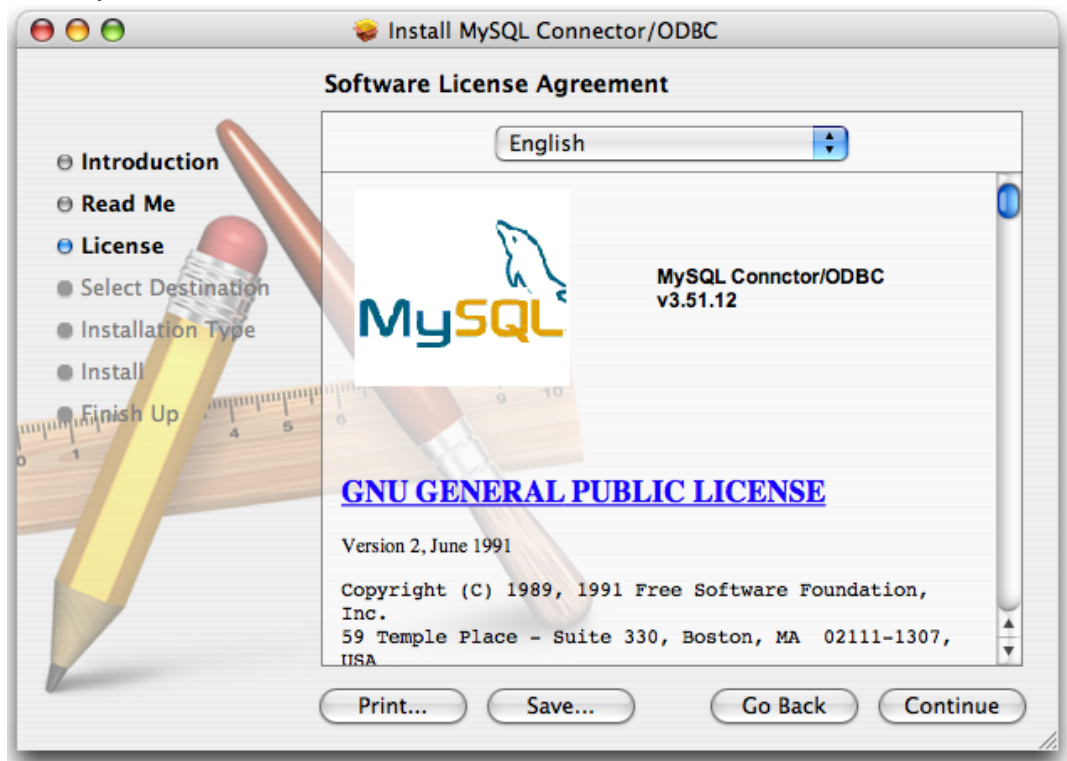

1. Download the file to your computer and double-click on the downloaded image file.
2. Within the disk image you will find an installer package (with the [.pkg](#) extension). Double click on this file to start the Mac OS X installer.
3. You will be presented with the installer welcome message. Click the [Continue](#) button to begin the installation process.

4. Please take the time to read the Important Information as it contains guidance on how to complete the installation process. Once you have read the notice and collected the necessary information, click [Continue](#).

5. MyODBC drivers are made available under the GNU General Public License. Please read the license if you are not familiar with it before continuing installation. Click [Continue](#) to approve the license (you will be asked to confirm that decision) and continue the installation.

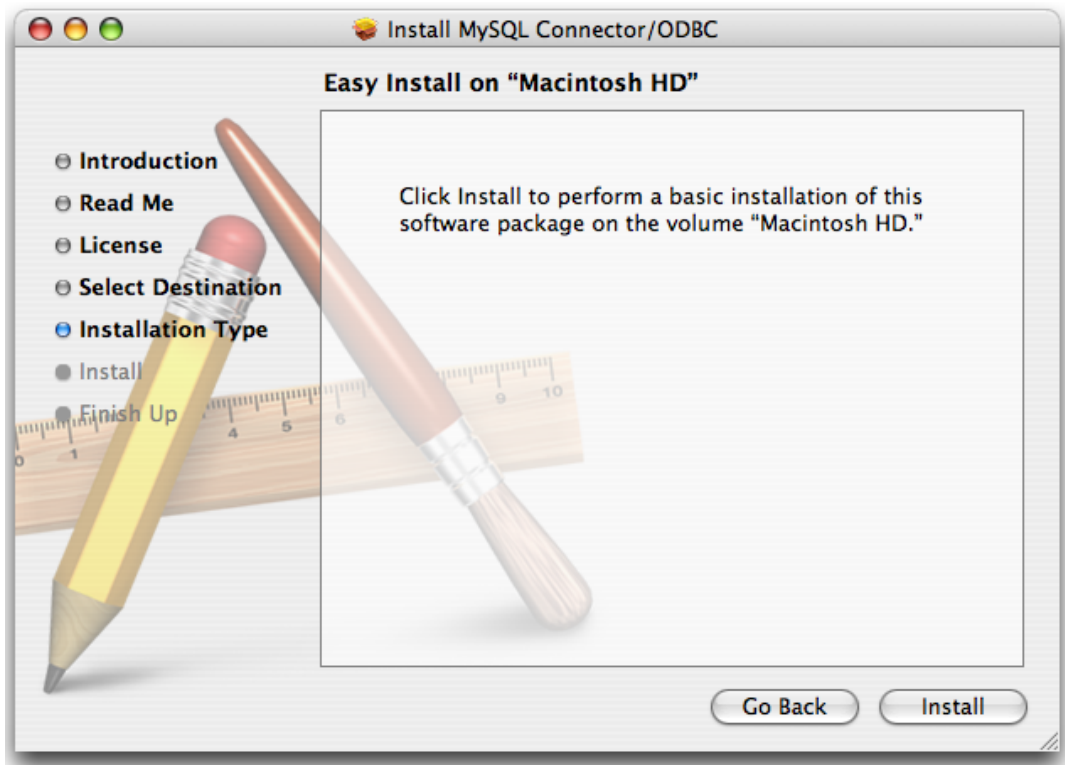

6. Choose a location to install the MyODBC drivers and the ODBC Administrator application. You must install the files onto a drive with an operating system and you may be limited in the choices available. Select the drive you want to use, and then click [Continue](#).

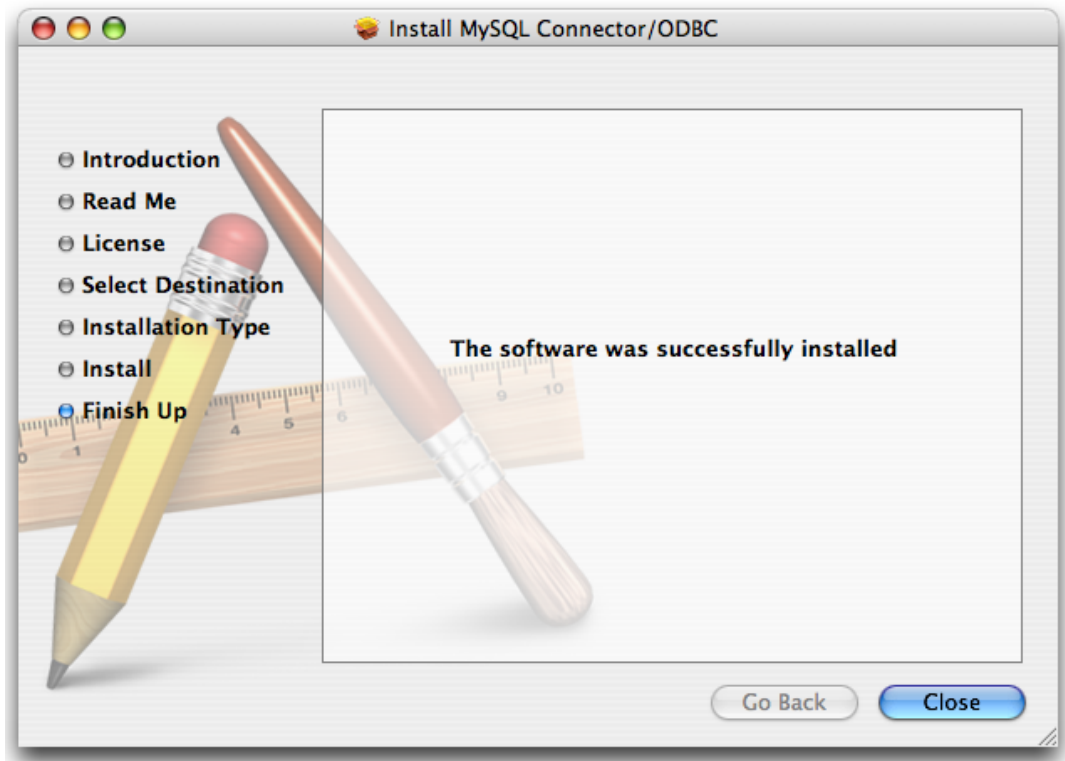

7. The installer will automatically select the files that need to be installed on your machine. Click [Install](#) to continue. The installer will copy the necessary files to your machine. A progress bar will be shown indicating the installation progress.

8. When installation has been completed you will get a window like the one shown below. Click **Close** to close and quit the installer.

## 18.1.2.4. Installing MyODBC from a source distribution

Installing MyODBC from a source distribution gives you greater flexibility in the contents and installation location of the MyODBC components. It also enables you to build and install MyODBC on platforms where a pre-compiled binary is not available.

MyODBC sources are available either as a downloadable package, or through the revision control system used by the MyODBC developers.

### 18.1.2.4.1. Installing MyODBC from a Source Distribution on Windows

You should only need to install MyODBC from source on Windows if you want to change or modify the source or installation. If you are unsure whether to install from source, please use the binary installation detailed in [Section 18.1.2.3.1, “Installing MyODBC from a Binary Distribution on Windows”](#).

Installing MyODBC from source on Windows requires a number of different tools and packages:

- MDAC, Microsoft Data Access SDK from <http://www.microsoft.com/data/>.
- Suitable C compiler, such as Microsoft Visual C++ or the C compiler included with Microsoft Visual Studio.
- Compatible `make` tool. Microsoft's `nmake` is used in the examples in this section.
- MySQL client libraries and include files from MySQL 4.0.0 or higher. (Preferably MySQL 4.0.16 or higher). This is required because MyODBC uses new calls and structures that exist only starting from this version of the library. To get the client libraries and include files, visit <http://dev.mysql.com/downloads/>.

#### 18.1.2.4.1.1. Building MyODBC 3.51

MyODBC source distributions include `Makefiles` that require the `nmake` or other `make` utility. In the distribution, you can find `Makefile` for building the release version and `Makefile_debug` for building debugging versions of the driver libraries and DLLs.

To build the driver, use this procedure:

1. Download and extract the sources to a folder, then change directory into that folder. The following command assumes the folder is named `myodbc3-src`:

```
C:\> cd myodbc3-src
```

2. Edit `Makefile` to specify the correct path for the MySQL client libraries and header files. Then use the following commands to build and install the release version:

```
C:\> nmake -f Makefile
C:\> nmake -f Makefile install
```

`nmake -f Makefile` builds the release version of the driver and places the binaries in subdirectory called `Release`.

`nmake -f Makefile install` installs (copies) the driver DLLs and libraries (`myodbc3.dll`, `myodbc3.lib`) to your system directory.

3. To build the debug version, use `Makefile_Debug` rather than `Makefile`, as shown below:

```
C:\> nmake -f Makefile_debug
C:\> nmake -f Makefile_debug install
```

4. You can clean and rebuild the driver by using:

```
C:\> nmake -f Makefile_clean
C:\> nmake -f Makefile_install
```

**Note:**

- Make sure to specify the correct MySQL client libraries and header files path in the Makefiles (set the `MYSQL_LIB_PATH` and `MYSQL_INCLUDE_PATH` variables). The default header file path is assumed to be `C:\mysql\include`. The default library path is assumed to be `C:\mysql\lib\opt` for release DLLs and `C:\mysql\lib\debug` for debug versions.
- For the complete usage of `nmake`, visit [http://msdn.microsoft.com/library/default.asp?url=/library/en-us/dv\\_vcce4/html/evgrfRunningNMAKE.asp](http://msdn.microsoft.com/library/default.asp?url=/library/en-us/dv_vcce4/html/evgrfRunningNMAKE.asp).
- If you are using the Subversion tree for compiling, all Windows-specific `Makefiles` are named as `Win_Makefile*`.

#### 18.1.2.4.1.2. Testing

After the driver libraries are copied/installed to the system directory, you can test whether the libraries are properly built by using the samples provided in the `samples` subdirectory:

```
C:\> cd samples
C:\> nmake -f Makefile_all
```

#### 18.1.2.4.1.3. Building MyODBC 2.50

The MyODBC 2.50 source distribution includes VC workspace files. You can build the driver using these files (`.dsp` and `.dsw`) directly by loading them from Microsoft Visual Studio 6.0 or higher.

#### 18.1.2.4.2. Installing MyODBC from a Source Distribution on Unix

You need the following tools to build MySQL from source on Unix:

- A working ANSI C++ compiler. `gcc` 2.95.2 or later, `egcs` 1.0.2 or later or `egcs 2.91.66`, SGI C++, and SunPro C++ are some of the compilers that are known to work.
- A good `make` program. GNU `make` is always recommended and is sometimes required.
- MySQL client libraries and include files from MySQL 4.0.0 or higher. (Preferably MySQL 4.0.16 or higher). This is required because MyODBC uses new calls and structures that exist only starting from this version of the library. To get the client libraries and include files, visit <http://dev.mysql.com/downloads/>.

If you have built your own MySQL server and/or client libraries from source then you must have used the `--enable-thread-safe-client` option to `configure` when the libraries were built.

You should also ensure that the `libmysqlclient` library were built and installed as a shared lib-

rary.

- A compatible ODBC manager must be installed. MyODBC is known to work with the `iODBC` and `unixODBC` managers. See [Section 18.1.1.2.2, “ODBC Driver Managers”](#), for more information.
- If you are using a character set that isn't compiled into the MySQL client library then you need to install the MySQL character definitions from the `charsets` directory into `SHAREDIR` (by default, `/usr/local/mysql/share/mysql/charsets`). These should be in place if you have installed the MySQL server on the same machine. See [Chapter 10, \*Character Set Support\*](#), for more information on character set support.

Once you have all the required files, unpack the source files to a separate directory, you then have to run `configure` and build the library using `make`.

#### 18.1.2.4.2.1. Typical `configure` Options

The `configure` script gives you a great deal of control over how you configure your MyODBC build. Typically you do this using options on the `configure` command line. You can also affect `configure` using certain environment variables. For a list of options and environment variables supported by `configure`, run this command:

```
shell> ./configure --help
```

Some of the more commonly used `configure` options are described here:

1. To compile MyODBC, you need to supply the MySQL client include and library files path using the `--with-mysql-path=DIR` option, where `DIR` is the directory where MySQL is installed.

MySQL compile options can be determined by running `DIR/bin/mysql_config`.

2. Supply the standard header and library files path for your ODBC Driver Manager (`iODBC` or `unixODBC`).
  - If you are using `iODBC` and `iODBC` is not installed in its default location (`/usr/local`), you might have to use the `--with-iodbc=DIR` option, where `DIR` is the directory where `iODBC` is installed.

If the `iODBC` headers do not reside in `DIR/include`, you can use the `--with-iodbc-includes=INCDIR` option to specify their location.

The applies to libraries. If they are not in `DIR/lib`, you can use the `--with-iodbc-libs=LIBDIR` option.

- If you are using `unixODBC`, use the `--with-unixODBC=DIR` option (case sensitive) to make `configure` look for `unixODBC` instead of `iODBC` by default, `DIR` is the directory where `unixODBC` is installed.

If the `unixODBC` headers and libraries aren't located in `DIR/include` and `DIR/lib`, use the `--with-unixODBC-includes=INCDIR` and `--with-unixODBC-libs=LIBDIR` options.

3. You might want to specify an installation prefix other than `/usr/local`. For example, to install the MyODBC drivers in `/usr/local/odbc/lib`, use the `--prefix=/usr/local/odbc` option.

The final configuration command looks something like this:

```
shell> ./configure --prefix=/usr/local \
--with-iodbc=/usr/local \
--with-mysql-path=/usr/local/mysql
```

#### 18.1.2.4.2.2. Additional configure Options

There are a number of other options that you need, or want, to set when configuring the MyODBC driver before it is built.

- To link the driver with MySQL thread safe client libraries `libmysqlclient_r.so` or `libmysqlclient_r.a`, you must specify the following `configure` option:

```
--enable-thread-safe
```

and can be disabled (default) using

```
--disable-thread-safe
```

This option enables the building of the driver thread-safe library `libmyodbc3_r.so` from by linking with MySQL thread-safe client library `libmysqlclient_r.so` (The extensions are OS dependent).

If the compilation with the thread-safe option fails, it may be because the correct thread-libraries on the system could not be located. You should set the value of `LIBS` to point to the correct thread library for your system.

```
LIBS="-lpthread" ./configure ..
```

- You can enable or disable the shared and static versions of MyODBC using these options:

```
--enable-shared[=yes/no]
--disable-shared
--enable-static[=yes/no]
--disable-static
```

- By default, all the binary distributions are built as non-debugging versions (configured with `--without-debug`).

To enable debugging information, build the driver from source distribution and use the `--with-debug` option when you run `configure`.

- This option is available only for source trees that have been obtained from the Subversion repository. This option does not apply to the packaged source distributions.

By default, the driver is built with the `--without-docs` option. If you would like the documentation to be built, then execute `configure` with:

```
--with-docs
```

#### 18.1.2.4.2.3. Building and Compilation

To build the driver libraries, you have to just execute `make`.

```
shell> make
```

If any errors occur, correct them and continue the build process. If you aren't able to build, then send a

detailed email to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com) for further assistance.

#### 18.1.2.4.2.4. Building Shared Libraries

On most platforms, MySQL does not build or support `.so` (shared) client libraries by default. This is based on our experience of problems when building shared libraries.

In cases like this, you have to download the MySQL distribution and configure it with these options:

```
--without-server --enable-shared
```

To build shared driver libraries, you must specify the `--enable-shared` option for `configure`. By default, `configure` does not enable this option.

If you have configured with the `--disable-shared` option, you can build the `.so` file from the static libraries using the following commands:

```
shell> cd MyODBC-3.51.01
shell> make
shell> cd driver
shell> CC=/usr/bin/gcc \
  $CC -bundle -flat_namespace -undefined error \
  -o .libs/libmyodbc3-3.51.01.so \
  catalog.o connect.o cursor.o dll.o error.o execute.o \
  handle.o info.o misc.o myodbc3.o options.o prepare.o \
  results.o transact.o utility.o \
  -L/usr/local/mysql/lib/mysql/ \
  -L/usr/local/iodbc/lib/ \
  -lz -lc -lmysqlclient -liodbcinst
```

Make sure to change `-liodbcinst` to `-lodbcinst` if you are using `unixODBC` instead of `iodbc`, and configure the library paths accordingly.

This builds and places the `libmyodbc3-3.51.01.so` file in the `.libs` directory. Copy this file to the MyODBC library installation directory (`/usr/local/lib` (or the `lib` directory under the installation directory that you supplied with the `--prefix`).

```
shell> cd .libs
shell> cp libmyodbc3-3.51.01.so /usr/local/lib
shell> cd /usr/local/lib
shell> ln -s libmyodbc3-3.51.01.so libmyodbc3.so
```

To build the thread-safe driver library:

```
shell> CC=/usr/bin/gcc \
  $CC -bundle -flat_namespace -undefined error \
  -o .libs/libmyodbc3_r-3.51.01.so \
  catalog.o connect.o cursor.o dll.o error.o execute.o \
  handle.o info.o misc.o myodbc3.o options.o prepare.o \
  results.o transact.o utility.o \
  -L/usr/local/mysql/lib/mysql/ \
  -L/usr/local/iodbc/lib/ \
  -lz -lc -lmysqlclient_r -liodbcinst
```

#### 18.1.2.4.2.5. Installing Driver Libraries

To install the driver libraries, execute the following command:

```
shell> make install
```

That command installs one of the following sets of libraries:

For MyODBC 3.51:

- `libmyodbc3.so`
- `libmyodbc3-3.51.01.so`, where 3.51.01 is the version of the driver
- `libmyodbc3.a`

For thread-safe MyODBC 3.51:

- `libmyodbc3_r.so`
- `libmyodbc3-3_r.51.01.so`
- `libmyodbc3_r.a`

For MyODBC 2.5.0:

- `libmyodbc.so`
- `libmyodbc-2.50.39.so`, where 2.50.39 is the version of the driver
- `libmyodbc.a`

For more information on build process, refer to the [INSTALL](#) file that comes with the source distribution. Note that if you are trying to use the `make` from Sun, you may end up with errors. On the other hand, GNU `gmake` should work fine on all platforms.

#### 18.1.2.4.2.6. Testing MyODBC on Unix

To run the basic samples provided in the distribution with the libraries that you built, use the following command:

```
shell> make test
```

Before running the tests, create the DSN 'myodbc3' in `odbc.ini` and set the environment variable `ODBCINI` to the correct `odbc.ini` file; and MySQL server is running. You can find a sample `odbc.ini` with the driver distribution.

You can even modify the `samples/run-samples` script to pass the desired DSN, UID, and PASSWORD values as the command-line arguments to each sample.

#### 18.1.2.4.2.7. Building MyODBC from Source on Mac OS X

To build the driver on Mac OS X (Darwin), make use of the following `configure` example:

```
shell> ./configure --prefix=/usr/local
--with-unixODBC=/usr/local
--with-mysql-path=/usr/local/mysql
--disable-shared
--enable-gui=no
--host=powerpc-apple
```

The command assumes that the `unixODBC` and MySQL are installed in the default locations. If not, configure accordingly.

On Mac OS X, `--enable-shared` builds `.dylib` files by default. You can build `.so` files like this:

```
shell> make
shell> cd driver
shell> CC=/usr/bin/gcc \
    $CC -bundle -flat_namespace -undefined error
    -o .libs/libmyodbc3-3.51.01.so *.o
    -L/usr/local/mysql/lib/
    -L/usr/local/iodbc/lib
    -liodbcinst -lmysqlclient -lz -lc
```

To build the thread-safe driver library:

```
shell> CC=/usr/bin/gcc \
    $CC -bundle -flat_namespace -undefined error
    -o .libs/libmyodbc3-3.51.01.so *.o
    -L/usr/local/mysql/lib/
    -L/usr/local/iodbc/lib
    -liodbcinst -lmysqlclient_r -lz -lc -lpthread
```

Make sure to change the `-liodbcinst` to `-lodbcinst` in case of using `unixODBC` instead of `iODBC` and configure the libraries path accordingly.

In Apple's version of GCC, both `cc` and `gcc` are actually symbolic links to `gcc3`.

Copy this library to the `$prefix/lib` directory and symlink to `libmyodbc3.so`.

You can cross-check the output shared-library properties using this command:

```
shell> otool -LD .libs/libmyodbc3-3.51.01.so
```

#### 18.1.2.4.2.8. Building MyODBC from Source on HP-UX

To build the driver on HP-UX 10.x or 11.x, make use of the following `configure` example:

If using `cc`:

```
shell> CC="cc" \
    CFLAGS="+z" \
    LDFLAGS="-Wl,+b:-Wl,+s" \
    ./configure --prefix=/usr/local
    --with-unixodbc=/usr/local
    --with-mysql-path=/usr/local/mysql/lib/mysql
    --enable-shared
    --enable-thread-safe
```

If using `gcc`:

```
shell> CC="gcc" \
    LDFLAGS="-Wl,+b:-Wl,+s" \
    ./configure --prefix=/usr/local
    --with-unixodbc=/usr/local
    --with-mysql-path=/usr/local/mysql
    --enable-shared
    --enable-thread-safe
```

Once the driver is built, cross-check its attributes using `chatr .libs/libmyodbc3.sl` to determine whether you need to have set the MySQL client library path using the `SHLIB_PATH` environment variable. For static versions, ignore all shared-library options and run `configure` with the `--disable-shared` option.

#### 18.1.2.4.2.9. Building MyODBC from Source on AIX

To build the driver on AIX, make use of the following `configure` example:

```
shell> ./configure --prefix=/usr/local
```

```
--with-unixodbc=/usr/local
--with-mysql-path=/usr/local/mysql
--disable-shared
--enable-thread-safe
```

**NOTE:** For more information about how to build and set up the static and shared libraries across the different platforms refer to ' [Using static and shared libraries across platforms](http://www.fortran-2000.com/ArnaudRecipes/sharedlib.html) [<http://www.fortran-2000.com/ArnaudRecipes/sharedlib.html>]'.

### 18.1.2.4.3. Installing MyODBC from the Development Source Tree

**Caution:** You should read this section only if you are interested in helping us test our new code. If you just want to get MySQL Connector/ODBC up and running on your system, you should use a standard release distribution.

To be able to access the MyODBC source tree, you must have Subversion installed. Subversion is freely available from <http://subversion.tigris.org/>.

To build from the source trees, you need the following tools:

- autoconf 2.52 (or newer)
- automake 1.4 (or newer)
- libtool 1.4 (or newer)
- m4

The most recent development source tree is available from our public Subversion trees at <http://dev.mysql.com/tech-resources/sources.html>.

To checkout out the Connector/ODBC sources, change to the directory where you want the copy of the MyODBC tree to be stored, then use the following command:

```
shell> svn co http://svn.mysql.com/svnpublic/connector-odbc3
```

You should now have a copy of the entire MyODBC source tree in the directory `connector-odbc3`. To build from this source tree on Unix or Linux follow these steps:

```
shell> cd connector-odbc3
shell> aclocal
shell> autoheader
shell> autoconf
shell> automake;
shell> ./configure # Add your favorite options here
shell> make
```

For more information on how to build, refer to the `INSTALL` file located in the same directory. For more information on options to `configure`, see [Section 18.1.2.4.2.1, “Typical configure Options”](#)

When the build is done, run `make install` to install the MyODBC 3.51 driver on your system.

If you have gotten to the `make` stage and the distribution does not compile, please report it to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com).

On Windows, make use of Windows Makefiles `WIN-Makefile` and `WIN-Makefile_debug` in building the driver. For more information, see [Section 18.1.2.4.1, “Installing MyODBC from a Source Distribution on Windows”](#).

After the initial checkout operation to get the source tree, you should run `svn update` periodically update your source according to the latest version.

## 18.1.3. MyODBC Configuration

Before you connect to a MySQL database using the MyODBC driver you must configure an ODBC *Data Source Name*. The DSN associates the various configuration parameters required to communicate with a database to a specific name. You use the DSN in an application to communicate with the database, rather than specifying individual parameters within the application itself. DSN information can be user specific, system specific, or provided in a special file. ODBC data source names are configured in different ways, depending on your platform and ODBC driver.

### 18.1.3.1. Data Source Names

A Data Source Name associates the configuration parameters for communicating with a specific database. Generally a DSN consists of the following parameters:

- Name
- Hostname
- Database Name
- Login
- Password

In addition, different ODBC drivers, including MyODBC, may accept additional driver-specific options and parameters.

There are three types of DSN:

- A *System DSN* is a global DSN definition that is available to any user and application on a particular system. A System DSN can normally only be configured by a systems administrator, or by a user who has specific permissions that let them create System DSNs.
- A *User DSN* is specific to an individual user, and can be used to store database connectivity information that the user regularly uses.
- A *File DSN* uses a simple file to define the DSN configuration. File DSNs can be shared between users and machines and are therefore more practical when installing or deploying DSN information as part of an application across many machines.

DSN information is stored in different locations depending on your platform and environment.

### 18.1.3.2. Configuring a MyODBC DSN on Windows

The [ODBC Data Source Administrator](#) within Windows enables you to create DSNs, check driver installation and configure ODBC systems such as tracing (used for debugging) and connection pooling.

Different editions and versions of Windows store the [ODBC Data Source Administrator](#) in different locations depending on the version of Windows that you are using.

To open the [ODBC Data Source Administrator](#) in Windows Server 2003:

1. On the [Start](#) menu, choose [Administrative Tools](#), and then click [Data Sources \(ODBC\)](#).

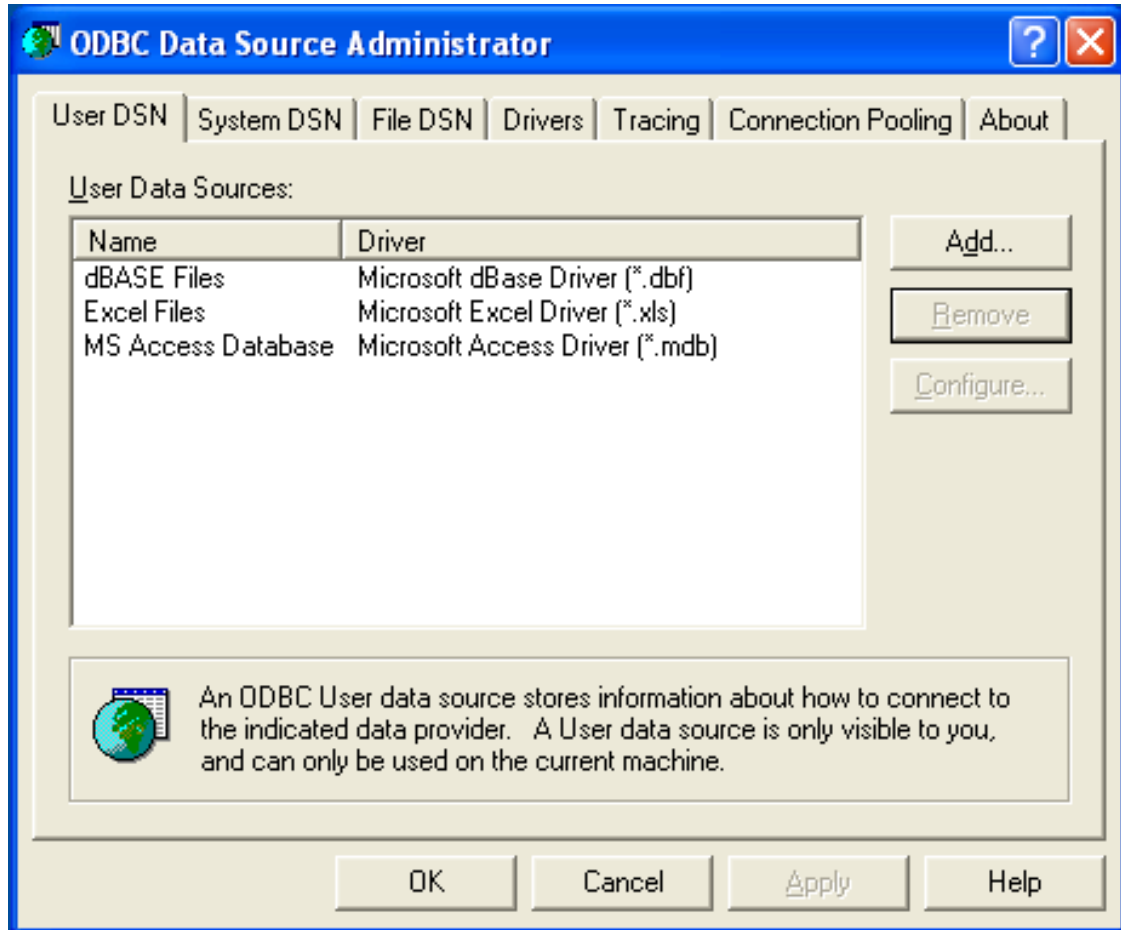

To open the [ODBC Data Source Administrator](#) in Windows 2000 Server or Windows 2000 Professional:

1. On the [Start](#) menu, choose [Settings](#), and then click [Control Panel](#).
2. In [Control Panel](#), click [Administrative Tools](#).
3. In [Administrative Tools](#), click [Data Sources \(ODBC\)](#).

To open the [ODBC Data Source Administrator](#) on Windows XP:

1. On the [Start](#) menu, click [Control Panel](#).
2. In the [Control Panel](#) when in [Category View](#) click [Performance and Maintenance](#) and then click [Administrative Tools](#). If you are viewing the [Control Panel](#) in [Classic View](#), click [Administrative Tools](#).
3. In [Administrative Tools](#), click [Data Sources \(ODBC\)](#).

Irrespective of your Windows version, you should be presented the [ODBC Data Source Administrator](#) window:

Within Windows XP, you can add the [Administrative Tools](#) folder to your [Start](#) menu to make it easier to locate the ODBC Data Source Administrator. To do this:

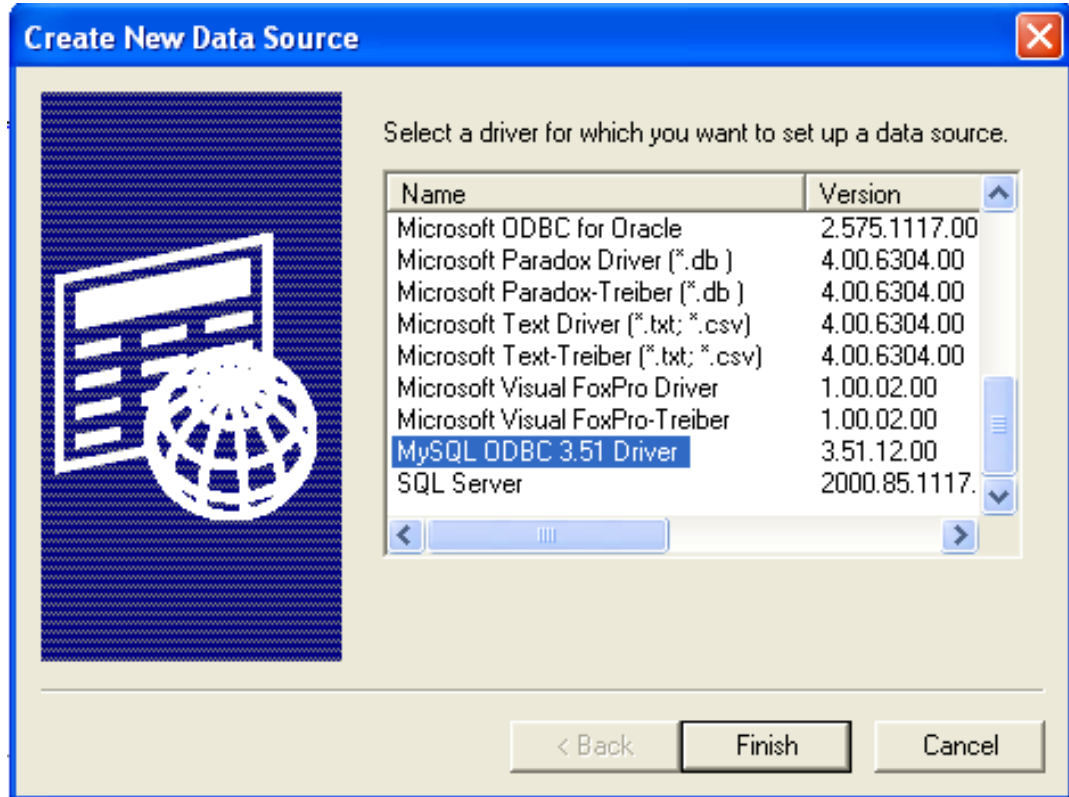

1. Right click on the [Start](#) menu.
2. Select [Properties](#).
3. Click [Customize...](#)
4. Select the [Advanced](#) tab.
5. Within [Start menu items](#), within the [System Administrative Tools](#) section, select [Display on the All Programs menu](#).

Within both Windows Server 2003 and Windows XP you may want to permanently add the [ODBC Data Source Administrator](#) to your [Start](#) menu. To do this, locate the [Data Sources \(ODBC\)](#) icon using the methods shown, then right-click on the icon and then choose [Pin to Start Menu](#).

### 18.1.3.2.1. Adding a MyODBC DSN on Windows

To add and configure a new MyODBC data source on Windows, use the [ODBC Data Source Administrator](#):

1. Open the [ODBC Data Source Administrator](#).
2. To create a System DSN (which will be available to all users) , select the [System DSN](#) tab. To create a User DSN, which will be unique only to the current user, click the [Add. .](#) button.
3. You will need to select the ODBC driver for this DSN.

Select [MySQL ODBC 3.51 Driver](#), then click [Finish](#).

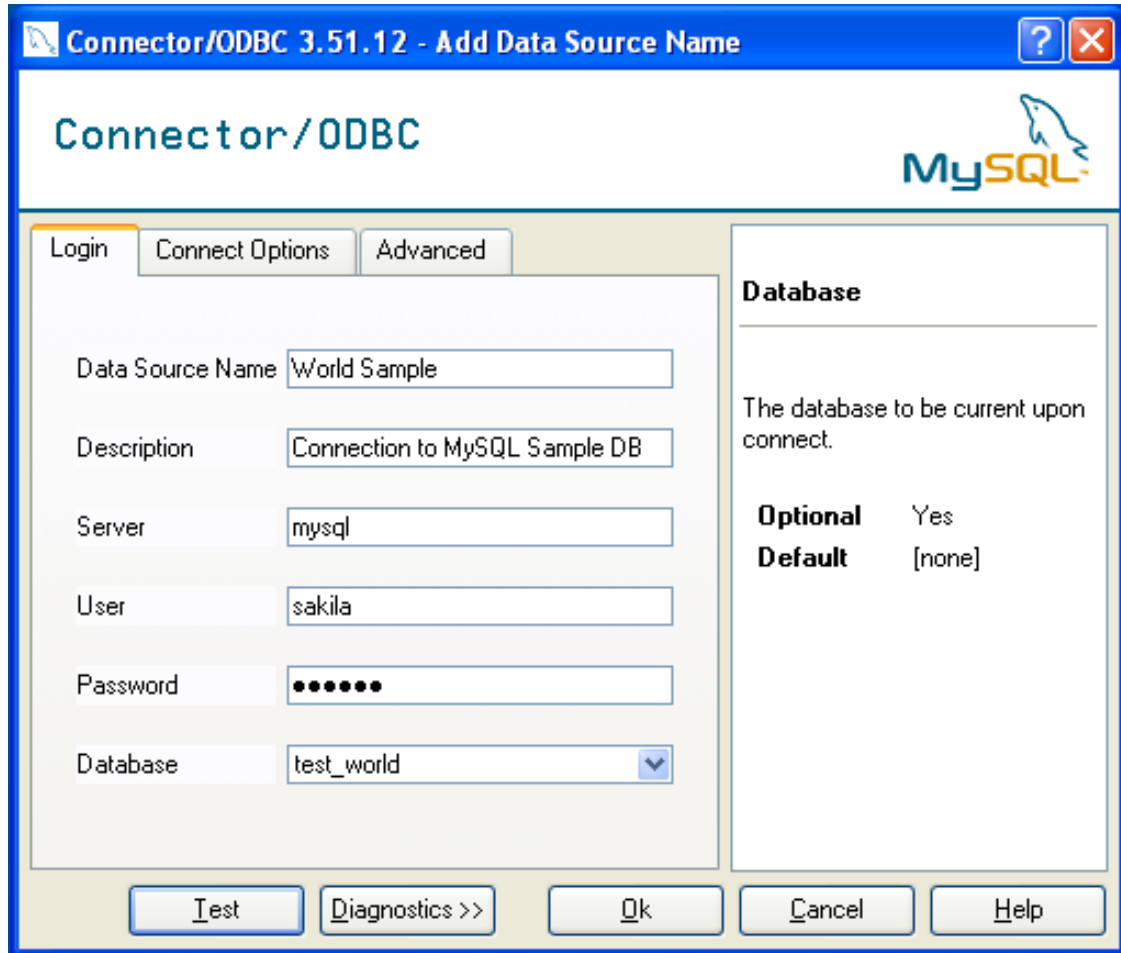

4. You now need to configure the specific fields for the DSN you are creating through the [Add Data Source Name](#) dialog.

In the **Data Source Name** box, enter the name of the data source you want to access. It can be any valid name that you choose.

5. In the **Description** box, enter some text to help identify the connection.
6. In the **Server** field, enter the name of the MySQL server host that you want to access. By default, it is `localhost`.
7. In the **User** field, enter the user name to use for this connection.
8. In the **Password** field, enter the corresponding password for this connection.
9. The **Database** popup should automatically populate with the list of databases that the user has permissions to access.
10. Click **OK** to save the DSN.

A completed DSN configuration may look like this:

### 18.1.3.2.2. Checking MyODBC DSN Configuration on Windows

You can verify the connection using the parameters you have entered by clicking the [Test](#) button. If the connection could be made successfully, you will be notified with a [Success; connection was made!](#) dialog.

If the connection failed, you can obtain more information on the test and why it may have failed by clicking the [Diagnostics...](#) button to show additional error messages.

### 18.1.3.2.3. MyODBC DSN Configuration Options

You can configure a number of options for a specific DSN by using either the [Connect Options](#) or [Advanced](#) tabs in the DSN configuration dialog.

The [Connection Options](#) dialog can be seen below.

The three options you can configure are:

- **Port** sets the TCP/IP port number to use when communicating with MySQL. Communication with MySQL uses port 3306 by default. If your server is configured to use a different TCP/IP port, you must specify that port number here.
- **Socket** sets the name or location of a specific socket or Windows pipe to use when communicating with MySQL.
- **Initial Statement** defines an SQL statement that will be executed when the connection to MySQL is opened. You can use this to set MySQL options for your connection, such as setting the default character set or database to use during your connection.

The **Advanced** tab enables you to configure MyODBC connection parameters. Refer to [Section 18.1.3.5, “MyODBC Connection Parameters”](#), for information about the meaning of these options.

#### 18.1.3.2.4. Errors and Debugging

This section answers MyODBC connection-related questions.

- **While configuring a MyODBC DSN, a `Could Not Load Translator or Setup Library` error occurs**

For more information, refer to [MS KnowledgeBase Article\(Q260558\)](http://support.microsoft.com/default.aspx?scid=kb;EN-US;q260558)

[<http://support.microsoft.com/default.aspx?scid=kb;EN-US;q260558>]. Also, make sure you have the latest valid `ct13d32.dll` in your system directory.

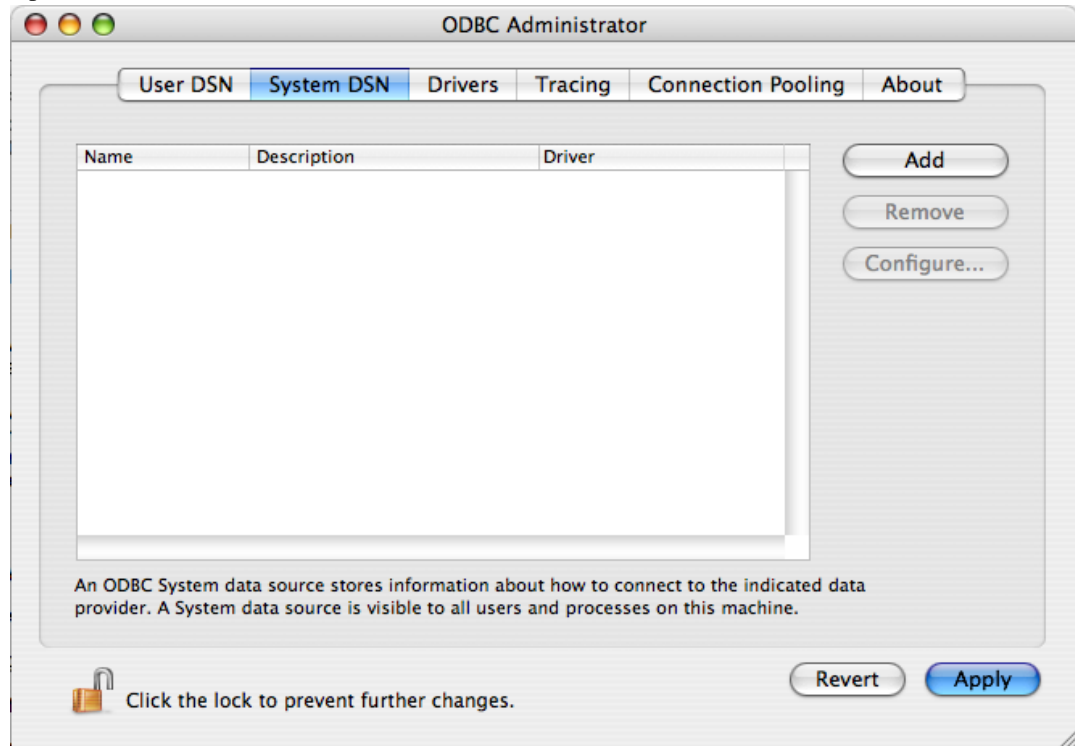

- On Windows, the default `myodbc3.dll` is compiled for optimal performance. If you want to debug MyODBC 3.51 (for example, to enable tracing), you should instead use `myodbc3d.dll`. To install this file, copy `myodbc3d.dll` over the installed `myodbc3.dll` file. Make sure to revert back to the release version of the driver DLL once you are done with the debugging because the debug version may cause performance issues. Note that the `myodbc3d.dll` isn't included in MyODBC 3.51.07 through 3.51.11. If you are using one of these versions, you should copy that DLL from a previous version (for example, 3.51.06).

For MyODBC 2.50, `myodbc.dll` and `myodbcd.dll` are used instead.

#### 18.1.3.3. Configuring a MyODBC DSN on Mac OS X

To configure a DSN on Mac OS X you should use the ODBC Administrator. If you have Mac OS X 10.2 or earlier, refer to [Section 18.1.3.4, “Configuring a MyODBC DSN on Unix”](#). Select whether you want to create a User DSN or a System DSN. If you want to add a System DSN, you may need to authenticate with the system. You must click the padlock and enter a user and password with administrator privileges.

1. Open the ODBC Administrator from the [Utilities](#) folder in the [Applications](#) folder.

2. On the User DSN or System DSN panel, click [Add](#).
3. Select the MyODBC driver and click [OK](#).
4. You will be presented with the [Data Source Name](#) dialog. Enter The [Data Source Name](#) and an optional [Description](#) for the DSN.

5. Click **Add** to add a new keyword/value pair to the panel. You should configure at least four pairs to specify the `server`, `username`, `password` and `database` connection parameters. See [Section 18.1.3.5, “MyODBC Connection Parameters”](#).
6. Click **OK** to add the DSN to the list of configured data source names.

A completed DSN configuration may look like this:

You can configure additional ODBC options to your DSN by adding further keyword/value pairs and

setting the corresponding values. See [Section 18.1.3.5, “MyODBC Connection Parameters”](#).

### 18.1.3.4. Configuring a MyODBC DSN on Unix

On [Unix](#), you configure DSN entries directly in the `odbc.ini` file. Here is a typical `odbc.ini` file that configures `myodbc` and `myodbc3` as the DSN names for MyODBC 2.50 and MyODBC 3.51, respectively:

```

;
; odbc.ini configuration for MyODBC and MyODBC 3.51 drivers
;

[ODBC Data Sources]
myodbc      = MyODBC 2.50 Driver DSN
myodbc3     = MyODBC 3.51 Driver DSN

[myodbc]
Driver      = /usr/local/lib/libmyodbc.so
Description = MyODBC 2.50 Driver DSN
SERVER      = localhost
PORT        =
USER        = root
Password    =
Database    = test
OPTION      = 3
SOCKET      =

[myodbc3]
Driver      = /usr/local/lib/libmyodbc3.so
Description = MyODBC 3.51 Driver DSN
SERVER      = localhost
PORT        =
USER        = root
Password    =
Database    = test
OPTION      = 3
SOCKET      =

[Default]
Driver      = /usr/local/lib/libmyodbc3.so
Description = MyODBC 3.51 Driver DSN
SERVER      = localhost
PORT        =
USER        = root
Password    =
Database    = test
OPTION      = 3
SOCKET      =

```

Refer to the [Section 18.1.3.5, “MyODBC Connection Parameters”](#), for the list of connection parameters that can be supplied.

**Note:** If you are using `unixODBC`, you can use the following tools to set up the DSN:

- ODBCConfig GUI tool([HOWTO: ODBCConfig](http://www.unixodbc.org/config.html) [<http://www.unixodbc.org/config.html>])
- `odbcinst`

In some cases when using `unixODBC`, you might get this error:

```
Data source name not found and no default driver specified
```

If this happens, make sure the `ODBCINI` and `ODBCSYSINI` environment variables are pointing to the right `odbc.ini` file. For example, if your `odbc.ini` file is located in `/usr/local/etc`, set the environment variables like this:

```
export ODBCINI=/usr/local/etc/odbc.ini
```

```
export ODBCYSINI=/usr/local/etc
```

### 18.1.3.5. MyODBC Connection Parameters

You can specify the parameters in the following tables for MyODBC when configuring a DSN. Users on Windows can use the Options and Advanced panels when configuring a DSN to set these parameters; see the table for information on which options relate to which fields and checkboxes. On Unix and Mac OS X, use the parameter name and value as the keyword/value pair in the DSN configuration. Alternatively, you can set these parameters within the `InConnectionString` argument in the `SQLDriverConnect()` call.

Parameter	Default Value	Comment
<code>user</code>	ODBC (on Windows)	The username used to connect to MySQL.
<code>server</code>	<code>localhost</code>	The hostname of the MySQL server.
<code>database</code>		The default database.
<code>option</code>	0	Options that specify how MyODBC should work. See below.
<code>port</code>	3306	The TCP/IP port to use if <code>server</code> is not <code>localhost</code> .
<code>stmt</code>		A statement to execute when connecting to MySQL.
<code>password</code>		The password for the <code>user</code> account on <code>server</code> .
<code>socket</code>		The Unix socket file or Windows named pipe to connect to if <code>server</code> is <code>localhost</code> .

The `option` argument is used to tell MyODBC that the client isn't 100% ODBC compliant. On Windows, you normally select options by toggling the checkboxes in the connection screen, but you can also select them in the `option` argument. The following options are listed in the order in which they appear in the MyODBC connect screen:

Value	Windows Checkbox	Description
1	Don't Optimized Column Width	The client can't handle that MyODBC returns the real width of a column.
2	Return Matching Rows	The client can't handle that MySQL returns the true value of affected rows. If this flag is set, MySQL returns "found rows" instead. You must have MySQL 3.21.14 or newer to get this to work.
4	Trace Driver Calls To myodbc.log	Make a debug log in <code>C:\myodbc.log</code> on Windows, or <code>/tmp/myodbc.log</code> on Unix variants.
8	Allow Big Results	Don't set any packet limit for results and parameters.
16	Don't Prompt Upon Connect	Don't prompt for questions even if driver would like to prompt.
32	Enable Dynamic Cursor	Enable or disable the dynamic cursor support. (Not allowed in MyODBC 2.50.)
64	Ignore # in Table Name	Ignore use of database name in <code>db_name.tbl_name.col_name</code> .
128	User Manager Cursors	Force use of ODBC manager cursors (experimental).
256	Don't Use Set Locale	Disable the use of extended fetch (experimental).
512	Pad Char To Full Length	Pad <code>CHAR</code> columns to full column length.
1024	Return Table Names for SQL-	<code>SQLDescribeCol()</code> returns fully qualified column

	DescribeCol	names.
2048	Use Compressed Protocol	Use the compressed client/server protocol.
4096	Ignore Space After Function Names	Tell server to ignore space after function name and before '(' (needed by PowerBuilder). This makes all function names keywords.
8192	Force Use of Named Pipes	Connect with named pipes to a <code>mysqld</code> server running on NT.
16384	Change BIGINT Columns to Int	Change <code>BIGINT</code> columns to <code>INT</code> columns (some applications can't handle <code>BIGINT</code> ).
32768	No Catalog (exp)	Return 'user' as <code>Table_qualifier</code> and <code>Table_owner</code> from <code>SQLTables</code> (experimental).
65536	Read Options From <code>my.cnf</code>	Read parameters from the <code>[client]</code> and <code>[odbc]</code> groups from <code>my.cnf</code> .
131072	Safe	Add some extra safety checks (should not be needed but...).
262144	Disable transaction	Disable transactions.
524288	Save queries to <code>myodbc.sql</code>	Enable query logging to <code>c:\myodbc.sql(/tmp/myodbc.sql)</code> file. (Enabled only in debug mode.)
1048576	Don't Cache Result (forward only cursors)	Do not cache the results locally in the driver, instead read from server ( <code>mysql_use_result()</code> ). This works only for forward-only cursors. This option is very important in dealing with large tables when you don't want the driver to cache the entire result set.
2097152	Force Use Of Forward Only Cursors	Force the use of <code>Forward-only</code> cursor type. In case of applications setting the default static/dynamic cursor type, and one wants the driver to use non-cache result sets, then this option ensures the forward-only cursor behavior.

To select multiple options, add together their values. For example, setting `option` to 12 (4+8) gives you debugging without packet limits.

The following table shows some recommended `option` values for various configurations:

Configuration	Option Value
Microsoft Access, Visual Basic	3
Driver trace generation (Debug mode)	4
Microsoft Access (with improved DELETE queries)	35
Large tables with too many rows	2049
Sybase PowerBuilder	135168
Query log generation (Debug mode)	524288
Generate driver trace as well as query log (Debug mode)	524292
Large tables with no-cache results	3145731

### 18.1.3.6. Connecting Without a Predefined DSN

You can connect to the MySQL server using `SQLDriverConnect`, by specifying the `DRIVER` name field. Here are the connection strings for MyODBC using DSN-Less connections:

**For MyODBC 2.50:**

```
ConnectionString = "DRIVER={MySQL};\  
SERVER=localhost;\  
DATABASE=test;\  
USER=venu;\  
PASSWORD=venu;\  
OPTION=3; "
```

**For MyODBC 3.51:**

```
ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};\  
SERVER=localhost;\  
DATABASE=test;\  
USER=venu;\  
PASSWORD=venu;\  
OPTION=3; "
```

If your programming language converts backslash followed by whitespace to a space, it is preferable to specify the connection string as a single long string, or to use a concatenation of multiple strings that does not add spaces in between. For example:

```
ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};"  
"SERVER=localhost;"  
"DATABASE=test;"  
"USER=venu;"  
"PASSWORD=venu;"  
"OPTION=3;"
```

**Note.** Note that on Mac OS X you may need to specify the full path to the MyODBC driver library.

Refer to the [Section 18.1.3.5, “MyODBC Connection Parameters”](#), for the list of connection parameters that can be supplied.

### 18.1.3.7. ODBC Connection Pooling

Connection pooling enables the ODBC driver to re-use existing connections to a given database from a pool of connections, instead of opening a new connection each time the database is accessed. By enabling connection pooling you can improve the overall performance of your application by lowering the time taken to open a connection to a database in the connection pool.

For more information about connection pooling: <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q169470>.

### 18.1.3.8. Getting an ODBC Trace File

If you encounter difficulties or problems with MyODBC, you should start by making a log file from the [ODBC Manager](#) and MyODBC. This is called *tracing*, and is enabled through the ODBC Manager. The procedure for this differs for Windows, Mac OS X and Unix.

#### 18.1.3.8.1. Enabling ODBC Tracing on Windows

To enable the trace option on Windows:

1. The [Tracing](#) tab of the ODBC Data Source Administrator dialog box enables you to configure the way ODBC function calls are traced.

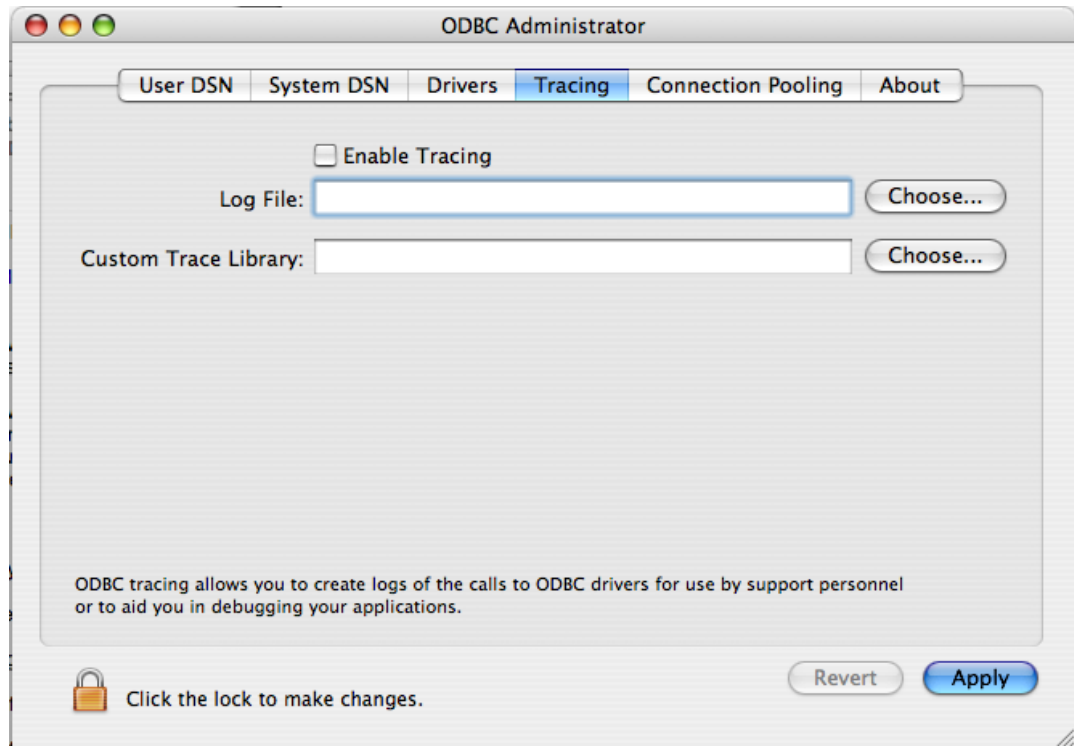

2. When you activate tracing from the [Tracing](#) tab, the [Driver Manager](#) logs all ODBC function calls for all subsequently run applications.
3. ODBC function calls from applications running before tracing is activated are not logged. ODBC function calls are recorded in a log file you specify.
4. Tracing ceases only after you click [Stop Tracing Now](#). Remember that while tracing is on, the log file continues to increase in size and that tracing affects the performance of all your ODBC applications.

### 18.1.3.8.2. Enabling ODBC Tracing on Mac OS X

To enable the trace option on Mac OS X 10.3 or later you should use the [Tracing](#) tab within ODBC Administrator .

1. Open the ODBC Administrator.
2. Select the [Tracing](#) tab.

3. Select the `Enable Tracing` checkbox.
4. Enter the location where you want to save the Tracing log. If you want to append information to an existing log file, click the `Choose...` button.

### 18.1.3.8.3. Enabling ODBC Tracing on Unix

To enable the trace option on Mac OS X 10.2 (or earlier) or Unix you must add the `trace` option to the ODBC configuration:

1. On Unix, you need to explicitly set the `Trace` option in the `ODBC.INI` file.

Set the tracing `ON` or `OFF` by using `TraceFile` and `Trace` parameters in `odbc.ini` as shown below:

```
TraceFile = /tmp/odbc.trace
Trace     = 1
```

`TraceFile` specifies the name and full path of the trace file and `Trace` is set to `ON` or `OFF`. You can also use `1` or `YES` for `ON` and `0` or `NO` for `OFF`. If you are using `ODBCConfig` from `unixODBC`, then follow the instructions for tracing `unixODBC` calls at [HOWTO-ODBCConfig](http://www.unixodbc.org/config.html) [<http://www.unixodbc.org/config.html>].

### 18.1.3.8.4. Enabling a MyODBC Log

To generate a MyODBC log, do the following:

1. Within Windows, enable the `Trace MyODBC` option flag in the MyODBC connect/configure

screen. The log is written to file `C:\myodbc.log`. If the trace option is not remembered when you are going back to the above screen, it means that you are not using the `myodbc.dll` driver, see [Section 18.1.3.2.4, “Errors and Debugging”](#).

On Mac OS X, Unix, or if you are using DSN-Less connection, then you need to supply `OPTIION=4` in the connection string or set the corresponding keyword/value pair in the DSN.

2. Start your application and try to get it to fail. Then check the MyODBC trace file to find out what could be wrong.

If you need help determining what is wrong, see [Section 18.1.7.1, “MyODBC Community Support”](#).

## 18.1.4. MyODBC Examples

Once you have configured a DSN to provide access to a database, how you access and use that connection is dependent on the application or programming language. As ODBC is a standardized interface, any application or language that supports ODBC can use the DSN and connect to the configured database.

### 18.1.4.1. Basic MyODBC Application Steps

Interacting with a MySQL server from an applications using the MyODBC typically involves the following operations:

- Configure the MyODBC DSN
- Connect to MySQL server
- Initialization operations
- Execute SQL statements
- Retrieve results
- Perform Transactions
- Disconnect from the server

Most applications use some variation of these steps. The basic application steps are shown in the following diagram:

### 18.1.4.2. Step-by-step Guide to Connecting to a MySQL Database through MyODBC

A typical installation situation where you would install MyODBC is when you want to access a database on a Linux or Unix host from a Windows machine.

As an example of the process required to set up access between two machines, the steps below take you through the basic steps. These instructions assume that you want to connect to system ALPHA from system BETA with a username and password of `myuser` and `mypassword`.

On system ALPHA (the MySQL server) follow these steps:

1. Start the MySQL server.
2. Use `GRANT` to set up an account with a username of `myuser` that can connect from system BETA using a password of `myuser` to the database `test`:

```
GRANT ALL ON test.* to 'myuser'@'BETA' IDENTIFIED BY 'mypassword';
```

For more information about MySQL privileges, refer to [Section 5.8, “MySQL User Account Management”](#).

On system BETA (the MyODBC client), follow these steps:

1. Configure a MyODBC DSN using parameters that match the server, database and authentication information that you have just configured on system ALPHA.

Parameter	Value	Comment
DSN	remote_test	A name to identify the connection.
SERVER	ALPHA	The address of the remote server.
DATABASE	test	The name of the default database.
USER	myuser	The username configured for access to this database.
PASSWORD	mypassword	The password for <code>myuser</code> .

2. Using an ODBC-capable application, such as Microsoft Office, connect to the MySQL server using the DSN you have just created. If the connection fails, use tracing to examine the connection process. See [Section 18.1.3.8, “Getting an ODBC Trace File”](#), for more information.

### 18.1.4.3. MyODBC and Third-Party ODBC Tools

Once you have configured your MyODBC DSN, you can access your MySQL database through any application that supports the ODBC interface, including programming languages and third-party applications. This section contains guides and help on using MyODBC with various ODBC-compatible tools and applications, including Microsoft Word, Microsoft Excel and Adobe/Macromedia ColdFusion.

#### 18.1.4.3.1. Applications Tested with MyODBC

MyODBC has been tested with the following applications:

Publisher	Application	Notes
Adobe	ColdFusion	Formerly Macromedia ColdFusion
Borland	C++ Builder	
	Builder 4	
	Delphi	
Business Objects	Crystal Reports	
Claris	Filemaker Pro	
Corel	Paradox	

Computer Associates	Visual Objects	Also known as CAVO
	AllFusion ERwin Data Modeler	
Gupta	Team Developer	Previously known as Centura Team Developer; Gupta SQL/Windows
Gensym	G2-ODBC Bridge	
Inline	iHTML	
Lotus	Notes	Versions 4.5 and 4.6
Microsoft	Access	
	Excel	
	Visio Enterprise	
	Visual C++	
	Visual Basic	
	ODBC.NET	Using C#, Visual Basic, C++
	FoxPro	
	Visual Interdev	
OpenOffice.org	OpenOffice.org	
Perl	DBD::ODBC	
Pervasive Software	DataJunction	
Sambar Technologies	Sambar Server	
SPSS	SPSS	
SoftVelocity	Clarion	
SQLExpress	SQLExpress for Xbase++	
Sun	StarOffice	
SunSystems	Vision	
Sybase	PowerBuilder	
	PowerDesigner	
theKompany.com	Data Architect	

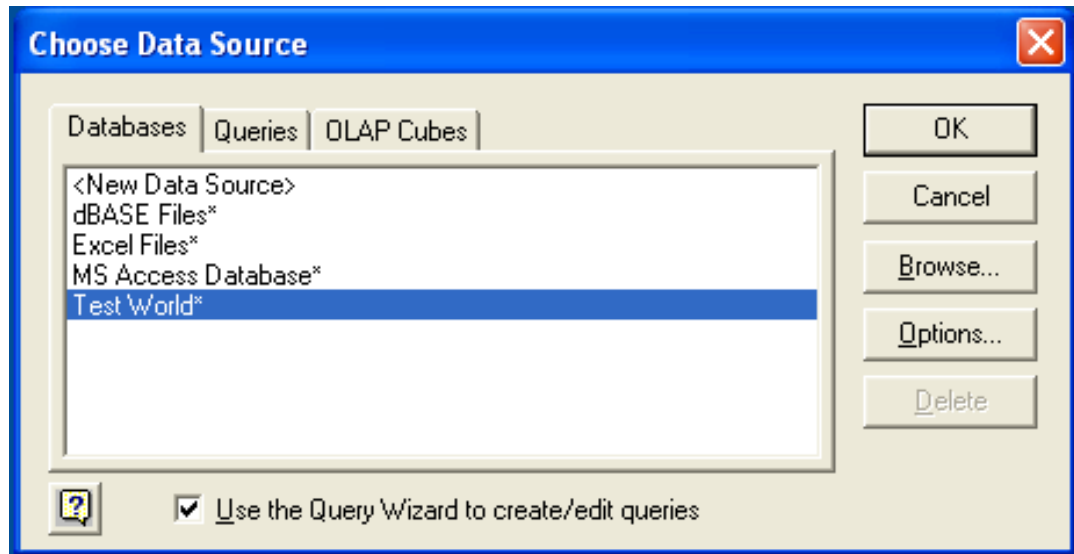

If you know of any other applications that work with MyODBC, please send mail to [myodbc@lists.mysql.com](mailto:myodbc@lists.mysql.com) about them.

#### 18.1.4.3.2. Using MyODBC with Microsoft Word or Excel

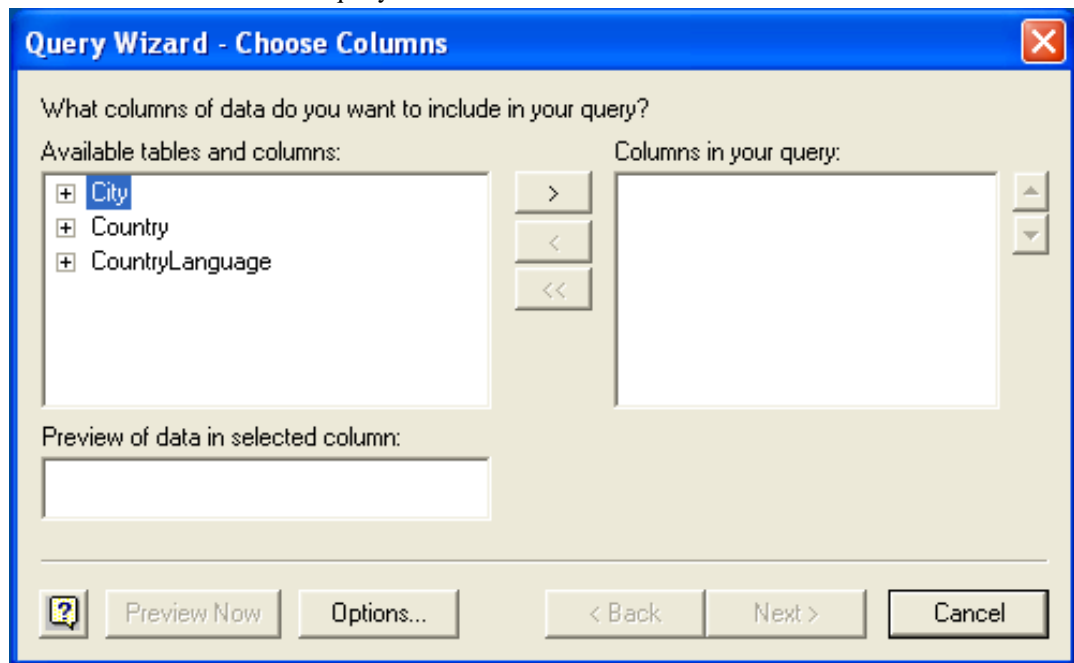

You can use Microsoft Word and Microsoft Excel to access information from a MySQL database using MyODBC. Within Microsoft Word, this facility is most useful when importing data for mailmerge, or for tables and data to be included in reports. Within Microsoft Excel, you can execute queries on your MySQL server and import the data directly into an Excel Worksheet, presenting the data as a series of rows and columns.

With both applications, data is accessed and imported into the application using Microsoft Query , which enables you to execute a query though an ODBC source. You use Microsoft Query to build the SQL statement to be executed, selecting the tables, fields, selection criteria and sort order. For example, to insert information from a table in the World test database into an Excel spreadsheet, using the DSN samples shown in [Section 18.1.3, “MyODBC Configuration”](#):

1. Create a new Worksheet.
2. From the **Data** menu, choose **Import External Data**, and then select **New Database Query**.
3. Microsoft Query will start. First, you need to choose the data source, by selecting an existing Data Source Name.

4. Within the **Query Wizard**, you must choose the columns that you want to import. The list of tables available to the user configured through the DSN is shown on the left, the columns that will be added to your query are shown on the right. The columns you choose are equivalent to those in the first section of a **SELECT** query. Click **Next** to continue.

5. You can filter rows from the query (the equivalent of a **WHERE** clause) using the **Filter Data** dialog. Click **Next** to continue.

6. Select an (optional) sort order for the data. This is equivalent to using a `ORDER BY` clause in your SQL query. You can select up to three fields for sorting the information returned by the query. Click [Next](#) to continue.

7. Select the destination for your query. You can select to return the data Microsoft Excel, where you can choose a worksheet and cell where the data will be inserted; you can continue to view the query and results within Microsoft Query, where you can edit the SQL query and further filter and sort the information returned; or you can create an OLAP Cube from the query, which can then be used directly within Microsoft Excel. Click [Finish](#).

The same process can be used to import data into a Word document, where the data will be inserted as a table. This can be used for mail merge purposes (where the field data is read from a Word table), or where you want to include data and reports within a report or other document.

### 18.1.4.3.3. Using MyODBC and Microsoft Access

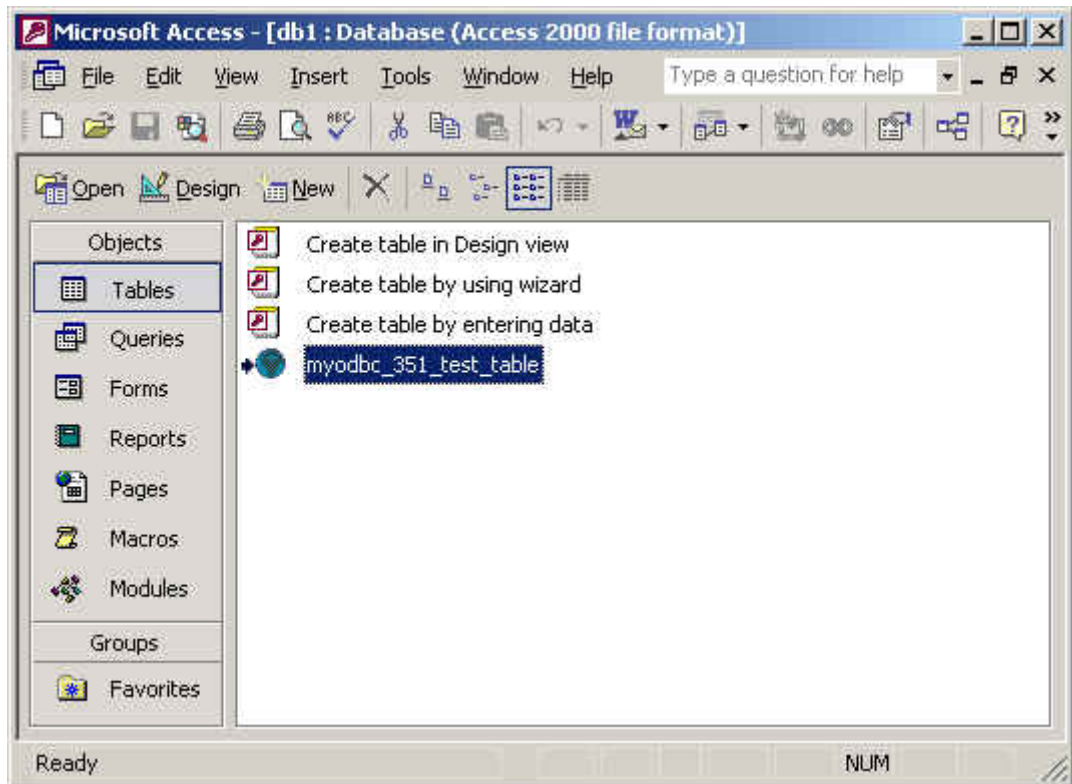

You can use MySQL database with Microsoft Access using MyODBC. The MySQL database can be used as an import source, an export source, or as a linked table for direct use within an Access application, so you can use Access as the front-end interface to a MySQL database.

#### 18.1.4.3.3.1. Exporting Access Data to MySQL

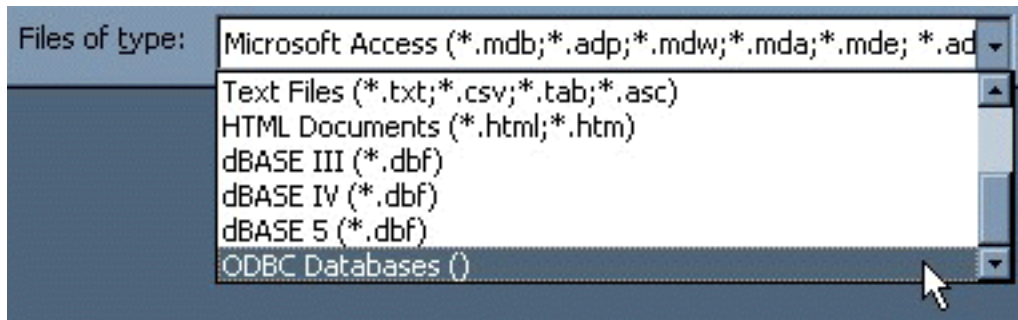

To export a table of data from an Access database to MySQL, follow these instructions:

1. When you open an Access database or an Access project, a Database window appears. It displays shortcuts for creating new database objects and opening existing objects.

2. Click the name of the [table](#) or [query](#) you want to export, and then in the [File](#) menu, select [Export](#).
3. In the [Export Object Type Object name To](#) dialog box, in the [Save As Type](#) box, select [ODBC Databases \(\)](#) as shown here:

4. In the [Export](#) dialog box, enter a name for the file (or use the suggested name), and then select [OK](#).
5. The [Select Data Source](#) dialog box is displayed; it lists the defined data sources for any ODBC drivers installed on your computer. Click either the [File Data Source](#) or [Machine Data Source](#) tab, and then double-click the [MyODBC](#) or [MyODBC 3.51](#) data source that you want to export to. To define a new data source for [MyODBC](#), please [Section 18.1.3.2, "Configuring a MyODBC DSN on Windows"](#).

Microsoft Access connects to the MySQL Server through this data source and exports new tables and or data.

#### 18.1.4.3.3.2. Importing MySQL Data to Access

To import or link a table or tables from MySQL to Access, follow these instructions:

1. Open a database, or switch to the Database window for the open database.
2. To import tables, on the **File** menu, point to **Get External Data**, and then click **Import**. To link tables, on the **File** menu, point to **Get External Data**, and then click **Link Tables**.
3. In the **Import** (or **Link**) dialog box, in the **Files Of Type** box, select **ODBC Databases ( )**. The **Select Data Source** dialog box lists the defined data sources. The **Select Data Source** dialog box is displayed; it lists the defined data source names.
4. If the ODBC data source that you selected requires you to log on, enter your login ID and password (additional information might also be required), and then click **OK**.
5. Microsoft Access connects to the MySQL server through **ODBC data source** and displays the list of tables that you can **import** or **link**.
6. Click each table that you want to **import** or **link**, and then click **OK**. If you're linking a table and it doesn't have an index that uniquely identifies each record, Microsoft Access displays a list of the fields in the linked table. Click a field or a combination of fields that uniquely identifies each record, and then click **OK**.

#### 18.1.4.3.3.3. Linking MySQL Data to Access Tables

Use the following procedure to view or to refresh links when the structure or location of a linked table has changed. The **Linked Table Manager** lists the paths to all currently linked tables.

**To view or refresh links:**

1. Open the database that contains links to tables.
2. On the **Tools** menu, point to **Add-ins (Database Utilities** in Access 2000 or newer), and then click **Linked Table Manager**.
3. Select the check box for the tables whose links you want to refresh.
4. Click **OK** to refresh the links.

Microsoft Access confirms a successful refresh or, if the table wasn't found, displays the **Select New Location of <table name>** dialog box in which you can specify its the table's new location. If several selected tables have moved to the new location that you specify, the **Linked Table Manager** searches that location for all selected tables, and updates all links in one step.

**To change the path for a set of linked tables:**

1. Open the database that contains links to tables.
2. On the **Tools** menu, point to **Add-ins (Database Utilities** in Access 2000 or newer), and then click **Linked Table Manager**.
3. Select the **Always Prompt For A New Location** check box.
4. Select the check box for the tables whose links you want to change, and then click **OK**.

5. In the **Select New Location of** <table name> dialog box, specify the new location, click **Open**, and then click **OK**.

#### 18.1.4.4. MyODBC Programming Examples

With a suitable ODBC Manager and the my MyODBC driver installed, any programming language or environment that can support ODBC should be able to connect to a MySQL database through MyODBC.

This includes, but is certainly not limited to, Microsoft support languages (including Visual Basic, C# and interfaces such as ODBC.NET), Perl (through the DBI module, and the DBD::ODBC driver).

##### 18.1.4.4.1. Using MyODBC with Visual Basic Using ADO, DAO and RDO

This section contains simple examples of the use of MySQL ODBC 3.51 Driver with ADO, DAO and RDO.

###### 18.1.4.4.1.1. ADO: `rs.addNew`, `rs.delete`, and `rs.update`

The following ADO (ActiveX Data Objects) example creates a table `my_ado` and demonstrates the use of `rs.addNew`, `rs.delete`, and `rs.update`.

```
Private Sub myodbc_ado_Click()

Dim conn As ADODB.Connection
Dim rs As ADODB.Recordset
Dim fld As ADODB.Field
Dim sql As String

'connect to MySQL server using MySQL ODBC 3.51 Driver
Set conn = New ADODB.Connection
conn.ConnectionString = "DRIVER={MySQL ODBC 3.51 Driver};"_
& "SERVER=localhost;"_
& " DATABASE=test;"_
& "UID=venu;PWD=venu; OPTION=3"

conn.Open

'create table
conn.Execute "DROP TABLE IF EXISTS my_ado"
conn.Execute "CREATE TABLE my_ado(id int not null primary key, name varchar(20)," _
& "txt text, dt date, tm time, ts timestamp)"

'direct insert
conn.Execute "INSERT INTO my_ado(id,name,txt) values(1,100,'venu')"
conn.Execute "INSERT INTO my_ado(id,name,txt) values(2,200,'MySQL')"
conn.Execute "INSERT INTO my_ado(id,name,txt) values(3,300,'Delete')"

Set rs = New ADODB.Recordset
rs.CursorLocation = adUseServer

'fetch the initial table ..
rs.Open "SELECT * FROM my_ado", conn
Debug.Print rs.RecordCount
rs.MoveFirst
Debug.Print String(50, "-") & "Initial my_ado Result Set " & String(50, "-")
For Each fld In rs.Fields
Debug.Print fld.Name,
Next
Debug.Print

Do Until rs.EOF
For Each fld In rs.Fields
Debug.Print fld.Value,
Next
rs.MoveNext
Debug.Print
Loop
rs.Close

'rs insert
```

```

rs.Open "select * from my_ado", conn, adOpenDynamic, adLockOptimistic
rs.AddNew
rs!Name = "Monty"
rs!txt = "Insert row"
rs.Update
rs.Close

'rs update
rs.Open "SELECT * FROM my_ado"
rs!Name = "update"
rs!txt = "updated-row"
rs.Update
rs.Close

'rs update second time..
rs.Open "SELECT * FROM my_ado"
rs!Name = "update"
rs!txt = "updated-second-time"
rs.Update
rs.Close

'rs delete
rs.Open "SELECT * FROM my_ado"
rs.MoveNext
rs.MoveNext
rs.Delete
rs.Close

'fetch the updated table ..
rs.Open "SELECT * FROM my_ado", conn
Debug.Print rs.RecordCount
rs.MoveFirst
Debug.Print String(50, "-") & "Updated my_ado Result Set " & String(50, "-")
For Each fld In rs.Fields
Debug.Print fld.Name,
Next
Debug.Print

Do Until rs.EOF
For Each fld In rs.Fields
Debug.Print fld.Value,
Next
rs.MoveNext
Debug.Print
Loop
rs.Close
conn.Close
End Sub

```

#### 18.1.4.4.1.2. DAO: `rs.addNew`, `rs.update`, and Scrolling

The following DAO (Data Access Objects) example creates a table `my_dao` and demonstrates the use of `rs.addNew`, `rs.update`, and result set scrolling.

```

Private Sub myodbc_dao_Click()

Dim ws As Workspace
Dim conn As Connection
Dim queryDef As queryDef
Dim str As String

'connect to MySQL using MySQL ODBC 3.51 Driver
Set ws = DBEngine.CreateWorkspace("", "venu", "venu", dbUseODBC)
str = "odbc;DRIVER={MySQL ODBC 3.51 Driver};"_
& "SERVER=localhost;"_
& " DATABASE=test;"_
& "UID=venu;PWD=venu; OPTION=3"
Set conn = ws.OpenConnection("test", dbDriverNoPrompt, False, str)

'Create table my_dao
Set queryDef = conn.CreateQueryDef("", "drop table if exists my_dao")
queryDef.Execute

Set queryDef = conn.CreateQueryDef("", "create table my_dao(Id INT AUTO_INCREMENT PRIMARY KEY, " _
& "Ts TIMESTAMP(14) NOT NULL, Name varchar(20), Id2 INT)")
queryDef.Execute

```

```

'Insert new records using rs.addNew
Set rs = conn.OpenRecordset("my_dao")
Dim i As Integer

For i = 10 To 15
rs.AddNew
rs!Name = "insert record" & i
rs!Id2 = i
rs.Update
Next i
rs.Close

'rs update..
Set rs = conn.OpenRecordset("my_dao")
rs.Edit
rs!Name = "updated-string"
rs.Update
rs.Close

'fetch the table back...
Set rs = conn.OpenRecordset("my_dao", dbOpenDynamic)
str = "Results:"
rs.MoveFirst
While Not rs.EOF
str = " " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print "DATA:" & str
rs.MoveNext
Wend

'rs Scrolling
rs.MoveFirst
str = " FIRST ROW: " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print str

rs.MoveLast
str = " LAST ROW: " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print str

rs.MovePrevious
str = " LAST-1 ROW: " & rs!Id & " , " & rs!Name & " , " & rs!Ts & " , " & rs!Id2
Debug.Print str

'free all resources
rs.Close
queryDef.Close
conn.Close
ws.Close

End Sub

```

#### 18.1.4.4.1.3. RDO: `rs.addNew` and `rs.update`

The following RDO (Remote Data Objects) example creates a table `my_rdo` and demonstrates the use of `rs.addNew` and `rs.update`.

```

Dim rs As rdoResultset
Dim cn As New rdoConnection
Dim cl As rdoColumn
Dim SQL As String

'cn.Connect = "DSN=test;"
cn.Connect = "DRIVER={MySQL ODBC 3.51 Driver};"_
& "SERVER=localhost;"_
& " DATABASE=test;"_
& "UID=venu;PWD=venu; OPTION=3"

cn.CursorDriver = rdUseOdbc
cn.EstablishConnection rdDriverPrompt

'drop table my_rdo
SQL = "drop table if exists my_rdo"
cn.Execute SQL, rdExecDirect

'create table my_rdo
SQL = "create table my_rdo(id int, name varchar(20))"
cn.Execute SQL, rdExecDirect

```

```

'insert - direct
SQL = "insert into my_rdo values (100,'venu')"
cn.Execute SQL, rdExecDirect

SQL = "insert into my_rdo values (200,'MySQL')"
cn.Execute SQL, rdExecDirect

'rs insert
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.AddNew
rs!id = 300
rs!Name = "Insert1"
rs.Update
rs.Close

'rs insert
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.AddNew
rs!id = 400
rs!Name = "Insert 2"
rs.Update
rs.Close

'rs update
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
rs.Edit
rs!id = 999
rs!Name = "updated"
rs.Update
rs.Close

'fetch back...
SQL = "select * from my_rdo"
Set rs = cn.OpenResultset(SQL, rdOpenStatic, rdConcurRowVer, rdExecDirect)
Do Until rs.EOF
For Each cl In rs.rdoColumns
Debug.Print cl.Value,
Next
rs.MoveNext
Debug.Print
Loop
Debug.Print "Row count="; rs.RowCount

'close
rs.Close
cn.Close

End Sub

```

#### 18.1.4.4.2. Using MyODBC with .NET

This section contains simple examples that demonstrate the use of MyODBC drivers with ODBC.NET.

##### 18.1.4.4.2.1. Using MyODBC with ODBC.NET and C# (C sharp)

The following sample creates a table `my_odbc_net` and demonstrates its use in C#.

```

/**
 * @sample      : mycon.cs
 * @purpose     : Demo sample for ODBC.NET using MyODBC
 * @author      : Venu, <myodbc@lists.mysql.com>
 *
 * (C) Copyright MySQL AB, 1995-2006
 *
 **/

/* build command
 *
 * csc /t:exe
 *      /out:mycon.exe mycon.cs
 *      /r:Microsoft.Data.Odbc.dll
 */

```

```
using Console = System.Console;
using Microsoft.Data.Odbc;

namespace myodbc3
{
    class mycon
    {
        static void Main(string[] args)
        {
            try
            {
                //Connection string for MyODBC 2.50
                /*string MyConString = "DRIVER={MySQL};" +
                    "SERVER=localhost;" +
                    "DATABASE=test;" +
                    "UID=venu;" +
                    "PASSWORD=venu;" +
                    "OPTION=3";
                */
                //Connection string for MyODBC 3.51
                string MyConString = "DRIVER={MySQL ODBC 3.51 Driver};" +
                    "SERVER=localhost;" +
                    "DATABASE=test;" +
                    "UID=venu;" +
                    "PASSWORD=venu;" +
                    "OPTION=3";

                //Connect to MySQL using MyODBC
                OdbcConnection MyConnection = new OdbcConnection(MyConString);
                MyConnection.Open();

                Console.WriteLine("\n !!! success, connected successfully !!!\n");

                //Display connection information
                Console.WriteLine("Connection Information:");
                Console.WriteLine("\tConnection String:" +
                    MyConnection.ConnectionString);
                Console.WriteLine("\tConnection Timeout:" +
                    MyConnection.ConnectionTimeout);
                Console.WriteLine("\tDatabase:" +
                    MyConnection.Database);
                Console.WriteLine("\tDataSource:" +
                    MyConnection.DataSource);
                Console.WriteLine("\tDriver:" +
                    MyConnection.Driver);
                Console.WriteLine("\tServerVersion:" +
                    MyConnection.ServerVersion);

                //Create a sample table
                OdbcCommand MyCommand =
                    new OdbcCommand("DROP TABLE IF EXISTS my_odbc_net",
                        MyConnection);
                MyCommand.ExecuteNonQuery();
                MyCommand.CommandText =
                    "CREATE TABLE my_odbc_net(id int, name varchar(20), idb bigint)";
                MyCommand.ExecuteNonQuery();

                //Insert
                MyCommand.CommandText =
                    "INSERT INTO my_odbc_net VALUES(10,'venu', 300)";
                Console.WriteLine("INSERT, Total rows affected:" +
                    MyCommand.ExecuteNonQuery());

                //Insert
                MyCommand.CommandText =
                    "INSERT INTO my_odbc_net VALUES(20,'mysql',400)";
                Console.WriteLine("INSERT, Total rows affected:" +
                    MyCommand.ExecuteNonQuery());

                //Insert
                MyCommand.CommandText =
                    "INSERT INTO my_odbc_net VALUES(20,'mysql',500)";
                Console.WriteLine("INSERT, Total rows affected:" +
                    MyCommand.ExecuteNonQuery());

                //Update
                MyCommand.CommandText =
                    "UPDATE my_odbc_net SET id=999 WHERE id=20";
                Console.WriteLine("Update, Total rows affected:" +
                    MyCommand.ExecuteNonQuery());
            }
        }
    }
}
```

```

//COUNT(*)
MyCommand.CommandText =
    "SELECT COUNT(*) as TRows FROM my_odbc_net";
Console.WriteLine("Total Rows:" +
    MyCommand.ExecuteScalar());

//Fetch
MyCommand.CommandText = "SELECT * FROM my_odbc_net";
OdbcDataReader MyDataReader;
MyDataReader = MyCommand.ExecuteReader();
while (MyDataReader.Read())
{
    if(string.Compare(MyConnection.Driver,"myodbc3.dll") == 0) {
        //Supported only by MyODBC 3.51
        Console.WriteLine("Data:" + MyDataReader.GetInt32(0) + " " +
            MyDataReader.GetString(1) + " " +
            MyDataReader.GetInt64(2));
    }
    else {
        //BIGINTs not supported by MyODBC
        Console.WriteLine("Data:" + MyDataReader.GetInt32(0) + " " +
            MyDataReader.GetString(1) + " " +
            MyDataReader.GetInt32(2));
    }
}

//Close all resources
MyDataReader.Close();
MyConnection.Close();
}
catch (OdbcException MyOdbcException) //Catch any ODBC exception ..
{
    for (int i=0; i < MyOdbcException.Errors.Count; i++)
    {
        Console.Write("ERROR #" + i + "\n" +
            "Message: " +
            MyOdbcException.Errors[i].Message + "\n" +
            "Native: " +
            MyOdbcException.Errors[i].NativeError.ToString() + "\n" +
            "Source: " +
            MyOdbcException.Errors[i].Source + "\n" +
            "SQL: " +
            MyOdbcException.Errors[i].SQLState + "\n");
    }
}
}
}
}
}

```

#### 18.1.4.4.2.2. Using MyODBC with ODBC.NET and Visual Basic

The following sample creates a table `my_vb_net` and demonstrates the use in VB.

```

' @sample      : myvb.vb
' @purpose     : Demo sample for ODBC.NET using MyODBC
' @author      : Venu, <myodbc@lists.mysql.com>
'
' (C) Copyright MySQL AB, 1995-2006
'
'
'
' build command
'
' vbc /target:exe
'     /out:myvb.exe
'     /r:Microsoft.Data.Odbc.dll
'     /r:System.dll
'     /r:System.Data.dll
'
Imports Microsoft.Data.Odbc
Imports System

Module myvb
    Sub Main()
        Try

```

```

'MyODBC 3.51 connection string
Dim MyConString As String = "DRIVER={MySQL ODBC 3.51 Driver};" & _
"SERVER=localhost;" & _
"DATABASE=test;" & _
"UID=venu;" & _
"PASSWORD=venu;" & _
"OPTION=3;"

'Connection
Dim MyConnection As New OdbcConnection(MyConString)
MyConnection.Open()

Console.WriteLine("Connection State::" & MyConnection.State.ToString)

'Drop
Console.WriteLine("Dropping table")
Dim MyCommand As New OdbcCommand()
MyCommand.Connection = MyConnection
MyCommand.CommandText = "DROP TABLE IF EXISTS my_vb_net"
MyCommand.ExecuteNonQuery()

'Create
Console.WriteLine("Creating...")
MyCommand.CommandText = "CREATE TABLE my_vb_net(id int, name varchar(30))"
MyCommand.ExecuteNonQuery()

'Insert
MyCommand.CommandText = "INSERT INTO my_vb_net VALUES(10,'venu')"
Console.WriteLine("INSERT, Total rows affected:" & _
MyCommand.ExecuteNonQuery())

'Insert
MyCommand.CommandText = "INSERT INTO my_vb_net VALUES(20,'mysql')"
Console.WriteLine("INSERT, Total rows affected:" & _
MyCommand.ExecuteNonQuery())

'Insert
MyCommand.CommandText = "INSERT INTO my_vb_net VALUES(20,'mysql')"
Console.WriteLine("INSERT, Total rows affected:" & _
MyCommand.ExecuteNonQuery())

'Insert
MyCommand.CommandText = "INSERT INTO my_vb_net(id) VALUES(30)"
Console.WriteLine("INSERT, Total rows affected:" & _
MyCommand.ExecuteNonQuery())

'Update
MyCommand.CommandText = "UPDATE my_vb_net SET id=999 WHERE id=20"
Console.WriteLine("Update, Total rows affected:" & _
MyCommand.ExecuteNonQuery())

'COUNT(*)
MyCommand.CommandText = "SELECT COUNT(*) as TRows FROM my_vb_net"
Console.WriteLine("Total Rows:" & MyCommand.ExecuteScalar())

'Select
Console.WriteLine("Select * FROM my_vb_net")
MyCommand.CommandText = "SELECT * FROM my_vb_net"
Dim MyDataReader As OdbcDataReader
MyDataReader = MyCommand.ExecuteReader
While MyDataReader.Read
    If MyDataReader("name") Is DBNull.Value Then
        Console.WriteLine("id = " & _
CStr(MyDataReader("id")) & " name = " & _
"NULL")
    Else
        Console.WriteLine("id = " & _
CStr(MyDataReader("id")) & " name = " & _
CStr(MyDataReader("name")))
    End If
End While

'Catch ODBC Exception
Catch MyOdbcException As OdbcException
Dim i As Integer
Console.WriteLine(MyOdbcException.ToString)

'Catch program exception
Catch MyException As Exception
Console.WriteLine(MyException.ToString)
End Try

```

## 18.1.5. MyODBC Reference

This section provides reference material for the MyODBC API, showing supported functions and methods, supported MySQL column types and the corresponding native type in MyODBC, and the error codes returned by MyODBC when a fault occurs.

### 18.1.5.1. MyODBC API Reference

This section summarizes ODBC routines, categorized by functionality.

For the complete ODBC API reference, please refer to the ODBC Programmer's Reference at [http://msdn.microsoft.com/library/en-us/odbc/hdm/odbcabout\\_this\\_manual.asp](http://msdn.microsoft.com/library/en-us/odbc/hdm/odbcabout_this_manual.asp).

An application can call `SQLGetInfo` function to obtain conformance information about MyODBC. To obtain information about support for a specific function in the driver, an application can call `SQLGetFunctions`.

Note: For backward compatibility, the MyODBC 3.51 driver supports all deprecated functions.

The following tables list MyODBC API calls grouped by task:

#### Connecting to a data source:

Function name	MyODBC		Standard	Purpose
	2.50	3.51		
<code>SQLAllocHandle</code>	No	Yes	ISO 92	Obtains an environment, connection, statement, or descriptor handle.
<code>SQLConnect</code>	Yes	Yes	ISO 92	Connects to a specific driver by data source name, user ID, and password.
<code>SQLDriverConnect</code>	Yes	Yes	ODBC	Connects to a specific driver by connection string or requests that the Driver Manager and driver display connection dialog boxes for the user.
<code>SQLAllocEnv</code>	Yes	Yes	Deprecated	Obtains an environment handle allocated from driver.
<code>SQLAllocConnect</code>	Yes	Yes	Deprecated	Obtains a connection handle

#### Obtaining information about a driver and data source:

Function name	MyODBC		Standard	Purpose
	2.50	3.51		
<code>SQLDataSources</code>	No	No	ISO 92	Returns the list of available data sources, handled by the Driver Manager
<code>SQLDrivers</code>	No	No	ODBC	Returns the list of installed drivers and their attributes, handles by Driver Manager
<code>SQLGetInfo</code>	Yes	Yes	ISO 92	Returns information about a specific driver and data source.
<code>SQLGetFunctions</code>	Yes	Yes	ISO 92	Returns supported driver functions.
<code>SQLGetTypeInfo</code>	Yes	Yes	ISO 92	Returns information about supported data types.

**Setting and retrieving driver attributes:**

Function name	MyODBC		Standard	Purpose
	2.50	3.51		
<a href="#">SQLSetConnectAttr</a>	No	Yes	ISO 92	Sets a connection attribute.
<a href="#">SQLGetConnectAttr</a>	No	Yes	ISO 92	Returns the value of a connection attribute.
<a href="#">SQLSetConnectOption</a>	Yes	Yes	Deprecated	Sets a connection option
<a href="#">SQLGetConnectOption</a>	Yes	Yes	Deprecated	Returns the value of a connection option
<a href="#">SQLSetEnvAttr</a>	No	Yes	ISO 92	Sets an environment attribute.
<a href="#">SQLGetEnvAttr</a>	No	Yes	ISO 92	Returns the value of an environment attribute.
<a href="#">SQLSetStmtAttr</a>	No	Yes	ISO 92	Sets a statement attribute.
<a href="#">SQLGetStmtAttr</a>	No	Yes	ISO 92	Returns the value of a statement attribute.
<a href="#">SQLSetStmtOption</a>	Yes	Yes	Deprecated	Sets a statement option
<a href="#">SQLGetStmtOption</a>	Yes	Yes	Deprecated	Returns the value of a statement option

**Preparing SQL requests:**

Function name	MyODBC		Standard	Purpose
	2.50	3.51		
<a href="#">SQLAllocStmt</a>	Yes	Yes	Deprecated	Allocates a statement handle
<a href="#">SQLPrepare</a>	Yes	Yes	ISO 92	Prepares an SQL statement for later execution.
<a href="#">SQLBindParameter</a>	Yes	Yes	ODBC	Assigns storage for a parameter in an SQL statement.
<a href="#">SQLGetCursorName</a>	Yes	Yes	ISO 92	Returns the cursor name associated with a statement handle.
<a href="#">SQLSetCursorName</a>	Yes	Yes	ISO 92	Specifies a cursor name.
<a href="#">SQLSetScrollOptions</a>	Yes	Yes	ODBC	Sets options that control cursor behavior.

**Submitting requests:**

Function name	MyODBC		Standard	Purpose
	2.50	3.51		
<a href="#">SQLExecute</a>	Yes	Yes	ISO 92	Executes a prepared statement.
<a href="#">SQLExecDirect</a>	Yes	Yes	ISO 92	Executes a statement
<a href="#">SQLNativeSql</a>	Yes	Yes	ODBC	Returns the text of an SQL statement as translated by the driver.
<a href="#">SQLDescribeParam</a>	Yes	Yes	ODBC	Returns the description for a specific parameter in a statement.
<a href="#">SQLNumParams</a>	Yes	Yes	ISO 92	Returns the number of parameters in a statement.
<a href="#">SQLParamData</a>	Yes	Yes	ISO 92	Used in conjunction with <a href="#">SQLPutData</a> to supply parameter data at execution time. (Useful for long data values.)

SQLPutData	Yes	Yes	ISO 92	Sends part or all of a data value for a parameter. (Useful for long data values.)
------------	-----	-----	--------	---

**Retrieving results and information about results:**

Function name	MyODBC		Standard	Purpose
	2.50	3.51		
SQLRowCount	Yes	Yes	ISO 92	Returns the number of rows affected by an insert, update, or delete request.
SQLNumResultCols	Yes	Yes	ISO 92	Returns the number of columns in the result set.
SQLDescribeCol	Yes	Yes	ISO 92	Describes a column in the result set.
SQLColAttribute	No	Yes	ISO 92	Describes attributes of a column in the result set.
SQLColAttributes	Yes	Yes	Deprecated	Describes attributes of a column in the result set.
SQLFetch	Yes	Yes	ISO 92	Returns multiple result rows.
SQLFetchScroll	No	Yes	ISO 92	Returns scrollable result rows.
SQLExtendedFetch	Yes	Yes	Deprecated	Returns scrollable result rows.
SQLSetPos	Yes	Yes	ODBC	Positions a cursor within a fetched block of data and allows an application to refresh data in the rowset or to update or delete data in the result set.
SQLBulkOperations	No	Yes	ODBC	Performs bulk insertions and bulk bookmark operations, including update, delete, and fetch by bookmark.

**Retrieving error or diagnostic information:**

Function name	MyODBC		Standard	Purpose
	2.50	3.51		
SQLError	Yes	Yes	Deprecated	Returns additional error or status information
SQLGetDiagField	Yes	Yes	ISO 92	Returns additional diagnostic information (a single field of the diagnostic data structure).
SQLGetDiagRec	Yes	Yes	ISO 92	Returns additional diagnostic information (multiple fields of the diagnostic data structure).

**Obtaining information about the data source's system tables (catalog functions) item:**

Function name	MyODBC		Standard	Purpose
	2.50	3.51		
SQLColumnPrivileges	Yes	Yes	ODBC	Returns a list of columns and associated privileges for one or more tables.
SQLColumns	Yes	Yes	X/Open	Returns the list of column names in specified tables.
SQLForeignKeys	Yes	Yes	ODBC	Returns a list of column names that make up foreign keys, if they exist for a specified table.
SQLPrimaryKeys	Yes	Yes	ODBC	Returns the list of column names that make up the primary key for a table.
SQLSpecialColumns	Yes	Yes	X/Open	Returns information about the optimal set of

				columns that uniquely identifies a row in a specified table, or the columns that are automatically updated when any value in the row is updated by a transaction.
<code>SQLStatistics</code>	Yes	Yes	ISO 92	Returns statistics about a single table and the list of indexes associated with the table.
<code>SQLTablePrivileges</code>	Yes	Yes	ODBC	Returns a list of tables and the privileges associated with each table.
<code>SQLTables</code>	Yes	Yes	X/Open	Returns the list of table names stored in a specific data source.

**Performing transactions:**

Function name	MyODBC		Standard	Purpose
	2.50	3.51		
<code>SQLTransact</code>	Yes	Yes	Deprecated	Commits or rolls back a transaction
<code>SQLEndTran</code>	No	Yes	ISO 92	Commits or rolls back a transaction.

**Terminating a statement:**

Function name	MyODBC		Standard	Purpose
	2.50	3.51		
<code>SQLFreeStmt</code>	Yes	Yes	ISO 92	Ends statement processing, discards pending results, and, optionally, frees all resources associated with the statement handle.
<code>SQLCloseCursor</code>	Yes	Yes	ISO 92	Closes a cursor that has been opened on a statement handle.
<code>SQLCancel</code>	Yes	Yes	ISO 92	Cancels an SQL statement.

**Terminating a connection:**

Function name	MyODBC		Standard	Purpose
	2.50	3.51		
<code>SQLDisconnect</code>	Yes	Yes	ISO 92	Closes the connection.
<code>SQLFreeHandle</code>	No	Yes	ISO 92	Releases an environment, connection, statement, or descriptor handle.
<code>SQLFreeConnect</code>	Yes	Yes	Deprecated	Releases connection handle
<code>SQLFreeEnv</code>	Yes	Yes	Deprecated	Releases an environment handle

## 18.1.5.2. MyODBC Data Types

The following table illustrates how driver maps the server data types to default SQL and C data types:

Native Value	SQL Type	C Type
<code>bit</code>	<code>SQL_BIT</code>	<code>SQL_C_BIT</code>
<code>tinyint</code>	<code>SQL_TINYINT</code>	<code>SQL_C_STINYINT</code>

## Connectors

tinyint unsigned	SQL_TINYINT	SQL_C_UTINYINT
bigint	SQL_BIGINT	SQL_C_SBIGINT
bigint unsigned	SQL_BIGINT	SQL_C_UBIGINT
long varbinary	SQL_LONGVARBINARY	SQL_C_BINARY
blob	SQL_LONGVARBINARY	SQL_C_BINARY
longblob	SQL_LONGVARBINARY	SQL_C_BINARY
tinyblob	SQL_LONGVARBINARY	SQL_C_BINARY
mediumblob	SQL_LONGVARBINARY	SQL_C_BINARY
long varchar	SQL_LONGVARCHAR	SQL_C_CHAR
text	SQL_LONGVARCHAR	SQL_C_CHAR
mediumtext	SQL_LONGVARCHAR	SQL_C_CHAR
char	SQL_CHAR	SQL_C_CHAR
numeric	SQL_NUMERIC	SQL_C_CHAR
decimal	SQL_DECIMAL	SQL_C_CHAR
integer	SQL_INTEGER	SQL_C_SLONG
integer unsigned	SQL_INTEGER	SQL_C_ULONG
int	SQL_INTEGER	SQL_C_SLONG
int unsigned	SQL_INTEGER	SQL_C_ULONG
mediumint	SQL_INTEGER	SQL_C_SLONG
mediumint unsigned	SQL_INTEGER	SQL_C_ULONG
smallint	SQL_SMALLINT	SQL_C_SSHORT
smallint unsigned	SQL_SMALLINT	SQL_C_USHORT
real	SQL_FLOAT	SQL_C_DOUBLE
double	SQL_FLOAT	SQL_C_DOUBLE
float	SQL_REAL	SQL_C_FLOAT
double precision	SQL_DOUBLE	SQL_C_DOUBLE
date	SQL_DATE	SQL_C_DATE
time	SQL_TIME	SQL_C_TIME
year	SQL_SMALLINT	SQL_C_SHORT
datetime	SQL_TIMESTAMP	SQL_C_TIMESTAMP
timestamp	SQL_TIMESTAMP	SQL_C_TIMESTAMP
text	SQL_VARCHAR	SQL_C_CHAR
varchar	SQL_VARCHAR	SQL_C_CHAR
enum	SQL_VARCHAR	SQL_C_CHAR
set	SQL_VARCHAR	SQL_C_CHAR
bit	SQL_CHAR	SQL_C_CHAR
bool	SQL_CHAR	SQL_C_CHAR

### 18.1.5.3. MyODBC Error Codes

The following tables lists the error codes returned by the driver apart from the server errors.

## Connectors

Native Code	SQLSTATE 2	SQLSTATE 3	Error Message
500	01000	01000	General warning
501	01004	01004	String data, right truncated
502	01S02	01S02	Option value changed
503	01S03	01S03	No rows updated/deleted
504	01S04	01S04	More than one row updated/deleted
505	01S06	01S06	Attempt to fetch before the result set returned the first row set
506	07001	07002	<a href="#">SQLBindParameter</a> not used for all parameters
507	07005	07005	Prepared statement not a cursor-specification
508	07009	07009	Invalid descriptor index
509	08002	08002	Connection name in use
510	08003	08003	Connection does not exist
511	24000	24000	Invalid cursor state
512	25000	25000	Invalid transaction state
513	25S01	25S01	Transaction state unknown
514	34000	34000	Invalid cursor name
515	S1000	HY000	General driver defined error
516	S1001	HY001	Memory allocation error
517	S1002	HY002	Invalid column number
518	S1003	HY003	Invalid application buffer type
519	S1004	HY004	Invalid SQL data type
520	S1009	HY009	Invalid use of null pointer
521	S1010	HY010	Function sequence error
522	S1011	HY011	Attribute can not be set now
523	S1012	HY012	Invalid transaction operation code
524	S1013	HY013	Memory management error
525	S1015	HY015	No cursor name available
526	S1024	HY024	Invalid attribute value
527	S1090	HY090	Invalid string or buffer length
528	S1091	HY091	Invalid descriptor field identifier
529	S1092	HY092	Invalid attribute/option identifier
530	S1093	HY093	Invalid parameter number
531	S1095	HY095	Function type out of range
532	S1106	HY106	Fetch type out of range
533	S1117	HY117	Row value out of range
534	S1109	HY109	Invalid cursor position
535	S1C00	HYC00	Optional feature not implemented
0	21S01	21S01	Column count does not match value count
0	23000	23000	Integrity constraint violation
0	42000	42000	Syntax error or access violation

0	42S02	42S02	Base table or view not found
0	42S12	42S12	Index not found
0	42S21	42S21	Column already exists
0	42S22	42S22	Column not found
0	08S01	08S01	Communication link failure

## 18.1.6. MyODBC Notes and Tips

Here are some common notes and tips for using MyODBC within different environments, applications and tools. The notes provided here are based on the experiences of MyODBC developers and users.

### 18.1.6.1. MyODBC General Functionality

This section provides help with common queries and areas of functionality in MySQL and how to use them with MyODBC.

#### 18.1.6.1.1. Obtaining Auto-Increment Values

Obtaining the value of column that uses `AUTO_INCREMENT` after an `INSERT` statement can be achieved in a number of different ways. To obtain the value immediately after an `INSERT`, use a `SELECT` query with the `LAST_INSERT_ID()` function.

For example, using MyODBC you would execute two separate statements, the `INSERT` statement and the `SELECT` query to obtain the auto-increment value.

```
INSERT INTO tbl (auto,text) VALUES(NULL,'text');
SELECT LAST_INSERT_ID();
```

If you do not require the value within your application, but do require the value as part of another `INSERT`, the entire process can be handled by executing the following statements:

```
INSERT INTO tbl (auto,text) VALUES(NULL,'text');
INSERT INTO tbl2 (id,text) VALUES(LAST_INSERT_ID(),'text');
```

Certain ODBC applications (including Delphi and Access) may have trouble obtaining the auto-increment value using the previous examples. In this case, try the following statement as an alternative:

```
SELECT * FROM tbl WHERE auto IS NULL;
```

See [Section 17.2.13.3, “How to Get the Unique ID for the Last Inserted Row”](#).

#### 18.1.6.1.2. Dynamic Cursor Support

Support for the `dynamic cursor` is provided in MyODBC 3.51, but dynamic cursors are not enabled by default. You can enable this function within Windows by selecting the `Enable Dynamic Cursor` checkbox within the ODBC Data Source Administrator.

On other platforms, you can enable the dynamic cursor by adding `32` to the `OPTION` value when creating the DSN.

#### 18.1.6.1.3. MyODBC Performance

The MyODBC driver has been optimized to provide very fast performance. If you experience problems with the performance of MyODBC, or notice a large amount of disk activity for simple queries, there are

a number of aspects you should check:

- Ensure that **ODBC Tracing** is not enabled. With tracing enabled, a lot of information is recorded in the tracing file by the ODBC Manager. You can check, and disable, tracing within Windows using the **Tracing** panel of the ODBC Data Source Administrator. Within Mac OS X, check the **Tracing** panel of ODBC Administrator. See [Section 18.1.3.8, “Getting an ODBC Trace File”](#).
- Make sure you are using the standard version of the driver, and not the debug version. The debug version includes additional checks and reporting measures.
- Disable the MyODBC driver trace and query logs. These options are enabled for each DSN, so make sure to examine only the DSN that you are using in your application. Within Windows, you can disable the MyODBC and query logs by modifying the DSN configuration. Within Mac OS X and Unix, ensure that the driver trace (option value 4) and query logging (option value 524288) are not enabled.

#### 18.1.6.1.4. Setting ODBC Query Timeout in Windows

For more information on how to set the query timeout on Microsoft Windows when executing queries through an ODBC connection, read the Microsoft knowledgebase document at <http://support.microsoft.com/default.aspx?scid=kb%3Ben-us%3B153756>.

#### 18.1.6.2. MyODBC Application Specific Tips

Most programs should work with MyODBC, but for each of those listed here, there are specific notes and tips to improve or enhance the way you work with MyODBC and these applications.

With all applications you should ensure that you are using the latest MyODBC drivers, ODBC Manager and any supporting libraries and interfaces used by your application. For example, on Windows, using the latest version of Microsoft Data Access Components (MDAC) will improve the compatibility with ODBC in general, and with the MyODBC driver.

##### 18.1.6.2.1. Using MyODBC with Microsoft Applications

The majority of Microsoft applications have been tested with MyODBC, including Microsoft Office, Microsoft Access and the various programming languages supported within ASP and Microsoft Visual Studio.

If you have problem with MyODBC and your program also works with OLEDB, you should try the OLEDB driver.

###### 18.1.6.2.1.1. Microsoft Access

To improve the integration between Microsoft Access and MySQL through MyODBC:

- For all versions of Access, you should enable the MyODBC **Return matching rows** option. For Access 2.0, you should additionally enable the **Simulate ODBC 1.0** option.
- You should have a **TIMESTAMP** column in all tables that you want to be able to update. For maximum portability, don't use a length specification in the column declaration (which is unsupported within MySQL in versions earlier than 4.1).
- You should have a primary key in each MySQL table you want to use with Access. If not, new or updated rows may show up as **#DELETED#**.

- Use only `DOUBLE` float fields. Access fails when comparing with single-precision floats. The symptom usually is that new or updated rows may show up as `#DELETED#` or that you can't find or update rows.
- If you are using MyODBC to link to a table that has a `BIGINT` column, the results are displayed as `#DELETED#`. The work around solution is:
  - Have one more dummy column with `TIMESTAMP` as the data type.
  - Select the `Change BIGINT columns to INT` option in the connection dialog in ODBC DSN Administrator.
  - Delete the table link from Access and re-create it.

Old records may still display as `#DELETED#`, but newly added/updated records are displayed properly.

- If you still get the error `Another user has changed your data` after adding a `TIMESTAMP` column, the following trick may help you:

Don't use a `table` data sheet view. Instead, create a form with the fields you want, and use that `form` data sheet view. You should set the `DefaultValue` property for the `TIMESTAMP` column to `NOW( )`. It may be a good idea to hide the `TIMESTAMP` column from view so your users are not confused.

- In some cases, Access may generate SQL statements that MySQL can't understand. You can fix this by selecting `"Query | SQLSpecific | Pass-Through"` from the Access menu.
- On Windows NT, Access reports `BLOB` columns as `OLE OBJECTS`. If you want to have `MEMO` columns instead, you should change `BLOB` columns to `TEXT` with `ALTER TABLE`.
- Access can't always handle the MySQL `DATE` column properly. If you have a problem with these, change the columns to `DATETIME`.
- If you have in Access a column defined as `BYTE`, Access tries to export this as `TINYINT` instead of `TINYINT UNSIGNED`. This gives you problems if you have values larger than 127 in the column.
- If you have very large (long) tables in Access, it might take a very long time to open them. Or you might run low on virtual memory and eventually get an `ODBC Query Failed` error and the table cannot open. To deal with this, select the following options:
  - Return Matching Rows (2)
  - Allow BIG Results (8).

These add up to a value of 10 (`OPTION=10`).

Some external articles and tips that may be useful when using Access, ODBC and MyODBC:

- For a list of tools that can be used with Access and ODBC data sources, refer to [converters](#)  
[http://www.mysql.com/portal/software/convertors/] section for list of available tools.

#### 18.1.6.2.1.2. Microsoft Excel and Column Types

If you have problems importing data into Microsoft Excel, particularly numerical, date, and time values, this is probably because of a bug in Excel, where the column type of the source data is used to determine the data type when that data is inserted into a cell within the worksheet. The result is that Excel incorrectly identifies the content and this affects both the display format and the data when it is used within calculations.

To address this issue, use the `CONCAT()` function in your queries. The use of `CONCAT()` forces Excel to treat the value as a string, which Excel will then parse and usually correctly identify the embedded information.

However, even with this option, some data may be incorrectly formatted, even though the source data remains unchanged. Use the `Format Cells` option within Excel to change the format of the displayed information.

#### 18.1.6.2.1.3. Microsoft Visual Basic

To be able to update a table, you must define a primary key for the table.

Visual Basic with ADO can't handle big integers. This means that some queries like `SHOW PROCESSLIST` do not work properly. The fix is to use `OPTION=16384` in the ODBC connect string or to select the `Change BIGINT columns to INT` option in the MyODBC connect screen. You may also want to select the `Return matching rows` option.

#### 18.1.6.2.1.4. Microsoft Visual InterDev

If you have a `BIGINT` in your result, you may get the error `[Microsoft][ODBC Driver Manager] Driver does not support this parameter`. Try selecting the `Change BIGINT columns to INT` option in the MyODBC connect screen.

#### 18.1.6.2.1.5. Visual Objects

You should select the `Don't optimize column widths` option.

#### 18.1.6.2.1.6. Microsoft ADO

When you are coding with the ADO API and MyODBC, you need to pay attention to some default properties that aren't supported by the MySQL server. For example, using the `CursorLocation Property` as `adUseServer` returns a result of `-1` for the `RecordCount Property`. To have the right value, you need to set this property to `adUseClient`, as shown in the VB code here:

```
Dim myconn As New ADOConnection
Dim myrs As New Recordset
Dim mySQL As String
Dim myrows As Long

myconn.Open "DSN=MyODBCsample"
mySQL = "SELECT * from user"
myrs.Source = mySQL
Set myrs.ActiveConnection = myconn
```

```
myrs.CursorLocation = adUseClient
myrs.Open
myrows = myrs.RecordCount

myrs.Close
myconn.Close
```

Another workaround is to use a `SELECT COUNT( *)` statement for a similar query to get the correct row count.

To find the number of rows affected by a specific SQL statement in ADO, use the `RecordsAffected` property in the ADO execute method. For more information on the usage of execute method, refer to <http://msdn.microsoft.com/library/default.asp?url=/library/en-us/ado270/htm/mdmthcnexecute.asp>.

For information, see [ActiveX Data Objects\(ADO\) Frequently Asked Questions](http://support.microsoft.com/default.aspx?scid=kb;EN-US;q183606) [http://support.microsoft.com/default.aspx?scid=kb;EN-US;q183606].

#### 18.1.6.2.1.7. Using MyODBC with Active Server Pages (ASP)

You should select the `Return matching rows` option in the DSN.

For more information about how to access MySQL via ASP using MyODBC, refer to the following articles:

- [Using MyODBC To Access Your MySQL Database Via ASP](http://www.devarticles.com/c/a/ASP/Using-MyODBC-To-Access-Your-MySQL-Database-Via-ASP/) [http://www.devarticles.com/c/a/ASP/Using-MyODBC-To-Access-Your-MySQL-Database-Via-ASP/]
- [ASP and MySQL at DWAM.NT](http://www.dwam.net/mysql/asp_myodbc.asp) [http://www.dwam.net/mysql/asp\_myodbc.asp]

A Frequently Asked Questions list for ASP can be found at <http://support.microsoft.com/default.aspx?scid=/Support/ActiveServer/faq/data/adofaq.asp>.

#### 18.1.6.2.1.8. Using MyODBC with Visual Basic (ADO, DAO and RDO) and ASP

Some articles that may help with Visual Basic and ASP:

- [MySQL BLOB columns and Visual Basic 6](http://dev.mysql.com/tech-resources/articles/vb-blob-handling.html) [http://dev.mysql.com/tech-resources/articles/vb-blob-handling.html] by Mike Hillyer (<mike@openwin.org>).
- [How to map Visual basic data type to MySQL types](http://dev.mysql.com/tech-resources/articles/visual-basic-datatypes.html) [http://dev.mysql.com/tech-resources/articles/visual-basic-datatypes.html] by Mike Hillyer (<mike@openwin.org>).

#### 18.1.6.2.2. Using MyODBC with Borland Applications

With all Borland applications where the Borland Database Engine (BDE) is used, follow these steps to improve compatibility:

- Update to BDE 3.2 or newer.
- Enable the `Don't optimize column widths` option in the DSN.

- Enabled the `Return matching rows` option in the DSN.

#### 18.1.6.2.2.1. Using MyODBC with Borland Builder 4

When you start a query, you can use the `Active` property or the `Open` method. Note that `Active` starts by automatically issuing a `SELECT * FROM ...` query. That may not be a good thing if your tables are large.

#### 18.1.6.2.2.2. Using MyODBC with Delphi

Also, here is some potentially useful Delphi code that sets up both an ODBC entry and a BDE entry for MyODBC. The BDE entry requires a BDE Alias Editor that is free at a Delphi Super Page near you. (Thanks to Bryan Brunton <[bryan@flesherfab.com](mailto:bryan@flesherfab.com)> for this):

```
fReg:= TRegistry.Create;
fReg.OpenKey('\Software\ODBC\ODBC.INI\DocumentsFab', True);
fReg.WriteString('Database', 'Documents');
fReg.WriteString('Description', '');
fReg.WriteString('Driver', 'C:\WINNT\System32\myodbc.dll');
fReg.WriteString('Flag', '1');
fReg.WriteString('Password', '');
fReg.WriteString('Port', '');
fReg.WriteString('Server', 'xmark');
fReg.WriteString('User', 'winuser');
fReg.OpenKey('\Software\ODBC\ODBC.INI\ODBC Data Sources', True);
fReg.WriteString('DocumentsFab', 'MySQL');
fReg.CloseKey;
fReg.Free;

Memol.Lines.Add('DATABASE NAME=');
Memol.Lines.Add('USER NAME=');
Memol.Lines.Add('ODBC DSN=DocumentsFab');
Memol.Lines.Add('OPEN MODE=READ/WRITE');
Memol.Lines.Add('BATCH COUNT=200');
Memol.Lines.Add('LANGDRIVER=');
Memol.Lines.Add('MAX ROWS=-1');
Memol.Lines.Add('SCHEMA CACHE DIR=');
Memol.Lines.Add('SCHEMA CACHE SIZE=8');
Memol.Lines.Add('SCHEMA CACHE TIME=-1');
Memol.Lines.Add('SQLPASSTHRU MODE=SHARED AUTOCOMMIT');
Memol.Lines.Add('SQLQRYMODE=');
Memol.Lines.Add('ENABLE SCHEMA CACHE=FALSE');
Memol.Lines.Add('ENABLE BCD=FALSE');
Memol.Lines.Add('ROWSET SIZE=20');
Memol.Lines.Add('BLOBS TO CACHE=64');
Memol.Lines.Add('BLOB SIZE=32');

AliasEditor.Add('DocumentsFab', 'MySQL', Memol.Lines);
```

#### 18.1.6.2.2.3. Using MyODBC with C++ Builder

Tested with BDE 3.0. The only known problem is that when the table schema changes, query fields are not updated. BDE, however, does not seem to recognize primary keys, only the index named `PRIMARY`, although this has not been a problem.

#### 18.1.6.2.3. Using MyODBC with ColdFusion

The following information is taken from the ColdFusion documentation:

Use the following information to configure ColdFusion Server for Linux to use the `unixODBC` driver with MyODBC for MySQL data sources. Allaire has verified that MyODBC 2.50.26 works with MySQL 3.22.27 and ColdFusion for Linux. (Any newer version should also work.) You can download MyODBC at <http://dev.mysql.com/downloads/connector/odbc/>.

ColdFusion version 4.5.1 allows you to use the ColdFusion Administrator to add the MySQL data source. However, the driver is not included with ColdFusion version 4.5.1. Before the MySQL driver appears in

the ODBC data sources drop-down list, you must build and copy the MyODBC driver to /  
[opt/coldfusion/lib/libmyodbc.so](#).

The Contrib directory contains the program [mydsn-xxx.zip](#) which allows you to build and remove the DSN registry file for the MyODBC driver on ColdFusion applications.

For more information and guides on using ColdFusion and MyODBC, see the following external sites:

- Refer to [MySQL ColdFusion unixODBC MyODBC and Solaris - how to succeed](#) [<http://dbforums.com/showthread.php?threadid=174934>]
- ColdFusion (on Solaris and NT with service pack 5), [How-to: MySQL and ColdFusion](#) [<http://www.njwtech.net/addons/coldfusion/mysql.html>].
- [Troubleshooting Data Sources and Database Connectivity for Unix Platforms](#) [<http://www.macromedia.com/v1/handlers/index.cfm?ID=11328&Method=Full&PageCall=/support/index.cfm>].

#### 18.1.6.2.4. Using MyODBC with OpenOffice

Open Office (<http://www.openoffice.org>) [How-to: MySQL + OpenOffice](#) [[http://dba.openoffice.org/proposals/MySQL\\_OOo.html](http://dba.openoffice.org/proposals/MySQL_OOo.html)]. [How-to: OpenOffice + MyODBC + unixODBC](#) [<http://www.unixodbc.org/doc/OOoMySQL.pdf>].

#### 18.1.6.2.5. Using MyODBC with Sambar Server

Sambar Server (<http://www.sambarserver.info>) [How-to: MyODBC + SambarServer + MySQL](#) [<http://www.sambarserver.info/article.php?sid=66>].

#### 18.1.6.2.6. Using MyODBC with Pervasive Software DataJunction

You have to change it to output `VARCHAR` rather than `ENUM`, as it exports the latter in a manner that causes MySQL problems.

#### 18.1.6.2.7. Using MyODBC with SunSystems Vision

You should select the `Return matching rows` option.

### 18.1.6.3. MyODBC Errors and Resolutions

The following section details some common errors and their suggested fix or alternative solution. If you are still experiencing problems, use the MyODBC mailing list; see [Section 18.1.7.1, “MyODBC Community Support”](#).

Many problems can be resolved by upgrading your MyODBC drivers to the latest available release. On Windows, you should also make sure that you have the latest versions of the Microsoft Data Access Components (MDAC) installed.

#### Questions

- [19.1.6.3.1](#): Are MyODBC 2.50 applications compatible with MyODBC 3.51?
- [19.1.6.3.2](#): I have installed MyODBC on Windows XP x64 Edition or Windows Server 2003 R2 x64. The installation completed successfully, but the MyODBC driver does not appear in [ODBC Data Source Administrator](#).

- [19.1.6.3.3](#): When connecting or using the **Test** button in **ODBC Data Source Administrator** I get error 10061 (Cannot connect to server)
- [19.1.6.3.4](#): The following error is reported when using transactions: **Transactions are not enabled**
- [19.1.6.3.5](#): The following error is reported when I submit a query: **Cursor not found**
- [19.1.6.3.6](#): Access reports records as **#DELETED#** when inserting or updating records in linked tables.
- [19.1.6.3.7](#): How do I handle Write Conflicts or Row Location errors?
- [19.1.6.3.8](#): Exporting data from Access 97 to MySQL reports a **Syntax Error**.

## Questions and Answers

### 19.1.6.3.1: Are MyODBC 2.50 applications compatible with MyODBC 3.51?

Applications based on MyODBC 2.50 should work fine with MyODBC 3.51 and later versions. If you find something is not working with the latest version of MyODBC which previously worked under an earlier version, please file a bug report. See [Section 18.1.7.2](#), “[How to Report MyODBC Problems or Bugs](#)”.

### 19.1.6.3.2: I have installed MyODBC on Windows XP x64 Edition or Windows Server 2003 R2 x64. The installation completed successfully, but the MyODBC driver does not appear in ODBC Data Source Administrator.

This is not a bug, but is related to the way Windows x64 editions operate with the ODBC driver. On Windows x64 editions, the MyODBC driver is installed in the `%SystemRoot%\SysWOW64` folder. However, the default **ODBC Data Source Administrator** that is available through the **Administrative Tools** or **Control Panel** in Windows x64 Editions is located in the `%SystemRoot%\system32` folder, and only searches this folder for ODBC drivers.

On Windows x64 editions, you should use the ODBC administration tool located at `%SystemRoot%\SysWOW64\odbcad32.exe`, this will correctly locate the installed MyODBC drivers and enable you to create a MyODBC DSN.

This issue was originally reported as [Bug#20301](#) [<http://bugs.mysql.com/20301>].

### 19.1.6.3.3: When connecting or using the **Test** button in **ODBC Data Source Administrator** I get error 10061 (Cannot connect to server)

This error can be raised by a number of different issues, including server problems, network problems,

---

and firewall and port blocking problems. For more information, see [Section A.2.2, “Can't connect to \[local\] MySQL server”](#).

#### **19.1.6.3.4: The following error is reported when using transactions: Transactions are not enabled**

This error indicates that you are trying to use transactions with a MySQL table that does not support transactions. Transactions are supported within MySQL when using the [InnoDB](#) and [BDB](#) database engines.

You should check the following before continuing:

- Verify that your MySQL server supports a transactional database engine. Use `SHOW ENGINES` to obtain a list of the available engine types.
- Verify that the tables you are updating use a transaction database engine.
- Ensure that you have not enabled the `disable transactions` option in your DSN.

#### **19.1.6.3.5: The following error is reported when I submit a query: Cursor not found**

This occurs because the application is using the old MyODBC 2.50 version, and it did not set the cursor name explicitly through `SQLSetCursorName`. The fix is to upgrade to MyODBC 3.51 version.

#### **19.1.6.3.6: Access reports records as #DELETED# when inserting or updating records in linked tables.**

If the inserted or updated records are shown as `#DELETED#` in the access, then:

- If you are using Access 2000, you should get and install the newest (version 2.6 or higher) Microsoft MDAC ([Microsoft Data Access Components](#)) from <http://www.microsoft.com/data/>. This fixes a bug in Access that when you export data to MySQL, the table and column names aren't specified. Another way to work around this bug is to upgrade to MyODBC 2.50.33 or higher and MySQL 3.23.x or higher, which together provide a workaround for the problem.

You should also get and apply the Microsoft Jet 4.0 Service Pack 5 (SP5) which can be found at <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q239114>. This fixes some cases where columns are marked as `#DELETED#` in Access.

Note: If you are using MySQL 3.22, you must apply the MDAC patch and use MyODBC 2.50.32 or 2.50.34 and up to work around this problem.

- For all versions of Access, you should enable the MyODBC `Return matching rows` option. For Access 2.0, you should additionally enable the `Simulate ODBC 1.0` option.
- You should have a timestamp in all tables that you want to be able to update..
- You should have a primary key in the table. If not, new or updated rows may show up as `#DELETED#`.
- Use only `DOUBLE` float fields. Access fails when comparing with single-precision floats. The symptom usually is that new or updated rows may show up as `#DELETED#` or that you can't find or update rows.
- If you are using MyODBC to link to a table that has a `BIGINT` column, the results are displayed as `#DELETED`. The work around solution is:

- Have one more dummy column with `TIMESTAMP` as the data type.
- Select the `Change BIGINT columns to INT` option in the connection dialog in ODBC DSN Administrator.
- Delete the table link from Access and re-create it.

Old records still display as `#DELETED#`, but newly added/updated records are displayed properly.

#### 19.1.6.3.7: How do I handle Write Conflicts or Row Location errors?

If you see the following errors, select the `Return Matching Rows` option in the DSN configuration dialog, or specify `OPTION=2`, as the connection parameter:

```
Write Conflict. Another user has changed your data.  
Row cannot be located for updating. Some values may have been changed  
since it was last read.
```

#### 19.1.6.3.8: Exporting data from Access 97 to MySQL reports a `Syntax Error`.

This error is specific to Access 97 and versions of MyODBC earlier than 3.51.02. Update to the latest version of the MyODBC driver to resolve this problem.

#### 19.1.6.3.9: Exporting data from Microsoft DTS to MySQL reports a `Syntax Error`.

This error occurs only with MySQL tables using the `TEXT` or `VARCHAR` data types. You can fix this error by upgrading your MyODBC driver to version 3.51.02 or higher.

#### 19.1.6.3.10: Using ODBC.NET with MyODBC, while fetching empty string (0 length), it starts giving the `SQL_NO_DATA` exception.

You can get the patch that addresses this problem from <http://support.microsoft.com/default.aspx?scid=kb;EN-US;q319243>.

#### 19.1.6.3.11: Using `SELECT COUNT(*) FROM tbl_name` within Visual Basic and ASP returns an error.

This error occurs because the `COUNT(*)` expression is returning a `BIGINT`, and ADO can't make sense of a number this big. Select the `Change BIGINT columns to INT` option (option value 16384).

#### 19.1.6.3.12: Using the `AppendChunk()` or `GetChunk()` ADO methods, the `Multiple-step operation generated errors. Check each status value error is returned`.

The `GetChunk()` and `AppendChunk()` methods from ADO doesn't work as expected when the cursor location is specified as `adUseServer`. On the other hand, you can overcome this error by using `adUseClient`.

A simple example can be found from [http://www.dwam.net/iishelp/ado/docs/adomth02\\_4.htm](http://www.dwam.net/iishelp/ado/docs/adomth02_4.htm)

#### 19.1.6.3.13: Access Returns `Another user had modified the record that you have modified while editing records on a Linked Table`.

In most cases, this can be solved by doing one of the following things:

- Add a primary key for the table if one doesn't exist.

- Add a timestamp column if one doesn't exist.
- Only use double-precision float fields. Some programs may fail when they compare single-precision floats.

If these strategies don't help, you should start by making a log file from the ODBC manager (the log you get when requesting logs from ODBCADMIN) and a MyODBC log to help you figure out why things go wrong. For instructions, see [Section 18.1.3.8, “Getting an ODBC Trace File”](#).

## 18.1.7. MyODBC Support

There are many different places where you can get support for using MyODBC. You should always try the MyODBC Mailing List or MyODBC Forum. See [Section 18.1.7.1, “MyODBC Community Support”](#), for help before reporting a specific bug or issue to MySQL.

### 18.1.7.1. MyODBC Community Support

MySQL AB provides assistance to the user community by means of its mailing lists. For MyODBC-related issues, you can get help from experienced users by using the `<myodbc@lists.mysql.com>` mailing list. Archives are available online at <http://lists.mysql.com/myodbc>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.7.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [MyODBC Forum](#) [<http://forums.mysql.com/list.php?37>]. You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.7.2, “MySQL Community Support at the MySQL Forums”](#).

### 18.1.7.2. How to Report MyODBC Problems or Bugs

If you encounter difficulties or problems with MyODBC, you should start by making a log file from the [ODBC Manager](#) (the log you get when requesting logs from `ODBC ADMIN`) and MyODBC. The procedure for doing this is described in [Section 18.1.3.8, “Getting an ODBC Trace File”](#).

Check the MyODBC trace file to find out what could be wrong. You should be able to determine what statements were issued by searching for the string `>mysql_real_query` in the `myodbc.log` file.

You should also try issuing the statements from the `mysql` client program or from `admndemo`. This helps you determine whether the error is in MyODBC or MySQL.

If you find out something is wrong, please only send the relevant rows (maximum 40 rows) to the `myo-  
dbc` mailing list. See [Section 1.7.1, “MySQL Mailing Lists”](#). Please never send the whole MyODBC or ODBC log file!

You should ideally include the following information with the email:

- Operating system and version
- MyODBC version
- ODBC Driver Manager type and version
- MySQL server version
- ODBC trace from Driver Manager

- MyODBC log file from MyODBC driver
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem!

Also, before posting the bug, check the MyODBC mailing list archive at <http://lists.mysql.com/myodbc>.

If you are unable to find out what's wrong, the last option is to create an archive in `tar` or Zip format that contains a MyODBC trace file, the ODBC log file, and a `README` file that explains the problem. You can send this to <ftp://ftp.mysql.com/pub/mysql/upload/>. Only MySQL engineers have access to the files you upload, and we are very discreet with the data.

If you can create a program that also demonstrates the problem, please include it in the archive as well.

If the program works with another SQL server, you should include an ODBC log file where you perform exactly the same SQL statements so that we can compare the results between the two systems.

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

### 18.1.7.3. How to Submit a MyODBC Patch

You can send a patch or suggest a better solution for any existing code or problems by sending a mail message to [<myodbc@lists.mysql.com>](mailto:myodbc@lists.mysql.com).

### 18.1.7.4. MyODBC Change History

The MyODBC Change History (Changelog) is located with the main Changelog for MySQL. See [Section D.6, “MySQL Connector/ODBC \(MyODBC\) Change History”](#).

### 18.1.7.5. Credits

These are the developers that have worked on the MyODBC and MyODBC 3.51 Drivers from MySQL AB.

- Michael (Monty) Widenius
- Venu Anuganti
- Peter Harvey

## 18.2. Connector/NET

Connector/NET enables developers to easily create .NET applications that require secure, high-performance data connectivity with MySQL. It implements the required ADO.NET interfaces and integrates into ADO.NET aware tools. Developers can build applications using their choice of .NET languages. Connector/NET is a fully managed ADO.NET driver written in 100% pure C#.

Connector/NET includes full support for:

- MySQL 5.0 features (such as stored procedures)

- MySQL 4.1 features (server-side prepared statements, Unicode, and shared memory access, and so forth)
- Large-packet support for sending and receiving rows and BLOBs up to 2 gigabytes in size.
- Protocol compression which allows for compressing the data stream between the client and server.
- Support for connecting using TCP/IP sockets, named pipes, or shared memory on Windows.
- Support for connecting using TCP/IP sockets or Unix sockets on Unix.
- Support for the Open Source Mono framework developed by Novell.
- Fully managed, does not utilize the MySQL client library.

This document is intended as a user's guide to Connector/NET and includes a full syntax reference. Syntax information is also included within the [Documentation.chm](#) file included with the Connector/NET distribution.

## 18.2.1. Connector/NET Versions

There is currently one version of the Connector/NET available:

- Connector/NET 1.0 includes support for MySQL 4.0, and MySQL 5.0 features, and full compatibility with the ADO.NET driver interface.

## 18.2.2. How to install Connector/NET

Connector/NET runs on any platform that supports the .NET framework. The .NET framework is primarily supported on recent versions of Microsoft Windows, and is supported on Linux through the Open Source Mono framework (see <http://www.mono-project.com>).

Connector/NET is available for download from <http://dev.mysql.com/downloads/connector/net/1.0.html>.

### 18.2.2.1. Installing Connector/NET on Windows

On Windows, installation is supported either through a binary installation process or by downloading a Zip file with the Connector/NET components.

Before installing, you should ensure that your system is up to date, including installing the latest version of the .NET Framework.

#### 18.2.2.1.1. Installing Connector/NET using the Installer

Using the installer is the most straightforward method of installing Connector/NET on Windows and the installed components include the source code, test code and full reference documentation.

Connector/NET is installed through the use of a Windows Installer ([.msi](#)) installation package, which can be used to install Connector/NET on all Windows operating systems. The MSI package is contained within a ZIP archive named [mysql-connector-net-version.zip](#), where *version* indicates the Connector/NET version.

To install Connector/NET:

1. Double click on the MSI installer file extracted from the Zip you downloaded. Click [Next](#) to start the installation.

2. You must choose the type of installation that you want to perform.

For most situations, the Typical installation will be suitable. Click the [Typical](#) button and proceed to Step 5. A Complete installation installs all the available files. To conduct a Complete installation, click the [Complete](#) button and proceed to step 5. If you want to customize your installation, including choosing the components to install and some installation options, click the [Custom](#) button and proceed to Step 3.

3. If you have chosen a custom installation, you can select the individual components that you want to install, including the core interface component, supporting documentation (a CHM file) samples and examples and the source code. Select the items, and their installation level, and then click [Next](#) to continue the installation.

4. For a custom installation you can also decide whether the Connector/NET component should be registered in the Global Assembly Cache - this will make the Connector/NET component available to all applications, not just those where you explicitly reference the Connector/NET component. You can also enable, or disable, the creation or appropriate items in the Start menu. Click [Next](#) when you have selected the required options.

5. You will be given a final opportunity to confirm the installation. Click [Install](#) to copy and install the files onto your machine.

6. Once the installation has been completed, click **Finish** to exit the installer.

Unless you choose otherwise, Connector/NET is installed in `C:\Program Files\MySQL\MySQL Connector Net X.X.X`, where `X.X.X` is replaced with the version of Connector/NET you are installing. New installations do not overwrite existing versions of Connector/NET.

Depending on your installation type, the installed components will include some or all of the following components:

- `bin` - Connector/NET MySQL libraries for different versions of the .NET environment.
- `docs` - contains a CHM of the Connector/NET documentation.
- `samples` - sample code and applications that use the Connector/NET component.
- `src` - the source code for the Connector/NET component.

You may also use the `/quiet` or `/q` command line option with the `msiexec` tool to install the Connector/NET package automatically (using the default options) with no notification to the user. Using this option you cannot select options and no prompts, messages or dialog boxes will be displayed.

```
C:\> msiexec /package connector-net.msi /quiet
```

To provide a progress bar to the user during automatic installation, but still without presenting the user with a dialog box of the ability to select options, use the `/passive` option.

### 18.2.2.1.2. Installing Connector/NET using the Zip package

If you are having problems running the installer, you can download a .zip file without an installer as an alternative. That file is called `mysql-connector-net-version-noinstall.zip`. Once downloaded, you can extract the files to a location of your choice.

The .zip file contains the following directories:

- `bin` - Connector/NET MySQL libraries for different versions of the .NET environment.
- `doc` - contains a CHM of the Connector/NET documentation.
- `Samples` - sample code and applications that use the Connector/NET component.
- `mysqlclient` - the source code for the Connector/NET component.
- `testsuite` - the test suite used to verify the operation of the Connector/NET component.

### 18.2.2.2. Installing Connector/NET on Unix with Mono

There is no installer available for installing the Connector/NET component on your Unix installation. However, the installation is very simple. Before installing, please ensure that you have a working Mono project installation.

Note that you should only install the Connector/NET component on Unix environments where you want to connect to a MySQL server through the Mono project. If you are deploying or developing on a different environment such as Java or Perl then you should use a more appropriate connectivity component. See the [Chapter 18, Connectors](#), or [Chapter 17, APIs and Libraries](#), for more information.

To install Connector/NET on Unix/Mono:

1. Download the `mysql-connector-net-version-noinstall.zip` and extract the contents.
2. Copy the `MySQL.Data.dll` file to your Mono project installation folder.
3. You must register the Connector/NET component in the Global Assembly Cache using the `gacutil` command:

```
shell> gacutil /i MySQL.Data.dll
```

Once installed, applications that are compiled with the Connector/NET component need no further changes. However, you must ensure that when you compile your applications you include the Connector/NET component using the `-r:MySQLData.dll` command line option.

### 18.2.2.3. Installing Connector/NET using the Source

**Caution:** You should read this section only if you are interested in helping us test our new code. If you just want to get Connector/NET up and running on your system, you should use a standard release distribution.

To be able to access the Connector/NET source tree, you must have Subversion installed. Subversion is freely available from <http://subversion.tigris.org/>.

The most recent development source tree is available from our public Subversion trees at <http://dev.mysql.com/tech-resources/sources.html>.

To checkout out the Connector/NET sources, change to the directory where you want the copy of the Connector/NET tree to be stored, then use the following command:

```
shell> svn co
http://svn.mysql.com/svnpublic/connector-net
```

A Visual Studio project is included in the source which you can use to build Connector/NET.

## 18.2.3. Connector/NET Examples

Connector/NET comprises several classes that are used to connect to the database, execute queries and statements, and manage query results.

The following are the major classes of Connector/NET:

- [MySqlCommand](#): Represents an SQL statement to execute against a MySQL database.
- [MySqlCommandBuilder](#): Automatically generates single-table commands used to reconcile changes made to a DataSet with the associated MySQL database.
- [MySqlConnection](#): Represents an open connection to a MySQL Server database.
- [MySqlDataAdapter](#): Represents a set of data commands and a database connection that are used to fill a dataset and update a MySQL database.
- [MySqlDataReader](#): Provides a means of reading a forward-only stream of rows from a MySQL database.
- [MySqlException](#): The exception that is thrown when MySQL returns an error.
- [MySqlHelper](#): Helper class that makes it easier to work with the provider.
- [MySqlTransaction](#): Represents an SQL transaction to be made in a MySQL database.

This section contains basic information and examples for each of the above classes. For a more detailed reference guide please see [Section 18.2.4, “Connector/NET Reference”](#).

### 18.2.3.1. MySqlCommand

Represents a SQL statement to execute against a MySQL database. This class cannot be inherited.

[MySqlCommand](#) features the following methods for executing commands at a MySQL database:

Item	Description
<a href="#">ExecuteReader</a>	Executes commands that return rows.
<a href="#">ExecuteNonQuery</a>	Executes commands such as SQL INSERT, DELETE, and UPDATE statements.
<a href="#">ExecuteScalar</a>	Retrieves a single value (for example, an aggregate value) from a database.

You can reset the [CommandText](#) property and reuse the [MySqlCommand](#) object. However, you must

close the [MySqlDataReader](#) before you can execute a new or previous command.

If a [MySqlException](#) is generated by the method executing a [MySqlCommand](#), the [MySqlConnection](#) remains open. It is the responsibility of the programmer to close the connection.

**Note.** Prior versions of the provider used the '@' symbol to mark parameters in SQL. This is incompatible with MySQL user variables, so the provider now uses the '?' symbol to locate parameters in SQL. To support older code, you can set 'old syntax=yes' on your connection string. If you do this, please be aware that an exception will not be throw if you fail to define a parameter that you intended to use in your SQL.

### Examples

The following example creates a [MySqlCommand](#) and a [MySqlConnection](#). The [MySqlConnection](#) is opened and set as the [Connection](#) for the [MySqlCommand](#). The example then calls [ExecuteNonQuery](#), and closes the connection. To accomplish this, the [ExecuteNonQuery](#) is passed a connection string and a query string that is a SQL INSERT statement.

Visual Basic example:

```
Public Sub InsertRow(myConnectionString As String)
    " If the connection string is null, use a default.
    If myConnectionString = "" Then
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass"
    End If
    Dim myConnection As New MySqlConnection(myConnectionString)
    Dim myInsertQuery As String = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)"
    Dim myCommand As New MySqlCommand(myInsertQuery)
    myCommand.Connection = myConnection
    myConnection.Open()
    myCommand.ExecuteNonQuery()
    myCommand.Connection.Close()
End Sub
```

C# example:

```
public void InsertRow(string myConnectionString)
{
    // If the connection string is null, use a default.
    if(myConnectionString == "")
    {
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass";
    }
    MySqlConnection myConnection = new MySqlConnection(myConnectionString);
    string myInsertQuery = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)";
    MySqlCommand myCommand = new MySqlCommand(myInsertQuery);
    myCommand.Connection = myConnection;
    myConnection.Open();
    myCommand.ExecuteNonQuery();
    myCommand.Connection.Close();
}
```

### 18.2.3.1.1. Class MySqlCommand Constructor Form 1

#### Overload methods for MySqlCommand

Initializes a new instance of the MySqlCommand class.

#### Examples

The following example creates a MySqlCommand and sets some of its properties.

**Note.** This example shows how to use one of the overloaded versions of the MySqlCommand constructor. For other examples that might be available, see the individual overload topics.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim myConnection As New MySqlConnection _
        ("Persist Security Info=False;database=test;server=myServer")
    myConnection.Open()
    Dim myTrans As MySQLTransaction = myConnection.BeginTransaction()
    Dim mySelectQuery As String = "SELECT * FROM MyTable"
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection, myTrans)
    myCommand.CommandTimeout = 20
End Sub
```

C# example:

```
public void CreateMySQLCommand()
{
    MySqlConnection myConnection = new MySqlConnection("Persist Security Info=False;
        database=test;server=myServer");
    myConnection.Open();
    MySQLTransaction myTrans = myConnection.BeginTransaction();
    string mySelectQuery = "SELECT * FROM myTable";
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection, myTrans);
    myCommand.CommandTimeout = 20;
}
```

C++ example:

```
public:
void CreateMySQLCommand()
{
    MySqlConnection* myConnection = new MySqlConnection(S"Persist Security Info=False;
        database=test;server=myServer");
    myConnection->Open();
    MySQLTransaction* myTrans = myConnection->BeginTransaction();
    String* mySelectQuery = S"SELECT * FROM myTable";
    MySqlCommand* myCommand = new MySqlCommand(mySelectQuery, myConnection, myTrans);
    myCommand->CommandTimeout = 20;
};
```

Initializes a new instance of the `MySQLCommand` class.

The base constructor initializes all fields to their default values. The following table shows initial property values for an instance of `MySQLCommand`.

Properties	Initial Value
<code>CommandText</code>	empty string ("")
<code>CommandTimeout</code>	0
<code>CommandType</code>	<code>CommandType.Text</code>
<code>Connection</code>	Null

You can change the value for any of these properties through a separate call to the property.

### Examples

The following example creates a `MySQLCommand` and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim myCommand As New MySqlCommand()
    myCommand.CommandType = CommandType.Text
```

---

End Sub

C# example:

```
public void CreateMySQLCommand()
{
    MySqlCommand myCommand = new MySqlCommand();
    myCommand.CommandType = CommandType.Text;
}
```

### 18.2.3.1.2. Class MySqlCommand Constructor Form 2

Initializes a new instance of the [MySqlCommand](#) class with the text of the query.

**Parameters:** The text of the query.

When an instance of [MySqlCommand](#) is created, the following read/write properties are set to initial values.

Properties	Initial Value
<a href="#">CommandText</a>	<a href="#">cmdText</a>
<a href="#">CommandTimeout</a>	0
<a href="#">CommandType</a>	<a href="#">CommandType.Text</a>
<a href="#">Connection</a>	Null

You can change the value for any of these properties through a separate call to the property.

#### Examples

The following example creates a [MySqlCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim sql as String = "SELECT * FROM mytable"
    Dim myCommand As New MySqlCommand(sql)
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySQLCommand()
{
    string sql = "SELECT * FROM mytable";
    MySqlCommand myCommand = new MySqlCommand(sql);
    myCommand.CommandType = CommandType.Text;
}
```

### 18.2.3.1.3. Class MySqlCommand Constructor Form 3

Initializes a new instance of the [MySqlCommand](#) class with the text of the query and a [MySQLConnection](#).

**Parameters:** The text of the query.

**Parameters:** A [MySQLConnection](#) that represents the connection to an instance of SQL Server.

When an instance of [MySqlCommand](#) is created, the following read/write properties are set to initial

---

values.

Properties	Initial Value
<a href="#">CommandText</a>	<a href="#">cmdText</a>
<a href="#">CommandTimeout</a>	<b>0</b>
<a href="#">CommandType</a>	<a href="#">CommandType.Text</a>
<a href="#">Connection</a>	<a href="#">connection</a>

You can change the value for any of these properties through a separate call to the property.

### Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim conn as new MySqlConnection("server=myServer")
    Dim sql as String = "SELECT * FROM mytable"
    Dim myCommand As New MySqlCommand(sql, conn)
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySQLCommand()
{
    MySqlConnection conn = new MySqlConnection("server=myserver")
    string sql = "SELECT * FROM mytable";
    MySqlCommand myCommand = new MySqlCommand(sql, conn);
    myCommand.CommandType = CommandType.Text;
}
```

#### 18.2.3.1.4. Class MySqlCommand Constructor Form 4

Initializes a new instance of the [MySQLCommand](#) class with the text of the query, a [MySQLConnection](#), and the [MySQLTransaction](#).

**Parameters:** The text of the query.

**Parameters:** A [MySQLConnection](#) that represents the connection to an instance of SQL Server.

**Parameters:** The [MySQLTransaction](#) in which the [MySQLCommand](#) executes.

When an instance of [MySQLCommand](#) is created, the following read/write properties are set to initial values.

Properties	Initial Value
<a href="#">CommandText</a>	<a href="#">cmdText</a>
<a href="#">CommandTimeout</a>	<b>0</b>
<a href="#">CommandType</a>	<a href="#">CommandType.Text</a>
<a href="#">Connection</a>	<a href="#">connection</a>

You can change the value for any of these properties through a separate call to the property.

### Examples

The following example creates a `MySQLCommand` and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim conn as new MySqlConnection("server=myServer")
    conn.Open();
    Dim txn as MySqlTransaction = conn.BeginTransaction()
    Dim sql as String = "SELECT * FROM mytable"
    Dim myCommand As New MySQLCommand(sql, conn, txn)
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySQLCommand()
{
    MySqlConnection conn = new MySqlConnection("server=myserver")
    conn.Open();
    MySqlTransaction txn = conn.BeginTransaction();
    string sql = "SELECT * FROM mytable";
    MySQLCommand myCommand = new MySQLCommand(sql, conn, txn);
    myCommand.CommandType = CommandType.Text;
}
```

### 18.2.3.1.5. ExecuteNonQuery

Executes a SQL statement against the connection and returns the number of rows affected.

**Returns:** Number of rows affected

You can use `ExecuteNonQuery` to perform any type of database operation, however any resultsets returned will not be available. Any output parameters used in calling a stored procedure will be populated with data and can be retrieved after execution is complete. For `UPDATE`, `INSERT`, and `DELETE` statements, the return value is the number of rows affected by the command. For all other types of statements, the return value is -1.

#### Examples

The following example creates a `MySQLCommand` and then executes it using `ExecuteNonQuery`. The example is passed a string that is a SQL statement (such as `UPDATE`, `INSERT`, or `DELETE`) and a string to use to connect to the data source.

Visual Basic example:

```
Public Sub CreateMySQLCommand(myExecuteQuery As String, myConnection As MySqlConnection)
    Dim myCommand As New MySQLCommand(myExecuteQuery, myConnection)
    myCommand.Connection.Open()
    myCommand.ExecuteNonQuery()
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLCommand(string myExecuteQuery, MySqlConnection myConnection)
{
    MySQLCommand myCommand = new MySQLCommand(myExecuteQuery, myConnection);
    myCommand.Connection.Open();
    myCommand.ExecuteNonQuery();
    myConnection.Close();
}
```

### 18.2.3.1.6. ExecuteReader1

Sends the `CommandText` to the `MySqlConnection` `Connection`, and builds a `MySqlDataReader` using one of the `CommandBehavior` values.

**Parameters:** One of the `CommandBehavior` values.

When the `CommandType` property is set to `StoredProcedure`, the `CommandText` property should be set to the name of the stored procedure. The command executes this stored procedure when you call `ExecuteReader`.

The `MySqlDataReader` supports a special mode that enables large binary values to be read efficiently. For more information, see the `SequentialAccess` setting for `CommandBehavior`.

While the `MySqlDataReader` is in use, the associated `MySqlConnection` is busy serving the `MySqlDataReader`. While in this state, no other operations can be performed on the `MySqlConnection` other than closing it. This is the case until the `MySqlDataReader.Close` method of the `MySqlDataReader` is called. If the `MySqlDataReader` is created with `CommandBehavior` set to `CloseConnection`, closing the `MySqlDataReader` closes the connection automatically.

**Note.** When calling `ExecuteReader` with the `SingleRow` behavior, you should be aware that using a `limit` clause in your SQL will cause all rows (up to the limit given) to be retrieved by the client. The `MySqlDataReader.Read` method will still return `false` after the first row but pulling all rows of data into the client will have a performance impact. If the `limit` clause is not necessary, it should be avoided.

**Returns:** A `MySqlDataReader` object.

### 18.2.3.1.7. ExecuteReader

Sends the `CommandText` to the `MySqlConnection` `Connection` and builds a `MySqlDataReader`.

**Returns:** A `MySqlDataReader` object.

When the `CommandType` property is set to `StoredProcedure`, the `CommandText` property should be set to the name of the stored procedure. The command executes this stored procedure when you call `ExecuteReader`.

While the `MySqlDataReader` is in use, the associated `MySqlConnection` is busy serving the `MySqlDataReader`. While in this state, no other operations can be performed on the `MySqlConnection` other than closing it. This is the case until the `MySqlDataReader.Close` method of the `MySqlDataReader` is called.

#### Examples

The following example creates a `MySqlCommand`, then executes it by passing a string that is a SQL `SELECT` statement, and a string to use to connect to the data source.

Visual Basic example:

```
Public Sub CreateMySqlDataReader(mySelectQuery As String, myConnection As MySqlConnection)
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection)
    myConnection.Open()
    Dim myReader As MySqlDataReader
    myReader = myCommand.ExecuteReader()
    Try
        While myReader.Read()
            Console.WriteLine(myReader.GetString(0))
        End While
    Finally
        myReader.Close()
        myConnection.Close()
    End Try
End Sub
```

```
End Try
End Sub
```

C# example:

```
public void CreateMySqlDataReader(string mySelectQuery, MySqlConnection myConnection)
{
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection);
    myConnection.Open();
    MySqlDataReader myReader;
    myReader = myCommand.ExecuteReader();
    try
    {
        while(myReader.Read())
        {
            Console.WriteLine(myReader.GetString(0));
        }
    }
    finally
    {
        myReader.Close();
        myConnection.Close();
    }
}
```

### 18.2.3.1.8. Prepare

Creates a prepared version of the command on an instance of MySQL Server.

Prepared statements are only supported on MySQL version 4.1 and higher. Calling prepare while connected to earlier versions of MySQL will succeed but will execute the statement in the same way as unprepared.

#### Examples

The following example demonstrates the use of the [Prepare](#) method.

Visual Basic example:

```
public sub PrepareExample()
    Dim cmd as New MySqlCommand("INSERT INTO mytable VALUES (?val)", myConnection)
    cmd.Parameters.Add( "?val", 10 )
    cmd.Prepare()
    cmd.ExecuteNonQuery()

    cmd.Parameters(0).Value = 20
    cmd.ExecuteNonQuery()
end sub
```

C# example:

```
private void PrepareExample()
{
    MySqlCommand cmd = new MySqlCommand("INSERT INTO mytable VALUES (?val)", myConnection);
    cmd.Parameters.Add( "?val", 10 );
    cmd.Prepare();
    cmd.ExecuteNonQuery();

    cmd.Parameters[0].Value = 20;
    cmd.ExecuteNonQuery();
}
```

### 18.2.3.1.9. ExecuteScalar

Executes the query, and returns the first column of the first row in the result set returned by the query. Extra columns or rows are ignored.

**Returns:** The first column of the first row in the result set, or a null reference if the result set is empty

Use the [ExecuteScalar](#) method to retrieve a single value (for example, an aggregate value) from a database. This requires less code than using the [ExecuteReader](#) method, and then performing the operations necessary to generate the single value using the data returned by a [MySqlDataReader](#)

A typical [ExecuteScalar](#) query can be formatted as in the following C# example:

C# example:

```
cmd.CommandText = "select count(*) from region";
Int32 count = (int32) cmd.ExecuteScalar();
```

### Examples

The following example creates a [MySqlCommand](#) and then executes it using [ExecuteScalar](#). The example is passed a string that is a SQL statement that returns an aggregate result, and a string to use to connect to the data source.

Visual Basic example:

```
Public Sub CreateMySqlCommand(myScalarQuery As String, myConnection As MySqlConnection)
    Dim myCommand As New MySqlCommand(myScalarQuery, myConnection)
    myCommand.Connection.Open()
    myCommand.ExecuteScalar()
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySqlCommand(string myScalarQuery, MySqlConnection myConnection)
{
    MySqlCommand myCommand = new MySqlCommand(myScalarQuery, myConnection);
    myCommand.Connection.Open();
    myCommand.ExecuteScalar();
    myConnection.Close();
}
```

C++ example:

```
public:
    void CreateMySqlCommand(String* myScalarQuery, MySqlConnection* myConnection)
    {
        MySqlCommand* myCommand = new MySqlCommand(myScalarQuery, myConnection);
        myCommand->Connection->Open();
        myCommand->ExecuteScalar();
        myConnection->Close();
    }
```

#### 18.2.3.1.10. CommandText

Gets or sets the SQL statement to execute at the data source.

**Value:** The SQL statement or stored procedure to execute. The default is an empty string.

When the [CommandType](#) property is set to [StoredProcedure](#), the [CommandText](#) property should be set to the name of the stored procedure. The user may be required to use escape character syntax if the stored procedure name contains any special characters. The command executes this stored pro-

cedure when you call one of the Execute methods.

### Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()  
    Dim myCommand As New MySQLCommand()  
    myCommand.CommandText = "SELECT * FROM Mytable ORDER BY id"  
    myCommand.CommandType = CommandType.Text  
End Sub
```

C# example:

```
public void CreateMySQLCommand()  
{  
    MySQLCommand myCommand = new MySQLCommand();  
    myCommand.CommandText = "SELECT * FROM mytable ORDER BY id";  
    myCommand.CommandType = CommandType.Text;  
}
```

#### 18.2.3.1.11. CommandTimeout

Gets or sets the wait time before terminating the attempt to execute a command and generating an error.

**Value:** The time (in seconds) to wait for the command to execute. The default is 0 seconds.

MySQL currently does not support any method of canceling a pending or executing operation. All commands issued against a MySQL server will execute until completion or exception occurs.

#### 18.2.3.1.12. CommandType

Gets or sets a value indicating how the [CommandText](#) property is to be interpreted.

**Value:** One of the [System.Data.CommandType](#) values. The default is [Text](#).

When you set the [CommandType](#) property to [StoredProcedure](#), you should set the [CommandText](#) property to the name of the stored procedure. The command executes this stored procedure when you call one of the Execute methods.

### Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()  
    Dim myCommand As New MySQLCommand()  
    myCommand.CommandType = CommandType.Text  
End Sub
```

C# example:

```
public void CreateMySQLCommand()  
{  
    MySQLCommand myCommand = new MySQLCommand();  
    myCommand.CommandType = CommandType.Text;  
}
```

#### 18.2.3.1.13. Connection

---

Gets or sets the [MySQLConnection](#) used by this instance of the [MySQLCommand](#).

**Value:** The connection to a data source. The default value is a null reference ([Nothing](#) in Visual Basic).

If you set [Connection](#) while a transaction is in progress and the [Transaction](#) property is not null, an [InvalidOperationException](#) is generated. If the [Transaction](#) property is not null and the transaction has already been committed or rolled back, [Transaction](#) is set to null.

### Examples

The following example creates a [MySQLCommand](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateMySQLCommand()
    Dim mySelectQuery As String = "SELECT * FROM mytable ORDER BY id"
    Dim myConnectionString As String = "Persist Security Info=False;database=test;server=myServer"
    Dim myCommand As New MySQLCommand(mySelectQuery)
    myCommand.Connection = New MySQLConnection(myConnectionString)
    myCommand.CommandType = CommandType.Text
End Sub
```

C# example:

```
public void CreateMySQLCommand()
{
    string mySelectQuery = "SELECT * FROM mytable ORDER BY id";
    string myConnectionString = "Persist Security Info=False;database=test;server=myServer";
    MySQLCommand myCommand = new MySQLCommand(mySelectQuery);
    myCommand.Connection = new MySQLConnection(myConnectionString);
    myCommand.CommandType = CommandType.Text;
}
```

#### 18.2.3.1.14. IsPrepared

Returns true if the statement is prepared.

#### 18.2.3.1.15. Parameters

Get the [MySQLParameterCollection](#)

**Value:** The parameters of the SQL statement or stored procedure. The default is an empty collection.

Connector/Net does not support unnamed parameters. Every parameter added to the collection must have an associated name.

### Examples

The following example creates a [MySQLCommand](#) and displays its parameters. To accomplish this, the method is passed a [MySQLConnection](#), a query string that is a SQL [SELECT](#) statement, and an array of [MySQLParameter](#) objects.

Visual Basic example:

```
Public Sub CreateMySQLCommand(myConnection As MySQLConnection, _
mySelectQuery As String, myParamArray() As MySQLParameter)
    Dim myCommand As New MySQLCommand(mySelectQuery, myConnection)
    myCommand.CommandText = "SELECT id, name FROM mytable WHERE age=?age"
    myCommand.UpdatedRowSource = UpdateRowSource.Both
    myCommand.Parameters.Add(myParamArray)
    Dim j As Integer
    For j = 0 To myCommand.Parameters.Count - 1
```

```

        myCommand.Parameters.Add(myParamArray(j))
    Next j
    Dim myMessage As String = ""
    Dim i As Integer
    For i = 0 To myCommand.Parameters.Count - 1
        myMessage += myCommand.Parameters(i).ToString() & ControlChars.Cr
    Next i
    Console.WriteLine(myMessage)
End Sub

```

C# example:

```

public void CreateMySQLCommand(MySqlConnection myConnection, string mySelectQuery,
    MySqlParameter[] myParamArray)
{
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection);
    myCommand.CommandText = "SELECT id, name FROM mytable WHERE age=?age";
    myCommand.Parameters.Add(myParamArray);
    for (int j=0; j<myParamArray.Length; j++)
    {
        myCommand.Parameters.Add(myParamArray[j]) ;
    }
    string myMessage = "";
    for (int i = 0; i < myCommand.Parameters.Count; i++)
    {
        myMessage += myCommand.Parameters[i].ToString() + "\n";
    }
    MessageBox.Show(myMessage);
}

```

### 18.2.3.1.16. Transaction

Gets or sets the [MySQLTransaction](#) within which the [MySQLCommand](#) executes.

**Value:** The [MySQLTransaction](#). The default value is a null reference ([Nothing](#) in Visual Basic).

You cannot set the [Transaction](#) property if it is already set to a specific value, and the command is in the process of executing. If you set the transaction property to a [MySQLTransaction](#) object that is not connected to the same [MySQLConnection](#) as the [MySQLCommand](#) object, an exception will be thrown the next time you attempt to execute a statement.

### 18.2.3.1.17. UpdatedRowSource

Gets or sets how command results are applied to the [DataRow](#) when used by the [System.Data.Common.DbDataAdapter.Update](#) method of the [System.Data.Common.DbDataAdapter](#).

**Value:** One of the [UpdateRowSource](#) values.

The default [System.Data.UpdateRowSource](#) value is [Both](#) unless the command is automatically generated (as in the case of the [MySQLCommandBuilder](#)), in which case the default is [None](#).

## 18.2.3.2. MySqlCommandBuilder

Automatically generates single-table commands used to reconcile changes made to a [DataSet](#) with the associated [MySQL](#) database. This class cannot be inherited.

The [MySQLDataAdapter](#) does not automatically generate the SQL statements required to reconcile changes made to a [System.Data.DataSet](#) with the associated instance of [MySQL](#). However, you can create a [MySQLCommandBuilder](#) object to automatically generate SQL statements for single-table updates if you set the [MySQLDataAdapter.SelectCommand](#) property of the [MySQLDataAdapter](#). Then, any additional SQL statements that you do not set are generated by the [MySQLCommandBuilder](#).

The `MySqlCommandBuilder` registers itself as a listener for `MySqlDataAdapter.OnRowUpdating` events whenever you set the `DataAdapter` property. You can only associate one `MySqlDataAdapter` or `MySqlCommandBuilder` object with each other at one time.

To generate INSERT, UPDATE, or DELETE statements, the `MySqlCommandBuilder` uses the `SelectCommand` property to retrieve a required set of metadata automatically. If you change the `SelectCommand` after the metadata has been retrieved (for example, after the first update), you should call the `RefreshSchema` method to update the metadata.

The `SelectCommand` must also return at least one primary key or unique column. If none are present, an `InvalidOperationException` exception is generated, and the commands are not generated.

The `MySqlCommandBuilder` also uses the `MySqlCommand.Connection`, `MySqlCommand.CommandTimeout`, and `MySqlCommand.Transaction` properties referenced by the `SelectCommand`. The user should call `RefreshSchema` if any of these properties are modified, or if the `SelectCommand` itself is replaced. Otherwise the `MySqlDataAdapter.InsertCommand`, `MySqlDataAdapter.UpdateCommand`, and `MySqlDataAdapter.DeleteCommand` properties retain their previous values.

If you call `Dispose`, the `MySqlCommandBuilder` is disassociated from the `MySqlDataAdapter`, and the generated commands are no longer used.

**Note.** Caution must be used when using `MySqlCommandBuilder` on MySQL 4.0 systems. With MySQL 4.0, database/schema information is not provided to the connector for a query. This means that a query that pulls columns from two identically named tables in two or more different databases will not cause an exception to be thrown but will not work correctly. Even more dangerous is the situation where your select statement references database X but is executed in database Y and both databases have tables with similar layouts. This situation can cause unwanted changes or deletes. This note does not apply to MySQL versions 4.1 and later.

## Examples

The following example uses the `MySqlCommand`, along `MySqlDataAdapter` and `MySqlConnection`, to select rows from a data source. The example is passed an initialized `System.Data.DataSet`, a connection string, a query string that is a SQL `SELECT` statement, and a string that is the name of the database table. The example then creates a `MySqlCommandBuilder`.

Visual Basic example:

```
Public Shared Function SelectRows(myConnection As String, mySelectQuery As String, myTableName As String)
    Dim myConn As New MySqlConnection(myConnection)
    Dim myDataAdapter As New MySqlDataAdapter()
    myDataAdapter.SelectCommand = New MySqlCommand(mySelectQuery, myConn)
    Dim cb As SqlCommandBuilder = New MySqlCommandBuilder(myDataAdapter)
    myConn.Open()
    Dim ds As DataSet = New DataSet
    myDataAdapter.Fill(ds, myTableName)
    ' Code to modify data in DataSet here
    ' Without the MySqlCommandBuilder this line would fail.
    myDataAdapter.Update(ds, myTableName)
    myConn.Close()
End Function 'SelectRows
```

C# example:

```
public static DataSet SelectRows(string myConnection, string mySelectQuery, string myTableName)
{
    MySqlConnection myConn = new MySqlConnection(myConnection);
    MySqlDataAdapter myDataAdapter = new MySqlDataAdapter();
    myDataAdapter.SelectCommand = new MySqlCommand(mySelectQuery, myConn);
```

```
MySQLCommandBuilder cb = new MySQLCommandBuilder(myDataAdapter);
myConn.Open();
DataSet ds = new DataSet();
myDataAdapter.Fill(ds, myTableName);
//code to modify data in DataSet here
//Without the MySQLCommandBuilder this line would fail
myDataAdapter.Update(ds, myTableName);
myConn.Close();
return ds;
}
```

### 18.2.3.2.1. Class MySQLCommandBuilder Constructor

Initializes a new instance of the [MySQLCommandBuilder](#) class.

### 18.2.3.2.2. Class MySQLCommandBuilder Constructor Form 1

Initializes a new instance of the [MySQLCommandBuilder](#) class and sets the last one wins property.

**Parameters:** False to generate change protection code. True otherwise.

The [lastOneWins](#) parameter indicates whether SQL code should be included with the generated DELETE and UPDATE commands that checks the underlying data for changes. If [lastOneWins](#) is true then this code is not included and data records could be overwritten in a multi-user or multi-threaded environments. Setting [lastOneWins](#) to false will include this check which will cause a concurrency exception to be thrown if the underlying data record has changed without our knowledge.

### 18.2.3.2.3. Class MySQLCommandBuilder Constructor Form 2

Initializes a new instance of the [MySQLCommandBuilder](#) class with the associated [MySQLDataAdapter](#) object.

**Parameters:** The [MySQLDataAdapter](#) to use.

The [MySQLCommandBuilder](#) registers itself as a listener for [MySQLDataAdapter.RowUpdating](#) events that are generated by the [MySQLDataAdapter](#) specified in this property.

When you create a new instance [MySQLCommandBuilder](#), any existing [MySQLCommandBuilder](#) associated with this [MySQLDataAdapter](#) is released.

### 18.2.3.2.4. Class MySQLCommandBuilder Constructor Form 3

Initializes a new instance of the [MySQLCommandBuilder](#) class with the associated [MySQLDataAdapter](#) object.

**Parameters:** The [MySQLDataAdapter](#) to use.

**Parameters:** False to generate change protection code. True otherwise.

The [MySQLCommandBuilder](#) registers itself as a listener for [MySQLDataAdapter.RowUpdating](#) events that are generated by the [MySQLDataAdapter](#) specified in this property.

When you create a new instance [MySQLCommandBuilder](#), any existing [MySQLCommandBuilder](#) associated with this [MySQLDataAdapter](#) is released.

The [lastOneWins](#) parameter indicates whether SQL code should be included with the generated DELETE and UPDATE commands that checks the underlying data for changes. If [lastOneWins](#) is true then this code is not included and data records could be overwritten in a multi-user or multi-threaded en-

vironments. Setting `lastOneWins` to false will include this check which will cause a concurrency exception to be thrown if the underlying data record has changed without our knowledge.

### 18.2.3.2.5. DataAdapter

Gets or sets a `MySqlDataAdapter` object for which SQL statements are automatically generated.

**Value:** A `MySqlDataAdapter` object.

The `MySqlCommandBuilder` registers itself as a listener for `MySqlDataAdapter.RowUpdating` events that are generated by the `MySqlDataAdapter` specified in this property.

When you create a new instance `MySqlCommandBuilder`, any existing `MySqlCommandBuilder` associated with this `MySqlDataAdapter` is released.

### 18.2.3.2.6. QuotePrefix

Gets or sets the beginning character or characters to use when specifying MySQL database objects (for example, tables or columns) whose names contain characters such as spaces or reserved tokens.

**Value:** The beginning character or characters to use. The default value is ` `.

Database objects in MySQL can contain special characters such as spaces that would make normal SQL strings impossible to correctly parse. Use of the `QuotePrefix` and the `QuoteSuffix` properties allows the `MySqlCommandBuilder` to build SQL commands that handle this situation.

### 18.2.3.2.7. QuoteSuffix

Gets or sets the beginning character or characters to use when specifying MySQL database objects (for example, tables or columns) whose names contain characters such as spaces or reserved tokens.

**Value:** The beginning character or characters to use. The default value is ` `.

Database objects in MySQL can contain special characters such as spaces that would make normal SQL strings impossible to correctly parse. Use of the `QuotePrefix` and the `QuoteSuffix` properties allows the `MySqlCommandBuilder` to build SQL commands that handle this situation.

### 18.2.3.2.8. DeriveParameters

### 18.2.3.2.9. GetDeleteCommand

Gets the automatically generated `MySqlCommand` object required to perform deletions on the database.

**Returns:** The `MySqlCommand` object generated to handle delete operations.

An application can use the `GetDeleteCommand` method for informational or troubleshooting purposes because it returns the `MySqlCommand` object to be executed.

You can also use `GetDeleteCommand` as the basis of a modified command. For example, you might call `GetDeleteCommand` and modify the `MySqlCommand.CommandTimeout` value, and then explicitly set that on the `MySqlDataAdapter`.

After the SQL statement is first generated, the application must explicitly call `RefreshSchema` if it changes the statement in any way. Otherwise, the `GetDeleteCommand` will be still be using information from the previous statement, which might not be correct. The SQL statements are first generated either when the application calls `System.Data.Common.DataAdapter.Update` or `GetDe-`

[leteCommand](#).

### 18.2.3.2.10. GetInsertCommand

Gets the automatically generated [MySQLCommand](#) object required to perform insertions on the database.

**Returns:** The [MySQLCommand](#) object generated to handle insert operations.

An application can use the [GetInsertCommand](#) method for informational or troubleshooting purposes because it returns the [MySQLCommand](#) object to be executed.

You can also use the [GetInsertCommand](#) as the basis of a modified command. For example, you might call [GetInsertCommand](#) and modify the [MySQLCommand.CommandTimeout](#) value, and then explicitly set that on the [MySQLDataAdapter](#).

After the SQL statement is first generated, the application must explicitly call [RefreshSchema](#) if it changes the statement in any way. Otherwise, the [GetInsertCommand](#) will be still be using information from the previous statement, which might not be correct. The SQL statements are first generated either when the application calls [System.Data.Common.DataAdapter.Update](#) or [GetInsertCommand](#).

### 18.2.3.2.11. GetUpdateCommand

Gets the automatically generated [MySQLCommand](#) object required to perform updates on the database.

**Returns:** The [MySQLCommand](#) object generated to handle update operations.

An application can use the [GetUpdateCommand](#) method for informational or troubleshooting purposes because it returns the [MySQLCommand](#) object to be executed.

You can also use [GetUpdateCommand](#) as the basis of a modified command. For example, you might call [GetUpdateCommand](#) and modify the [MySQLCommand.CommandTimeout](#) value, and then explicitly set that on the [MySQLDataAdapter](#).

After the SQL statement is first generated, the application must explicitly call [RefreshSchema](#) if it changes the statement in any way. Otherwise, the [GetUpdateCommand](#) will be still be using information from the previous statement, which might not be correct. The SQL statements are first generated either when the application calls [System.Data.Common.DataAdapter.Update](#) or [GetUpdateCommand](#).

### 18.2.3.2.12. RefreshSchema

Refreshes the database schema information used to generate INSERT, UPDATE, or DELETE statements.

An application should call [RefreshSchema](#) whenever the [SELECT](#) statement associated with the [MySQLCommandBuilder](#) changes.

An application should call [RefreshSchema](#) whenever the [MySQLDataAdapter.SelectCommand](#) value of the [MySQLDataAdapter](#) changes.

### 18.2.3.3. MySqlConnection

Represents an open connection to a MySQL Server database. This class cannot be inherited.

A [MySqlConnection](#) object represents a session to a MySQL Server data source. When you create an instance of [MySqlConnection](#), all properties are set to their initial values. For a list of these values, see the [MySqlConnection](#) constructor.

If the `MySqlConnection` goes out of scope, it is not closed. Therefore, you must explicitly close the connection by calling `MySqlConnection.Close` or `MySqlConnection.Dispose`.

### Examples

The following example creates a `MySqlCommand` and a `MySqlConnection`. The `MySqlConnection` is opened and set as the `MySqlCommand.Connection` for the `MySqlCommand`. The example then calls `MySqlCommand.ExecuteNonQuery`, and closes the connection. To accomplish this, the `ExecuteNonQuery` is passed a connection string and a query string that is a SQL INSERT statement.

Visual Basic example:

```
Public Sub InsertRow(myConnectionString As String)
    ' If the connection string is null, use a default.
    If myConnectionString = "" Then
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass"
    End If
    Dim myConnection As New MySqlConnection(myConnectionString)
    Dim myInsertQuery As String = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)"
    Dim myCommand As New MySqlCommand(myInsertQuery)
    myCommand.Connection = myConnection
    myConnection.Open()
    myCommand.ExecuteNonQuery()
    myCommand.Connection.Close()
End Sub
```

C# example:

```
public void InsertRow(string myConnectionString)
{
    // If the connection string is null, use a default.
    if(myConnectionString == "")
    {
        myConnectionString = "Database=Test;Data Source=localhost;User Id=username;Password=pass";
    }
    MySqlConnection myConnection = new MySqlConnection(myConnectionString);
    string myInsertQuery = "INSERT INTO Orders (id, customerId, amount) Values(1001, 23, 30.66)";
    MySqlCommand myCommand = new MySqlCommand(myInsertQuery);
    myCommand.Connection = myConnection;
    myConnection.Open();
    myCommand.ExecuteNonQuery();
    myCommand.Connection.Close();
}
```

#### 18.2.3.3.1. Class MySqlConnection Constructor (Default)

Initializes a new instance of the `MySqlConnection` class.

When a new instance of `MySqlConnection` is created, the read/write properties are set to the following initial values unless they are specifically set using their associated keywords in the `ConnectionString` property.

Properties	Initial Value
<code>ConnectionString</code>	empty string ("" )
<code>ConnectionTimeout</code>	15
<code>Database</code>	empty string ("" )
<code>DataSource</code>	empty string ("" )
<code>ServerVersion</code>	empty string ("" )

You can change the value for these properties only by using the [ConnectionString](#) property.

### Examples

#### Overload methods for MySqlConnection

Initializes a new instance of the [MySqlConnection](#) class.

#### 18.2.3.3.2. Class MySqlConnection Constructor Form 1

Initializes a new instance of the [MySqlConnection](#) class when given a string containing the connection string.

When a new instance of [MySqlConnection](#) is created, the read/write properties are set to the following initial values unless they are specifically set using their associated keywords in the [ConnectionString](#) property.

Properties	Initial Value
<a href="#">ConnectionString</a>	empty string ("" )
<a href="#">ConnectionTimeout</a>	15
<a href="#">Database</a>	empty string ("" )
<a href="#">DataSource</a>	empty string ("" )
<a href="#">ServerVersion</a>	empty string ("" )

You can change the value for these properties only by using the [ConnectionString](#) property.

### Examples

**Parameters:** The connection properties used to open the MySQL database.

#### 18.2.3.3.3. Open

Opens a database connection with the property settings specified by the [ConnectionString](#).

**Exception:** Cannot open a connection without specifying a data source or server.

**Exception:** A connection-level error occurred while opening the connection.

The [MySqlConnection](#) draws an open connection from the connection pool if one is available. Otherwise, it establishes a new connection to an instance of MySQL.

### Examples

The following example creates a [MySqlConnection](#), opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```
Public Sub CreateMySqlConnection(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.Cr + "State: " + myConnection.State.ToString())
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +
        "\nState: " + myConnection.State.ToString());
    myConnection.Close();
}
```

#### 18.2.3.3.4. Database

Gets the name of the current database or the database to be used after a connection is opened.

**Returns:** The name of the current database or the name of the database to be used after a connection is opened. The default value is an empty string.

The [Database](#) property does not update dynamically. If you change the current database using a SQL statement, then this property may reflect the wrong value. If you change the current database using the [ChangeDatabase](#) method, this property is updated to reflect the new database.

#### Examples

The following example creates a [MySQLConnection](#) and displays some of its read-only properties.

Visual Basic example:

```
Public Sub CreateMySQLConnection()
    Dim myConnString As String = _
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass"
    Dim myConnection As New MySqlConnection( myConnString )
    myConnection.Open()
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion _
        + ControlChars.NewLine + "Database: " + myConnection.Database )
    myConnection.ChangeDatabase( "test2" )
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.NewLine + "Database: " + myConnection.Database )
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection()
{
    string myConnString =
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass";
    MySqlConnection myConnection = new MySqlConnection( myConnString );
    myConnection.Open();
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion
        + "\nDatabase: " + myConnection.Database );
    myConnection.ChangeDatabase( "test2" );
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion
        + "\nDatabase: " + myConnection.Database );
    myConnection.Close();
}
```

#### 18.2.3.3.5. State

Gets the current state of the connection.

**Returns:** A bitwise combination of the [System.Data.ConnectionState](#) values. The default is [Closed](#).

The allowed state changes are:

- From [Closed](#) to [Open](#), using the [Open](#) method of the connection object.
- From [Open](#) to [Closed](#), using either the [Close](#) method or the [Dispose](#) method of the connection object.

### Examples

The following example creates a [MySQLConnection](#), opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```
Public Sub CreateMySQLConnection(myConnString As String)
    Dim myConnection As New MySQLConnection(myConnString)
    myConnection.Open()
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.Cr + "State: " + myConnection.State.ToString())
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +
        "\nState: " + myConnection.State.ToString());
    myConnection.Close();
}
```

### 18.2.3.3.6. ServerVersion

Gets a string containing the version of the MySQL server to which the client is connected.

**Returns:** The version of the instance of MySQL.

**Exception:** The connection is closed.

### Examples

The following example creates a [MySQLConnection](#), opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```
Public Sub CreateMySQLConnection(myConnString As String)
    Dim myConnection As New MySQLConnection(myConnString)
    myConnection.Open()
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.Cr + "State: " + myConnection.State.ToString())
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection(string myConnString)
{
```

```

MySQLConnection myConnection = new MySQLConnection(myConnString);
myConnection.Open();
MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +
"\nState: " + myConnection.State.ToString());
myConnection.Close();
}

```

### 18.2.3.3.7. Close

Closes the connection to the database. This is the preferred method of closing any open connection.

The `Close` method rolls back any pending transactions. It then releases the connection to the connection pool, or closes the connection if connection pooling is disabled.

An application can call `Close` more than one time. No exception is generated.

#### Examples

The following example creates a `MySQLConnection`, opens it, displays some of its properties, then closes the connection.

Visual Basic example:

```

Public Sub CreateMySQLConnection(myConnString As String)
    Dim myConnection As New MySQLConnection(myConnString)
    myConnection.Open()
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion _
+ ControlChars.Cr + "State: " + myConnection.State.ToString())
    myConnection.Close()
End Sub

```

C# example:

```

public void CreateMySQLConnection(string myConnString)
{
    MySQLConnection myConnection = new MySQLConnection(myConnString);
    myConnection.Open();
    MessageBox.Show("ServerVersion: " + myConnection.ServerVersion +
"\nState: " + myConnection.State.ToString());
    myConnection.Close();
}

```

### 18.2.3.3.8. CreateCommand

Creates and returns a `MySQLCommand` object associated with the `MySQLConnection`.

**Returns:** A `MySQLCommand` object.

### 18.2.3.3.9. BeginTransaction

Begins a database transaction.

**Returns:** An object representing the new transaction.

**Exception:** Parallel transactions are not supported.

This command is equivalent to the MySQL `BEGIN TRANSACTION` command.

You must explicitly commit or roll back the transaction using the `MySQLTransaction.Commit` or `MySQLTransaction.Rollback` method.

**Note.** If you do not specify an isolation level, the default isolation level is used. To specify an isolation level with the [BeginTransaction](#) method, use the overload that takes the `iso` parameter.

### Examples

The following example creates a [MySQLConnection](#) and a [MySQLTransaction](#). It also demonstrates how to use the [BeginTransaction](#), a [MySQLTransaction.Commit](#), and [MySQLTransaction.Rollback](#) methods.

Visual Basic example:

```
Public Sub RunTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySQLTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()
    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into Test (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into Test (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Both records are written to database.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySQLException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " + ex.GetType().ToString() + _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " + e.GetType().ToString() + _
            "was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub
```

C# example:

```
public void RunTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySQLTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "insert into Test (id, desc) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "insert into Test (id, desc) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch(Exception e)
```

```

{
    try
    {
        myTrans.Rollback();
    }
    catch (SqlException ex)
    {
        if (myTrans.Connection != null)
        {
            Console.WriteLine("An exception of type " + ex.GetType() +
                " was encountered while attempting to roll back the transaction.");
        }
    }

    Console.WriteLine("An exception of type " + e.GetType() +
        " was encountered while inserting the data.");
    Console.WriteLine("Neither record was written to database.");
}
finally
{
    myConnection.Close();
}
}

```

### 18.2.3.3.10. BeginTransaction1

Begins a database transaction with the specified isolation level.

**Parameters:** The isolation level under which the transaction should run.

**Returns:** An object representing the new transaction.

**Exception:** Parallel exceptions are not supported.

This command is equivalent to the MySQL BEGIN TRANSACTION command.

You must explicitly commit or roll back the transaction using the [MySQLTransaction.Commit](#) or [MySQLTransaction.Rollback](#) method.

**Note.** If you do not specify an isolation level, the default isolation level is used. To specify an isolation level with the [BeginTransaction](#) method, use the overload that takes the `iso` parameter.

#### Examples

The following example creates a [MySQLConnection](#) and a [MySQLTransaction](#). It also demonstrates how to use the [BeginTransaction](#), a [MySQLTransaction.Commit](#), and [MySQLTransaction.Rollback](#) methods.

Visual Basic example:

```

Public Sub RunTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySQLTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()
    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into Test (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into Test (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
    
```

```

    myTrans.Commit()
    Console.WriteLine("Both records are written to database.")
Catch e As Exception
    Try
        myTrans.Rollback()
    Catch ex As MySqlException
        If Not myTrans.Connection Is Nothing Then
            Console.WriteLine("An exception of type " + ex.GetType().ToString() + _
                " was encountered while attempting to roll back the transaction.")
        End If
    End Try

    Console.WriteLine("An exception of type " + e.GetType().ToString() + _
        " was encountered while inserting the data.")
    Console.WriteLine("Neither record was written to database.")
Finally
    myConnection.Close()
End Try
End Sub

```

C# example:

```

public void RunTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "insert into Test (id, desc) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "insert into Test (id, desc) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch(Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (SqlException ex)
        {
            if (myTrans.Connection != null)
            {
                Console.WriteLine("An exception of type " + ex.GetType() +
                    " was encountered while attempting to roll back the transaction.");
            }
        }

        Console.WriteLine("An exception of type " + e.GetType() +
            " was encountered while inserting the data.");
        Console.WriteLine("Neither record was written to database.");
    }
    finally
    {
        myConnection.Close();
    }
}

```

### 18.2.3.3.11. ChangeDatabase

Changes the current database for an open MySqlConnection.

**Parameters:** The name of the database to use.

The value supplied in the `database` parameter must be a valid database name. The `database` parameter cannot contain a null value, an empty string, or a string with only blank characters.

When you are using connection pooling against MySQL, and you close the connection, it is returned to the connection pool. The next time the connection is retrieved from the pool, the reset connection request executes before the user performs any operations.

**Exception:** The database name is not valid.

**Exception:** The connection is not open.

**Exception:** Cannot change the database.

### Examples

The following example creates a `MySqlConnection` and displays some of its read-only properties.

Visual Basic example:

```
Public Sub CreateMySQLConnection()
    Dim myConnString As String = _
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass"
    Dim myConnection As New MySqlConnection( myConnString )
    myConnection.Open()
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion _
        + ControlChars.NewLine + "Database: " + myConnection.Database )
    myConnection.ChangeDatabase( "test2" )
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion _
        + ControlChars.NewLine + "Database: " + myConnection.Database )
    myConnection.Close()
End Sub
```

C# example:

```
public void CreateMySQLConnection()
{
    string myConnString =
        "Persist Security Info=False;database=test;server=localhost;user id=joeuser;pwd=pass";
    MySqlConnection myConnection = new MySqlConnection( myConnString );
    myConnection.Open();
    MessageBox.Show( "Server Version: " + myConnection.ServerVersion
        + "\nDatabase: " + myConnection.Database );
    myConnection.ChangeDatabase( "test2" );
    MessageBox.Show( "ServerVersion: " + myConnection.ServerVersion
        + "\nDatabase: " + myConnection.Database );
    myConnection.Close();
}
```

### 18.2.3.3.12. StateChange

Occurs when the state of the connection changes.

The `StateChange` event fires whenever the `State` changes from closed to opened, or from opened to closed. `StateChange` fires immediately after the `MySqlConnection` transitions.

If an event handler throws an exception from within the `StateChange` event, the exception propagates to the caller of the `Open` or `Close` method.

The `StateChange` event is not raised unless you explicitly call `Close` or `Dispose`.

The event handler receives an argument of type `System.Data.StateChangeEventArgs` containing data related to this event. The following `StateChangeEventArgs` properties provide information specific to this event.

Property	Description
<code>System.Data.StateChangeEventArgs.CurrentState</code>	Gets the new state of the connection. The connection object will be in the new state already when the event is fired.
<code>System.Data.StateChangeEventArgs.OriginalState</code>	Gets the original state of the connection.

### 18.2.3.3.13. InfoMessage

Occurs when MySQL returns warnings as a result of executing a command or query.

### 18.2.3.3.14. ConnectionTimeout

Gets the time to wait while trying to establish a connection before terminating the attempt and generating an error.

**Exception:** The value set is less than 0.

A value of 0 indicates no limit, and should be avoided in a `MySQLConnection.ConnectionString` because an attempt to connect will wait indefinitely.

#### Examples

The following example creates a `MySQLConnection` and sets some of its properties in the connection string.

Visual Basic example:

```
Public Sub CreateSqlConnection()
    Dim myConnection As New MySqlConnection()
    myConnection.ConnectionString = "Persist Security Info=False;Username=user;Password=pass;database=test"
    myConnection.Open()
End Sub
```

C# example:

```
public void CreateSqlConnection()
{
    MySqlConnection myConnection = new MySqlConnection();
    myConnection.ConnectionString = "Persist Security Info=False;Username=user;Password=pass;database=test";
    myConnection.Open();
}
```

### 18.2.3.3.15. ConnectionString

Gets or sets the string used to connect to a MySQL Server database.

The `ConnectionString` returned may not be exactly like what was originally set but will be identical in terms of keyword/value pairs. Security information will not be included unless the `Persist Security Info` value is set to true.

You can use the `ConnectionString` property to connect to a database. The following example illustrates a typical connection string.

```
"Persist Security Info=False;database=MyDB;server=MySQLServer;user id=myUser;Password=myPass"
```

The `ConnectionString` property can be set only when the connection is closed. Many of the connection string values have corresponding read-only properties. When the connection string is set, all of these properties are updated, except when an error is detected. In this case, none of the properties are updated. `MySQLConnection` properties return only those settings contained in the `ConnectionString`.

To connect to a local machine, specify "localhost" for the server. If you do not specify a server, localhost is assumed.

Resetting the `ConnectionString` on a closed connection resets all connection string values (and related properties) including the password. For example, if you set a connection string that includes "Database= MyDb", and then reset the connection string to "Data Source=myserver;UserId=myUser;Password=myPass", the `MySQLConnection.Database` property is no longer set to MyDb.

The connection string is parsed immediately after being set. If errors in syntax are found when parsing, a runtime exception, such as `ArgumentException`, is generated. Other errors can be found only when an attempt is made to open the connection.

The basic format of a connection string consists of a series of keyword/value pairs separated by semicolons. The equal sign (=) connects each keyword and its value. To include values that contain a semicolon, single-quote character, or double-quote character, the value must be enclosed in double quotes. If the value contains both a semicolon and a double-quote character, the value can be enclosed in single quotes. The single quote is also useful if the value begins with a double-quote character. Conversely, the double quote can be used if the value begins with a single quote. If the value contains both single-quote and double-quote characters, the quote character used to enclose the value must be doubled each time it occurs within the value.

To include preceding or trailing spaces in the string value, the value must be enclosed in either single quotes or double quotes. Any leading or trailing spaces around integer, Boolean, or enumerated values are ignored, even if enclosed in quotes. However, spaces within a string literal keyword or value are preserved. Using .NET Framework version 1.1, single or double quotes may be used within a connection string without using delimiters (for example, Data Source= my'Server or Data Source= my"Server), unless a quote character is the first or last character in the value.

To include an equal sign (=) in a keyword or value, it must be preceded by another equal sign. For example, in the hypothetical connection string

```
"key==word=value"
```

the keyword is "key=word" and the value is "value".

If a specific keyword in a keyword= value pair occurs multiple times in a connection string, the last occurrence listed is used in the value set.

Keywords are not case sensitive.

The following table lists the valid names for keyword values within the `ConnectionString`.

Name	Default	Description
Connect Timeout -or- Connection Timeout	15	The length of time (in seconds) to wait for a connection to the server before terminating the attempt and generating an error.
Host -or- Server -or- Data Source -or- DataSource -or- Address -or- Addr -or- Network Address	localhost	The name or network address of the instance of MySQL to which to connect. Multiple hosts can be

		specified separated by &. This can be useful where multiple MySQL servers are configured for replication and you are not concerned about the precise server you are connecting to. No attempt is made by the provider to synchronize writes to the database so care should be taken when using this option. In Unix environment with Mono, this can be a fully qualified path to MySQL socket filename. With this configuration, the Unix socket will be used instead of TCP/IP socket. Currently only a single socket name can be given so accessing MySQL in a replicated environment using Unix sockets is not currently supported.
Port	3306	The port MySQL is using to listen for connections. Specify -1 for this value to use a named pipe connection (Windows only). This value is ignored if Unix socket is used.
Protocol	socket	Specifies the type of connection to make to the server. Values can be: socket or tcp for a socket connection pipe for a named pipe connection unix for a Unix socket connection memory to use MySQL shared memory
CharSet -or Character Set		Specifies the character set that should be used to encode all queries sent to the server. Result-sets are still returned in the character set of the data returned.
Logging	false	When true, various pieces of information is output to any configured TraceListeners.
Allow Batch	true	When true, multiple SQL statements can be sent with one command execution. -Note- Starting with MySQL 4.1.1, batch statements should be separated by the server-defined separator character. Commands sent to earlier versions of MySQL should be separated with ';'.
Encrypt	false	When <code>true</code> , SSL encryption is used for all data sent between the client and server if the server has a certificate installed. Recognized values are <code>true</code> , <code>false</code> , <code>yes</code> ,

		and <a href="#">no</a> . <a href="#">Note</a> This parameter currently has no effect.
Initial Catalog -or- Database	mysql	The name of the database to use initially
Password -or- pwd		The password for the MySQL account being used.
Persist Security Info	false	When set to <a href="#">false</a> or <a href="#">no</a> (strongly recommended), security-sensitive information, such as the password, is not returned as part of the connection if the connection is open or has ever been in an open state. Resetting the connection string resets all connection string values including the password. Recognized values are <a href="#">true</a> , <a href="#">false</a> , <a href="#">yes</a> , and <a href="#">no</a> .
User Id -or- Username -or- Uid -or- User name		The MySQL login account being used.
Shared Memory Name	MYSQL	The name of the shared memory object to use for communication if the connection protocol is set to memory.
Allow Zero Datetime	false	True to have <a href="#">MySqlDataReader.GetValue()</a> return a <a href="#">MySqlDateTime</a> for date or datetime columns that have illegal values. False will cause a <a href="#">DateTime</a> object to be returned for legal values and an exception will be thrown for illegal values.
Convert Zero Datetime	false	True to have <a href="#">MySqlDataReader.GetValue()</a> and <a href="#">MySqlDataReader.GetDateTime()</a> return <a href="#">DateTime.MinValue</a> for date or datetime columns that have illegal values.
Old Syntax -or- OldSyntax	false	Allows use of '@' symbol as a parameter marker. See <a href="#">MySQL-Command</a> for more info. This is for compatibility only. All future code should be written to use the new '?' parameter marker.
Pipe Name -or- Pipe	mysql	When set to the name of a named pipe, the <a href="#">MySqlConnection</a> will attempt to connect to MySQL on that named pipe. This settings only applies to the Windows platform.

The following table lists the valid names for connection pooling values within the [ConnectionString](#). For more information about connection pooling, see [Connection Pooling for the MySQL Data](#)

Provider.

Name	Default	Description
Connection Lifetime	0	When a connection is returned to the pool, its creation time is compared with the current time, and the connection is destroyed if that time span (in seconds) exceeds the value specified by <code>Connection Lifetime</code> . This is useful in clustered configurations to force load balancing between a running server and a server just brought online. A value of zero (0) causes pooled connections to have the maximum connection timeout.
Max Pool Size	100	The maximum number of connections allowed in the pool.
Min Pool Size	0	The minimum number of connections allowed in the pool.
Pooling	true	When <code>true</code> , the <code>MySQLConnection</code> object is drawn from the appropriate pool, or if necessary, is created and added to the appropriate pool. Recognized values are <code>true</code> , <code>false</code> , <code>yes</code> , and <code>no</code> .
Reset Pooled Connections -or- ResetConnections -or- Reset- PooledConnections	true	Specifies whether a ping and a reset should be sent to the server before a pooled connection is returned. Not resetting will yeild faster connection opens but also will not clear out session items such as temp tables.
Cache Server Configuration -or- CacheServerConfiguration -or- CacheServerConfig	false	Specifies whether server variables should be updated when a pooled connection is returned. Turning this one will yeild faster opens but will also not catch any server changes made by other connections.

When setting keyword or connection pooling values that require a Boolean value, you can use 'yes' instead of 'true', and 'no' instead of 'false'.

**Note** The MySQL Data Provider uses the native socket protocol to communicate with MySQL. Therefore, it does not support the use of an ODBC data source name (DSN) when connecting to MySQL because it does not add an ODBC layer.

**CAUTION** In this release, the application should use caution when constructing a connection string based on user input (for example when retrieving user ID and password information from a dialog box, and appending it to the connection string). The application should ensure that a user cannot embed extra connection string parameters in these values (for example, entering a password as "validpassword;database=somedb" in an attempt to attach to a different database).

## Examples

The following example creates a [MySQLConnection](#) and sets some of its properties

Visual Basic example:

```
Public Sub CreateConnection()
    Dim myConnection As New MySqlConnection()
    myConnection.ConnectionString = "Persist Security Info=False;database=myDB;server=myHost;Connect T
    myConnection.Open()
End Sub 'CreateConnection
```

C# example:

```
public void CreateConnection()
{
    MySqlConnection myConnection = new MySqlConnection();
    myConnection.ConnectionString = "Persist Security Info=False;database=myDB;server=myHost;Connect T
    myConnection.Open();
}
```

## Examples

The following example creates a [MySQLConnection](#) in Unix environment with Mono installed. MySQL socket filename used in this example is `"/var/lib/mysql/mysql.sock"`. The actual filename depends on your MySQL configuration.

Visual Basic example:

```
Public Sub CreateConnection()
    Dim myConnection As New MySqlConnection()
    myConnection.ConnectionString = "database=myDB;server=/var/lib/mysql/mysql.sock;user id=myUser; pwo
    myConnection.Open()
End Sub 'CreateConnection
```

C# example:

```
public void CreateConnection()
{
    MySqlConnection myConnection = new MySqlConnection();
    myConnection.ConnectionString = "database=myDB;server=/var/lib/mysql/mysql.sock;user id=myUser; pwo
    myConnection.Open();
}
```

### 18.2.3.4. MySqlConnectionAdapter

Represents a set of data commands and a database connection that are used to fill a dataset and update a MySQL database. This class cannot be inherited.

The [MySQLDataAdapter](#), serves as a bridge between a [System.Data.DataSet](#) and MySQL for retrieving and saving data. The [MySQLDataAdapter](#) provides this bridge by mapping [DbDataAdapter.Fill](#), which changes the data in the [DataSet](#) to match the data in the data source, and [DbDataAdapter.Update](#), which changes the data in the data source to match the data in the [DataSet](#), using the appropriate SQL statements against the data source.

When the [MySQLDataAdapter](#) fills a [DataSet](#), it will create the necessary tables and columns for the returned data if they do not already exist. However, primary key information will not be included in the implicitly created schema unless the [System.Data.MissingSchemaAction](#) property is set to [System.Data.MissingSchemaAction.AddWithKey](#). You may also have the

`MySQLDataAdapter` create the schema of the `DataSet`, including primary key information, before filling it with data using `System.Data.Common.DbDataAdapter.FillSchema`.

`MySQLDataAdapter` is used in conjunction with `MySqlConnection` and `MySqlCommand` to increase performance when connecting to a MySQL database.

The `MySQLDataAdapter` also includes the `MySqlCommand.SelectCommand`, `MySqlCommand.InsertCommand`, `MySqlCommand.DeleteCommand`, `MySqlCommand.UpdateCommand`, and `DataAdapter.TableMappings` properties to facilitate the loading and updating of data.

When an instance of `MySQLDataAdapter` is created, the read/write properties are set to initial values. For a list of these values, see the `MySQLDataAdapter` constructor.

**Note.** Please be aware that the `DataColumn` class in .NET 1.0 and 1.1 does not allow columns with type of `UInt16`, `UInt32`, or `UInt64` to be autoincrement columns. If you plan to use autoincrement columns with MySQL, you should consider using signed integer columns.

### Examples

The following example creates a `MySqlCommand` and a `MySqlConnection`. The `MySqlConnection` is opened and set as the `MySqlCommand.Connection` for the `MySqlCommand`. The example then calls `MySqlCommand.ExecuteNonQuery`, and closes the connection. To accomplish this, the `ExecuteNonQuery` is passed a connection string and a query string that is a SQL INSERT statement.

Visual Basic example:

```
Public Function SelectRows(dataSet As DataSet, connection As String, query As String) As DataSet
    Dim conn As New MySqlConnection(connection)
    Dim adapter As New MySQLDataAdapter()
    adapter.SelectCommand = new MySqlCommand(query, conn)
    adapter.Fill(dataset)
    Return dataset
End Function
```

C# example:

```
public DataSet SelectRows(DataSet dataset,string connection,string query)
{
    MySqlConnection conn = new MySqlConnection(connection);
    MySQLDataAdapter adapter = new MySQLDataAdapter();
    adapter.SelectCommand = new MySqlCommand(query, conn);
    adapter.Fill(dataset);
    return dataset;
}
```

#### 18.2.3.4.1. Class `MySqlCommand` Constructor

##### Overload methods for `MySqlCommand`

Initializes a new instance of the `MySqlCommand` class.

When an instance of `MySqlCommand` is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
<code>MissingMappingAction</code>	<code>MissingMappingAction.Passthrough</code>
<code>MissingSchemaAction</code>	<code>MissingSchemaAction.Add</code>

You can change the value of any of these properties through a separate call to the property.

### Examples

The following example creates a [MySQLDataAdapter](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateSqlDataAdapter()
    Dim conn As MySqlConnection = New MySqlConnection("Data Source=localhost;" & _
        "database=test")
    Dim da As MySQLDataAdapter = New MySQLDataAdapter
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.SelectCommand = New MySqlCommand("SELECT id, name FROM mytable", conn)
    da.InsertCommand = New MySqlCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (?id, ?name)", conn)
    da.UpdateCommand = New MySqlCommand("UPDATE mytable SET id=?id, name=?name " & _
        "WHERE id=?oldId", conn)
    da.DeleteCommand = New MySqlCommand("DELETE FROM mytable WHERE id=?id", conn)
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
End Sub
```

C# example:

```
public static void CreateSqlDataAdapter()
{
    MySqlConnection conn = new MySqlConnection("Data Source=localhost;database=test");
    MySQLDataAdapter da = new MySQLDataAdapter();
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.SelectCommand = new MySqlCommand("SELECT id, name FROM mytable", conn);
    da.InsertCommand = new MySqlCommand("INSERT INTO mytable (id, name) " +
        "VALUES (?id, ?name)", conn);
    da.UpdateCommand = new MySqlCommand("UPDATE mytable SET id=?id, name=?name " +
        "WHERE id=?oldId", conn);
    da.DeleteCommand = new MySqlCommand("DELETE FROM mytable WHERE id=?id", conn);
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
}
```

#### 18.2.3.4.2. Class MySQLDataAdapter Constructor Form 1

Initializes a new instance of the [MySQLDataAdapter](#) class with the specified [MySQLCommand](#) as the [SelectCommand](#) property.

**Parameters:** [MySQLCommand](#) that is a SQL [SELECT](#) statement or stored procedure and is set as the [SelectCommand](#) property of the [MySQLDataAdapter](#).

When an instance of [MySQLDataAdapter](#) is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
<a href="#">MissingMappingAction</a>	<a href="#">MissingMappingAction.Passthrough</a>
<a href="#">MissingSchemaAction</a>	<a href="#">MissingSchemaAction.Add</a>

You can change the value of any of these properties through a separate call to the property.

When [SelectCommand](#) (or any of the other command properties) is assigned to a previously created [MySQLCommand](#), the [MySQLCommand](#) is not cloned. The [SelectCommand](#) maintains a reference to the previously created [MySQLCommand](#) object.

### Examples

The following example creates a [MySQLDataAdapter](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateSqlDataAdapter()
    Dim conn As MySqlConnection = New MySqlConnection("Data Source=localhost;" & _
        "database=test")
    Dim cmd As new MySqlCommand("SELECT id, name FROM mytable", conn)
    Dim da As MySQLDataAdapter = New MySQLDataAdapter(cmd)
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.InsertCommand = New MySqlCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (?id, ?name)", conn)
    da.UpdateCommand = New MySqlCommand("UPDATE mytable SET id=?id, name=?name " & _
        "WHERE id=?oldId", conn)
    da.DeleteCommand = New MySqlCommand("DELETE FROM mytable WHERE id=?id", conn)
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
End Sub
```

C# example:

```
public static void CreateSqlDataAdapter()
{
    MySqlConnection conn = new MySqlConnection("Data Source=localhost;database=test");
    MySqlCommand cmd = new MySqlCommand("SELECT id, name FROM mytable", conn);
    MySQLDataAdapter da = new MySQLDataAdapter(cmd);
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.InsertCommand = new MySqlCommand("INSERT INTO mytable (id, name) " +
        "VALUES (?id, ?name)", conn);
    da.UpdateCommand = new MySqlCommand("UPDATE mytable SET id=?id, name=?name " +
        "WHERE id=?oldId", conn);
    da.DeleteCommand = new MySqlCommand("DELETE FROM mytable WHERE id=?id", conn);
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
}
```

#### 18.2.3.4.3. Class MySQLDataAdapter Constructor Form 2

Initializes a new instance of the [MySQLDataAdapter](#) class with a [SelectCommand](#) and a [MySQLConnection](#) object.

**Parameters:** A [String](#) that is a SQL [SELECT](#) statement or stored procedure to be used by the [SelectCommand](#) property of the [MySQLDataAdapter](#).

**Parameters:** A [MySQLConnection](#) that represents the connection.

This implementation of the [MySQLDataAdapter](#) opens and closes a [MySQLConnection](#) if it is not

already open. This can be useful in an application that must call the `DbDataAdapter.Fill` method for two or more `MySqlConnection` objects. If the `MySqlConnection` is already open, you must explicitly call `MySqlConnection.Close` or `MySqlConnection.Dispose` to close it.

When an instance of `MySqlConnection` is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
<code>MissingMappingAction</code>	<code>MissingMappingAction.Passthrough</code>
<code>MissingSchemaAction</code>	<code>MissingSchemaAction.Add</code>

You can change the value of any of these properties through a separate call to the property.

### Examples

The following example creates a `MySqlConnection` and sets some of its properties.

Visual Basic example:

```
Public Sub CreateSqlConnection()
    Dim conn As MySqlConnection = New MySqlConnection("Data Source=localhost;" & _
        "database=test")
    Dim da As MySqlDataAdapter = New MySqlDataAdapter("SELECT id, name FROM mytable", conn)
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.InsertCommand = New MySqlCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (?id, ?name)", conn)
    da.UpdateCommand = New MySqlCommand("UPDATE mytable SET id=?id, name=?name " & _
        "WHERE id=?oldId", conn)
    da.DeleteCommand = New MySqlCommand("DELETE FROM mytable WHERE id=?id", conn)
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original
End Sub
```

C# example:

```
public static void CreateSqlConnection()
{
    MySqlConnection conn = new MySqlConnection("Data Source=localhost;database=test");
    MySqlDataAdapter da = new MySqlDataAdapter("SELECT id, name FROM mytable", conn);
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.InsertCommand = new MySqlCommand("INSERT INTO mytable (id, name) " +
        "VALUES (?id, ?name)", conn);
    da.UpdateCommand = new MySqlCommand("UPDATE mytable SET id=?id, name=?name " +
        "WHERE id=?oldId", conn);
    da.DeleteCommand = new MySqlCommand("DELETE FROM mytable WHERE id=?id", conn);
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Original;
}
```

#### 18.2.3.4.4. Class MySqlConnection Constructor Form 3

Initializes a new instance of the `MySqlConnection` class with a `SelectCommand` and a connection string.

**Parameters:** A [string](#) that is a SQL [SELECT](#) statement or stored procedure to be used by the [SelectCommand](#) property of the [MySqlDataAdapter](#).

**Parameters:** The connection string

When an instance of [MySqlDataAdapter](#) is created, the following read/write properties are set to the following initial values.

Properties	Initial Value
<a href="#">MissingMappingAction</a>	<a href="#">MissingMappingAction.Passthrough</a>
<a href="#">MissingSchemaAction</a>	<a href="#">MissingSchemaAction.Add</a>

You can change the value of any of these properties through a separate call to the property.

### Examples

The following example creates a [MySqlDataAdapter](#) and sets some of its properties.

Visual Basic example:

```
Public Sub CreateSqlDataAdapter()
    Dim da As MySqlDataAdapter = New MySqlDataAdapter("SELECT id, name FROM mytable", "Data Source=localhost;")
    Dim conn As MySqlConnection = da.SelectCommand.Connection
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey

    da.InsertCommand = New MySqlCommand("INSERT INTO mytable (id, name) " & _
        "VALUES (?id, ?name)", conn)
    da.UpdateCommand = New MySqlCommand("UPDATE mytable SET id=?id, name=?name " & _
        "WHERE id=?oldId", conn)
    da.DeleteCommand = New MySqlCommand("DELETE FROM mytable WHERE id=?id", conn)
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name")
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Current
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Current
End Sub
```

C# example:

```
public static void CreateSqlDataAdapter()
{
    MySqlDataAdapter da = new MySqlDataAdapter("SELECT id, name FROM mytable", "Data Source=localhost;");
    MySqlConnection conn = da.SelectCommand.Connection;
    da.MissingSchemaAction = MissingSchemaAction.AddWithKey;

    da.InsertCommand = new MySqlCommand("INSERT INTO mytable (id, name) " +
        "VALUES (?id, ?name)", conn);
    da.UpdateCommand = new MySqlCommand("UPDATE mytable SET id=?id, name=?name " +
        "WHERE id=?oldId", conn);
    da.DeleteCommand = new MySqlCommand("DELETE FROM mytable WHERE id=?id", conn);
    da.InsertCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.InsertCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");

    da.UpdateCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    da.UpdateCommand.Parameters.Add("?name", MySqlDbType.VarChar, 40, "name");
    da.UpdateCommand.Parameters.Add("?oldId", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Current;
    da.DeleteCommand.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id").SourceVersion = DataRowVersion.Current;
}
```

#### 18.2.3.4.5. DeleteCommand

Gets or sets a SQL statement or stored procedure used to delete records from the data set.

**Value:** A `MySqlCommand` used during `System.Data.Common.DataAdapter.Update` to delete records in the database that correspond to deleted rows in the `DataSet`.

During `System.Data.Common.DataAdapter.Update`, if this property is not set and primary key information is present in the `DataSet`, the `DeleteCommand` can be generated automatically if you set the `SelectCommand` property and use the `MySqlCommandBuilder`. Then, any additional commands that you do not set are generated by the `MySqlCommandBuilder`. This generation logic requires key column information to be present in the `DataSet`.

When `DeleteCommand` is assigned to a previously created `MySqlCommand`, the `MySqlCommand` is not cloned. The `DeleteCommand` maintains a reference to the previously created `MySqlCommand` object.

### Examples

The following example creates a `MySqlDataAdapter` and sets the `SelectCommand` and `DeleteCommand` properties. It assumes you have already created a `MySqlConnection` object.

Visual Basic example:

```
Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySqlDataAdapter
    Dim da As MySqlDataAdapter = New MySqlDataAdapter()
    Dim cmd As MySqlCommand
    Dim parm As MySqlParameter
    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the DeleteCommand.
    cmd = New MySqlCommand("DELETE FROM mytable WHERE id=?id", conn)
    parm = cmd.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id")
    parm.SourceVersion = DataRowVersion.Original
    da.DeleteCommand = cmd
    Return da
End Function
```

C# example:

```
public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
    MySqlCommand cmd;
    MySqlParameter parm;
    // Create the SelectCommand.
    cmd = new MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15);
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the DeleteCommand.
    cmd = new MySqlCommand("DELETE FROM mytable WHERE id=?id", conn);
    parm = cmd.Parameters.Add("?id", MySqlDbType.VarChar, 5, "id");
    parm.SourceVersion = DataRowVersion.Original;
    da.DeleteCommand = cmd;
    return da;
}
```

### 18.2.3.4.6. InsertCommand

Gets or sets a SQL statement or stored procedure used to insert records into the data set.

**Value:** A `MySqlCommand` used during `System.Data.Common.DataAdapter.Update` to insert records into the database that correspond to new rows in the `DataSet`.

During `System.Data.Common.DataAdapter.Update`, if this property is not set and primary

key information is present in the [DataSet](#), the [InsertCommand](#) can be generated automatically if you set the [SelectCommand](#) property and use the [MySQLCommandBuilder](#). Then, any additional commands that you do not set are generated by the [MySQLCommandBuilder](#). This generation logic requires key column information to be present in the [DataSet](#).

When [InsertCommand](#) is assigned to a previously created [MySQLCommand](#), the [MySQLCommand](#) is not cloned. The [InsertCommand](#) maintains a reference to the previously created [MySQLCommand](#) object.

**Note.** If execution of this command returns rows, these rows may be added to the [DataSet](#) depending on how you set the [MySQLCommand.UpdatedRowSource](#) property of the [MySQLCommand](#) object.

### Examples

The following example creates a [MySQLDataAdapter](#) and sets the [SelectCommand](#) and [InsertCommand](#) properties. It assumes you have already created a [MySQLConnection](#) object.

Visual Basic example:

```
Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySqlDataAdapter
    Dim da As MySqlDataAdapter = New MySqlDataAdapter()
    Dim cmd As MySqlCommand
    Dim parm As MySqlParameter
    ' Create the SelectCommand.
    cmd = New MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the InsertCommand.
    cmd = New MySqlCommand("INSERT INTO mytable (id,name) VALUES (?id, ?name)", conn)
    cmd.Parameters.Add( "?id", MySqlDbType.VarChar, 15, "id" )
    cmd.Parameters.Add( "?name", MySqlDbType.VarChar, 15, "name" )
    da.InsertCommand = cmd

    Return da
End Function
```

C# example:

```
public static MySqlDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySqlDataAdapter da = new MySqlDataAdapter();
    MySqlCommand cmd;
    MySqlParameter parm;
    // Create the SelectCommand.
    cmd = new MySqlCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15);
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the InsertCommand.
    cmd = new MySqlCommand("INSERT INTO mytable (id,name) VALUES (?id,?name)", conn);
    cmd.Parameters.Add("?id", MySqlDbType.VarChar, 15, "id" );
    cmd.Parameters.Add("?name", MySqlDbType.VarChar, 15, "name" );

    da.InsertCommand = cmd;
    return da;
}
```

#### 18.2.3.4.7. UpdateCommand

Gets or sets a SQL statement or stored procedure used to updated records in the data source.

**Value:** A [MySQLCommand](#) used during [System.Data.Common.DataAdapter.Update](#) to update records in the database with data from the [DataSet](#).

During [System.Data.Common.DataAdapter.Update](#), if this property is not set and primary key information is present in the [DataSet](#), the [UpdateCommand](#) can be generated automatically if

you set the `SelectCommand` property and use the `MySQLCommandBuilder`. Then, any additional commands that you do not set are generated by the `MySQLCommandBuilder`. This generation logic requires key column information to be present in the `DataSet`.

When `UpdateCommand` is assigned to a previously created `MySQLCommand`, the `MySQLCommand` is not cloned. The `UpdateCommand` maintains a reference to the previously created `MySQLCommand` object.

**Note.** If execution of this command returns rows, these rows may be merged with the `DataSet` depending on how you set the `MySQLCommand.UpdatedRowSource` property of the `MySQLCommand` object.

### Examples

The following example creates a `MySQLDataAdapter` and sets the `SelectCommand` and `UpdateCommand` properties. It assumes you have already created a `MySQLConnection` object.

Visual Basic example:

```
Public Shared Function CreateCustomerAdapter(conn As MySqlConnection) As MySQLDataAdapter
    Dim da As MySQLDataAdapter = New MySQLDataAdapter()
    Dim cmd As MySQLCommand
    Dim parm As MySQLParameter
    ' Create the SelectCommand.
    cmd = New MySQLCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the UpdateCommand.
    cmd = New MySQLCommand("UPDATE mytable SET id=?id, name=?name WHERE id=?oldId", conn)
    cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15, "id" )
    cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15, "name" )

    parm = cmd.Parameters.Add("?oldId", MySQLDbType.VarChar, 15, "id")
    parm.SourceVersion = DataRowVersion.Original

    da.UpdateCommand = cmd

    Return da
End Function
```

C# example:

```
public static MySQLDataAdapter CreateCustomerAdapter(MySqlConnection conn)
{
    MySQLDataAdapter da = new MySQLDataAdapter();
    MySQLCommand cmd;
    MySQLParameter parm;
    // Create the SelectCommand.
    cmd = new MySQLCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
    cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15);
    cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the UpdateCommand.
    cmd = new MySQLCommand("UPDATE mytable SET id=?id, name=?name WHERE id=?oldId", conn);
    cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15, "id" );
    cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15, "name" );

    parm = cmd.Parameters.Add( "?oldId", MySQLDbType.VarChar, 15, "id" );
    parm.SourceVersion = DataRowVersion.Original;

    da.UpdateCommand = cmd;
    return da;
}
```

#### 18.2.3.4.8. SelectCommand

Gets or sets a SQL statement or stored procedure used to select records in the data source.

**Value:** A `MySQLCommand` used during `System.Data.Common.DbDataAdapter.Fill` to select records from the database for placement in the `DataSet`.

When `SelectCommand` is assigned to a previously created `MySQLCommand`, the `MySQLCommand` is not cloned. The `SelectCommand` maintains a reference to the previously created `MySQLCommand` object.

If the `SelectCommand` does not return any rows, no tables are added to the `DataSet`, and no exception is raised.

### Examples

The following example creates a `MySQLDataAdapter` and sets the `SelectCommand` and `InsertCommand` properties. It assumes you have already created a `MySQLConnection` object.

Visual Basic example:

```
Public Shared Function CreateCustomerAdapter(conn As MySQLConnection) As MySQLDataAdapter
    Dim da As MySQLDataAdapter = New MySQLDataAdapter()
    Dim cmd As MySQLCommand
    Dim parm As MySQLParameter
    ' Create the SelectCommand.
    cmd = New MySQLCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn)
    cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15)
    cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15)
    da.SelectCommand = cmd
    ' Create the InsertCommand.
    cmd = New MySQLCommand("INSERT INTO mytable (id,name) VALUES (?id, ?name)", conn)
    cmd.Parameters.Add( "?id", MySQLDbType.VarChar, 15, "id" )
    cmd.Parameters.Add( "?name", MySQLDbType.VarChar, 15, "name" )
    da.InsertCommand = cmd

    Return da
End Function
```

C# example:

```
public static MySQLDataAdapter CreateCustomerAdapter(MySQLConnection conn)
{
    MySQLDataAdapter da = new MySQLDataAdapter();
    MySQLCommand cmd;
    MySQLParameter parm;
    // Create the SelectCommand.
    cmd = new MySQLCommand("SELECT * FROM mytable WHERE id=?id AND name=?name", conn);
    cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15);
    cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15);
    da.SelectCommand = cmd;
    // Create the InsertCommand.
    cmd = new MySQLCommand("INSERT INTO mytable (id,name) VALUES (?id,?name)", conn);
    cmd.Parameters.Add("?id", MySQLDbType.VarChar, 15, "id" );
    cmd.Parameters.Add("?name", MySQLDbType.VarChar, 15, "name" );

    da.InsertCommand = cmd;
    return da;
}
```

## 18.2.3.5. MySQLDataReader

To create a `MySQLDataReader`, you must call the `MySQLCommand.ExecuteReader` method of the `MySQLCommand` object, rather than directly using a constructor.

While the `MySQLDataReader` is in use, the associated `MySQLConnection` is busy serving the `MySQLDataReader`, and no other operations can be performed on the `MySQLConnection` other than closing it. This is the case until the `MySQLDataReader.Close` method of the `MySQLDataReader` is called.

`MySqlDataReader.IsClosed` and `MySqlDataReader.RecordsAffected` are the only properties that you can call after the `MySqlDataReader` is closed. Though the `RecordsAffected` property may be accessed at any time while the `MySqlDataReader` exists, always call `Close` before returning the value of `RecordsAffected` to ensure an accurate return value.

For optimal performance, `MySqlDataReader` avoids creating unnecessary objects or making unnecessary copies of data. As a result, multiple calls to methods such as `MySqlDataReader.GetValue` return a reference to the same object. Use caution if you are modifying the underlying value of the objects returned by methods such as `GetValue`.

### Examples

The following example creates a `MySqlConnection`, a `MySqlCommand`, and a `MySqlDataReader`. The example reads through the data, writing it out to the console. Finally, the example closes the `MySqlDataReader`, then the `MySqlConnection`.

Visual Basic example:

```
Public Sub ReadMyData(myConnString As String)
    Dim mySelectQuery As String = "SELECT OrderID, CustomerID FROM Orders"
    Dim myConnection As New MySqlConnection(myConnString)
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection)
    myConnection.Open()
    Dim myReader As MySqlDataReader
    myReader = myCommand.ExecuteReader()
    ' Always call Read before accessing data.
    While myReader.Read()
        Console.WriteLine((myReader.GetInt32(0) & ", " & myReader.GetString(1)))
    End While
    ' always call Close when done reading.
    myReader.Close()
    ' Close the connection when done with it.
    myConnection.Close()
End Sub 'ReadMyData
```

C# example:

```
public void ReadMyData(string myConnString) {
    string mySelectQuery = "SELECT OrderID, CustomerID FROM Orders";
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection);
    myConnection.Open();
    MySqlDataReader myReader;
    myReader = myCommand.ExecuteReader();
    // Always call Read before accessing data.
    while (myReader.Read()) {
        Console.WriteLine(myReader.GetInt32(0) + ", " + myReader.GetString(1));
    }
    // always call Close when done reading.
    myReader.Close();
    // Close the connection when done with it.
    myConnection.Close();
}
```

#### 18.2.3.5.1. GetBytes

`GetBytes` returns the number of available bytes in the field. In most cases this is the exact length of the field. However, the number returned may be less than the true length of the field if `GetBytes` has already been used to obtain bytes from the field. This may be the case, for example, if the `MySqlDataReader` is reading a large data structure into a buffer. For more information, see the `SequentialAccess` setting for `MySqlCommand.CommandBehavior`.

If you pass a buffer that is a null reference (`Nothing` in Visual Basic), `GetBytes` returns the length of the field in bytes.

No conversions are performed; therefore the data retrieved must already be a byte array.

#### 18.2.3.5.2. **GetTimeSpan**

Gets the value of the specified column as a [TimeSpan](#) object.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### 18.2.3.5.3. **GetDateTime**

Gets the value of the specified column as a [DateTime](#) object.

**Note.** MySQL allows date columns to contain the value '0000-00-00' and datetime columns to contain the value '0000-00-00 00:00:00'. The [DateTime](#) structure cannot contain or represent these values. To read a datetime value from a column that might contain zero values, use [GetMySQLDateTime](#). The behavior of reading a zero datetime column using this method is defined by the [ZeroDateTimeBehavior](#) connection string option. For more information on this option, please refer to [MySQLConnection.ConnectionString](#).

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### 18.2.3.5.4. **GetMySQLDateTime**

Gets the value of the specified column as a [MySQL.Data.Types.MySQLDateTime](#) object.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### 18.2.3.5.5. **GetString**

Gets the value of the specified column as a [String](#) object.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### 18.2.3.5.6. **GetDecimal**

Gets the value of the specified column as a [Decimal](#) object.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### 18.2.3.5.7. **GetDouble**

Gets the value of the specified column as a double-precision floating point number.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### **18.2.3.5.8. GetFloat**

Gets the value of the specified column as a single-precision floating point number.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### **18.2.3.5.9. GetGuid**

Gets the value of the specified column as a globally-unique identifier (GUID).

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### **18.2.3.5.10. GetInt16**

Gets the value of the specified column as a 16-bit signed integer.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### **18.2.3.5.11. GetInt32**

Gets the value of the specified column as a 32-bit signed integer.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### **18.2.3.5.12. GetInt64**

Gets the value of the specified column as a 64-bit signed integer.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### **18.2.3.5.13. GetUInt16**

Gets the value of the specified column as a 16-bit unsigned integer.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### **18.2.3.5.14. GetUInt32**

Gets the value of the specified column as a 32-bit unsigned integer.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

#### **18.2.3.5.15. GetUInt64**

Gets the value of the specified column as a 64-bit unsigned integer.

**Parameters:** The zero-based column ordinal.

**Returns:** The value of the specified column.

### 18.2.3.6. MySqlConnectionException

This class is created whenever the MySQL Data Provider encounters an error generated from the server.

Any open connections are not automatically closed when an exception is thrown. If the client application determines that the exception is fatal, it should close any open [MySQLDataReader](#) objects or [MySqlConnection](#) objects.

#### Examples

The following example generates a [MySqlConnectionException](#) due to a missing server, and then displays the exception.

Visual Basic example:

```
Public Sub ShowException()  
    Dim mySelectQuery As String = "SELECT column1 FROM table1"  
    Dim myConnection As New MySqlConnection ("Data Source=localhost;Database=Sample;")  
    Dim myCommand As New MySqlCommand(mySelectQuery, myConnection)  
    Try  
        myCommand.Connection.Open()  
    Catch e As MySqlConnectionException  
        MessageBox.Show( e.Message )  
    End Try  
End Sub
```

C# example:

```
public void ShowException()  
{  
    string mySelectQuery = "SELECT column1 FROM table1";  
    MySqlConnection myConnection =  
        new MySqlConnection("Data Source=localhost;Database=Sample;");  
    MySqlCommand myCommand = new MySqlCommand(mySelectQuery, myConnection);  
    try  
    {  
        myCommand.Connection.Open();  
    }  
    catch (MySqlConnectionException e)  
    {  
        MessageBox.Show( e.Message );  
    }  
}
```

### 18.2.3.7. MySqlParameter

Parameter names are not case sensitive.

#### Examples

The following example creates multiple instances of [MySqlParameter](#) through the [MySqlParameterCollection](#) collection within the [MySqlDataAdapter](#). These parameters are used to select data from the data source and place the data in the [DataSet](#). This example assumes that a [DataSet](#) and a [MySqlDataAdapter](#) have already been created with the appropriate schema, commands, and connection.

Visual Basic example:

```
Public Sub AddSqlParameters()
    ' ...
    ' create myDataSet and myDataAdapter
    ' ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySqlDbType.VarChar, 80).Value = "toast"
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySqlDbType.Long).Value = 239

    myDataAdapter.Fill(myDataSet)
End Sub 'AddSqlParameters
```

C# example:

```
public void AddSqlParameters()
{
    // ...
    // create myDataSet and myDataAdapter
    // ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySqlDbType.VarChar, 80).Value = "toaster"
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySqlDbType.Long).Value = 239;
    myDataAdapter.Fill(myDataSet);
}
```

### 18.2.3.8. MySqlConnectionParameterCollection

The number of the parameters in the collection must be equal to the number of parameter placeholders within the command text, or an exception will be generated.

#### Examples

The following example creates multiple instances of [MySqlConnectionParameter](#) through the [MySqlConnectionParameterCollection](#) collection within the [MySqlConnectionDataAdapter](#). These parameters are used to select data within the data source and place the data in the [DataSet](#). This code assumes that a [DataSet](#) and a [MySqlConnectionDataAdapter](#) have already been created with the appropriate schema, commands, and connection.

Visual Basic example:

```
Public Sub AddParameters()
    ' ...
    ' create myDataSet and myDataAdapter
    ' ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySqlDbType.VarChar, 80).Value = "toast"
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySqlDbType.Long).Value = 239

    myDataAdapter.Fill(myDataSet)
End Sub 'AddSqlParameters
```

C# example:

```
public void AddSqlParameters()
{
    // ...
    // create myDataSet and myDataAdapter
    // ...
    myDataAdapter.SelectCommand.Parameters.Add("@CategoryName", MySqlDbType.VarChar, 80).Value = "toaster"
    myDataAdapter.SelectCommand.Parameters.Add("@SerialNum", MySqlDbType.Long).Value = 239;
    myDataAdapter.Fill(myDataSet);
}
```

### 18.2.3.9. MySqlConnectionTransaction

Represents a SQL transaction to be made in a MySQL database. This class cannot be inherited.

The application creates a `MySqlTransaction` object by calling `MySqlConnection.BeginTransaction` on the `MySqlConnection` object. All subsequent operations associated with the transaction (for example, committing or aborting the transaction), are performed on the `MySqlTransaction` object.

### Examples

The following example creates a `MySqlConnection` and a `MySqlTransaction`. It also demonstrates how to use the `MySqlConnection.BeginTransaction`, `MySqlTransaction.Commit`, and `MySqlTransaction.Rollback` methods.

Visual Basic example:

```
Public Sub RunTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySqlTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()
    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (100, 'Description 100)"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (101, 'Description 101)"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Both records are written to database.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySqlException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " & ex.GetType().ToString() & _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " & e.GetType().ToString() & _
            " was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub 'RunTransaction
```

C# example:

```
public void RunTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (100, 'Description 100)"
        myCommand.ExecuteNonQuery();
    }
}
```

```

        myCommand.CommandText = "Insert into Region (RegionID, RegionDescription) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch (Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (MySqlException ex)
        {
            if (myTrans.Connection != null)
            {
                Console.WriteLine("An exception of type " + ex.GetType() +
                    " was encountered while attempting to roll back the transaction.");
            }
        }

        Console.WriteLine("An exception of type " + e.GetType() +
            " was encountered while inserting the data.");
        Console.WriteLine("Neither record was written to database.");
    }
    finally
    {
        myConnection.Close();
    }
}

```

### 18.2.3.9.1. Rollback

Rolls back a transaction from a pending state.

The Rollback method is equivalent to the MySQL statement ROLLBACK. The transaction can only be rolled back from a pending state (after BeginTransaction has been called, but before Commit is called).

#### Examples

The following example creates [MySqlConnection](#) and a [MySqlTransaction](#). It also demonstrates how to use the [MySqlConnection.BeginTransaction](#), [Commit](#), and [Rollback](#) methods.

Visual Basic example:

```

Public Sub RunSqlTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySqlTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()

    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Success.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySqlException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " & ex.GetType().ToString() & _

```

```

        " was encountered while attempting to roll back the transaction.")
    End If
End Try

Console.WriteLine("An exception of type " & e.GetType().ToString() & _
    "was encountered while inserting the data.")
Console.WriteLine("Neither record was written to database.")
Finally
    myConnection.Close()
End Try
End Sub

```

C# example:

```

public void RunSqlTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch (Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (MySqlException ex)
        {
            if (myTrans.Connection != null)
            {
                Console.WriteLine("An exception of type " + ex.GetType() +
                    " was encountered while attempting to roll back the transaction.");
            }
        }

        Console.WriteLine("An exception of type " + e.GetType() +
            " was encountered while inserting the data.");
        Console.WriteLine("Neither record was written to database.");
    }
    finally
    {
        myConnection.Close();
    }
}

```

### 18.2.3.9.2. Commit

Commits the database transaction.

The [Commit](#) method is equivalent to the MySQL SQL statement COMMIT.

#### Examples

The following example creates [MySqlConnection](#) and a [MySqlTransaction](#). It also demonstrates how to use the [MySqlConnection.BeginTransaction](#), [Commit](#), and [Rollback](#) methods.

## Visual Basic example:

```

Public Sub RunSqlTransaction(myConnString As String)
    Dim myConnection As New MySqlConnection(myConnString)
    myConnection.Open()

    Dim myCommand As MySqlCommand = myConnection.CreateCommand()
    Dim myTrans As MySqlTransaction

    ' Start a local transaction
    myTrans = myConnection.BeginTransaction()

    ' Must assign both transaction object and connection
    ' to Command object for a pending local transaction
    myCommand.Connection = myConnection
    myCommand.Transaction = myTrans

    Try
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')"
        myCommand.ExecuteNonQuery()
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')"
        myCommand.ExecuteNonQuery()
        myTrans.Commit()
        Console.WriteLine("Success.")
    Catch e As Exception
        Try
            myTrans.Rollback()
        Catch ex As MySqlException
            If Not myTrans.Connection Is Nothing Then
                Console.WriteLine("An exception of type " & ex.GetType().ToString() & _
                    " was encountered while attempting to roll back the transaction.")
            End If
        End Try

        Console.WriteLine("An exception of type " & e.GetType().ToString() & _
            " was encountered while inserting the data.")
        Console.WriteLine("Neither record was written to database.")
    Finally
        myConnection.Close()
    End Try
End Sub

```

## C# example:

```

public void RunSqlTransaction(string myConnString)
{
    MySqlConnection myConnection = new MySqlConnection(myConnString);
    myConnection.Open();
    MySqlCommand myCommand = myConnection.CreateCommand();
    MySqlTransaction myTrans;
    // Start a local transaction
    myTrans = myConnection.BeginTransaction();
    // Must assign both transaction object and connection
    // to Command object for a pending local transaction
    myCommand.Connection = myConnection;
    myCommand.Transaction = myTrans;
    try
    {
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (100, 'Description')";
        myCommand.ExecuteNonQuery();
        myCommand.CommandText = "Insert into mytable (id, desc) VALUES (101, 'Description')";
        myCommand.ExecuteNonQuery();
        myTrans.Commit();
        Console.WriteLine("Both records are written to database.");
    }
    catch(Exception e)
    {
        try
        {
            myTrans.Rollback();
        }
        catch (MySqlException ex)
        {
            if (myTrans.Connection != null)
            {
                Console.WriteLine("An exception of type " + ex.GetType() +
                    " was encountered while attempting to roll back the transaction.");
            }
        }
    }
}

```

```

    }
    Console.WriteLine("An exception of type " + e.GetType() +
        " was encountered while inserting the data.");
    Console.WriteLine("Neither record was written to database.");
}
finally
{
    myConnection.Close();
}
}

```

## 18.2.4. Connector/NET Reference

This section of the manual contains a complete reference to the Connector/NET ADO.NET component, automatically generated from the embedded documentation.

### 18.2.4.1. MySql.Data.MySqlClient

[Namespace hierarchy](#)

#### Classes

Class	Description
<a href="#">MySqlCommand</a>	
<a href="#">MySqlCommandBuilder</a>	
<a href="#">MySqlConnection</a>	
<a href="#">MySqlDataAdapter</a>	
<a href="#">MySqlDataReader</a>	Provides a means of reading a forward-only stream of rows from a MySQL database. This class cannot be inherited.
<a href="#">MySqlError</a>	Collection of error codes that can be returned by the server
<a href="#">MySqlException</a>	The exception that is thrown when MySQL returns an error. This class cannot be inherited.
<a href="#">MySqlHelper</a>	Helper class that makes it easier to work with the provider.
<a href="#">MySqlInfoMessageEventArgs</a>	Provides data for the InfoMessage event. This class cannot be inherited.
<a href="#">MySqlParameter</a>	Represents a parameter to a <a href="#">MySqlCommand</a> , and optionally, its mapping to DataSet columns. This class cannot be inherited.
<a href="#">MySqlParameterCollection</a>	Represents a collection of parameters relevant to a <a href="#">MySqlCommand</a> as well as their respective mappings to columns in a DataSet. This class cannot be inherited.
<a href="#">MySqlRowUpdatedEventArgs</a>	Provides data for the RowUpdated event. This class cannot be inherited.
<a href="#">MySqlRowUpdatingEventArgs</a>	Provides data for the RowUpdating event. This class cannot be inherited.
<a href="#">MySqlTransaction</a>	

#### Delegates

Delegate	Description
<a href="#">MySqlInfoMessageEventHandler</a>	Represents the method that will handle the <a href="#">InfoMessage</a> event of a <a href="#">MySqlConnection</a> .
<a href="#">MySqlRowUpdatedEventHandler</a>	Represents the method that will handle the RowUpdatedevent of a <a href="#">MySqlDataAdapter</a> .
<a href="#">MySqlRowUpdatingEventHandler</a>	Represents the method that will handle the RowUpdatingevent of a <a href="#">MySqlDataAdapter</a> .

### Enumerations

Enumeration	Description
<a href="#">MySqlDbType</a>	Specifies MySQL specific data type of a field, property, for use in a <a href="#">MySqlParameter</a> .
<a href="#">MySqlErrorCode</a>	

#### 18.2.4.1.1. MySql.Data.MySqlCommandHierarchy

See Also

#### 18.2.4.1.2.1. MySqlCommand Members

[MySqlCommand overview](#)

**Public Instance Constructors**

<a href="#"> MySqlCommand </a>	Overloaded. Initializes a new instance of the MySqlCommand class.
--------------------------------	---

**Public Instance Properties**

<a href="#"> CommandText </a>	
<a href="#"> CommandTimeout </a>	
<a href="#"> CommandType </a>	
<a href="#"> Connection </a>	
Container(inherited from Component)	Gets the IContainerthat contains the Component.
<a href="#"> IsPrepared </a>	
<a href="#"> Parameters </a>	
Site(inherited from Component)	Gets or sets the ISiteof the Component.
<a href="#"> Transaction </a>	
<a href="#"> UpdatedRowSource </a>	

**Public Instance Methods**

<a href="#"> Cancel </a>	Attempts to cancel the execution of a MySqlCommand. This operation is not supported.
CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
<a href="#"> CreateParameter </a>	Creates a new instance of a <a href="#"> MySqlCommandParameter </a> object.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Objectis equal to the current Object.
<a href="#"> ExecuteNonQuery </a>	
<a href="#"> ExecuteReader </a>	Overloaded.
<a href="#"> ExecuteScalar </a>	
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCodeis suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Typeof the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
<a href="#"> Prepare </a>	
ToString(inherited from Component)	Returns a Stringcontaining the name of the Component, if any. This method should not be overridden.

**Public Instance Events**

Disposed(inherited from Component)	Adds an event handler to listen to the Disposed event on the component.
------------------------------------	---

- [public MySQLConnection\(string\);](#)

**See Also**

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.1.1. MySQLConnection Constructor ()

Initializes a new instance of the [MySQLConnection](#) class.

**Syntax: Visual Basic**

```
Overloads Public Sub New()
```

**Syntax: C#**

```
public MySQLConnection();
```

**See Also**

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLConnection Constructor Overload List](#)

## 18.2.4.1.2.1.1.3.1.1.1.2. MySQLConnection Constructor (String)

**Syntax: Visual Basic**

```
Overloads Public Sub New( _  
    ByVal connectionString As String _  
)
```

**Syntax: C#**

```
public MySqlConnection(  
    string connectionString  
);
```

**See Also**

[MySqlConnection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlConnection Constructor Overload List](#)

## 18.2.4.1.2.1.1.3.1.1.2. ConnectionString Property

**Syntax: Visual Basic**

```
NotOverridable Public Property ConnectionString As String _  
    Implements IDbConnection.ConnectionString
```

**Syntax: C#**

```
public string ConnectionString {get; set;}
```

**Implements**

IDbConnection.ConnectionString

**See Also**

[MySqlConnection Class](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.3. ConnectionTimeout Property

**Syntax: Visual Basic**

```
NotOverridable Public ReadOnly Property ConnectionTimeout As Integer _  
    Implements IDbConnection.ConnectionTimeout
```

**Syntax: C#**

```
public int ConnectionTimeout {get;}
```

**Implements**

IDbConnection.ConnectionTimeout

**See Also**

[MySqlConnection Class](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.4. Database Property

**Syntax: Visual Basic**

```
NotOverridable Public ReadOnly Property Database As String _  
    Implements IDbConnection.Database
```

**Syntax: C#**

```
public string Database {get;}
```

**Implements**

IDbConnection.Database

**See Also**

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.5. DataSource Property

Gets the name of the MySQL server to which to connect.

**Syntax: Visual Basic**

```
Public ReadOnly Property DataSource As String
```

**Syntax: C#**

```
public string DataSource {get;}
```

**See Also**

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.6. ServerThread Property

Returns the id of the server thread this connection is executing on

**Syntax: Visual Basic**

```
Public ReadOnly Property ServerThread As Integer
```

**Syntax: C#**

```
public int ServerThread {get;}
```

**See Also**

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.7. ServerVersion Property

**Syntax: Visual Basic**

```
Public ReadOnly Property ServerVersion As String
```

**Syntax: C#**

```
public string ServerVersion {get;}
```

**See Also**

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.1.3.1.1.8. State Property

**Syntax: Visual Basic**

```
NotOverridable Public ReadOnly Property State As ConnectionState _  
    Implements IDbConnection.State
```

**Syntax: C#**

```
public System.Data.ConnectionState State {get;}
```

**Implements**

IDbConnection.State

**See Also**

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.1.3.1.1.9. UseCompression Property

Indicates if this connection should use compression when communicating with the server.

**Syntax: Visual Basic**

```
Public ReadOnly Property UseCompression As Boolean
```

**Syntax: C#**

```
public bool UseCompression {get;}
```

**See Also**

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.1.3.1.1.10. BeginTransaction Method

**Overload List**

- [public MySQLTransaction BeginTransaction\(\);](#)
- [public MySQLTransaction BeginTransaction\(IsolationLevel\);](#)

**See Also**

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.1.3.1.1.10.1. MySQLConnection.BeginTransaction Method ()

**Syntax: Visual Basic**

```
Overloads Public Function BeginTransaction() As MySQLTransaction
```

**Syntax: C#**

```
public MySQLTransaction BeginTransaction();
```

**See Also**

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLConnection.BeginTransaction Overload List](#)

## 18.2.4.1.2.1.1.3.1.1.10.1.1. MySQLTransaction Class

For a list of all members of this type, see [MySQLTransaction Members](#) .

**Syntax: Visual Basic**

```
NotInheritable Public Class MySQLTransaction_
    Implements IDbTransaction, IDisposable
```

**Syntax: C#**

```
public sealed class MySQLTransaction : IDbTransaction, IDisposable
```

**Thread Safety**

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

**Requirements**

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

**See Also**

[MySQLTransaction Members](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.10.1.1.1. MySQLTransaction Members

[MySQLTransaction overview](#)

**Public Instance Properties**

<a href="#">Connection</a>	Gets the <a href="#">MySQLConnection</a> object associated with the transaction, or a null reference (Nothing in Visual Basic) if the transaction is no longer valid.
<a href="#">IsolationLevel</a>	Specifies the IsolationLevel for this transaction.

**Public Instance Methods**

<a href="#">Commit</a>	
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
<a href="#">Rollback</a>	
ToString(inherited from Object)	Returns a String that represents the current Object.

**See Also**

[MySQLTransaction Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.10.1.1.1.1. Connection Property

Gets the [MySQLConnection](#) object associated with the transaction, or a null reference (Nothing in Visual Basic) if the transaction is no longer valid.

**Syntax: Visual Basic**

```
Public ReadOnly Property Connection As MySqlConnection
```

**Syntax: C#**

```
public MySqlConnection Connection {get;}
```

**Property Value**

The [MySQLConnection](#) object associated with this transaction.

**Remarks**

A single application may have multiple database connections, each with zero or more transactions. This property enables you to determine the connection object associated with a particular transaction created by [BeginTransaction](#) .

**See Also**

[MySQLTransaction Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.10.1.1.1.2. IsolationLevel Property

Specifies the IsolationLevel for this transaction.

**Syntax: Visual Basic**

```
NotOverridable Public ReadOnly Property IsolationLevel As IsolationLevel _  
- Implements IDbTransaction.IsolationLevel
```

**Syntax: C#**

```
public System.Data.IsolationLevel IsolationLevel {get;}
```

**Property Value**

The IsolationLevel for this transaction. The default is ReadCommitted.

**Implements**

IDbTransaction.IsolationLevel

**Remarks**

Parallel transactions are not supported. Therefore, the IsolationLevel applies to the entire transaction.

**See Also**

[MySQLTransaction Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.1.3.1.1.10.1.1.1.3. MySQLTransaction.Commit Method

##### Syntax: Visual Basic

```
NotOverridable Public Sub Commit() _  
- Implements IDbTransaction.Commit
```

##### Syntax: C#

```
public void Commit();
```

##### Implements

IDbTransaction.Commit

##### See Also

[MySQLTransaction Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.1.3.1.1.10.1.1.1.4. MySQLTransaction.Rollback Method

##### Syntax: Visual Basic

```
NotOverridable Public Sub Rollback() _  
- Implements IDbTransaction.Rollback
```

##### Syntax: C#

```
public void Rollback();
```

##### Implements

IDbTransaction.Rollback

##### See Also

[MySQLTransaction Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.1.3.1.1.10.2. MySqlConnection.BeginTransaction Method (IsolationLevel)

##### Syntax: Visual Basic

```
Overloads Public Function BeginTransaction( _  
    ByVal iso As IsolationLevel _  
    ) As MySQLTransaction
```

##### Syntax: C#

```
public MySQLTransaction BeginTransaction(  
    IsolationLevel iso  
);
```

##### See Also

[MySQLConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLConnection.BeginTransaction](#)

[Overload List](#)

## 18.2.4.1.2.1.1.3.1.1.11. MySqlConnection.ChangeDatabase Method

**Syntax: Visual Basic**

```
NotOverridable Public Sub ChangeDatabase( _  
    ByVal databaseName As String _  
) _  
- Implements IDbConnection.ChangeDatabase
```

**Syntax: C#**

```
public void ChangeDatabase(  
string databaseName  
);
```

**Implements**

IDbConnection.ChangeDatabase

**See Also**[MySqlConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.12. MySqlConnection.Close Method

**Syntax: Visual Basic**

```
NotOverridable Public Sub Close() _  
- Implements IDbConnection.Close
```

**Syntax: C#**

```
public void Close();
```

**Implements**

IDbConnection.Close

**See Also**[MySqlConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.13. MySqlConnection.CreateCommand Method

**Syntax: Visual Basic**

```
Public Function CreateCommand() As MySqlCommand
```

**Syntax: C#**

```
public MySqlCommand CreateCommand();
```

**See Also**[MySqlConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.14. MySqlConnection.Open Method

**Syntax: Visual Basic**

```
NotOverridable Public Sub Open() _  
    Implements IDbConnection.Open
```

**Syntax: C#**

```
public void Open();
```

**Implements**

IDbConnection.Open

**See Also**

[MySqlConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.15. MySqlConnection.Ping Method

Ping

**Syntax: Visual Basic**

```
Public Function Ping() As Boolean
```

**Syntax: C#**

```
public bool Ping();
```

**Return Value****See Also**

[MySqlConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.16. MySqlConnection.InfoMessage Event

**Syntax: Visual Basic**

```
Public Event InfoMessage As MySqlInfoMessageEventHandler
```

**Syntax: C#**

```
public event MySqlInfoMessageEventHandler InfoMessage;
```

**See Also**

[MySqlConnection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.16.1. MySqlInfoMessageEventHandler Delegate

Represents the method that will handle the [InfoMessage](#) event of a [MySqlConnection](#) .

**Syntax: Visual Basic**

```
Public Delegate Sub MySqlInfoMessageEventHandler( _
    ByVal sender As Object, _
    ByVal args As MySqlInfoMessageEventArgs _
)
```

**Syntax: C#**

```
public delegate void MySqlInfoMessageEventHandler(
    object sender,
    MySqlInfoMessageEventArgs args
);
```

**Requirements**

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

**See Also**

[MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.16.1.1. MySqlInfoMessageEventArgs Class

Provides data for the InfoMessage event. This class cannot be inherited.

For a list of all members of this type, see [MySqlInfoMessageEventArgs Members](#) .

**Syntax: Visual Basic**

```
Public Class MySqlInfoMessageEventArgs_
    Inherits EventArgs
```

**Syntax: C#**

```
public class MySqlInfoMessageEventArgs : EventArgs
```

**Thread Safety**

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

**Requirements**

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

**See Also**

[MySqlInfoMessageEventArgs Members](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.16.1.1.1. MySqlInfoMessageEventArgs Members

[MySqlInfoMessageEventArgs overview](#)

**Public Instance Constructors**

<a href="#">MySqlInfoMessageEventArgs Constructor</a>	Initializes a new instance of the <a href="#">MySqlInfoMessageEventArgs</a> class.
---	--

**Public Instance Fields**

<a href="#">errors</a>	
------------------------	--

**Public Instance Methods**

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

**Protected Instance Methods**

Finalize(inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

**See Also**

[MySQLInfoMessageEventArgs Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.1.3.1.1.16.1.1.1.1. MySQLInfoMessageEventArgs Constructor

Initializes a new instance of the [MySQLInfoMessageEventArgs](#) class.

**Syntax: Visual Basic**

```
Public Sub New()
```

**Syntax: C#**

```
public MySQLInfoMessageEventArgs();
```

**See Also**

18.2.4.1.2.1.7. Parameters Property

**Syntax: Visual Basic**

```
Public ReadOnly Property Parameters As MySqlParameterCollection
```

**Syntax: C#**

```
public MySqlParameterCollection Parameters {get;}
```

**See Also**

[MySQLCommand Class](#) , [MySql.Data.MySqlClient Namespace](#)

18.2.4.1.2.1.7.1. MySqlParameterCollection Class

Represents a collection of parameters relevant to a [MySQLCommand](#) as well as their respective mappings to columns in a DataSet. This class cannot be inherited.

For a list of all members of this type, see [MySQLParameterCollection Members](#) .

### Syntax: Visual Basic

```
NotInheritable Public Class MySQLParameterCollection_
    Inherits MarshalByRefObject_
    Implements IDataParameterCollection, IList, ICollection, IEnumerable
```

### Syntax: C#

```
public sealed class MySQLParameterCollection : MarshalByRefObject, IDataParameterCollection, IList, IC
```

### Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

### Requirements

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

### See Also

[MySQLParameterCollection Members](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1. MySQLParameterCollection Members

[MySQLParameterCollection overview](#)

### Public Instance Constructors

<a href="#">MySQLParameterCollection Constructor</a>	Initializes a new instance of the <a href="#">MySQLParameterCollection</a> class.
--	---

### Public Instance Properties

<a href="#">Count</a>	Gets the number of MySQLParameter objects in the collection.
<a href="#">Item</a>	Overloaded. Gets the <a href="#">MySQLParameter</a> with a specified attribute. In C#, this property is the indexer for the <a href="#">MySQLParameterCollection</a> class.

### Public Instance Methods

<a href="#">Add</a>	Overloaded. Adds the specified <a href="#">MySQLParameter</a> object to the <a href="#">MySQLParameterCollection</a> .
<a href="#">Clear</a>	Removes all items from the collection.
<a href="#">Contains</a>	Overloaded. Gets a value indicating whether a <a href="#">MySQLParameter</a> exists in the collection.
<a href="#">CopyTo</a>	Copies MySQLParameter objects from the MySQLParameterCollection to the specified array.
<a href="#">CreateObjRef</a> (inherited from MarshalByRefOb-	Creates an object that contains all the relevant in-

ject)	formation required to generate a proxy used to communicate with a remote object.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
<a href="#">IndexOf</a>	Overloaded. Gets the location of a <a href="#">MySQLParameter</a> in the collection.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
<a href="#">Insert</a>	Inserts a <a href="#">MySQLParameter</a> into the collection at the specified index.
<a href="#">Remove</a>	Removes the specified <a href="#">MySQLParameter</a> from the collection.
<a href="#">RemoveAt</a>	Overloaded. Removes the specified <a href="#">MySQLParameter</a> from the collection.
ToString(inherited from Object)	Returns a String that represents the current Object.

## 18.2.4.1.2.1.7.1.1.1. MySQLParameterCollection Constructor

Initializes a new instance of the [MySQLParameterCollection](#) class.

**Syntax: Visual Basic**

```
Public Sub New()
```

**Syntax: C#**

```
public MySQLParameterCollection();
```

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.2. Count Property

Gets the number of [MySQLParameter](#) objects in the collection.

**Syntax: Visual Basic**

```
NotOverridable Public ReadOnly Property Count As Integer _  
_ Implements ICollection.Count
```

**Syntax: C#**

```
public int Count {get;}
```

**Implements**

ICollection.Count

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3. Item Property

Gets the [MySQLParameter](#) with a specified attribute. In C#, this property is the indexer for the [MySQLParameterCollection](#) class.

**Overload List**

Gets the [MySQLParameter](#) at the specified index.

- `public MySQLParameter this[int] {get; set;}`

Gets the [MySQLParameter](#) with the specified name.

- `public MySQLParameter this[string] {get; set;}`

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1. MySQLParameter Class

Represents a parameter to a [MySQLCommand](#) , and optionally, its mapping to DataSetcolumns. This class cannot be inherited.

For a list of all members of this type, see [MySQLParameter Members](#) .

**Syntax: Visual Basic**

```
NotInheritable Public Class MySQLParameter_
    Inherits MarshalByRefObject_
    Implements IDataParameter, IDbDataParameter, ICloneable
```

**Syntax: C#**

```
public sealed class MySQLParameter : MarshalByRefObject, IDataParameter, IDbDataParameter, ICloneable
```

**Thread Safety**

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

**Requirements**

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

**See Also**

[MySqlParameter Members](#) , [MySql.Data.MySqlClient Namespace](#)

18.2.4.1.2.1.7.1.1.3.1.1. MySqlConnection Members

[MySqlParameter overview](#)

**Public Instance Constructors**

<a href="#">MySqlParameter</a>	Overloaded. Initializes a new instance of the MySqlConnection class.
--------------------------------	--

**Public Instance Properties**

<a href="#">DbType</a>	Gets or sets the DbType of the parameter.
<a href="#">Direction</a>	Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter. As of MySql version 4.1 and earlier, input-only is the only valid choice.
<a href="#">IsNullable</a>	Gets or sets a value indicating whether the parameter accepts null values.
<a href="#">IsUnsigned</a>	
<a href="#">MySqlDbType</a>	Gets or sets the MySqlDbType of the parameter.
<a href="#">ParameterName</a>	Gets or sets the name of the MySqlConnection.
<a href="#">Precision</a>	Gets or sets the maximum number of digits used to represent the <a href="#">Value</a> property.
<a href="#">Scale</a>	Gets or sets the number of decimal places to which <a href="#">Value</a> is resolved.
<a href="#">Size</a>	Gets or sets the maximum size, in bytes, of the data within the column.
<a href="#">SourceColumn</a>	Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the <a href="#">Value</a> .
<a href="#">SourceVersion</a>	Gets or sets the DataRowVersion to use when loading <a href="#">Value</a> .
<a href="#">Value</a>	Gets or sets the value of the parameter.

**Public Instance Methods**

<a href="#">CreateObjRef</a> (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
<a href="#">Equals</a> (inherited from Object)	Determines whether the specified Object is equal to the current Object.
<a href="#">GetHashCode</a> (inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.

GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
<a href="#">ToString</a>	Overridden. Gets a string containing the <a href="#">ParameterName</a> .

## 18.2.4.1.2.1.7.1.1.3.1.1.1. MySQLParameter Constructor

Initializes a new instance of the MySQLParameter class.

**Overload List**

Initializes a new instance of the MySQLParameter class.

- [public MySQLParameter\(\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and the data type.

- [public MySQLParameter\(string,MySQLDbType\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySQLDbType](#) , and the size.

- [public MySQLParameter\(string,MySQLDbType,int\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the type of the parameter, the size of the parameter, a [ParameterDirection](#), the precision of the parameter, the scale of the parameter, the source column, a [DataRowVersion](#) to use, and the value of the parameter.

- [public MySQLParameter\(string,MySQLDbType,int,ParameterDirection,bool,byte,byte,string,DataRowVersion,object\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySQLDbType](#) , the size, and the source column name.

- [public MySQLParameter\(string,MySQLDbType,int,string\);](#)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and a value of the new MySQLParameter.

- [public MySQLParameter\(string,object\);](#)

#### 18.2.4.1.2.1.7.1.1.3.1.1.1.1. MySQLParameter Constructor ()

Initializes a new instance of the [MySQLParameter](#) class.

**Syntax: Visual Basic**

```
Overloads Public Sub New()
```

**Syntax: C#**

```
public MySQLParameter();
```

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameter Constructor Overload List](#)

#### 18.2.4.1.2.1.7.1.1.3.1.1.1.2. MySQLParameter Constructor (String, MySQLDbType)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and the data type.

**Syntax: Visual Basic**

```
Overloads Public Sub New( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySQLDbType _  
)
```

**Syntax: C#**

```
public MySQLParameter(  
    stringparameterName,  
    MySQLDbTypedbType  
);
```

**Parameters**

- [parameterName](#): The name of the parameter to map.
- [dbType](#): One of the [MySQLDbType](#) values.

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameter Constructor Overload List](#)

#### 18.2.4.1.2.1.7.1.1.3.1.1.2.1. MySQLDbType Enumeration

Specifies MySQL specific data type of a field, property, for use in a [MySQLParameter](#) .

**Syntax: Visual Basic**

```
Public Enum MySqlDbType
```

**Syntax: C#**

```
public enum MySqlDbType
```

**Members**

Member Name	Description
VarChar	A variable-length string containing 0 to 65535 characters
Timestamp	A timestamp. The range is '1970-01-01 00:00:00' to sometime in the year 2037
LongBlob	A BLOB or TEXT column with a maximum length of 4294967295 or 4G (2 <sup>32</sup> - 1) characters
Time	Time The range is '-838:59:59' to '838:59:59'.
TinyBlob	A BLOB or TEXT column with a maximum length of 255 (2 <sup>8</sup> - 1) characters
Datetime	DateTime The supported range is '1000-01-01 00:00:00' to '9999-12-31 23:59:59'.
Decimal	Decimal A fixed precision and scale numeric value between -1038 -1 and 10 38 -1.
UByte	
Blob	A BLOB or TEXT column with a maximum length of 65535 (2 <sup>16</sup> - 1) characters
Double	Double A normal-size (double-precision) floating-point number. Allowable values are - 1.7976931348623157E+308 to - 2.2250738585072014E-308, 0, and 2.2250738585072014E-308 to 1.7976931348623157E+308.
Newdate	Obsolete Use Datetime or Date type
Byte	Byte The signed range is -128 to 127. The unsigned range is 0 to 255.
Date	Date The supported range is '1000-01-01' to '9999-12-31'.
VarChar	A variable-length string containing 0 to 255 characters
UInt16	
UInt24	
Int16	Int16 A 16-bit signed integer. The signed range is -

	32768 to 32767. The unsigned range is 0 to 65535
NewDecimal	New Decimal
Set	A set. A string object that can have zero or more values, each of which must be chosen from the list of values 'value1', 'value2', ... A SET can have a maximum of 64 members.
String	Obsolete Use VarChar type
Enum	An enumeration. A string object that can have only one value, chosen from the list of values 'value1', 'value2', ..., NULL or the special "" error value. An ENUM can have a maximum of 65535 distinct values
Geometry	
UInt64	
Int64	Int64 A 64-bit signed integer.
UInt32	
Int24	Specifies a 24 (3 byte) signed or unsigned value.
Bit	Bit-field data type
Float	Single A small (single-precision) floating-point number. Allowable values are -3.402823466E+38 to -1.175494351E-38, 0, and 1.175494351E-38 to 3.402823466E+38.
Year	A year in 2- or 4-digit format (default is 4-digit). The allowable values are 1901 to 2155, 0000 in the 4-digit year format, and 1970-2069 if you use the 2-digit format (70-69)
Int32	Int32 A 32-bit signed integer
MediumBlob	A BLOB or TEXT column with a maximum length of 16777215 (2 <sup>24</sup> - 1) characters

**Requirements**

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

**See Also**

[MySql.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.7.1.1.3.1.1.3. MySqlParameter Constructor (String, MySqlDbType, Int32)

Initializes a new instance of the [MySqlParameter](#) class with the parameter name, the [MySqlDbType](#) , and the size.

**Syntax: Visual Basic**

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer _
)
```

**Syntax: C#**

```
public MySqlParameter(
    stringparameterName,
    MySqlDbTypedbType,
    intsize
);
```

**Parameters**

- `parameterName`: The name of the parameter to map.
- `dbType`: One of the [MySqlDbType](#) values.
- `size`: The length of the parameter.

**See Also**

[MySqlParameter Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameter Constructor Overload List](#)

#### 18.2.4.1.2.1.7.1.1.3.1.1.1.4. MySqlParameter Constructor (String, MySqlDbType, Int32, ParameterDirection, Boolean, Byte, Byte, String, DataRowVersion, Object)

Initializes a new instance of the [MySqlParameter](#) class with the parameter name, the type of the parameter, the size of the parameter, a [ParameterDirection](#), the precision of the parameter, the scale of the parameter, the source column, a [DataRowVersion](#) to use, and the value of the parameter.

**Syntax: Visual Basic**

```
Overloads Public Sub New( _
    ByVal parameterName As String, _
    ByVal dbType As MySqlDbType, _
    ByVal size As Integer, _
    ByVal direction As ParameterDirection, _
    ByVal isNullable As Boolean, _
    ByVal precision As Byte, _
    ByVal scale As Byte, _
    ByVal sourceColumn As String, _
    ByVal sourceVersion As DataRowVersion, _
    ByVal value As Object _
)
```

**Syntax: C#**

```
public MySqlParameter(
    stringparameterName,
    MySqlDbTypedbType,
    intsize,
    ParameterDirectiondirection,
    boolisNullable,
    byteprecision,
    bytescale,
    stringsourceColumn,
    DataRowVersionsourceVersion,
    objectvalue
);
```

```
);
```

## Parameters

- `parameterName`: The name of the parameter to map.
- `dbType`: One of the [MySQLDbType](#) values.
- `size`: The length of the parameter.
- `direction`: One of the [ParameterDirection](#) values.
- `isNullable`: true if the value of the field can be null, otherwise false.
- `precision`: The total number of digits to the left and right of the decimal point to which [Value](#) is resolved.
- `scale`: The total number of decimal places to which [Value](#) is resolved.
- `sourceColumn`: The name of the source column.
- `sourceVersion`: One of the [DataRowVersion](#) values.
- `value`: An Object that is the value of the [MySQLParameter](#).

## Exceptions

Exception Type	Condition
ArgumentException

### 18.2.4.1.2.1.7.1.1.3.1.1.4.1. Value Property

Gets or sets the value of the parameter.

#### Syntax: Visual Basic

```
NotOverridable Public Property Value As Object _
    Implements IDataParameter.Value
```

#### Syntax: C#

```
public object Value {get; set;}
```

## Implements

[IDataParameter.Value](#)

## See Also

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.1.5. MySQLParameter Constructor (String, MySqlDbType, Int32, String)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name, the [MySqlDbType](#) , the size, and the source column name.

**Syntax: Visual Basic**

```
Overloads Public Sub New( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType, _  
    ByVal size As Integer, _  
    ByVal sourceColumn As String _  
)
```

**Syntax: C#**

```
public MySQLParameter(  
    stringparameterName,  
    MySqlDbTypedbType,  
    intsize,  
    stringsourceColumn  
);
```

**Parameters**

- [parameterName](#): The name of the parameter to map.
- [dbType](#): One of the [MySqlDbType](#) values.
- [size](#): The length of the parameter.
- [sourceColumn](#): The name of the source column.

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameter Constructor Overload List](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.1.6. MySQLParameter Constructor (String, Object)

Initializes a new instance of the [MySQLParameter](#) class with the parameter name and a value of the new [MySQLParameter](#).

**Syntax: Visual Basic**

```
Overloads Public Sub New( _  
    ByVal parameterName As String, _  
    ByVal value As Object _  
)
```

**Syntax: C#**

```
public MySQLParameter(  
    stringparameterName,  
    objectvalue  
);
```

**Parameters**

- `parameterName`: The name of the parameter to map.
- `value`: An Object that is the value of the [MySQLParameter](#) .

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameter Constructor Overload List](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.2. DbType Property

Gets or sets the DbType of the parameter.

**Syntax: Visual Basic**

```
NotOverridable Public Property DbType As DbType _  
    Implements IDataParameter.DbType
```

**Syntax: C#**

```
public System.Data.DbType DbType {get; set;}
```

**Implements**

IDataParameter.DbType

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.3. Direction Property

Gets or sets a value indicating whether the parameter is input-only, output-only, bidirectional, or a stored procedure return value parameter. As of MySQL version 4.1 and earlier, input-only is the only valid choice.

**Syntax: Visual Basic**

```
NotOverridable Public Property Direction As ParameterDirection _  
    Implements IDataParameter.Direction
```

**Syntax: C#**

```
public System.Data.ParameterDirection Direction {get; set;}
```

**Implements**

IDataParameter.Direction

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.4. IsNullable Property

Gets or sets a value indicating whether the parameter accepts null values.

**Syntax: Visual Basic**

```
NotOverridable Public Property IsNullable As Boolean _  
    Implements IDataParameter.IsNullable
```

**Syntax: C#**

```
public bool IsNullable {get; set;}
```

**Implements**

IDataParameter.IsNullable

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.5. IsUnsigned Property

**Syntax: Visual Basic**

```
Public Property IsUnsigned As Boolean
```

**Syntax: C#**

```
public bool IsUnsigned {get; set;}
```

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.6. MySQLDbType Property

Gets or sets the MySQLDbType of the parameter.

**Syntax: Visual Basic**

```
Public Property MySQLDbType As MySQLDbType
```

**Syntax: C#**

```
public MySQLDbType MySQLDbType {get; set;}
```

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.7. ParameterName Property

Gets or sets the name of the MySQLParameter.

**Syntax: Visual Basic**

```
NotOverridable Public Property ParameterName As String _  
    Implements IDataParameter.ParameterName
```

**Syntax: C#**

```
public string ParameterName {get; set;}
```

**Implements**

IDataParameter.ParameterName

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.8. Precision Property

Gets or sets the maximum number of digits used to represent the [Value](#) property.

**Syntax: Visual Basic**

```
NotOverridable Public Property Precision As Byte _  
- Implements IDbDataParameter.Precision
```

**Syntax: C#**

```
public byte Precision {get; set;}
```

**Implements**

IDbDataParameter.Precision

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.9. Scale Property

Gets or sets the number of decimal places to which [Value](#) is resolved.

**Syntax: Visual Basic**

```
NotOverridable Public Property Scale As Byte _  
- Implements IDbDataParameter.Scale
```

**Syntax: C#**

```
public byte Scale {get; set;}
```

**Implements**

IDbDataParameter.Scale

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.10. Size Property

Gets or sets the maximum size, in bytes, of the data within the column.

**Syntax: Visual Basic**

```
NotOverridable Public Property Size As Integer _  
    Implements IDbDataParameter.Size
```

**Syntax: C#**

```
public int Size {get; set;}
```

**Implements**

IDbDataParameter.Size

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.11. SourceColumn Property

Gets or sets the name of the source column that is mapped to the DataSet and used for loading or returning the [Value](#) .

**Syntax: Visual Basic**

```
NotOverridable Public Property SourceColumn As String _  
    Implements IDataParameter.SourceColumn
```

**Syntax: C#**

```
public string SourceColumn {get; set;}
```

**Implements**

IDataParameter.SourceColumn

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.12. SourceVersion Property

Gets or sets the DataRowVersion to use when loading [Value](#) .

**Syntax: Visual Basic**

```
NotOverridable Public Property SourceVersion As DataRowVersion _  
    Implements IDataParameter.SourceVersion
```

**Syntax: C#**

```
public System.Data.DataRowVersion SourceVersion {get; set;}
```

**Implements**

IDataParameter.SourceVersion

**See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.1.1.13. MySQLParameter.ToString Method

Overridden. Gets a string containing the [ParameterName](#) .

**Syntax: Visual Basic**

```
Overrides Public Function ToString() As String
```

**Syntax: C#**

```
public override string ToString();
```

**Return Value****See Also**

[MySQLParameter Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.3.2. Item Property (Int32)

Gets the [MySQLParameter](#) at the specified index.

**Syntax: Visual Basic**

```
Overloads Public Default Property Item( _  
    ByVal index As Integer _  
) As MySQLParameter
```

**Syntax: C#**

```
public MySQLParameter this[  
    int index  
] {get; set;}
```

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Item Overload List](#)

## 18.2.4.1.2.1.7.1.1.3.3. Item Property (String)

Gets the [MySQLParameter](#) with the specified name.

**Syntax: Visual Basic**

```
Overloads Public Default Property Item( _  
    ByVal name As String _  
) As MySQLParameter
```

**Syntax: C#**

```
public MySQLParameter this[  
    string name  
] {get; set;}
```

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Item Overload List](#)

## 18.2.4.1.2.1.7.1.1.4. Add Method

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

**Overload List**

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

- `public MySQLParameter Add(MySQLParameter);`

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

- `public int Add(object);`

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the parameter name and the data type.

- `public MySQLParameter Add(string,MySQLDbType);`

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) with the parameter name, the data type, and the column length.

- `public MySQLParameter Add(string,MySQLDbType,int);`

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) with the parameter name, the data type, the column length, and the source column name.

- `public MySQLParameter Add(string,MySQLDbType,int,string);`

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the specified parameter name and value.

- `public MySQLParameter Add(string,object);`

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.4.1. MySQLParameterCollection.Add Method (MySQLParameter)

Adds the specified [MySQLParameter](#) object to the [MySQLParameterCollection](#) .

**Syntax: Visual Basic**

```
Overloads Public Function Add( _
```

```
ByVal value As MySqlParameter _  
) As MySqlParameter
```

**Syntax: C#**

```
public MySqlParameter Add(  
    MySqlParameter value  
);
```

**Parameters**

- `value`: The [MySqlParameter](#) to add to the collection.

**Return Value**

The newly added [MySqlParameter](#) object.

**See Also**

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Add Overload List](#)

#### 18.2.4.1.2.1.7.1.1.4.2. MySqlConnection.Add Method (Object)

Adds the specified [MySqlParameter](#) object to the [MySqlParameterCollection](#) .

**Syntax: Visual Basic**

```
NotOverridable Overloads Public Function Add( _  
    ByVal value As Object _  
    ) As Integer _  
    Implements IList.Add
```

**Syntax: C#**

```
public int Add(  
    object value  
);
```

**Parameters**

- `value`: The [MySqlParameter](#) to add to the collection.

**Return Value**

The index of the new [MySqlParameter](#) object.

**Implements**

[IList.Add](#)

**See Also**

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Add Overload List](#)

#### 18.2.4.1.2.1.7.1.1.4.3. MySqlConnection.Add Method (String, MySqlDbType)

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) given the parameter name and the data type.

##### Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType _  
) As MySqlParameter
```

##### Syntax: C#

```
public MySqlParameter Add(  
    stringparameterName,  
    MySqlDbTypedbType  
);
```

##### Parameters

- [parameterName](#): The name of the parameter.
- [dbType](#): One of the [MySqlDbType](#) values.

##### Return Value

The newly added [MySqlParameter](#) object.

##### See Also

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Add Overload List](#)

#### 18.2.4.1.2.1.7.1.1.4.4. MySqlConnection.Add Method (String, MySqlDbType, Int32)

Adds a [MySqlParameter](#) to the [MySqlParameterCollection](#) with the parameter name, the data type, and the column length.

##### Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType, _  
    ByVal size As Integer _  
) As MySqlParameter
```

##### Syntax: C#

```
public MySqlParameter Add(  
    stringparameterName,  
    MySqlDbTypedbType,  
    intsize  
);
```

##### Parameters

- [parameterName](#): The name of the parameter.
- [dbType](#): One of the [MySqlDbType](#) values.

- `size`: The length of the column.

### Return Value

The newly added [MySQLParameter](#) object.

### See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

#### 18.2.4.1.2.1.7.1.1.4.5. MySQLParameterCollection.Add Method (String, MySqlDbType, Int32, String)

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) with the parameter name, the data type, the column length, and the source column name.

### Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal dbType As MySqlDbType, _  
    ByVal size As Integer, _  
    ByVal sourceColumn As String _  
) As MySQLParameter
```

### Syntax: C#

```
public MySQLParameter Add(  
    stringparameterName,  
    MySqlDbTypedbType,  
    intsize,  
    stringsourceColumn  
);
```

### Parameters

- `parameterName`: The name of the parameter.
- `dbType`: One of the [MySQLDbType](#) values.
- `size`: The length of the column.
- `sourceColumn`: The name of the source column.

### Return Value

The newly added [MySQLParameter](#) object.

### See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Add Overload List](#)

#### 18.2.4.1.2.1.7.1.1.4.6. MySQLParameterCollection.Add Method (String, Object)

Adds a [MySQLParameter](#) to the [MySQLParameterCollection](#) given the specified parameter name and value.

### Syntax: Visual Basic

```
Overloads Public Function Add( _  
    ByVal parameterName As String, _  
    ByVal value As Object _  
) As MySqlParameter
```

**Syntax: C#**

```
public MySqlParameter Add(  
    stringparameterName,  
    objectvalue  
);
```

**Parameters**

- `parameterName`: The name of the parameter.
- `value`: The [Value](#) of the [MySqlParameter](#) to add to the collection.

**Return Value**

The newly added [MySqlParameter](#) object.

**See Also**

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.Add Overload List](#)

#### 18.2.4.1.2.1.7.1.1.5. MySqlConnection.Clear Method

Removes all items from the collection.

**Syntax: Visual Basic**

```
NotOverridable Public Sub Clear() _  
    Implements IList.Clear
```

**Syntax: C#**

```
public void Clear();
```

**Implements**

[IList.Clear](#)

**See Also**

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.7.1.1.6. Contains Method

Gets a value indicating whether a [MySqlParameter](#) exists in the collection.

**Overload List**

Gets a value indicating whether a [MySqlParameter](#) exists in the collection.

- `public bool Contains(object);`

Gets a value indicating whether a [MySQLParameter](#) with the specified parameter name exists in the collection.

- `public bool Contains(string);`

#### See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.7.1.1.6.1. MySQLParameterCollection.Contains Method (Object)

Gets a value indicating whether a [MySQLParameter](#) exists in the collection.

#### Syntax: Visual Basic

```
NotOverridable Overloads Public Function Contains( _
    ByVal value As Object _
) As Boolean _
- Implements IList.Contains
```

#### Syntax: C#

```
public bool Contains(
    object value
);
```

#### Parameters

- `value`: The value of the [MySQLParameter](#) object to find.

#### Return Value

true if the collection contains the [MySQLParameter](#) object; otherwise, false.

#### Implements

[IList.Contains](#)

#### See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Contains Overload List](#)

#### 18.2.4.1.2.1.7.1.1.6.2. MySQLParameterCollection.Contains Method (String)

Gets a value indicating whether a [MySQLParameter](#) with the specified parameter name exists in the collection.

#### Syntax: Visual Basic

```
NotOverridable Overloads Public Function Contains( _
    ByVal name As String _
) As Boolean _
-
```

---

```
Implements IDataParameterCollection.Contains
```

**Syntax: C#**

```
public bool Contains(  
    stringname  
);
```

**Parameters**

- `name`: The name of the [MySQLParameter](#) object to find.

**Return Value**

true if the collection contains the parameter; otherwise, false.

**Implements**

[IDataParameterCollection.Contains](#)

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.Contains Overload List](#)

#### 18.2.4.1.2.1.7.1.1.7. MySQLParameterCollection.CopyTo Method

Copies MySQLParameter objects from the MySQLParameterCollection to the specified array.

**Syntax: Visual Basic**

```
NotOverridable Public Sub CopyTo( _  
    ByVal array As Array, _  
    ByVal index As Integer _  
) _  
- Implements ICollection.CopyTo
```

**Syntax: C#**

```
public void CopyTo(  
    Arrayarray,  
    intindex  
);
```

**Parameters**

- `array`:
- `index`:

**Implements**

[ICollection.CopyTo](#)

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.7.1.1.8. IndexOf Method

Gets the location of a [MySQLParameter](#) in the collection.

##### Overload List

Gets the location of a [MySQLParameter](#) in the collection.

- `public int IndexOf(object);`

Gets the location of the [MySQLParameter](#) in the collection with a specific parameter name.

- `public int IndexOf(string);`

##### See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.7.1.1.8.1. MySQLParameterCollection.IndexOf Method (Object)

Gets the location of a [MySQLParameter](#) in the collection.

##### Syntax: Visual Basic

```
NotOverridable Overloads Public Function IndexOf( _  
    ByVal value As Object _  
) As Integer _  
- Implements IList.IndexOf
```

##### Syntax: C#

```
public int IndexOf(  
    objectvalue  
);
```

##### Parameters

- `value`: The [MySQLParameter](#) object to locate.

##### Return Value

The zero-based location of the [MySQLParameter](#) in the collection.

##### Implements

`IList.IndexOf`

##### See Also

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.IndexOf Overload List](#)

#### 18.2.4.1.2.1.7.1.1.8.2. MySqlConnection.IndexOf Method (String)

Gets the location of the [MySqlParameter](#) in the collection with a specific parameter name.

##### Syntax: Visual Basic

```
NotOverridable Overloads Public Function IndexOf( _  
    ByVal parameterName As String _  
) As Integer _  
- Implements IDataParameterCollection.IndexOf
```

##### Syntax: C#

```
public int IndexOf(  
stringparameterName  
);
```

##### Parameters

- `parameterName`: The name of the [MySqlParameter](#) object to retrieve.

##### Return Value

The zero-based location of the [MySqlParameter](#) in the collection.

##### Implements

[IDataParameterCollection.IndexOf](#)

##### See Also

[MySqlParameterCollection Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlParameterCollection.IndexOf Overload List](#)

#### 18.2.4.1.2.1.7.1.1.9. MySqlConnection.Insert Method

Inserts a [MySqlParameter](#) into the collection at the specified index.

##### Syntax: Visual Basic

```
NotOverridable Public Sub Insert( _  
    ByVal index As Integer, _  
    ByVal value As Object _  
) _  
- Implements IList.Insert
```

##### Syntax: C#

```
public void Insert(  
intindex,  
objectvalue  
);
```

##### Parameters

- `index`:

- `value`:

**Implements**

`ICollection.Insert`

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.7.1.1.10. MySQLParameterCollection.Remove Method

Removes the specified `MySQLParameter` from the collection.

**Syntax: Visual Basic**

```
NotOverridable Public Sub Remove( _  
    ByVal value As Object _  
) _  
- Implements ICollection.Remove
```

**Syntax: C#**

```
public void Remove(  
    object value  
);
```

**Parameters**

- `value`:

**Implements**

`ICollection.Remove`

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.7.1.1.11. RemoveAt Method

Removes the specified `MySQLParameter` from the collection.

**Overload List**

Removes the specified `MySQLParameter` from the collection using a specific index.

- `public void RemoveAt(int);`

Removes the specified `MySQLParameter` from the collection using the parameter name.

- `public void RemoveAt(string);`

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.7.1.1.11.1. MySQLParameterCollection.RemoveAt Method (Int32)

Removes the specified [MySQLParameter](#) from the collection using a specific index.

**Syntax: Visual Basic**

```
NotOverridable Overloads Public Sub RemoveAt( _  
    ByVal index As Integer _  
) _  
- Implements IList.RemoveAt
```

**Syntax: C#**

```
public void RemoveAt(  
    int index  
);
```

**Parameters**

- **index**: The zero-based index of the parameter.

**Implements**

IList.RemoveAt

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.RemoveAt Overload List](#)

## 18.2.4.1.2.1.7.1.1.11.2. MySQLParameterCollection.RemoveAt Method (String)

Removes the specified [MySQLParameter](#) from the collection using the parameter name.

**Syntax: Visual Basic**

```
NotOverridable Overloads Public Sub RemoveAt( _  
    ByVal name As String _  
) _  
- Implements IDataParameterCollection.RemoveAt
```

**Syntax: C#**

```
public void RemoveAt(  
    string name  
);
```

**Parameters**

- **name**: The name of the [MySQLParameter](#) object to retrieve.

**Implements**

[IDataParameterCollection.RemoveAt](#)

**See Also**

[MySQLParameterCollection Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLParameterCollection.RemoveAt Overload List](#)

## 18.2.4.1.2.1.8. Transaction Property

**Syntax: Visual Basic**

```
Public Property Transaction As MySQLTransaction
```

**Syntax: C#**

```
public MySQLTransaction Transaction {get; set;}
```

**See Also**

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.9. UpdatedRowSource Property

**Syntax: Visual Basic**

```
NotOverridable Public Property UpdatedRowSource As UpdateRowSource _  
    Implements IDbCommand.UpdatedRowSource
```

**Syntax: C#**

```
public System.Data.UpdateRowSource UpdatedRowSource {get; set;}
```

**Implements**

[IDbCommand.UpdatedRowSource](#)

**See Also**

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.10. MySQLCommand.Cancel Method

Attempts to cancel the execution of a [MySQLCommand](#). This operation is not supported.

**Syntax: Visual Basic**

```
NotOverridable Public Sub Cancel() _  
    Implements IDbCommand.Cancel
```

**Syntax: C#**

```
public void Cancel();
```

**Implements**

IDbCommand.Cancel

### Remarks

Cancelling an executing command is currently not supported on any version of MySQL.

### Exceptions

Exception Type	Condition
NotSupportedException	This operation is not supported.

### See Also

[MySQLCommand Class](#) , [MySql.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.11. MySqlCommand.CreateParameter Method

Creates a new instance of a [MySqlParameter](#) object.

### Syntax: Visual Basic

```
Public Function CreateParameter() As MySqlParameter
```

### Syntax: C#

```
public MySqlParameter CreateParameter();
```

### Return Value

A [MySqlParameter](#) object.

### Remarks

This method is a strongly-typed version of CreateParameter.

### See Also

[MySQLCommand Class](#) , [MySql.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.12. MySqlCommand.ExecuteNonQuery Method

### Syntax: Visual Basic

```
NotOverridable Public Function ExecuteNonQuery() As Integer _
    Implements IDbCommand.ExecuteNonQuery
```

### Syntax: C#

```
public int ExecuteNonQuery();
```

### Implements

IDbCommand.ExecuteNonQuery

### See Also

[MySqlCommand Class](#) ,  [MySql.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.13. ExecuteReader Method

##### Overload List

- [public MySqlDataReader ExecuteReader\(\);](#)
- [public MySqlDataReader ExecuteReader\(CommandBehavior\);](#)

##### See Also

[MySqlCommand Class](#) ,  [MySql.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.13.1. MySqlCommand.ExecuteReader Method ()

##### Syntax: Visual Basic

```
Overloads Public Function ExecuteReader() As MySqlDataReader
```

##### Syntax: C#

```
public MySqlDataReader ExecuteReader();
```

##### See Also

[MySqlCommand Class](#) ,  [MySql.Data.MySqlClient Namespace](#) ,  [MySqlCommand.ExecuteReader Overload List](#)

#### 18.2.4.1.2.1.13.1.1. MySqlDataReader Class

Provides a means of reading a forward-only stream of rows from a MySQL database. This class cannot be inherited.

For a list of all members of this type, see  [MySqlDataReader Members](#) .

##### Syntax: Visual Basic

```
NotInheritable Public Class MySqlDataReader_  
    Inherits MarshalByRefObject_  
    Implements IEnumerable, IDataReader, IDisposable, IDataRecord
```

##### Syntax: C#

```
public sealed class MySqlDataReader : MarshalByRefObject, IEnumerable, IDataReader, IDisposable, IDataRecord
```

##### Thread Safety

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

##### Requirements

Namespace:  [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

**See Also**

[MySqlDataReader Members](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1. MySqlDataReader Members

[MySqlDataReader overview](#)

**Public Instance Properties**

<a href="#">Depth</a>	Gets a value indicating the depth of nesting for the current row. This method is not supported currently and always returns 0.
<a href="#">FieldCount</a>	Gets the number of columns in the current row.
<a href="#">HasRows</a>	Gets a value indicating whether the MySqlDataReader contains one or more rows.
<a href="#">IsClosed</a>	Gets a value indicating whether the data reader is closed.
<a href="#">Item</a>	Overloaded. Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySqlDataReader class.
<a href="#">RecordsAffected</a>	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

**Public Instance Methods**

<a href="#">Close</a>	Closes the MySqlDataReader object.
<a href="#">CreateObjRef</a> (inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
<a href="#">Equals</a> (inherited from Object)	Determines whether the specified Object is equal to the current Object.
<a href="#">GetBoolean</a>	Gets the value of the specified column as a Boolean.
<a href="#">GetByte</a>	Gets the value of the specified column as a byte.
<a href="#">GetBytes</a>	Reads a stream of bytes from the specified column offset into the buffer an array starting at the given buffer offset.
<a href="#">GetChar</a>	Gets the value of the specified column as a single character.
<a href="#">GetChars</a>	Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.
<a href="#">GetDataTypeName</a>	Gets the name of the source data type.
<a href="#">GetDateTime</a>	
<a href="#">GetDecimal</a>	
<a href="#">GetDouble</a>	
<a href="#">GetFieldType</a>	Gets the Type that is the data type of the object.
<a href="#">GetFloat</a>	

<a href="#">GetGuid</a>	
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
<a href="#">GetInt16</a>	
<a href="#">GetInt32</a>	
<a href="#">GetInt64</a>	
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
<a href="#">GetMySqlDateTime</a>	
<a href="#">GetName</a>	Gets the name of the specified column.
<a href="#">GetOrdinal</a>	Gets the column ordinal, given the name of the column.
<a href="#">GetSchemaTable</a>	Returns a DataTable that describes the column metadata of the MySqlDataReader.
<a href="#">GetString</a>	
<a href="#">GetTimeSpan</a>	
GetType(inherited from Object)	Gets the Type of the current instance.
<a href="#">GetUInt16</a>	
<a href="#">GetUInt32</a>	
<a href="#">GetUInt64</a>	
<a href="#">GetValue</a>	Gets the value of the specified column in its native format.
<a href="#">GetValues</a>	Gets all attribute columns in the collection for the current row.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
<a href="#">IsDBNull</a>	Gets a value indicating whether the column contains non-existent or missing values.
<a href="#">NextResult</a>	Advances the data reader to the next result, when reading the results of batch SQL statements.
<a href="#">Read</a>	Advances the MySqlDataReader to the next record.
ToString(inherited from Object)	Returns a String that represents the current Object.

**See Also**

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.1.1. Depth Property

Gets a value indicating the depth of nesting for the current row. This method is not supported currently and always returns 0.

**Syntax: Visual Basic**

```
NotOverridable Public ReadOnly Property Depth As Integer _
    Implements IDataReader.Depth
```

**Syntax: C#**

```
public int Depth {get;}
```

**Implements**

IDataReader.Depth

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.2. FieldCount Property

Gets the number of columns in the current row.

**Syntax: Visual Basic**

```
NotOverridable Public ReadOnly Property FieldCount As Integer _  
- Implements IDataRecord.FieldCount
```

**Syntax: C#**

```
public int FieldCount {get;}
```

**Implements**

IDataRecord.FieldCount

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.3. HasRows Property

Gets a value indicating whether the MySQLDataReader contains one or more rows.

**Syntax: Visual Basic**

```
Public ReadOnly Property HasRows As Boolean
```

**Syntax: C#**

```
public bool HasRows {get;}
```

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.4. IsClosed Property

Gets a value indicating whether the data reader is closed.

**Syntax: Visual Basic**

```
NotOverridable Public ReadOnly Property IsClosed As Boolean _  
- Implements IDataReader.IsClosed
```

**Syntax: C#**

```
public bool IsClosed {get;}
```

**Implements**

IDataReader.IsClosed

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.5. Item Property

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

**Overload List**

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

- [public object this\[int\] {get;}](#)

Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

- [public object this\[string\] {get;}](#)

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.5.1. Item Property (Int32)

Overloaded. Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

**Syntax: Visual Basic**

```
NotOverridable Overloads Public Default ReadOnly Property Item( _
    ByVal i As Integer _
) _
- Implements IDataRecord.Item As Object _
- Implements IDataRecord.Item
```

**Syntax: C#**

```
public object this[
    inti
] {get;}
```

**Implements**

IDataRecord.Item

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLDataReader.Item Overload List](#)

## 18.2.4.1.2.1.13.1.1.1.5.2. Item Property (String)

Gets the value of a column in its native format. In C#, this property is the indexer for the MySQLDataReader class.

**Syntax: Visual Basic**

```
NotOverridable Overloads Public Default ReadOnly Property Item( _  
    ByVal name As String _  
) _  
- Implements IDataRecord.Item As Object _  
- Implements IDataRecord.Item
```

**Syntax: C#**

```
public object this[  
    stringname  
] {get;}
```

**Implements**

IDataRecord.Item

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLDataReader.Item Overload List](#)

## 18.2.4.1.2.1.13.1.1.1.6. RecordsAffected Property

Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.

**Syntax: Visual Basic**

```
NotOverridable Public ReadOnly Property RecordsAffected As Integer _  
- Implements IDataReader.RecordsAffected
```

**Syntax: C#**

```
public int RecordsAffected {get;}
```

**Implements**

IDataReader.RecordsAffected

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.7. MySQLDataReader.Close Method

Closes the MySQLDataReader object.

**Syntax: Visual Basic**

```
NotOverridable Public Sub Close() _  
    Implements IDataReader.Close
```

**Syntax: C#**

```
public void Close();
```

**Implements**

IDataReader.Close

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.13.1.1.1.8. MySQLDataReader.GetBoolean Method

Gets the value of the specified column as a Boolean.

**Syntax: Visual Basic**

```
NotOverridable Public Function GetBoolean( _  
    ByVal i As Integer _  
) As Boolean _  
    Implements IDataRecord.GetBoolean
```

**Syntax: C#**

```
public bool GetBoolean(  
    inti  
);
```

**Parameters**

- `i`:

**Return Value****Implements**

IDataRecord.GetBoolean

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.13.1.1.1.9. MySQLDataReader.GetByte Method

Gets the value of the specified column as a byte.

**Syntax: Visual Basic**

```
NotOverridable Public Function GetByte( _  
    ByVal i As Integer _  
) As Byte _  
    Implements IDataRecord.GetByte
```

**Syntax: C#**

```
public byte GetByte(  
    inti  
);
```

**Parameters**

- `i`:

**Return Value****Implements**

IDataRecord.GetByte

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

**18.2.4.1.2.1.13.1.1.1.10. MySQLDataReader.GetBytes Method**

Reads a stream of bytes from the specified column offset into the buffer an array starting at the given buffer offset.

**Syntax: Visual Basic**

```
NotOverridable Public Function GetBytes( _  
    ByVal i As Integer, _  
    ByVal dataIndex As Long, _  
    ByVal buffer As Byte(), _  
    ByVal bufferIndex As Integer, _  
    ByVal length As Integer _  
    ) As Long _  
- Implements IDataRecord.GetBytes
```

**Syntax: C#**

```
public long GetBytes(  
    inti,  
    longdataIndex,  
    byte[]buffer,  
    intbufferIndex,  
    intlength  
);
```

**Parameters**

- `i`: The zero-based column ordinal.
- `dataIndex`: The index within the field from which to begin the read operation.
- `buffer`: The buffer into which to read the stream of bytes.
- `bufferIndex`: The index for buffer to begin the read operation.
- `length`: The maximum length to copy into the buffer.

**Return Value**

The actual number of bytes read.

**Implements**

IDataRecord.GetBytes

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.11. MySQLDataReader.GetChar Method

Gets the value of the specified column as a single character.

**Syntax: Visual Basic**

```
NotOverridable Public Function GetChar( _
    ByVal i As Integer _
) As Char _
    Implements IDataRecord.GetChar
```

**Syntax: C#**

```
public char GetChar(
    inti
);
```

**Parameters**

- *i*:

**Return Value****Implements**

IDataRecord.GetChar

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.12. MySQLDataReader.GetChars Method

Reads a stream of characters from the specified column offset into the buffer as an array starting at the given buffer offset.

**Syntax: Visual Basic**

```
NotOverridable Public Function GetChars( _
    ByVal i As Integer, _
    ByVal fieldOffset As Long, _
    ByVal buffer As Char(), _
    ByVal bufferoffset As Integer, _
    ByVal length As Integer _
) As Long _
    Implements IDataRecord.GetChars
```

**Syntax: C#**

```
public long GetChars(  
    inti,  
    longfieldOffset,  
    char[]buffer,  
    intbufferoffset,  
    intlength  
);
```

**Parameters**

- `i`:
- `fieldOffset`:
- `buffer`:
- `bufferoffset`:
- `length`:

**Return Value****Implements**

IDataRecord.GetChars

**See Also**

[MySQLDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

**18.2.4.1.2.1.13.1.1.13. MySQLDataReader.GetDataTypeName Method**

Gets the name of the source data type.

**Syntax: Visual Basic**

```
NotOverridable Public Function GetDataTypeName( _  
    ByVal i As Integer _  
) As String _  
— Implements IDataRecord.GetDataTypeName
```

**Syntax: C#**

```
public string GetDataTypeName(  
    inti  
);
```

**Parameters**

- `i`:

**Return Value****Implements**

IDataRecord.GetDataTypeName

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.13.1.1.1.14. MySQLDataReader.GetDateTime Method

**Syntax: Visual Basic**

```
NotOverridable Public Function GetDateTime( _  
    ByVal index As Integer _  
    ) As Date _  
    Implements IDataRecord.GetDateTime
```

**Syntax: C#**

```
public DateTime GetDateTime(  
    int index  
);
```

**Implements**

IDataRecord.GetDateTime

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.13.1.1.1.15. MySQLDataReader.GetDecimal Method

**Syntax: Visual Basic**

```
NotOverridable Public Function GetDecimal( _  
    ByVal index As Integer _  
    ) As Decimal _  
    Implements IDataRecord.GetDecimal
```

**Syntax: C#**

```
public decimal GetDecimal(  
    int index  
);
```

**Implements**

IDataRecord.GetDecimal

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.13.1.1.1.16. MySQLDataReader.GetDouble Method

**Syntax: Visual Basic**

```
NotOverridable Public Function GetDouble( _  
    ByVal index As Integer _  
    ) As Double _  
    Implements IDataRecord.GetDouble
```

**Syntax: C#**

```
public double GetDouble(  
int index  
);
```

**Implements**

IDataRecord.GetDouble

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

**18.2.4.1.2.1.13.1.1.17. MySQLDataReader.GetFieldType Method**

Gets the Type that is the data type of the object.

**Syntax: Visual Basic**

```
NotOverridable Public Function GetFieldType( _  
    ByVal i As Integer _  
    ) As Type _  
    Implements IDataRecord.GetFieldType
```

**Syntax: C#**

```
public Type GetFieldType(  
int i  
);
```

**Parameters**

- **i**:

**Return Value****Implements**

IDataRecord.GetFieldType

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

**18.2.4.1.2.1.13.1.1.18. MySQLDataReader.GetFloat Method****Syntax: Visual Basic**

```
NotOverridable Public Function GetFloat( _  
    ByVal index As Integer _  
    ) As Single _  
    Implements IDataRecord.GetFloat
```

**Syntax: C#**

```
public float GetFloat(  
int index
```

```
);
```

**Implements**

IDataRecord.GetFloat

**See Also**[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.19. MySQLDataReader.GetGuid Method

**Syntax: Visual Basic**

```
NotOverridable Public Function GetGuid( _  
    ByVal index As Integer _  
) As Guid _  
Implements IDataRecord.GetGuid
```

**Syntax: C#**

```
public Guid GetGuid(  
    int index  
);
```

**Implements**

IDataRecord.GetGuid

**See Also**[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.20. MySQLDataReader.GetInt16 Method

**Syntax: Visual Basic**

```
NotOverridable Public Function GetInt16( _  
    ByVal index As Integer _  
) As Short _  
Implements IDataRecord.GetInt16
```

**Syntax: C#**

```
public short GetInt16(  
    int index  
);
```

**Implements**

IDataRecord.GetInt16

**See Also**[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.21. MySQLDataReader.GetInt32 Method

**Syntax: Visual Basic**

```
NotOverridable Public Function GetInt32( _  
    ByVal index As Integer _  
) As Integer _  
- Implements IDataRecord.GetInt32
```

**Syntax: C#**

```
public int GetInt32(  
    int index  
);
```

**Implements**

IDataRecord.GetInt32

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.13.1.1.1.22. MySQLDataReader.GetInt64 Method

**Syntax: Visual Basic**

```
NotOverridable Public Function GetInt64( _  
    ByVal index As Integer _  
) As Long _  
- Implements IDataRecord.GetInt64
```

**Syntax: C#**

```
public long GetInt64(  
    int index  
);
```

**Implements**

IDataRecord.GetInt64

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.13.1.1.1.23. MySQLDataReader.GetMySqlDateTime Method

**Syntax: Visual Basic**

```
Public Function GetMySqlDateTime( _  
    ByVal index As Integer _  
) As MySqlDateTime
```

**Syntax: C#**

```
public MySqlDateTime GetMySqlDateTime(  
    int index  
);
```

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.13.1.1.24. MySqlDataReader.GetName Method

Gets the name of the specified column.

##### Syntax: Visual Basic

```
NotOverridable Public Function GetName( _  
    ByVal i As Integer _  
) As String _  
- Implements IDataRecord.GetName
```

##### Syntax: C#

```
public string GetName(  
    inti  
);
```

##### Parameters

- `i`:

##### Return Value

##### Implements

IDataRecord.GetName

##### See Also

[MySqlDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.13.1.1.25. MySqlDataReader.GetOrdinal Method

Gets the column ordinal, given the name of the column.

##### Syntax: Visual Basic

```
NotOverridable Public Function GetOrdinal( _  
    ByVal name As String _  
) As Integer _  
- Implements IDataRecord.GetOrdinal
```

##### Syntax: C#

```
public int GetOrdinal(  
    stringname  
);
```

##### Parameters

- `name`:

##### Return Value

##### Implements

IDataRecord.GetOrdinal

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

18.2.4.1.2.1.13.1.1.1.26. MySQLDataReader.GetSchemaTable Method

Returns a DataTable that describes the column metadata of the MySQLDataReader.

**Syntax: Visual Basic**

```
NotOverridable Public Function GetSchemaTable() As DataTable _  
    Implements IDataReader.GetSchemaTable
```

**Syntax: C#**

```
public DataTable GetSchemaTable();
```

**Return Value**

**Implements**

IDataReader.GetSchemaTable

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

18.2.4.1.2.1.13.1.1.1.27. MySQLDataReader.GetString Method

**Syntax: Visual Basic**

```
NotOverridable Public Function GetString( _  
    ByVal index As Integer _  
) As String _  
    Implements IDataRecord.GetString
```

**Syntax: C#**

```
public string GetString(  
    int index  
);
```

**Implements**

IDataRecord.GetString

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

18.2.4.1.2.1.13.1.1.1.28. MySQLDataReader.GetTimeSpan Method

**Syntax: Visual Basic**

```
Public Function GetTimeSpan( _  
    ByVal index As Integer _  
) As TimeSpan
```

**Syntax: C#**

```
public TimeSpan GetTimeSpan(  
    int index  
);
```

**See Also**

[MySQLDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.29. MySQLDataReader.GetUInt16 Method

**Syntax: Visual Basic**

```
Public Function GetUInt16( _  
    ByVal index As Integer _  
) As UInt16
```

**Syntax: C#**

```
public ushort GetUInt16(  
    int index  
);
```

**See Also**

[MySQLDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.30. MySQLDataReader.GetUInt32 Method

**Syntax: Visual Basic**

```
Public Function GetUInt32( _  
    ByVal index As Integer _  
) As UInt32
```

**Syntax: C#**

```
public uint GetUInt32(  
    int index  
);
```

**See Also**

[MySQLDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.31. MySQLDataReader.GetUInt64 Method

**Syntax: Visual Basic**

```
Public Function GetUInt64( _  
    ByVal index As Integer _  
) As UInt64
```

**Syntax: C#**

```
public ulong GetUInt64(  
    int index  
);
```

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.32. MySQLDataReader.GetValue Method

Gets the value of the specified column in its native format.

**Syntax: Visual Basic**

```
NotOverridable Public Function GetValue( _  
    ByVal i As Integer _  
) As Object _  
- Implements IDataRecord.GetValue
```

**Syntax: C#**

```
public object GetValue(  
    inti  
);
```

**Parameters**

- `i`:

**Return Value****Implements**

IDataRecord.GetValue

**See Also**

[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.33. MySQLDataReader.GetValues Method

Gets all attribute columns in the collection for the current row.

**Syntax: Visual Basic**

```
NotOverridable Public Function GetValues( _  
    ByVal values As Object() _  
) As Integer _  
- Implements IDataRecord.GetValues
```

**Syntax: C#**

```
public int GetValues(  
    object[] values  
);
```

**Parameters**

- `values`:

**Return Value****Implements**

IDataRecord.GetValues

**See Also**[MySQLDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.34. MySQLDataReader.IsDBNull Method

Gets a value indicating whether the column contains non-existent or missing values.

**Syntax: Visual Basic**

```
NotOverridable Public Function IsDBNull( _  
    ByVal i As Integer _  
) As Boolean _  
- Implements IDataRecord.IsDBNull
```

**Syntax: C#**

```
public bool IsDBNull(  
    inti  
);
```

**Parameters**

- *i*:

**Return Value****Implements**

IDataRecord.IsDBNull

**See Also**[MySQLDataReader Class](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.35. MySQLDataReader.NextResult Method

Advances the data reader to the next result, when reading the results of batch SQL statements.

**Syntax: Visual Basic**

```
NotOverridable Public Function NextResult() As Boolean _  
- Implements IDataReader.NextResult
```

**Syntax: C#**

```
public bool NextResult();
```

**Return Value**

**Implements**

IDataReader.NextResult

**See Also**[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.1.1.1.36. MySQLDataReader.Read Method

Advances the MySQLDataReader to the next record.

**Syntax: Visual Basic**

```
NotOverridable Public Function Read() As Boolean _  
    Implements IDataReader.Read
```

**Syntax: C#**

```
public bool Read();
```

**Return Value****Implements**

IDataReader.Read

**See Also**[MySQLDataReader Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.2.1.13.2. MySqlCommand.ExecuteReader Method (CommandBehavior)

**Syntax: Visual Basic**

```
Overloads Public Function ExecuteReader( _  
    ByVal behavior As CommandBehavior _  
) As MySQLDataReader
```

**Syntax: C#**

```
public MySQLDataReader ExecuteReader(  
    CommandBehaviorbehavior  
);
```

**See Also**[MySqlCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySqlCommand.ExecuteReader Overload List](#)

## 18.2.4.1.2.1.14. MySqlCommand.ExecuteScalar Method

**Syntax: Visual Basic**

```
NotOverridable Public Function ExecuteScalar() As Object _  
    Implements IDbCommand.ExecuteScalar
```

**Syntax: C#**

```
public object ExecuteScalar();
```

**Implements**

IDbCommand.ExecuteScalar

**See Also**

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.2.1.15. MySQLCommand.Prepare Method

**Syntax: Visual Basic**

```
NotOverridable Public Sub Prepare() _  
    Implements IDbCommand.Prepare
```

**Syntax: C#**

```
public void Prepare();
```

**Implements**

IDbCommand.Prepare

**See Also**

[MySQLCommand Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.3. MySQLCommandBuilder Class

For a list of all members of this type, see [MySQLCommandBuilder Members](#) .

**Syntax: Visual Basic**

```
NotInheritable Public Class MySQLCommandBuilder_  
    Inherits Component
```

**Syntax: C#**

```
public sealed class MySQLCommandBuilder : Component
```

**Thread Safety**

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

**Requirements**

Namespace: [MySQL.Data.MySqlClient](#)

Assembly: MySQL.Data (in MySQL.Data.dll)

**See Also**

[MySQLCommandBuilder Members](#) , [MySQL.Data.MySqlClient Namespace](#)

**18.2.4.1.3.1. MySqlCommandBuilder Members**[MySqlCommandBuilder overview](#)**Public Static (Shared) Methods**

<a href="#">DeriveParameters</a>	Overloaded. Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.
----------------------------------	--

**Public Instance Constructors**

<a href="#">MySqlCommandBuilder</a>	Overloaded. Initializes a new instance of the MySqlCommandBuilder class.
-------------------------------------	--

**Public Instance Properties**

Container(inherited from Component)	Gets the IContainerthat contains the Component.
<a href="#">DataAdapter</a>	
<a href="#">QuotePrefix</a>	
<a href="#">QuoteSuffix</a>	
Site(inherited from Component)	Gets or sets the ISiteof the Component.

**Public Instance Methods**

CreateObjRef(inherited from MarshalByRefObject)	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
Dispose(inherited from Component)	Releases all resources used by the Component.
Equals(inherited from Object)	Determines whether the specified Objectis equal to the current Object.
<a href="#">GetDeleteCommand</a>	
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCodeis suitable for use in hashing algorithms and data structures like a hash table.
<a href="#">GetInsertCommand</a>	
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Typeof the current instance.
<a href="#">GetUpdateCommand</a>	
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
<a href="#">RefreshSchema</a>	
ToString(inherited from Component)	Returns a Stringcontaining the name of the Component, if any. This method should not be overrid-

	den.
--	------

### Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Dispose- devent on the component.
------------------------------------	---

### See Also

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.3.1.1. DeriveParameters Method

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

### Overload List

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

- [public static void DeriveParameters\(MySqlCommand\);](#)
- [public static void DeriveParameters\(MySqlCommand,bool\);](#)

### See Also

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.3.1.1.1. MySqlCommandBuilder.DeriveParameters Method (MySqlCommand)

Retrieves parameter information from the stored procedure specified in the MySqlCommand and populates the Parameters collection of the specified MySqlCommand object. This method is not currently supported since stored procedures are not available in MySQL.

### Syntax: Visual Basic

```
Overloads Public Shared Sub DeriveParameters( _
    ByVal command As MySqlCommand _
)
```

### Syntax: C#

```
public static void DeriveParameters(
    MySqlCommandcommand
);
```

### Parameters

- [command](#): The MySqlCommand referencing the stored procedure from which the parameter information is to be derived. The derived parameters are added to the Parameters collection of the MySqlCommand.

**Exceptions**

Exception Type	Condition
InvalidOperationException	The command text is not a valid stored procedure name.

**See Also**

## 18.2.4.1.3.1.1.2. MySQLCommandBuilder.DeriveParameters Method (MySQLCommand, Boolean)

**Syntax: Visual Basic**

```
Overloads Public Shared Sub DeriveParameters( _
    ByVal command As MySQLCommand, _
    ByVal useProc As Boolean _
)
```

**Syntax: C#**

```
public static void DeriveParameters(
    MySQLCommand command,
    bool useProc
);
```

**See Also**

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLCommandBuilder.DeriveParameters Overload List](#)

## 18.2.4.1.3.1.2. MySQLCommandBuilder Constructor

Initializes a new instance of the [MySQLCommandBuilder](#) class.

**Overload List**

Initializes a new instance of the [MySQLCommandBuilder](#) class.

- [public MySQLCommandBuilder\(\);](#)
- [public MySQLCommandBuilder\(MySQLDataAdapter\);](#)
- [public MySQLCommandBuilder\(MySQLDataAdapter,bool\);](#)
- [public MySQLCommandBuilder\(bool\);](#)

#### 18.2.4.1.3.1.2.2.1. MySqlDataAdapter Class

For a list of all members of this type, see [MySqlDataAdapter Members](#) .

**Syntax: Visual Basic**

```
NotInheritable Public Class MySqlDataAdapter_  
    Inherits DbDataAdapter
```

**Syntax: C#**

```
public sealed class MySqlDataAdapter : DbDataAdapter
```

**Thread Safety**

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

**Requirements**

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

**See Also**

[MySqlDataAdapter Members](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.3.1.2.2.1.1. MySqlDataAdapter Members

[MySqlDataAdapter overview](#)**Public Instance Constructors**

<a href="#">MySqlDataAdapter</a>	Overloaded. Initializes a new instance of the <code>MySqlDataAdapter</code> class.
----------------------------------	--

**Public Instance Properties**

<code>AcceptChangesDuringFill</code> (inherited from <code>DataAdapter</code> )	Gets or sets a value indicating whether <code>AcceptChanges</code> is called on a <code>DataRow</code> after it is added to the <code>DataTable</code> during any of the Fill operations.
<code>AcceptChangesDuringUpdate</code> (inherited from <code>DataAdapter</code> )	Gets or sets whether <code>AcceptChanges</code> is called during a <code>Update</code> .
<code>Container</code> (inherited from <code>Component</code> )	Gets the <code>IContainer</code> that contains the <code>Component</code> .
<code>ContinueUpdateOnError</code> (inherited from <code>DataAdapter</code> )	Gets or sets a value that specifies whether to generate an exception when an error is encountered during a row update.
<a href="#">DeleteCommand</a>	Overloaded.
<code>FillLoadOption</code> (inherited from <code>DataAdapter</code> )	Gets or sets the <code>LoadOption</code> that determines how the adapter fills the <code>DataTable</code> from the <code>DbDataReader</code> .
<a href="#">InsertCommand</a>	Overloaded.
<code>MissingMappingAction</code> (inherited from <code>DataAdapter</code> )	Determines the action to take when incoming data does not have a matching table or column.
<code>MissingSchemaAction</code> (inherited from <code>DataAdapter</code> )	Determines the action to take when existing <code>DataSets</code> schema does not match incoming data.
<code>ReturnProviderSpecificTypes</code> (inherited from <code>DataAdapter</code> )	Gets or sets whether the <code>Fill</code> method should return provider-specific values or common CLS-compliant values.
<a href="#">SelectCommand</a>	Overloaded.
<code>Site</code> (inherited from <code>Component</code> )	Gets or sets the <code>ISite</code> of the <code>Component</code> .
<code>TableMappings</code> (inherited from <code>DataAdapter</code> )	Gets a collection that provides the master mapping between a source table and a <code>DataTable</code> .
<code>UpdateBatchSize</code> (inherited from <code>DbDataAdapter</code> )	Gets or sets a value that enables or disables batch processing support, and specifies the number of commands that can be executed in a batch.
<a href="#">UpdateCommand</a>	Overloaded.

**Public Instance Methods**

<code>CreateObjRef</code> (inherited from <code>MarshalByRefObject</code> )	Creates an object that contains all the relevant information required to generate a proxy used to communicate with a remote object.
<code>Dispose</code> (inherited from <code>Component</code> )	Releases all resources used by the <code>Component</code> .
<code>Equals</code> (inherited from <code>Object</code> )	Determines whether the specified <code>Object</code> is equal to the current <code>Object</code> .

Fill(inherited from DbDataAdapter)	Overloaded. Adds or refreshes rows in the DataSet to match those in the data source using the DataSetname, and creates a DataTable named "Table."
FillSchema(inherited from DbDataAdapter)	Overloaded. Configures the schema of the specified DataTable based on the specified SchemaType.
GetFillParameters(inherited from DbDataAdapter)	Gets the parameters set by the user when executing an SQL <code>SELECT</code> statement.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetLifetimeService(inherited from MarshalByRefObject)	Retrieves the current lifetime service object that controls the lifetime policy for this instance.
GetType(inherited from Object)	Gets the Type of the current instance.
InitializeLifetimeService(inherited from MarshalByRefObject)	Obtains a lifetime service object to control the lifetime policy for this instance.
ResetFillLoadOption(inherited from DataAdapter)	Resets FillLoadOption to its default state and causes Fill to honor AcceptChangesDuringFill.
ShouldSerializeAcceptChangesDuringFill(inherited from DataAdapter)	Determines whether the AcceptChangesDuringFill property should be persisted.
ShouldSerializeFillLoadOption(inherited from DataAdapter)	Determines whether the FillLoadOption property should be persisted.
ToString(inherited from Component)	Returns a String containing the name of the Component, if any. This method should not be overridden.
Update(inherited from DbDataAdapter)	Overloaded. Calls the respective INSERT, UPDATE, or DELETE statements for each inserted, updated, or deleted row in the specified DataSet.

### Public Instance Events

Disposed(inherited from Component)	Adds an event handler to listen to the Dispose event on the component.
FillError(inherited from DataAdapter)	Returned when an error occurs during a fill operation.
<a href="#">RowUpdated</a>	Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.
<a href="#">RowUpdating</a>	Occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

### Protected Internal Instance Properties

FillCommandBehavior(inherited from DbDataAdapter)	Gets or sets the behavior of the command used to fill the data adapter.

## 18.2.4.1.3.1.2.2.1.1.6. MySqlDataAdapter.RowUpdated Event

Occurs during Update after a command is executed against the data source. The attempt to update is made, so the event fires.

**Syntax: Visual Basic**

```
Public Event RowUpdated As MySqlRowUpdatedEventHandler
```

**Syntax: C#**

```
public event MySqlRowUpdatedEventHandler RowUpdated;
```

**Event Data**

The event handler receives an argument of type [MySqlRowUpdatedEventArgs](#) containing data related to

this event. The following `MySqlRowUpdatedEventArgs` properties provide information specific to this event.

Property	Description
<a href="#">Command</a>	Gets or sets the <code>MySqlCommand</code> executed when <code>Update</code> is called.
Errors	Gets any errors generated by the .NET Framework data provider when the <code>Command</code> was executed.
RecordsAffected	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.
Row	Gets the <code>DataRow</code> sent through an <code>Update</code> .
RowCount	Gets the number of rows processed in a batch of updated records.
StatementType	Gets the type of SQL statement executed.
Status	Gets the <code>UpdateStatus</code> of the <code>Command</code> property.
TableMapping	Gets the <code>DataTableMapping</code> sent through an <code>Update</code> .

#### See Also

[MySqlDataAdapter Class](#) , [MySql.Data.MySqlClient Namespace](#)

#### 18.2.4.1.3.1.2.2.1.1.6.1. MySqlRowUpdatedEventHandler Delegate

Represents the method that will handle the `RowUpdated` event of a [MySqlDataAdapter](#) .

#### Syntax: Visual Basic

```
Public Delegate Sub MySqlRowUpdatedEventHandler( _
    ByVal sender As Object, _
    ByVal e As MySqlRowUpdatedEventArgs _
)
```

#### Syntax: C#

```
public delegate void MySqlRowUpdatedEventHandler(
    object sender,
    MySqlRowUpdatedEventArgs
);
```

#### Requirements

Namespace: [MySql.Data.MySqlClient](#)

Assembly: `MySql.Data` (in `MySql.Data.dll`)

#### See Also

[MySql.Data.MySqlClient Namespace](#)

#### 18.2.4.1.3.1.2.2.1.1.6.1.1. MySqlRowUpdatedEventArgs Class

Provides data for the `RowUpdated` event. This class cannot be inherited.

For a list of all members of this type, see [MySqlRowUpdatedEventArgs Members](#) .

**Syntax: Visual Basic**

```
NotInheritable Public Class MySqlRowUpdatedEventArgs_
    Inherits RowUpdatedEventArgs
```

**Syntax: C#**

```
public sealed class MySqlRowUpdatedEventArgs : RowUpdatedEventArgs
```

**Thread Safety**

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

**Requirements**

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

## 18.2.4.1.3.1.2.2.1.1.6.1.1.1. MySqlRowUpdatedEventArgs Members

[MySqlRowUpdatedEventArgs overview](#)

**Public Instance Constructors**

<a href="#">MySqlRowUpdatedEventArgs Constructor</a>	Initializes a new instance of the MySqlRowUpdatedEventArgs class.
--	---

**Public Instance Properties**

<a href="#">Command</a>	Overloaded. Gets or sets the MySqlCommand executed when Update is called.
Errors(inherited from RowUpdatedEventArgs)	Gets any errors generated by the .NET Framework data provider when the Command was executed.
RecordsAffected(inherited from RowUpdatedEventArgs)	Gets the number of rows changed, inserted, or deleted by execution of the SQL statement.
Row(inherited from RowUpdatedEventArgs)	Gets the DataRow sent through an Update.
RowCount(inherited from RowUpdatedEventArgs)	Gets the number of rows processed in a batch of updated records.
StatementType(inherited from RowUpdatedEventArgs)	Gets the type of SQL statement executed.
Status(inherited from RowUpdatedEventArgs)	Gets the UpdateStatus of the Command property.
TableMapping(inherited from RowUpdatedEventArgs)	Gets the DataTableMapping sent through an Update.

**Public Instance Methods**

CopyToRows(inherited from RowUpdatedEventArgs)	Overloaded. Copies references to the modified
--	---

Args)	rows into the provided array.
Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

#### 18.2.4.1.3.1.2.2.1.1.6.1.1.1.1. MySQLRowUpdatedEventArgs Constructor

Initializes a new instance of the MySQLRowUpdatedEventArgs class.

**Syntax: Visual Basic**

```
Public Sub New( _
    ByVal row As DataRow, _
    ByVal command As IDbCommand, _
    ByVal statementType As StatementType, _
    ByVal tableMapping As DataTableMapping _
)
```

**Syntax: C#**

```
public MySQLRowUpdatedEventArgs(
    DataRow row,
    IDbCommand command,
    StatementType statementType,
    DataTableMapping tableMapping
);
```

**Parameters**

- **row**: The DataRow sent through an Update.
- **command**: The IDbCommand executed when Update is called.
- **statementType**: One of the StatementType values that specifies the type of query executed.
- **tableMapping**: The DataTableMapping sent through an Update.

**See Also**

[MySQLRowUpdatedEventArgs Class](#) , [MySQL.Data.MySqlCommand Namespace](#)

#### 18.2.4.1.3.1.2.2.1.1.6.1.1.1.2. Command Property

Gets or sets the MySqlCommand executed when Update is called.

**Syntax: Visual Basic**

```
Overloads Public ReadOnly Property Command As MySqlCommand
```

**Syntax: C#**

```
new public MySqlCommand Command {get;}
```

**See Also**

[MySqlRowUpdatedEventArgs Class](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.3.1.2.2.1.1.7. MySqlDataAdapter.RowUpdating Event

Occurs during Update before a command is executed against the data source. The attempt to update is made, so the event fires.

**Syntax: Visual Basic**

```
Public Event RowUpdating As MySqlRowUpdatingEventHandler
```

**Syntax: C#**

```
public event MySqlRowUpdatingEventHandler RowUpdating;
```

**Event Data**

The event handler receives an argument of type [MySqlRowUpdatingEventArgs](#) containing data related to this event. The following [MySqlRowUpdatingEventArgs](#) properties provide information specific to this event.

Property	Description
<a href="#">Command</a>	Gets or sets the MySqlCommand to execute when performing the Update.
Errors	Gets any errors generated by the .NET Framework data provider when the Command executes.
Row	Gets the DataRow that will be sent to the server as part of an insert, update, or delete operation.
StatementType	Gets the type of SQL statement to execute.
Status	Gets or sets the UpdateStatus of the Command-property.
TableMapping	Gets the DataTableMapping to send through the Update.

## 18.2.4.1.3.1.2.2.1.1.7.1. MySqlRowUpdatingEventHandler Delegate

Represents the method that will handle the RowUpdating event of a [MySqlDataAdapter](#) .

**Syntax: Visual Basic**

```
Public Delegate Sub MySqlRowUpdatingEventHandler( _
    ByVal sender As Object, _
    ByVal e As MySqlRowUpdatingEventArgs _
)
```

**Syntax: C#**

```
public delegate void MySqlRowUpdatingEventHandler(
    object sender,
    MySqlRowUpdatingEventArgs
);
```

**Requirements**

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

**See Also**

[MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.3.1.2.2.1.1.7.1.1. MySqlRowUpdatingEventArgs Class

Provides data for the RowUpdating event. This class cannot be inherited.

For a list of all members of this type, see [MySqlRowUpdatingEventArgs Members](#) .

**Syntax: Visual Basic**

```
NotInheritable Public Class MySqlRowUpdatingEventArgs_
    Inherits RowUpdatingEventArgs
```

**Syntax: C#**

```
public sealed class MySqlRowUpdatingEventArgs : RowUpdatingEventArgs
```

**Thread Safety**

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

**Requirements**

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

**See Also**

## 18.2.4.1.3.1.2.2.1.1.7.1.1.1. MySqlRowUpdatingEventArgs Members

[MySqlRowUpdatingEventArgs overview](#)

**Public Instance Constructors**

<a href="#">MySqlRowUpdatingEventArgs Constructor</a>	Initializes a new instance of the MySqlRowUpdatingEventArgs class.
---	--

**Public Instance Properties**

<a href="#">Command</a>	Overloaded. Gets or sets the MySqlCommand to execute when performing the Update.
Errors(inherited from RowUpdatingEventArgs)	Gets any errors generated by the .NET Framework data provider when the Command executes.
Row(inherited from RowUpdatingEventArgs)	Gets the DataRow that will be sent to the server as part of an insert, update, or delete operation.
StatementType(inherited from RowUpdatingEventArgs)	Gets the type of SQL statement to execute.
Status(inherited from RowUpdatingEventArgs)	Gets or sets the UpdateStatus of the Command property.
TableMapping(inherited from RowUpdatingEventArgs)	Gets the DataTableMapping to send through the Update.

### Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

#### 18.2.4.1.3.1.2.2.1.1.7.1.1.1.1. MySQLRowUpdatingEventArgs Constructor

Initializes a new instance of the MySQLRowUpdatingEventArgs class.

#### Syntax: Visual Basic

```
Public Sub New( _
    ByVal row As DataRow, _
    ByVal command As IDbCommand, _
    ByVal statementType As StatementType, _
    ByVal tableMapping As DataTableMapping _
)
```

#### Syntax: C#

```
public MySQLRowUpdatingEventArgs(
    DataRow row,
    IDbCommand command,
    StatementType statementType,
    DataTableMapping tableMapping
);
```

### Parameters

- row**: The DataRow to Update.
- command**: The IDbCommand to execute during Update.

- `statementType`: One of the `StatementType` values that specifies the type of query executed.
- `tableMapping`: The `DataTableMapping` sent through an `Update`.

## 18.2.4.1.3.1.3. DataAdapter Property

**Syntax: Visual Basic**

```
Public Property DataAdapter As MySqlDataAdapter
```

**Syntax: C#**

```
public MySqlDataAdapter DataAdapter {get; set;}
```

**See Also**

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.3.1.4. QuotePrefix Property

**Syntax: Visual Basic**

```
Public Property QuotePrefix As String
```

**Syntax: C#**

```
public string QuotePrefix {get; set;}
```

**See Also**

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.3.1.5. QuoteSuffix Property

**Syntax: Visual Basic**

```
Public Property QuoteSuffix As String
```

**Syntax: C#**

```
public string QuoteSuffix {get; set;}
```

**See Also**

[MySQLCommandBuilder Class](#) , [MySQL.Data.MySqlClient Namespace](#)

## 18.2.4.1.3.1.6. MySQLCommandBuilder.GetDeleteCommand Method

**Syntax: Visual Basic**

```
Public Function GetDeleteCommand() As MySqlCommand
```

**Syntax: C#**

```
public MySqlCommand GetDeleteCommand();
```

**See Also**

[MySqlCommandBuilder Class](#) ,  [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.3.1.7. MySqlCommandBuilder.GetInsertCommand Method

**Syntax: Visual Basic**

```
Public Function GetInsertCommand() As MySqlCommand
```

**Syntax: C#**

```
public MySqlCommand GetInsertCommand();
```

**See Also**

[MySqlCommandBuilder Class](#) ,  [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.3.1.8. MySqlCommandBuilder.GetUpdateCommand Method

**Syntax: Visual Basic**

```
Public Function GetUpdateCommand() As MySqlCommand
```

**Syntax: C#**

```
public MySqlCommand GetUpdateCommand();
```

**See Also**

[MySqlCommandBuilder Class](#) ,  [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.3.1.9. MySqlCommandBuilder.RefreshSchema Method

**Syntax: Visual Basic**

```
Public Sub RefreshSchema()
```

**Syntax: C#**

```
public void RefreshSchema();
```

**See Also**

[MySqlCommandBuilder Class](#) ,  [MySql.Data.MySqlClient Namespace](#)

**18.2.4.1.4. MySqlConnectionException Class**

The exception that is thrown when MySQL returns an error. This class cannot be inherited.

For a list of all members of this type, see  [MySqlConnectionException Members](#) .

**Syntax: Visual Basic**

```
NotInheritable Public Class MySqlConnectionException_  
    Inherits SystemException
```

**Syntax: C#**

```
public sealed class MySqlConnection : SystemException
```

**Thread Safety**

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

**Requirements**

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

**See Also**

[MySqlConnection Members](#) , [MySql.Data.MySqlClient Namespace](#)

**18.2.4.1.4.1. MySqlConnection Members**

[MySqlConnection overview](#)

**Public Instance Properties**

Data(inherited from Exception)	Gets a collection of key/value pairs that provide additional, user-defined information about the exception.
HelpLink(inherited from Exception)	Gets or sets a link to the help file associated with this exception.
InnerException(inherited from Exception)	Gets the Exception instance that caused the current exception.
Message(inherited from Exception)	Gets a message that describes the current exception.
<a href="#">Number</a>	Gets a number that identifies the type of error.
Source(inherited from Exception)	Gets or sets the name of the application or the object that causes the error.
StackTrace(inherited from Exception)	Gets a string representation of the frames on the call stack at the time the current exception was thrown.
TargetSite(inherited from Exception)	Gets the method that throws the current exception.

**Public Instance Methods**

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetBaseException(inherited from Exception)	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetObjectData(inherited from Exception)	When overridden in a derived class, sets the Serial-

	izationInfo with information about the exception.
GetType(inherited from Exception)	Gets the runtime type of the current instance.
ToString(inherited from Exception)	Creates and returns a string representation of the current exception.

**See Also**

[MySqlException Class](#) , [MySql.Data.MySqlClient Namespace](#)

**18.2.4.1.4.1.1. Number Property**

Gets a number that identifies the type of error.

**Syntax: Visual Basic**

```
Public ReadOnly Property Number As Integer
```

**Syntax: C#**

```
public int Number {get;}
```

**See Also**

[MySqlException Class](#) , [MySql.Data.MySqlClient Namespace](#)

**18.2.4.1.5. MySqlHelper Class**

Helper class that makes it easier to work with the provider.

For a list of all members of this type, see [MySqlHelper Members](#) .

**Syntax: Visual Basic**

```
NotInheritable Public Class MySqlHelper
```

**Syntax: C#**

```
public sealed class MySqlHelper
```

**Thread Safety**

Public static (Shared in Visual Basic) members of this type are safe for multithreaded operations. Instance members are not guaranteed to be thread-safe.

**Requirements**

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

**See Also**

[MySqlHelper Members](#) , [MySql.Data.MySqlClient Namespace](#)

**18.2.4.1.5.1. MySqlHelper Members**

[MySqlHelper overview](#)**Public Static (Shared) Methods**

<a href="#">ExecuteDataRow</a>	Executes a single SQL command and returns the first row of the resultset. A new MySqlConnection object is created, opened, and closed during this method.
<a href="#">ExecuteDataset</a>	Overloaded. Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.
<a href="#">ExecuteNonQuery</a>	Overloaded. Executes a single command against a MySQL database. The <a href="#">MySqlConnection</a> is assumed to be open when the method is called and remains open after the method completes.
<a href="#">ExecuteReader</a>	Overloaded. Executes a single command against a MySQL database.
<a href="#">ExecuteScalar</a>	Overloaded. Execute a single command against a MySQL database.
<a href="#">UpdateDataSet</a>	Updates the given table with data from the given DataSet

**Public Instance Methods**

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetType(inherited from Object)	Gets the Type of the current instance.
ToString(inherited from Object)	Returns a String that represents the current Object.

**See Also**[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)18.2.4.1.5.1.1. [MySqlHelper.ExecuteDataRow Method](#)

Executes a single SQL command and returns the first row of the resultset. A new MySqlConnection object is created, opened, and closed during this method.

**Syntax: Visual Basic**

```
Public Shared Function ExecuteDataRow( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray parms As MySqlParameter() _
) As DataRow
```

**Syntax: C#**

```
public static DataRow ExecuteDataRow(
    string connectionString,
```

```
stringcommandText,  
    params MySqlParameter[]parms  
);
```

### Parameters

- `connectionString`: Settings to be used for the connection
- `commandText`: Command to execute
- `parms`: Parameters to use for the command

### Return Value

DataRow containing the first row of the resultset

### See Also

#### 18.2.4.1.5.1.2. ExecuteDataset Method

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

#### Overload List

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

- `public static DataSet ExecuteDataset(MySqlConnection,string);`

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

- `public static DataSet ExecuteDataset(MySqlConnection,string,params MySqlParameter[]);`

Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

- `public static DataSet ExecuteDataset(string,string);`

Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

- `public static DataSet ExecuteDataset(string,string,params MySqlParameter[]);`

#### 18.2.4.1.5.1.2.1. MySqlConnection.ExecuteDataset Method (MySqlConnection, String)

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

##### Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _  
    ByVal connection As MySqlConnection, _  
    ByVal commandText As String _  
) As DataSet
```

##### Syntax: C#

```
public static DataSet ExecuteDataset(  
    MySqlConnection connection,  
    string commandText  
);
```

##### Parameters

- `connection`: [MySqlConnection](#) object to use
- `commandText`: Command to execute

##### Return Value

DataSet containing the resultset

##### See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteDataset Overload List](#)

#### 18.2.4.1.5.1.2.2. MySqlConnection.ExecuteDataset Method (MySqlConnection, String, MySqlParameter[])

Executes a single SQL command and returns the resultset in a DataSet. The state of the [MySqlConnection](#) object remains unchanged after execution of this method.

##### Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteDataset( _  
    ByVal connection As MySqlConnection, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As DataSet
```

##### Syntax: C#

```
public static DataSet ExecuteDataset(  
    MySqlConnection connection,  
    string commandText,  
    params MySqlParameter[] commandParameters  
);
```

##### Parameters

- `connection`: [MySqlConnection](#) object to use

- `commandText`: Command to execute
- `commandParameters`: Parameters to use for the command

**Return Value**

DataSet containing the resultset

**See Also**

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteDataset Overload List](#)

#### 18.2.4.1.5.1.2.3. MySQLHelper.ExecuteDataset Method (String, String)

Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

**Syntax: Visual Basic**

```
Overloads Public Shared Function ExecuteDataset( _  
    ByVal connectionString As String, _  
    ByVal commandText As String _  
) As DataSet
```

**Syntax: C#**

```
public static DataSet ExecuteDataset(  
    string connectionString,  
    string commandText  
);
```

**Parameters**

- `connectionString`: Settings to be used for the connection
- `commandText`: Command to execute

**Return Value**

DataSet containing the resultset

**See Also**

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteDataset Overload List](#)

#### 18.2.4.1.5.1.2.4. MySQLHelper.ExecuteDataset Method (String, String, MySqlParameter[])

Executes a single SQL command and returns the resultset in a DataSet. A new MySqlConnection object is created, opened, and closed during this method.

**Syntax: Visual Basic**

```
Overloads Public Shared Function ExecuteDataset( _  
    ByVal connectionString As String, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As DataSet
```

**Syntax: C#**

```
public static DataSet ExecuteDataset(
    string connectionString,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

**Parameters**

- `connectionString`: Settings to be used for the connection
- `commandText`: Command to execute
- `commandParameters`: Parameters to use for the command

**Return Value**

DataSet containing the resultset

**See Also**

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteDataset Overload List](#)

## 18.2.4.1.5.1.3. ExecuteNonQuery Method

Executes a single command against a MySQL database. The [MySqlConnection](#) is assumed to be open when the method is called and remains open after the method completes.

**Overload List**

Executes a single command against a MySQL database. The [MySqlConnection](#) is assumed to be open when the method is called and remains open after the method completes.

- `public static int ExecuteNonQuery(MySqlConnection, string, params MySqlParameter[]);`

Executes a single command against a MySQL database. A new [MySqlConnection](#) is created using the [ConnectionString](#) given.

- `public static int ExecuteNonQuery(string, string, params MySqlParameter[]);`

**See Also**

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

## 18.2.4.1.5.1.3.1. MySqlHelper.ExecuteNonQuery Method (MySqlConnection, String, MySqlParameter[])

Executes a single command against a MySQL database. The [MySqlConnection](#) is assumed to be open when the method is called and remains open after the method completes.

**Syntax: Visual Basic**

```
Overloads Public Shared Function ExecuteNonQuery( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String, _
```

```
ParamArray commandParameters As MySqlParameter() _
) As Integer
```

**Syntax: C#**

```
public static int ExecuteNonQuery(
    MySqlConnection connection,
    string commandText,
    params MySqlParameter[] commandParameters
);
```

**Parameters**

- **connection**: [MySqlConnection](#) object to use
- **commandText**: SQL command to be executed
- **commandParameters**: Array of [MySqlParameter](#) objects to use with the command.

**Return Value****See Also**

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteNonQuery Overload List](#)

#### 18.2.4.1.5.1.3.2. MySqlHelper.ExecuteNonQuery Method (String, String, MySqlParameter[])

Executes a single command against a MySQL database. A new [MySqlConnection](#) is created using the [ConnectionString](#) given.

**Syntax: Visual Basic**

```
Overloads Public Shared Function ExecuteNonQuery( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray parms As MySqlParameter() _
) As Integer
```

**Syntax: C#**

```
public static int ExecuteNonQuery(
    string connectionString,
    string commandText,
    params MySqlParameter[] parms
);
```

**Parameters**

- **connectionString**: [ConnectionString](#) to use
- **commandText**: SQL command to be executed
- **parms**: Array of [MySqlParameter](#) objects to use with the command.

**Return Value****See Also**

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteNonQuery Overload List](#)

#### 18.2.4.1.5.1.4. ExecuteReader Method

Executes a single command against a MySQL database.

##### Overload List

Executes a single command against a MySQL database.

- `public static MySqlDataReader ExecuteReader(string,string);`

Executes a single command against a MySQL database.

- `public static MySqlDataReader ExecuteReader(string,string,params MySqlParameter[]);`

##### See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#)

#### 18.2.4.1.5.1.4.1. MySQLHelper.ExecuteReader Method (String, String)

Executes a single command against a MySQL database.

##### Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteReader( _  
    ByVal connectionString As String, _  
    ByVal commandText As String _  
) As MySqlDataReader
```

##### Syntax: C#

```
public static MySqlDataReader ExecuteReader(  
    stringconnectionString,  
    stringcommandText  
);
```

##### Parameters

- `connectionString`: Settings to use for this command
- `commandText`: Command text to use

##### Return Value

[MySqlDataReader](#) object ready to read the results of the command

##### See Also

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteReader Overload List](#)

#### 18.2.4.1.5.1.4.2. MySQLHelper.ExecuteReader Method (String, String, MySqlParameter[])

Executes a single command against a MySQL database.

**Syntax: Visual Basic**

```
Overloads Public Shared Function ExecuteReader( _  
    ByVal connectionString As String, _  
    ByVal commandText As String, _  
    ParamArray commandParameters As MySqlParameter() _  
) As MySqlDataReader
```

**Syntax: C#**

```
public static MySqlDataReader ExecuteReader(  
    string connectionString,  
    string commandText,  
    params MySqlParameter[] commandParameters  
);
```

**Parameters**

- `connectionString`: Settings to use for this command
- `commandText`: Command text to use
- `commandParameters`: Array of [MySqlParameter](#) objects to use with the command

**Return Value**

[MySqlDataReader](#) object ready to read the results of the command

**See Also**

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteReader Overload List](#)

#### 18.2.4.1.5.1.5. ExecuteScalar Method

Execute a single command against a MySQL database.

**Overload List**

Execute a single command against a MySQL database.

- [public static object ExecuteScalar\(MySqlConnection,string\);](#)

Execute a single command against a MySQL database.

- [public static object ExecuteScalar\(MySqlConnection,string,params MySqlParameter\[\]\);](#)

Execute a single command against a MySQL database.

- [public static object ExecuteScalar\(string,string\);](#)

Execute a single command against a MySQL database.

- [public static object ExecuteScalar\(string,string,params MySqlParameter\[\]\);](#)

#### See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

#### 18.2.4.1.5.1.5.1. MySqlHelper.ExecuteScalar Method (MySqlConnection, String)

Execute a single command against a MySQL database.

#### Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String _
) As Object
```

#### Syntax: C#

```
public static object ExecuteScalar(
    MySqlConnectionconnection,
    stringcommandText
);
```

#### Parameters

- **connection**: [MySqlConnection](#) object to use
- **commandText**: Command text to use for the command

#### Return Value

The first column of the first row in the result set, or a null reference if the result set is empty.

#### See Also

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteScalar Overload List](#)

#### 18.2.4.1.5.1.5.2. MySqlHelper.ExecuteScalar Method (MySqlConnection, String, MySqlParameter[])

Execute a single command against a MySQL database.

#### Syntax: Visual Basic

```
Overloads Public Shared Function ExecuteScalar( _
    ByVal connection As MySqlConnection, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySqlParameter() _
) As Object
```

#### Syntax: C#

```
public static object ExecuteScalar(
    MySqlConnectionconnection,
    stringcommandText,
    params MySqlParameter[]commandParameters
);
```

**Parameters**

- `connection`: [MySQLConnection](#) object to use
- `commandText`: Command text to use for the command
- `commandParameters`: Parameters to use for the command

**Return Value**

The first column of the first row in the result set, or a null reference if the result set is empty.

**See Also**

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteScalar Overload List](#)

## 18.2.4.1.5.1.5.3. MySQLHelper.ExecuteScalar Method (String, String)

Execute a single command against a MySQL database.

**Syntax: Visual Basic**

```
Overloads Public Shared Function ExecuteScalar( _
    ByVal connectionString As String, _
    ByVal commandText As String _
) As Object
```

**Syntax: C#**

```
public static object ExecuteScalar(
    string connectionString,
    string commandText
);
```

**Parameters**

- `connectionString`: Settings to use for the update
- `commandText`: Command text to use for the update

**Return Value**

The first column of the first row in the result set, or a null reference if the result set is empty.

**See Also**

[MySQLHelper Class](#) , [MySQL.Data.MySqlClient Namespace](#) , [MySQLHelper.ExecuteScalar Overload List](#)

## 18.2.4.1.5.1.5.4. MySQLHelper.ExecuteScalar Method (String, String, MySQLParameter[])

Execute a single command against a MySQL database.

**Syntax: Visual Basic**

```
Overloads Public Shared Function ExecuteScalar( _
    ByVal connectionString As String, _
    ByVal commandText As String, _
    ParamArray commandParameters As MySQLParameter() _
```

```
) As Object
```

**Syntax: C#**

```
public static object ExecuteScalar(  
    string connectionString,  
    string commandText,  
    params MySqlParameter[] commandParameters  
);
```

**Parameters**

- `connectionString`: Settings to use for the command
- `commandText`: Command text to use for the command
- `commandParameters`: Parameters to use for the command

**Return Value**

The first column of the first row in the result set, or a null reference if the result set is empty.

**See Also**

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#) , [MySqlHelper.ExecuteScalar Overload List](#)

#### 18.2.4.1.5.1.6. MySqlHelper.UpdateDataSet Method

Updates the given table with data from the given DataSet

**Syntax: Visual Basic**

```
Public Shared Sub UpdateDataSet( _  
    ByVal connectionString As String, _  
    ByVal commandText As String, _  
    ByVal ds As DataSet, _  
    ByVal tablename As String _  
)
```

**Syntax: C#**

```
public static void UpdateDataSet(  
    string connectionString,  
    string commandText,  
    DataSet ds,  
    string tablename  
);
```

**Parameters**

- `connectionString`: Settings to use for the update
- `commandText`: Command text to use for the update
- `ds`: DataSet containing the new data to use in the update
- `tablename`: Tablename in the dataset to update

**See Also**

[MySqlHelper Class](#) , [MySql.Data.MySqlClient Namespace](#)

**18.2.4.1.6. MySqlConnection ErrorCode Enumeration****Syntax: Visual Basic**

```
Public Enum MySqlConnectionErrorCode
```

**Syntax: C#**

```
public enum MySqlConnectionErrorCode
```

**Members**

Member Name	Description
PacketTooLarge	
PasswordNotAllowed	
DuplicateKeyEntry	
HostNotPrivileged	
PasswordNoMatch	
AnonymousUser	
DuplicateKey	
KeyNotFound	
DuplicateKeyName	

**Requirements**

Namespace: [MySql.Data.MySqlClient](#)

Assembly: MySql.Data (in MySql.Data.dll)

**See Also**

**Public Instance Constructors**

<a href="#">MySQLConversionException Constructor</a>	Ctor
--	------

**Public Instance Properties**

Data(inherited from Exception)	Gets a collection of key/value pairs that provide additional, user-defined information about the exception.
HelpLink(inherited from Exception)	Gets or sets a link to the help file associated with this exception.
InnerException(inherited from Exception)	Gets the Exception instance that caused the current exception.
Message(inherited from Exception)	Gets a message that describes the current exception.
Source(inherited from Exception)	Gets or sets the name of the application or the object that causes the error.

StackTrace(inherited from Exception)	Gets a string representation of the frames on the call stack at the time the current exception was thrown.
TargetSite(inherited from Exception)	Gets the method that throws the current exception.

### Public Instance Methods

Equals(inherited from Object)	Determines whether the specified Object is equal to the current Object.
GetBaseException(inherited from Exception)	When overridden in a derived class, returns the Exception that is the root cause of one or more subsequent exceptions.
GetHashCode(inherited from Object)	Serves as a hash function for a particular type. GetHashCode is suitable for use in hashing algorithms and data structures like a hash table.
GetObjectData(inherited from Exception)	When overridden in a derived class, sets the SerializationInfo with information about the exception.
GetType(inherited from Exception)	Gets the runtime type of the current instance.
ToString(inherited from Exception)	Creates and returns a string representation of the current exception.

### Protected Instance Properties

HResult(inherited from Exception)	Gets or sets HRESULT, a coded numerical value that is assigned to a specific exception.
-----------------------------------	---

### Protected Instance Methods

Finalize(inherited from Object)	Allows an Object to attempt to free resources and perform other cleanup operations before the Object is reclaimed by garbage collection.
MemberwiseClone(inherited from Object)	Creates a shallow copy of the current Object.

[MySqlValue Class](#) , [MySql.Data.Types Namespace](#)

18.2.4.2.3.1.4.1.1.3. [ValueAsObject](#) Property

Returns the value of this field as an object

**Syntax: Visual Basic**

```
Public ReadOnly Property ValueAsObject As Object
```

**Syntax: C#**

```
public object ValueAsObject {get;}
```

**See Also**

[MySQLValue Class](#) , [MySQL.Data.Types Namespace](#)

## 18.2.4.2.3.1.4.1.1.4. MySQLValue.ToString Method

Returns a string representation of this value

**Syntax: Visual Basic**

```
Overrides Public Function ToString() As String
```

**Syntax: C#**

```
public override string ToString();
```

**See Also**

[MySQLValue Class](#) , [MySQL.Data.Types Namespace](#)

## 18.2.4.2.3.1.4.1.1.5. MySQLValue.classType Field

The system type represented by this value

**Syntax: Visual Basic**

```
Protected classType As Type
```

**Syntax: C#**

```
protected Type classType;
```

**See Also**

[MySQLValue Class](#) , [MySQL.Data.Types Namespace](#)

## 18.2.4.2.3.1.4.1.1.6. MySQLValue.dbType Field

The generic dbtype of this value

**Syntax: Visual Basic**

```
Protected dbType As DbType
```

**Syntax: C#**

```
protected DbType dbType;
```

**See Also**

[MySqlValue Class](#) , [MySql.Data.Types Namespace](#)

## 18.2.4.2.3.1.4.1.1.7. MySqlValue.mySqlDbType Field

The specific MySQL db type

**Syntax: Visual Basic**

```
Protected MySqlDbType As MySqlDbType
```

**Syntax: C#**

```
protected MySqlDbType mySqlDbType;
```

**See Also**

[MySqlValue Class](#) , [MySql.Data.Types Namespace](#)

## 18.2.4.2.3.1.4.1.1.8. MySqlValue.mySqlTypeName Field

The MySQL specific typename of this value

**Syntax: Visual Basic**

```
Protected MySqlTypeName As String
```

**Syntax: C#**

```
protected string mySqlTypeName;
```

**See Also**

[MySqlValue Class](#) , [MySql.Data.Types Namespace](#)

## 18.2.4.2.3.1.4.1.1.9. MySqlValue.objectValue Field

**Syntax: Visual Basic**

```
Protected objectValue As Object
```

**Syntax: C#**

```
protected object objectValue;
```

**See Also**

[MySqlValue Class](#) , [MySql.Data.Types Namespace](#)

## 18.2.4.2.3.1.5. IsValidDateTime Property

Indicates if this object contains a value that can be represented as a DateTime

**Syntax: Visual Basic**

```
Public ReadOnly Property IsValidDateTime As Boolean
```

**Syntax: C#**

```
public bool IsValidDateTime {get;}
```

**See Also**

[MySqlDateTime Class](#) , [MySql.Data.Types Namespace](#)

## 18.2.4.2.3.1.6. Minute Property

Returns the minute portion of this datetime

**Syntax: Visual Basic**

```
Public Property Minute As Integer
```

**Syntax: C#**

```
public int Minute {get; set;}
```

**See Also**

[MySqlDateTime Class](#) , [MySql.Data.Types Namespace](#)

## 18.2.4.2.3.1.7. Month Property

Returns the month portion of this datetime

**Syntax: Visual Basic**

```
Public Property Month As Integer
```

**Syntax: C#**

```
public int Month {get; set;}
```

**See Also**

[MySqlDateTime Class](#) , [MySql.Data.Types Namespace](#)

## 18.2.4.2.3.1.8. Second Property

Returns the second portion of this datetime

**Syntax: Visual Basic**

```
Public Property Second As Integer
```

**Syntax: C#**

```
public int Second {get; set;}
```

**See Also**

[MySqlDateTime Class](#) , [MySql.Data.Types Namespace](#)

## 18.2.4.2.3.1.9. Year Property

Returns the year portion of this datetime

**Syntax: Visual Basic**

```
Public Property Year As Integer
```

**Syntax: C#**

```
public int Year {get; set;}
```

**See Also**

[MySQLDateTime Class](#) , [MySQL.Data.Types Namespace](#)

#### 18.2.4.2.3.1.10. MySQLDateTime.GetDateTime Method

Returns this value as a DateTime

**Syntax: Visual Basic**

```
Public Function GetDateTime() As Date
```

**Syntax: C#**

```
public DateTime GetDateTime();
```

**See Also**

[MySQLDateTime Class](#) , [MySQL.Data.Types Namespace](#)

#### 18.2.4.2.3.1.11. MySQLDateTime.ToString Method

Returns a MySQL specific string representation of this value

**Syntax: Visual Basic**

```
Overrides Public Function ToString() As String
```

**Syntax: C#**

```
public override string ToString();
```

**See Also**

[MySQLDateTime Class](#) , [MySQL.Data.Types Namespace](#)

## 18.2.5. Connector/NET Notes and Tips

In this section we will cover some of the more common use cases for Connector/NET, including BLOB handling, date handling, and using Connector/NET with common tools such as Crystal Reports.

### 18.2.5.1. Connecting to MySQL Using Connector/NET

#### 18.2.5.1.1. Introduction

All interaction between a .NET application and the MySQL server is routed through a [MySQLConnec-](#)

---

tion object. Before your application can interact with the server, a `MySQLConnection` object must be instantiated, configured, and opened.

Even when using the `MySQLHelper` class, a `MySQLConnection` object is created by the helper class.

In this section, we will describe how to connect to MySQL using the `MySQLConnection` object.

### 18.2.5.1.2. Creating a Connection String

The `MySQLConnection` object is configured using a connection string. A connection string contains sever key/value pairs, separated by semicolons. Each key/value pair is joined with an equals sign.

The following is a sample connection string:

```
Server=127.0.0.1;Uid=root;Pwd=12345;Database=test;
```

In this example, the `MySQLConnection` object is configured to connect to a MySQL server at `127.0.0.1`, with a username of `root` and a password of `12345`. The default database for all statements will be the `test` database.

The following options are typically used (a full list of options is available in the API documentation for [Section 18.2.3.3.15, "ConnectionString"](#)):

- **Server:** The name or network address of the instance of MySQL to which to connect. The default is `localhost`. Aliases include `host`, `Data Source`, `DataSource`, `Address`, `Addr` and `Network Address`.
- **Uid:** The MySQL user account to use when connecting. Aliases include `User Id`, `Username` and `User name`.
- **Pwd:** The password for the MySQL account being used. Alias `Password` can also be used.
- **Database:** The default database that all statements are applied to. Default is `mysql`. Alias `Initial Catalog` can also be used.
- **Port:** The port MySQL is using to listen for connections. Default is `3306`. Specify `-1` for this value to use a named-pipe connection.

### 18.2.5.1.3. Opening a Connection

Once you have created a connection string it can be used to open a connection to the MySQL server.

The following code is used to create a `MySQLConnection` object, assign the connection string, and open the connection.

Visual Basic Example

```
Dim conn As New MySql.Data.MySqlClient.MySqlConnection
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    conn.ConnectionString = myConnectionString
    conn.Open()
```

```
Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

### C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection();
    conn.ConnectionString = myConnectionString;
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

You can also pass the connection string to the constructor of the [MySqlConnection](#) class:

### Visual Basic Example

```
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    MessageBox.Show(ex.Message)
End Try
```

### C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message);
}
```

Once the connection is open it can be used by the other Connector/.NET classes to communicate with the MySQL server.

#### 18.2.5.1.4. Handling Connection Errors

Because connecting to an external server is unpredictable, it is important to add error handling to your .NET application. When there is an error connecting, the [MySqlConnection](#) class will return a [MySqlException](#) object. This object has two properties that are of interest when handling errors:

- **Message:** A message that describes the current exception.
- **Number:** The MySQL error number.

When handling errors, you can your application's response based on the error number. The two most common error numbers when connecting are as follows:

- **0:** Cannot connect to server.
- **1045:** Invalid username and/or password.

The following code shows how to adapt the application's response based on the actual error:

#### Visual Basic Example

```
Dim myConnectionString as String

myConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test;"

Try
    Dim conn As New MySql.Data.MySqlClient.MySqlConnection(myConnectionString)
    conn.Open()
Catch ex As MySql.Data.MySqlClient.MySqlException
    Select Case ex.Number
        Case 0
            MessageBox.Show("Cannot connect to server. Contact administrator")
        Case 1045
            MessageBox.Show("Invalid username/password, please try again")
    End Select
End Try
```

#### C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
string myConnectionString;

myConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn = new MySql.Data.MySqlClient.MySqlConnection(myConnectionString);
    conn.Open();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    switch (ex.Number)
    {
        case 0:
            MessageBox.Show("Cannot connect to server. Contact administrator");
        case 1045:
            MessageBox.Show("Invalid username/password, please try again");
    }
}
```

**Important:** Note that if you are using multilanguage databases you must specify the character set in the connection string. If you do not specify the character set, the connection defaults to the `latin1` charset. You can specify the character set as part of the connection string, for example:

```
MySqlConnection myConnection = new MySqlConnection("server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;Charset=latin1;");
```

## 18.2.5.2. Using the Connector/NET with Prepared Statements

### 18.2.5.2.1. Introduction

As of MySQL 4.1, it is possible to use prepared statements with Connector/NET. Use of prepared statements can provide significant performance improvements on queries that are executed more than once.

Prepared execution is faster than direct execution for statements executed more than once, primarily because the query is parsed only once. In the case of direct execution, the query is parsed every time it is executed. Prepared execution also can provide a reduction of network traffic because for each execution of the prepared statement, it is necessary only to send the data for the parameters.

Another advantage of prepared statements is that it uses a binary protocol that makes data transfer between client and server more efficient.

### 18.2.5.2.2. Preparing Statements in Connector/NET

To prepare a statement, create a command object and set the `.CommandText` property to your query.

After entering your statement, call the `.Prepare` method of the `MySQLCommand` object. After the statement is prepared, add parameters for each of the dynamic elements in the query.

After you enter your query and enter parameters, execute the statement using the `.ExecuteNonQuery()`, `.ExecuteScalar()`, or `.ExecuteReader` methods.

For subsequent executions, you need only modify the values of the parameters and call the execute method again, there is no need to set the `.CommandText` property or redefine the parameters.

#### Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = strConnection

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, ?number, ?text)"
    cmd.Prepare()

    cmd.Parameters.Add("?number", 1)
    cmd.Parameters.Add("?text", "One")

    For i = 1 To 1000
        cmd.Parameters["?number"].Value = i
        cmd.Parameters["?text"].Value = "A string value"

        cmd.ExecuteNonQuery()
    Next
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK)
End Try
```

#### C# Example

```
MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = strConnection;

try
```

```
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "INSERT INTO myTable VALUES(NULL, ?number, ?text)";
    cmd.Prepare();

    cmd.Parameters.Add("?number", 1);
    cmd.Parameters.Add("?text", "One");

    for (int i=1; i <= 1000; i++)
    {
        cmd.Parameters["?number"].Value = i;
        cmd.Parameters["?text"].Value = "A string value";

        cmd.ExecuteNonQuery();
    }
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

### 18.2.5.3. Accessing Stored Procedures with Connector/NET

#### 18.2.5.3.1. Introduction

With the release of MySQL version 5 the MySQL server now supports stored procedures with the SQL 2003 stored procedure syntax.

A stored procedure is a set of SQL statements that can be stored in the server. Once this has been done, clients don't need to keep reissuing the individual statements but can refer to the stored procedure instead.

Stored procedures can be particularly useful in situations such as the following:

- When multiple client applications are written in different languages or work on different platforms, but need to perform the same database operations.
- When security is paramount. Banks, for example, use stored procedures for all common operations. This provides a consistent and secure environment, and procedures can ensure that each operation is properly logged. In such a setup, applications and users would not get any access to the database tables directly, but can only execute specific stored procedures.

Connector/NET supports the calling of stored procedures through the `MySqlCommand` object. Data can be passed in and out of a MySQL stored procedure through use of the `MySqlCommand.Parameters` collection.

**Note:** When you call a stored procedure, the command object makes an additional `SELECT` call to determine the parameters of the stored procedure. You must ensure that the user calling the procedure has the `SELECT` privilege on the `mysql.proc` table to enable them to verify the parameters. Failure to do this will result in an error when calling the procedure.

This section will not provide in-depth information on creating Stored Procedures. For such information, please refer to <http://dev.mysql.com/doc/mysql/en/stored-procedures.html>.

A sample application demonstrating how to use stored procedures with Connector/NET can be found in the `Samples` directory of your Connector/NET installation.

#### 18.2.5.3.2. Creating Stored Procedures from Connector/NET

Stored procedures in MySQL can be created using a variety of tools. First, stored procedures can be created using the [mysql](#) command-line client. Second, stored procedures can be created using the [MySQL Query Browser](#) GUI client. Finally, stored procedures can be created using the [.ExecuteNonQuery](#) method of the [MySqlCommand](#) object:

#### Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" & _
    & "uid=root;" & _
    & "pwd=12345;" & _
    & "database=test"

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "CREATE PROCEDURE add_emp(" & _
        & "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " & _
        & "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " & _
        & "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END"

    cmd.ExecuteNonQuery()
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

#### C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "CREATE PROCEDURE add_emp(" +
        "IN fname VARCHAR(20), IN lname VARCHAR(20), IN bday DATETIME, OUT empno INT) " +
        "BEGIN INSERT INTO emp(first_name, last_name, birthdate) " +
        "VALUES(fname, lname, DATE(bday)); SET empno = LAST_INSERT_ID(); END";

    cmd.ExecuteNonQuery();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

It should be noted that, unlike the command-line and GUI clients, you are not required to specify a special delimiter when creating stored procedures in Connector/NET.

### 18.2.5.3.3. Calling a Stored Procedure from Connector/NET

To call a stored procedure using Connector/NET, create a [MySqlCommand](#) object and pass the stored procedure name as the [.CommandText](#) property. Set the [.CommandType](#) property to [CommandType.StoredProcedure](#).

After the stored procedure is named, create one [MySqlCommand](#) parameter for every parameter in the stored procedure. [IN](#) parameters are defined with the parameter name and the object containing the value, [OUT](#) parameters are defined with the parameter name and the datatype that is expected to be re-

turned. All parameters need the parameter direction defined.

After defining parameters, call the stored procedure by using the `MySqlCommand.ExecuteNonQuery()` method:

### Visual Basic Example

```
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()
    cmd.Connection = conn

    cmd.CommandText = "add_emp"
    cmd.CommandType = CommandType.StoredProcedure

    cmd.Parameters.Add("?lname", 'Jones')
    cmd.Parameters["?lname"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("?fname", 'Tom')
    cmd.Parameters["?fname"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("?bday", #12/13/1977 2:17:36 PM#)
    cmd.Parameters["?bday"].Direction = ParameterDirection.Input

    cmd.Parameters.Add("?empno", MySqlDbType.Int32)
    cmd.Parameters["?empno"].Direction = ParameterDirection.Output

    cmd.ExecuteNonQuery()

    MessageBox.Show(cmd.Parameters["?empno"].Value)
Catch ex As MySqlException
    MessageBox.Show("Error " & ex.Number & " has occurred: " & ex.Message, "Error", MessageBoxButtons.YesNo)
End Try
```

### C# Example

```
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    conn.Open();
    cmd.Connection = conn;

    cmd.CommandText = "add_emp";
    cmd.CommandType = CommandType.StoredProcedure;

    cmd.Parameters.Add("?lname", "Jones");
    cmd.Parameters["?lname"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("?fname", "Tom");
    cmd.Parameters["?fname"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("?bday", DateTime.Parse("12/13/1977 2:17:36 PM"));
    cmd.Parameters["?bday"].Direction = ParameterDirection.Input;

    cmd.Parameters.Add("?empno", MySqlDbType.Int32);
    cmd.Parameters["?empno"].Direction = ParameterDirection.Output;

    cmd.ExecuteNonQuery();

    MessageBox.Show(cmd.Parameters["?empno"].Value);
}
catch (MySql.Data.MySqlClient.MySqlException ex)
```

```
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

Once the stored procedure is called, the values of output parameters can be retrieved by using the `.Value` property of the `MySQLConnector.Parameters` collection.

## 18.2.5.4. Handling BLOB Data With Connector/NET

### 18.2.5.4.1. Introduction

One common use for MySQL is the storage of binary data in `BLOB` columns. MySQL supports four different BLOB datatypes: `TINYBLOB`, `BLOB`, `MEDIUMBLOB`, and `LONGBLOB`.

Data stored in a BLOB column can be accessed using Connector/NET and manipulated using client-side code. There are no special requirements for using Connector/NET with BLOB data.

Simple code examples will be presented within this section, and a full sample application can be found in the `Samples` directory of the Connector/NET installation.

### 18.2.5.4.2. Preparing the MySQL Server

The first step in using MySQL with BLOB data is to configure the server. Let's start by creating a table to be accessed. In my file tables, I usually have four columns: an `AUTO_INCREMENT` column of appropriate size (`UNSIGNED SMALLINT`) to serve as a primary key to identify the file, a `VARCHAR` column that stores the filename, an `UNSIGNED MEDIUMINT` column that stores the size of the file, and a `MEDIUMBLOB` column that stores the file itself. For this example, I will use the following table definition:

```
CREATE TABLE file(
file_id SMALLINT UNSIGNED AUTO_INCREMENT NOT NULL PRIMARY KEY,
file_name VARCHAR(64) NOT NULL,
file_size MEDIUMINT UNSIGNED NOT NULL,
file MEDIUMBLOB NOT NULL);
```

After creating a table, you may need to modify the `max_allowed_packet` system variable. This variable determines how large of a packet (i.e. a single row) can be sent to the MySQL server. By default, the server will only accept a maximum size of 1 meg from our client application. If you do not intend to exceed 1 meg, this should be fine. If you do intend to exceed 1 meg in your file transfers, this number has to be increased.

The `max_allowed_packet` option can be modified using MySQL Administrator's Startup Variables screen. Adjust the Maximum allowed option in the Memory section of the Networking tab to an appropriate setting. After adjusting the value, click the `Apply Changes` button and restart the server using the `Service Control` screen of MySQL Administrator. You can also adjust this value directly in the `my.cnf` file (add a line that reads `max_allowed_packet=xxM`), or use the `SET max_allowed_packet=xxM`; syntax from within MySQL.

Try to be conservative when setting `max_allowed_packet`, as transfers of BLOB data can take some time to complete. Try to set a value that will be adequate for your intended use and increase the value if necessary.

### 18.2.5.4.3. Writing a File to the Database

To write a file to a database we need to convert the file to a byte array, then use the byte array as a parameter to an `INSERT` query.

The following code opens a file using a `FileStream` object, reads it into a byte array, and inserts it into

the [file](#) table:

### Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

Dim SQL As String

Dim FileSize As UInt32
Dim rawData() As Byte
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    fs = New FileStream("c:\image.png", FileMode.Open, FileAccess.Read)
    FileSize = fs.Length

    rawData = New Byte(FileSize) {}
    fs.Read(rawData, 0, FileSize)
    fs.Close()

    conn.Open()

    SQL = "INSERT INTO file VALUES(NULL, ?FileName, ?FileSize, ?File)"

    cmd.Connection = conn
    cmd.CommandText = SQL
    cmd.Parameters.Add("?FileName", strFileName)
    cmd.Parameters.Add("?FileSize", FileSize)
    cmd.Parameters.Add("?File", rawData)

    cmd.ExecuteNonQuery()

    MessageBox.Show("File Inserted into database successfully!", _
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", _
        MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

### C# Example

```

MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    fs = new FileStream(@"c:\image.png", FileMode.Open, FileAccess.Read);
    FileSize = fs.Length;

    rawData = new byte[FileSize];
    fs.Read(rawData, 0, FileSize);
    fs.Close();

    conn.Open();

    SQL = "INSERT INTO file VALUES(NULL, ?FileName, ?FileSize, ?File)";
}

```

```

cmd.Connection = conn;
cmd.CommandText = SQL;
cmd.Parameters.Add("?FileName", strFileName);
cmd.Parameters.Add("?FileSize", FileSize);
cmd.Parameters.Add("?File", rawData);

cmd.ExecuteNonQuery();

MessageBox.Show("File Inserted into database successfully!",
    "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

conn.Close();
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The `Read` method of the `FileStream` object is used to load the file into a byte array which is sized according to the `Length` property of the `FileStream` object.

After assigning the byte array as a parameter of the `MySqlCommand` object, the `ExecuteNonQuery` method is called and the BLOB is inserted into the `file` table.

#### 18.2.5.4.4. Reading a BLOB from the Database to a File on Disk

Once a file is loaded into the `file` table, we can use the `MySqlDataReader` class to retrieve it.

The following code retrieves a row from the `file` table, then loads the data into a `FileStream` object to be written to disk:

##### Visual Basic Example

```

Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myData As MySqlDataReader
Dim SQL As String
Dim rawData() As Byte
Dim FileSize As UInt32
Dim fs As FileStream

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

SQL = "SELECT file_name, file_size, file FROM file"

Try
    conn.Open()

    cmd.Connection = conn
    cmd.CommandText = SQL

    myData = cmd.ExecuteReader

    If Not myData.HasRows Then Throw New Exception("There are no BLOBs to save")

    myData.Read()

    FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"))
    rawData = New Byte(FileSize) {}

    myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize)

    fs = New FileStream("C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write)
    fs.Write(rawData, 0, FileSize)
    fs.Close()

    MessageBox.Show("File successfully written to disk!", "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk)

    myData.Close()

```

```

    conn.Close()
Catch ex As Exception
    MessageBox.Show("There was an error: " & ex.Message, "Error", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

### C# Example

```

MySQL.Data.MySqlClient.MySqlConnection conn;
MySQL.Data.MySqlClient.MySqlCommand cmd;
MySQL.Data.MySqlClient.MySqlDataReader myData;

conn = new MySQL.Data.MySqlClient.MySqlConnection();
cmd = new MySQL.Data.MySqlClient.MySqlCommand();

string SQL;
UInt32 FileSize;
byte[] rawData;
FileStream fs;

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

SQL = "SELECT file_name, file_size, file FROM file";

try
{
    conn.Open();

    cmd.Connection = conn;
    cmd.CommandText = SQL;

    myData = cmd.ExecuteReader();

    if (! myData.HasRows)
        throw new Exception("There are no BLOBs to save");

    myData.Read();

    FileSize = myData.GetUInt32(myData.GetOrdinal("file_size"));
    rawData = new byte[FileSize];

    myData.GetBytes(myData.GetOrdinal("file"), 0, rawData, 0, FileSize);

    fs = new FileStream(@"C:\newfile.png", FileMode.OpenOrCreate, FileAccess.Write);
    fs.Write(rawData, 0, FileSize);
    fs.Close();

    MessageBox.Show("File successfully written to disk!",
        "Success!", MessageBoxButtons.OK, MessageBoxIcon.Asterisk);

    myData.Close();
    conn.Close();
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show("Error " + ex.Number + " has occurred: " + ex.Message,
        "Error", MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

After connecting, the contents of the `file` table are loaded into a `MySqlDataReader` object. The `GetBytes` method of the `MySqlDataReader` is used to load the BLOB into a byte array, which is then written to disk using a `FileStream` object.

The `GetOrdinal` method of the `MySqlDataReader` can be used to determine the integer index of a named column. Use of the `GetOrdinal` method prevents errors if the column order of the `SELECT` query is changed.

## 18.2.5.5. Using Connector/NET with Crystal Reports

### 18.2.5.5.1. Introduction

Crystal Reports is a common tool used by Windows application developers to perform reporting and document generation. In this section we will show how to use Crystal Reports XI with MySQL and Connector/NET.

### 18.2.5.5.2. Creating a Data Source

When creating a report in Crystal Reports there are two options for accessing the MySQL data while designing your report.

The first option is to use Connector/ODBC as an ADO data source when designing your report. You will be able to browse your database and choose tables and fields using drag and drop to build your report. The disadvantage of this approach is that additional work must be performed within your application to produce a dataset that matches the one expected by your report.

The second option is to create a dataset in VB.NET and save it as XML. This XML file can then be used to design a report. This works quite well when displaying the report in your application, but is less versatile at design time because you must choose all relevant columns when creating the dataset. If you forget a column you must re-create the dataset before the column can be added to the report.

The following code can be used to create a dataset from a query and write it to disk:

#### Visual Basic Example

```
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myData.WriteXml("C:\dataset.xml", XmlWriteMode.WriteSchema)
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try
```

#### C# Example

```
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;
```

```

myAdapter.SelectCommand = cmd;
myAdapter.Fill(myData);

myData.WriteXml(@"C:\dataset.xml", XmlWriteMode.WriteSchema);
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

The resulting XML file can be used as an ADO.NET XML datasource when designing your report.

If you choose to design your reports using Connector/ODBC, it can be downloaded from [dev.mysql.com](http://dev.mysql.com/downloads/connector/odbc/3.51.html) [http://dev.mysql.com/downloads/connector/odbc/3.51.html].

### 18.2.5.5.3. Creating the Report

For most purposes the Standard Report wizard should help with the initial creation of a report. To start the wizard, open Crystal Reports and choose the New > Standard Report option from the File menu.

The wizard will first prompt you for a data source. If you are using Connector/ODBC as your data source, use the OLEDB provider for ODBC option from the OLE DB (ADO) tree instead of the ODBC (RDO) tree when choosing a data source. If using a saved dataset, choose the ADO.NET (XML) option and browse to your saved dataset.

The remainder of the report creation process is done automatically by the wizard.

After the report is created, choose the Report Options... entry of the File menu. Un-check the Save Data With Report option. This prevents saved data from interfering with the loading of data within our application.

### 18.2.5.5.4. Displaying the Report

To display a report we first populate a dataset with the data needed for the report, then load the report and bind it to the dataset. Finally we pass the report to the crViewer control for display to the user.

The following references are needed in a project that displays a report:

- CrystalDecisions.CrystalReports.Engine
- CrystalDecisions.ReportSource
- CrystalDecisions.Shared
- CrystalDecisions.Windows.Forms

The following code assumes that you created your report using a dataset saved using the code shown in [Section 18.2.5.5.2, "Creating a Data Source"](#), and have a crViewer control on your form named `myViewer`.

Visual Basic Example

```

Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySQL.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand

```

```

Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = _
    "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=test"

Try
    conn.Open()

    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " _
        & "country.name, country.population, country.continent " _
        & "FROM country, city ORDER BY country.continent, country.name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.SetDataSource(myData)
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Error)
End Try

```

### C# Example

```

using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT city.name AS cityName, city.population AS CityPopulation, " +
        "country.name, country.population, country.continent " +
        "FROM country, city ORDER BY country.continent, country.name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);

    myReport.Load(@".\world_report.rpt");
    myReport.SetDataSource(myData);
    myViewer.ReportSource = myReport;
}
catch (MySql.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}

```

A new dataset is generated using the same query used to generate the previously saved dataset. Once the dataset is filled, a ReportDocument is used to load the report file and bind it to the dataset. The ReportDocument is then passed as the ReportSource of the crViewer.

This same approach is taken when a report is created from a single table using Connector/ODBC. The dataset replaces the table used in the report and the report is displayed properly.

When a report is created from multiple tables using Connector/ODBC, a dataset with multiple tables must be created in our application. This allows each table in the report data source to be replaced with a

report in the dataset.

We populate a dataset with multiple tables by providing multiple `SELECT` statements in our MySQL-Command object. These `SELECT` statements are based on the SQL query shown in Crystal Reports in the Database menu's Show SQL Query option. Assume the following query:

```
SELECT `country`.`Name`, `country`.`Continent`, `country`.`Population`, `city`.`Name`, `city`.`Populat
FROM `world`.`country` `country` LEFT OUTER JOIN `world`.`city` `city` ON `country`.`Code`=`city`.`Cour
ORDER BY `country`.`Continent`, `country`.`Name`, `city`.`Name`
```

This query is converted to two `SELECT` queries and displayed with the following code:

### Visual Basic Example

```
Imports CrystalDecisions.CrystalReports.Engine
Imports System.Data
Imports MySql.Data.MySqlClient

Dim myReport As New ReportDocument
Dim myData As New DataSet
Dim conn As New MySqlConnection
Dim cmd As New MySqlCommand
Dim myAdapter As New MySqlDataAdapter

conn.ConnectionString = "server=127.0.0.1;" _
    & "uid=root;" _
    & "pwd=12345;" _
    & "database=world"

Try
    conn.Open()
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER BY countrycode, name; " _
        & "SELECT name, population, code, continent FROM country ORDER BY continent, name"
    cmd.Connection = conn

    myAdapter.SelectCommand = cmd
    myAdapter.Fill(myData)

    myReport.Load(".\world_report.rpt")
    myReport.Database.Tables(0).SetDataSource(myData.Tables(0))
    myReport.Database.Tables(1).SetDataSource(myData.Tables(1))
    myViewer.ReportSource = myReport
Catch ex As Exception
    MessageBox.Show(ex.Message, "Report could not be created", MessageBoxButtons.OK, MessageBoxIcon.Err
End Try
```

### C# Example

```
using CrystalDecisions.CrystalReports.Engine;
using System.Data;
using MySql.Data.MySqlClient;

ReportDocument myReport = new ReportDocument();
DataSet myData = new DataSet();
MySql.Data.MySqlClient.MySqlConnection conn;
MySql.Data.MySqlClient.MySqlCommand cmd;
MySql.Data.MySqlClient.MySqlDataAdapter myAdapter;

conn = new MySql.Data.MySqlClient.MySqlConnection();
cmd = new MySql.Data.MySqlClient.MySqlCommand();
myAdapter = new MySql.Data.MySqlClient.MySqlDataAdapter();

conn.ConnectionString = "server=127.0.0.1;uid=root;" +
    "pwd=12345;database=test;";

try
{
    cmd.CommandText = "SELECT name, population, countrycode FROM city ORDER " +
        "BY countrycode, name; SELECT name, population, code, continent FROM " +
        "country ORDER BY continent, name";
    cmd.Connection = conn;

    myAdapter.SelectCommand = cmd;
    myAdapter.Fill(myData);
}
```

```
myReport.Load(@".\world_report.rpt");
myReport.Database.Tables(0).SetDataSource(myData.Tables(0));
myReport.Database.Tables(1).SetDataSource(myData.Tables(1));
myViewer.ReportSource = myReport;
}
catch (MySQL.Data.MySqlClient.MySqlException ex)
{
    MessageBox.Show(ex.Message, "Report could not be created",
        MessageBoxButtons.OK, MessageBoxIcon.Error);
}
```

It is important to order the [SELECT](#) queries in alphabetical order, as this is the order the report will expect its source tables to be in. One `SetDataSource` statement is needed for each table in the report.

This approach can cause performance problems because Crystal Reports must bind the tables together on the client-side, which will be slower than using a pre-saved dataset.

## 18.2.5.6. Handling Date and Time Information in Connector/NET

### 18.2.5.6.1. Introduction

MySQL and the .NET languages handle date and time information differently, with MySQL allowing dates that cannot be represented by a .NET data type, such as '0000-00-00 00:00:00'. These differences can cause problems if not properly handled.

In this section we will demonstrate how to properly handle date and time information when using Connector/NET.

### 18.2.5.6.2. Problems when Using Invalid Dates

The differences in date handling can cause problems for developers who use invalid dates. Invalid MySQL dates cannot be loaded into native .NET `DateTime` objects, including `NULL` dates.

Because of this issue, .NET `DataSet` objects cannot be populated by the `Fill` method of the `MySqlDataAdapter` class as invalid dates will cause a `System.ArgumentOutOfRangeException` exception to occur.

### 18.2.5.6.3. Restricting Invalid Dates

The best solution to the date problem is to restrict users from entering invalid dates. This can be done on either the client or the server side.

Restricting invalid dates on the client side is as simple as always using the .NET `DateTime` class to handle dates. The `DateTime` class will only allow valid dates, ensuring that the values in your database are also valid. The disadvantage of this is that it is not useful in a mixed environment where .NET and non .NET code are used to manipulate the database, as each application must perform its own date validation.

Users of MySQL 5.0.2 and higher can use the new `traditional` SQL mode to restrict invalid date values. For information on using the `traditional` SQL mode, see [Section 5.2.5, “SQL Modes”](#).

### 18.2.5.6.4. Handling Invalid Dates

Although it is strongly recommended that you avoid the use of invalid dates within your .NET application, it is possible to use invalid dates by means of the `MySqlDateTime` datatype.

The `MySqlDateTime` datatype supports the same date values that are supported by the MySQL server. The default behavior of Connector/NET is to return a .NET `DateTime` object for valid date values, and return an error for invalid dates. This default can be modified to cause Connector/NET to return

`MySqlDateTime` objects for invalid dates.

To instruct Connector/NET to return a `MySqlDateTime` object for invalid dates, add the following line to your connection string:

```
Allow Zero Datetime=True
```

Please note that the use of the `MySqlDateTime` class can still be problematic. The following are some known issues:

1. Data binding for invalid dates can still cause errors (zero dates like 0000-00-00 do not seem to have this problem).
2. The `ToString` method return a date formatted in the standard MySQL format (for example, 2005-02-23 08:50:25). This differs from the `ToString` behavior of the .NET `DateTime` class.
3. The `MySqlDateTime` class supports NULL dates, while the .NET `DateTime` class does not. This can cause errors when trying to convert a `MySQLDateTime` to a `DateTime` if you do not check for NULL first.

Because of the known issues, the best recommendation is still to use only valid dates in your application.

#### 18.2.5.6.5. Handling NULL Dates

The .NET `DateTime` datatype cannot handle `NULL` values. As such, when assigning values from a query to a `DateTime` variable, you must first check whether the value is in fact `NULL`.

When using a `MySqlDataReader`, use the `.IsDBNull` method to check whether a value is `NULL` before making the assignment:

Visual Basic Example

```
If Not myReader.IsDBNull(myReader.GetOrdinal("mytime")) Then
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"))
Else
    myTime = DateTime.MinValue
End If
```

C# Example

```
if (! myReader.IsDBNull(myReader.GetOrdinal("mytime")))
    myTime = myReader.GetDateTime(myReader.GetOrdinal("mytime"));
else
    myTime = DateTime.MinValue;
```

`NULL` values will work in a dataset and can be bound to form controls without special handling.

## 18.2.6. Connector/NET Support

The developers of Connector/NET greatly value the input of our users in the software development process. If you find Connector/NET lacking some feature important to you, or if you discover a bug and need to file a bug report, please use the instructions in [Section 1.8, "How to Report Bugs or Problems"](#).

### 18.2.6.1. Connector/NET Community Support

- Community support for Connector/NET can be found through the forums at <http://forums.mysql.com>.
- Community support for Connector/NET can also be found through the mailing lists at <http://lists.mysql.com>.
- Paid support is available from MySQL AB. Additional information is available at <http://www.mysql.com/support/>.

### 18.2.6.2. How to report Connector/NET Problems or Bugs

If you encounter difficulties or problems with Connector/NET, contact the Connector/NET community [Section 18.2.6.1, “Connector/NET Community Support”](#).

You should first try to execute the same SQL statements and commands from the `mysql` client program or from `admindemo`. This helps you determine whether the error is in Connector/NET or MySQL.

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/NET version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

### 18.2.6.3. Connector/NET Change History

The Connector/NET Change History (Changelog) is located with the main Changelog for MySQL. See [Section D.7, “MySQL Connector/NET Change History”](#).

## 18.3. MySQL Connector/J

MySQL provides connectivity for client applications developed in the Java programming language via a JDBC driver, which is called MySQL Connector/J.

MySQL Connector/J is a JDBC-3.0 Type 4 driver, which means that is pure Java, implements version 3.0 of the JDBC specification, and communicates directly with the MySQL server using the MySQL protocol.

Although JDBC is useful by itself, we would hope that if you are not familiar with JDBC that after reading the first few sections of this manual, that you would avoid using naked JDBC for all but the most trivial problems and consider using one of the popular persistence frameworks such as [Hibernate](http://www.hibernate.org/) [http://www.hibernate.org/], [Spring's JDBC templates](http://www.springframework.org/) [http://www.springframework.org/] or [Ibatis SQL Maps](http://ibatis.apache.org/) [http://ibatis.apache.org/] to do the majority of repetitive work and heavier lifting that is sometimes required with JDBC.

This section is not designed to be a complete JDBC tutorial. If you need more information about using JDBC you might be interested in the following online tutorials that are more in-depth than the information presented here:

- [JDBC Basics](http://java.sun.com/docs/books/tutorial/jdbc/basics/index.html) [http://java.sun.com/docs/books/tutorial/jdbc/basics/index.html] — A tutorial from Sun covering beginner topics in JDBC
- [JDBC Short Course](http://java.sun.com/developer/onlineTraining/Database/JDBCShortCourse/index.html) [http://java.sun.com/developer/onlineTraining/Database/JDBCShortCourse/index.html] — A more in-depth tutorial from Sun and JGuru

## 18.3.1. Connector/J Versions

There are currently three version of MySQL Connector/J available:

- Connector/J 3.0 provides core functionality and was designed with connectivity to MySQL 3.x or MySQL 4.1 servers, although it will provide basic compatibility with later versions of MySQL. Connector/J 3.0 does not support server-side prepared statements, and does not support any of the features in versions of MySQL later than 4.1.
- Connector/J 3.1 was designed for connectivity to MySQL 4.1 and MySQL 5.0 servers and provides support for all the functionality in MySQL 5.0 except distributed transaction (XA) support.
- Connector/J 5.0 provides support for all the functionality offered by Connector/J 3.1 and includes distributed transaction (XA) support.

The current recommended version for Connector/J is 5.0. This guide covers all three connector versions, with specific notes given where a setting applies to a specific option.

### 18.3.1.1. Java Versions Supported

MySQL Connector/J supports Java-2 JVMs, including:

- JDK 1.2.x
- JDK 1.3.x
- JDK 1.4.x
- JDK 1.5.x

If you are building Connector/J from source using the source distribution (see [Section 18.3.2.4, “Installing from the Development Source Tree”](#)) then you must use JDK 1.4.x or newer to compile the Connector package.

MySQL Connector/J does not support JDK-1.1.x or JDK-1.0.x

Because of the implementation of `java.sql.Savepoint`, Connector/J 3.1.0 and newer will not run on JDKs older than 1.4 unless the class verifier is turned off (by setting the `-Xverify:none` option to the Java runtime). This is because the class verifier will try to load the class definition for `java.sql.Savepoint` even though it is not accessed by the driver unless you actually use savepoint functionality.

Caching functionality provided by Connector/J 3.1.0 or newer is also not available on JVMs older than 1.4.x, as it relies on `java.util.LinkedHashMap` which was first available in JDK-1.4.0.

## 18.3.2. Installing Connector/J

You can install the Connector/J package using two methods, using either the binary or source distribution. The binary distribution provides the easiest methods for installation; the source distribution enables you to customize your installation further. With either solution, you must

### 18.3.2.1. Installing Connector/J from a Binary Distribution

The easiest method of installation is to use the binary distribution of the Connector/J package. The binary distribution is available either as a Tar/Gzip or Zip file which you must extract to a suitable location and then optionally make the information about the package available by changing your `CLASSPATH` (see Section 18.3.2.2, “Installing the Driver and Configuring the `CLASSPATH`”).

MySQL Connector/J is distributed as a `.zip` or `.tar.gz` archive containing the sources, the class files, and the JAR archive named `mysql-connector-java-[version]-bin.jar`, and starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar`.

Starting with Connector/J 3.1.9, the `.class` files that constitute the JAR files are only included as part of the driver JAR file.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or bug to MySQL AB, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

You will need to use the appropriate graphical or command-line utility to un-archive the distribution (for example, WinZip for the `.zip` archive, and `tar` for the `.tar.gz` archive). Because there are potentially long filenames in the distribution, we use the GNU tar archive format. You will need to use GNU tar (or an application that understands the GNU tar archive format) to unpack the `.tar.gz` variant of the distribution.

### 18.3.2.2. Installing the Driver and Configuring the `CLASSPATH`

Once you have extracted the distribution archive, you can install the driver by placing `mysql-connector-java-[version]-bin.jar` in your classpath, either by adding the full path to it to your `CLASSPATH` environment variable, or by directly specifying it with the command line switch `-cp` when starting your JVM.

If you are going to use the driver with the JDBC DriverManager, you would use `com.mysql.jdbc.Driver` as the class that implements `java.sql.Driver`.

You can set the `CLASSPATH` environment variable under UNIX, Linux or Mac OS X either locally for a user within their `.profile`, `.login` or other login file. You can also set it globally by editing the global `/etc/profile` file.

For example, under a C shell (`csh`, `tcsh`) you would add the Connector/J driver to your `CLASSPATH` using the following:

```
shell> setenv CLASSPATH /path/to/mysql-connector-java-[version]-bin.jar:$CLASSPATH
```

Or with a Bourne-compatible shell (`sh`, `ksh`, `bash`):

```
export set CLASSPATH=/path/to/mysql-connector-java-[version]-bin.jar:$CLASSPATH
```

Within Windows 2000, Windows XP and Windows Server 2003, you must set the environment variable through the System control panel.

If you want to use MySQL Connector/J with an application server such as Tomcat or JBoss, you will have to read your vendor's documentation for more information on how to configure third-party class libraries, as most application servers ignore the `CLASSPATH` environment variable. For configuration examples for some J2EE application servers, see [Section 18.3.5.2, “Using Connector/J with J2EE and Other Java Frameworks”](#). However, the authoritative source for JDBC connection pool configuration information for your particular application server is the documentation for that application server.

If you are developing servlets or JSPs, and your application server is J2EE-compliant, you can put the driver's .jar file in the `WEB-INF/lib` subdirectory of your webapp, as this is a standard location for third party class libraries in J2EE web applications.

You can also use the `MysqlDataSource` or `MysqlConnectionPoolDataSource` classes in the `com.mysql.jdbc.jdbc2.optional` package, if your J2EE application server supports or requires them. Starting with Connector/J 5.0.0, the `javax.sql.XADataSource` interface is implemented via the `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` class, which supports XA distributed transactions when used in combination with MySQL server version 5.0.

The various `MysqlDataSource` classes support the following parameters (through standard set mutators):

- user
- password
- serverName (see the previous section about fail-over hosts)
- databaseName
- port

### 18.3.2.3. Upgrading from an Older Version

MySQL AB tries to keep the upgrade process as easy as possible, however as is the case with any software, sometimes changes need to be made in new versions to support new features, improve existing functionality, or comply with new standards.

This section has information about what users who are upgrading from one version of Connector/J to another (or to a new version of the MySQL server, with respect to JDBC functionality) should be aware of.

#### 18.3.2.3.1. Upgrading from MySQL Connector/J 3.0 to 3.1

Connector/J 3.1 is designed to be backward-compatible with Connector/J 3.0 as much as possible. Major changes are isolated to new functionality exposed in MySQL-4.1 and newer, which includes Unicode character sets, server-side prepared statements, `SQLState` codes returned in error messages by the server and various performance enhancements that can be enabled or disabled via configuration properties.

- **Unicode Character Sets** — See the next section, as well as [Chapter 10, \*Character Set Support\*](#), for information on this new feature of MySQL. If you have something misconfigured, it will usually show up as an error with a message similar to `Illegal mix of collations`.
- **Server-side Prepared Statements** — Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer).

Starting with version 3.1.7, the driver scans SQL you are preparing via all variants of `Connec-`

`tion.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this feature by passing `emulateUnsupportedPstmts=false` in your JDBC URL.

If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the connection property `useServerPrepStmts=false`

- **Datetimes** with all-zero components (`0000-00-00 ...`) — These values can not be represented reliably in Java. Connector/J 3.0.x always converted them to NULL when being read from a ResultSet.

Connector/J 3.1 throws an exception by default when these values are encountered as this is the most correct behavior according to the JDBC and SQL standards. This behavior can be modified using the `zeroDateTimeBehavior` configuration property. The allowable values are:

- `exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`.
- `convertToNull`, which returns `NULL` instead of the date.
- `round`, which rounds the date to the nearest closest value which is `0001-01-01`.

Starting with Connector/J 3.1.7, `ResultSet.getString()` can be decoupled from this behavior via `noDatetimeStringSync=true` (the default value is `false`) so that you can get retrieve the unaltered all-zero value as a `String`. It should be noted that this also precludes using any time zone conversions, therefore the driver will not allow you to enable `noDatetimeStringSync` and `useTimeZone` at the same time.

- **New SQLState Codes** — Connector/J 3.1 uses SQL:1999 SQLState codes returned by the MySQL server (if supported), which are different from the legacy X/Open state codes that Connector/J 3.0 uses. If connected to a MySQL server older than MySQL-4.1.0 (the oldest version to return SQLStates as part of the error code), the driver will use a built-in mapping. You can revert to the old mapping by using the configuration property `useSqlStateCodes=false`.
- **ResultSet.getString()** — Calling `ResultSet.getString()` on a BLOB column will now return the address of the `byte[]` array that represents it, instead of a `String` representation of the BLOB. BLOBs have no character set, so they can't be converted to `java.lang.Strings` without data loss or corruption.

To store strings in MySQL with LOB behavior, use one of the TEXT types, which the driver will treat as a `java.sql.Clob`.

- **Debug builds** — Starting with Connector/J 3.1.8 a debug build of the driver in a file named `mysql-connector-java-[version]-bin-g.jar` is shipped alongside the normal binary jar file that is named `mysql-connector-java-[version]-bin.jar`.

Starting with Connector/J 3.1.9, we don't ship the `.class` files unbundled, they are only available in the JAR archives that ship with the driver.

You should not use the debug build of the driver unless instructed to do so when reporting a problem or bug to MySQL AB, as it is not designed to be run in production environments, and will have adverse performance impact when used. The debug binary also depends on the Aspect/J runtime library, which is located in the `src/lib/aspectjrt.jar` file that comes with the Connector/J distribution.

### 18.3.2.3.2. JDBC-Specific Issues When Upgrading to MySQL Server 4.1 or Newer

- *Using the UTF-8 Character Encoding* - Prior to MySQL server version 4.1, the UTF-8 character encoding was not supported by the server, however the JDBC driver could use it, allowing storage of multiple character sets in latin1 tables on the server.

Starting with MySQL-4.1, this functionality is deprecated. If you have applications that rely on this functionality, and can not upgrade them to use the official Unicode character support in MySQL server version 4.1 or newer, you should add the following property to your connection URL:

```
useOldUTF8Behavior=true
```

- *Server-side Prepared Statements* - Connector/J 3.1 will automatically detect and use server-side prepared statements when they are available (MySQL server version 4.1.0 and newer). If your application encounters issues with server-side prepared statements, you can revert to the older client-side emulated prepared statement code that is still presently used for MySQL servers older than 4.1.0 with the following connection property:

```
useServerPrepStmts=false
```

### 18.3.2.4. Installing from the Development Source Tree

**Caution.** You should read this section only if you are interested in helping us test our new code. If you just want to get MySQL Connector/J up and running on your system, you should use a standard release distribution.

To install MySQL Connector/J from the development source tree, make sure that you have the following prerequisites:

- Subversion, to check out the sources from our repository (available from <http://subversion.tigris.org/>).
- Apache Ant version 1.6 or newer (available from <http://ant.apache.org/>).
- JDK-1.4.2 or later. Although MySQL Connector/J can be installed on older JDKs, to compile it from source you must have at least JDK-1.4.2.

The Subversion source code repository for MySQL Connector/J is located at <http://svn.mysql.com/svnpublic/connector-j>. In general, you should not check out the entire repository because it contains every branch and tag for MySQL Connector/J and is quite large.

To check out and compile a specific branch of MySQL Connector/J, follow these steps:

1. At the time of this writing, there are three active branches of Connector/J: `branch_3_0`, `branch_3_1` and `branch_5_0`. Check out the latest code from the branch that you want with the following command (replacing `[major]` and `[minor]` with appropriate version numbers):

```
shell> svn co »  
http://svn.mysql.com/svnpublic/connector-j/branches/branch\_\[major\]\_\[minor\]/connector-j
```

This creates a `connector-j` subdirectory in the current directory that contains the latest sources for the requested branch.

2. Change location to the `connector-j` directory to make it your current working directory:

```
shell> cd connector-j
```

3. Issue the following command to compile the driver and create a `.jar` file suitable for installation:

```
shell> ant dist
```

This creates a `build` directory in the current directory, where all build output will go. A directory is created in the `build` directory that includes the version number of the sources you are building from. This directory contains the sources, compiled `.class` files, and a `.jar` file suitable for deployment. For other possible targets, including ones that will create a fully packaged distribution, issue the following command:

```
shell> ant --projecthelp
```

4. A newly created `.jar` file containing the JDBC driver will be placed in the directory `build/mysql-connector-java-[version]`.

Install the newly created JDBC driver as you would a binary `.jar` file that you download from MySQL by following the instructions in [Section 18.3.2.2, “Installing the Driver and Configuring the CLASSPATH”](#).

### 18.3.3. Connector/J Examples

Examples of using Connector/J are located throughout this document, this section provides a summary and links to these examples.

- [Example 18.1, “Obtaining a connection from the DriverManager”](#)
- [Example 18.2, “Using java.sql.Statement to execute a SELECT query”](#)
- [Example 18.3, “Stored Procedures”](#)
- [Example 18.4, “Using Connection.prepareStatement\(\)”](#)
- [Example 18.5, “Registering output parameters”](#)
- [Example 18.6, “Setting CallableStatement input parameters”](#)
- [Example 18.7, “Retrieving results and output parameter values”](#)
- [Example 18.8, “Retrieving AUTO\\_INCREMENT column values using Statement.getGeneratedKeys\(\)”](#)
- [Example 18.9, “Retrieving AUTO\\_INCREMENT column values using SELECT LAST\\_INSERT\\_ID\(\)”](#)
- [Example 18.10, “Retrieving AUTO\\_INCREMENT column values in Updatable ResultSets”](#)
- [Example 18.11, “Using a connection pool with a J2EE application server”](#)
- [Example 18.12, “Example of transaction with retry logic”](#)

### 18.3.4. Connector/J (JDBC) Reference

This section of the manual contains reference material for MySQL Connector/J, some of which is automatically generated during the Connector/J build process.

### 18.3.4.1. Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J

The name of the class that implements `java.sql.Driver` in MySQL Connector/J is `com.mysql.jdbc.Driver`. The `org.gjt.mm.mysql.Driver` class name is also usable to remain backward-compatible with MM.MySQL. You should use this class name when registering the driver, or when otherwise configuring software to use MySQL Connector/J.

The JDBC URL format for MySQL Connector/J is as follows, with items in square brackets ([, ]) being optional:

```
jdbc:mysql://[host][,failoverhost...][:port]/[database] »
[?propertyName1[=propertyValue1][&propertyName2[=propertyValue2]...
```

If the hostname is not specified, it defaults to 127.0.0.1. If the port is not specified, it defaults to 3306, the default port number for MySQL servers.

```
jdbc:mysql://[host:port],[host:port].../[database] »
[?propertyName1[=propertyValue1][&propertyName2[=propertyValue2]...
```

If the database is not specified, the connection will be made with no default database. In this case, you will need to either call the `setCatalog()` method on the `Connection` instance or fully-specify table names using the database name (i.e. `SELECT dbname.tablename.colname FROM dbname.tablename...`) in your SQL. Not specifying the database to use upon connection is generally only useful when building tools that work with multiple databases, such as GUI database managers.

MySQL Connector/J has fail-over support. This allows the driver to fail-over to any number of slave hosts and still perform read-only queries. Fail-over only happens when the connection is in an `autoCommit(true)` state, because fail-over can not happen reliably when a transaction is in progress. Most application servers and connection pools set `autoCommit` to `true` at the end of every transaction/connection use.

The fail-over functionality has the following behavior:

- If the URL property `autoReconnect` is `false`: Failover only happens at connection initialization, and failback occurs when the driver determines that the first host has become available again.
- If the URL property `autoReconnect` is `true`: Failover happens when the driver determines that the connection has failed (before *every* query), and falls back to the first host when it determines that the host has become available again (after `queriesBeforeRetryMaster` queries have been issued).

In either case, whenever you are connected to a "failed-over" server, the connection will be set to read-only state, so queries that would modify data will have exceptions thrown (the query will **never** be processed by the MySQL server).

Configuration properties define how Connector/J will make a connection to a MySQL server. Unless otherwise noted, properties can be set for a `DataSource` object or for a `Connection` object.

Configuration Properties can be set in one of the following ways:

- Using the `set*()` methods on MySQL implementations of `java.sql.DataSource` (which is the preferred method when using implementations of `java.sql.DataSource`):
  - `com.mysql.jdbc.jdbc2.optional.MysqlDataSource`

- `com.mysql.jdbc.jdbc2.optional.MysqlConnectionPoolDataSource`
- As a key/value pair in the `java.util.Properties` instance passed to `DriverManager.getConnection()` or `Driver.connect()`
- As a JDBC URL parameter in the URL given to `java.sql.DriverManager.getConnection()`, `java.sql.Driver.connect()` or the MySQL implementations of the `javax.sql.DataSource.setURL()` method.

**Note.** If the mechanism you use to configure a JDBC URL is XML-based, you will need to use the XML character literal `&#amp;`; to separate configuration parameters, as the ampersand is a reserved character for XML.

The properties are listed in the following tables.

#### Connection/Authentication.

Property Name	Definition	Default Value	Since Version
user	The user to connect as		all
password	The password to use when connecting		all
socketFactory	The name of the class that the driver should use for creating socket connections to the server. This class must implement the interface <code>com.mysql.jdbc.SocketFactory</code> and have public no-args constructor.	<code>com.mysql.jdbc.StandardSocketFactory</code>	3.0.3
connectTimeout	Timeout for socket connect (in milliseconds), with 0 being no timeout. Only works on JDK-1.4 or newer. Defaults to 0.	0	3.0.1
socketTimeout	Timeout on network socket operations (0, the default means no timeout).	0	3.0.1
useConfigs	Load the comma-delimited list of configuration properties before parsing the URL or applying user-specified properties. See <a href="#">Section 18.3.4.1, “Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J”</a>		3.1.5
interactiveClient	Set the <code>CLIENT_INTERACTIVE</code> flag, which tells MySQL to timeout connections based on <code>INTERACTIVE_TIMEOUT</code> instead of <code>WAIT_TIMEOUT</code>	false	3.1.0
propertiesTransform	An implementation of <code>com.mysql.jdbc.ConnectionPropertiesTransform</code> that the driver will use to modify URL properties passed to the driver before attempting a connection		3.1.4
useCompression	Use zlib compression when communicating with the server (true/false)? Defaults to <code>false</code> .	false	3.0.17

#### High Availability and Clustering.

Property Name	Definition	Default	Since
---------------	------------	---------	-------

		Value	Version
autoReconnect	Should the driver try to re-establish stale and/or dead connections? If enabled the driver will throw an exception for a queries issued on a stale or dead connection, which belong to the current transaction, but will attempt reconnect before the next query issued on the connection in a new transaction. The use of this feature is not recommended, because it has side effects related to session state and data consistency when applications don'thandle SQLExceptions properly, and is only designed to be used when you are unable to configure your application to handle SQLExceptions resulting from dead andstale connections properly. Alternatively, investigate setting the MySQL server variable "wait_timeout"to some high value rather than the default of 8 hours.	false	1.1
autoReconnectForPools	Use a reconnection strategy appropriate for connection pools (defaults to 'false')	false	3.1.3
failOverReadOnly	When failing over in autoReconnect mode, should the connection be set to 'read-only'?	true	3.0.12
reconnectAtTxEnd	If autoReconnect is set to true, should the driver attempt reconnectionsat the end of every transaction?	false	3.0.10
roundRobinLoadBalance	When autoReconnect is enabled, and failover-ReadOnly is false, should we pick hosts to connect to on a round-robin basis?	false	3.1.2
queriesBeforeRetryMaster	Number of queries to issue before falling back to master when failed over (when using multi-host failover). Whichever condition is met first, 'queriesBeforeRetryMaster' or 'secondsBeforeRetryMaster' will cause an attempt to be made to reconnect to the master. Defaults to 50.	50	3.0.2
secondsBeforeRetryMaster	How long should the driver wait, when failed over, before attempting to reconnect to the master server? Whichever condition is met first, 'queriesBeforeRetryMaster' or 'secondsBeforeRetryMaster' will cause an attempt to be made to reconnect to the master. Time in seconds, defaults to 30	30	3.0.2
resourceId	A globally unique name that identifies the resource that this datasource or connection is connected to, used for <code>XAResource.isSameRM()</code> when the driver can't determine this value based on host-names used in the URL		5.0.1

**Security.**

Property Name	Definition	Default Value	Since Version
allowMultiQueries	Allow the use of ';' to delimit multiple queries during one statement (true/false, defaults to 'false')	false	3.1.1
useSSL	Use SSL when communicating with the server	false	3.0.2

	(true/false), defaults to 'false'		
requireSSL	Require SSL connection if useSSL=true? (defaults to 'false').	false	3.1.0
allowUrlInLocalInfile	Should the driver allow URLs in 'LOAD DATA LOCAL INFILE' statements?	false	3.1.4
paranoid	Take measures to prevent exposure sensitive information in error messages and clear data structures holding sensitive data when possible? (defaults to 'false')	false	3.0.1

**Performance Extensions.**

Property Name	Definition	Default Value	Since Version
metadataCacheSize	The number of queries to cacheResultSetMetadata for if cacheResultSetMetaData is set to 'true' (default 50)	50	3.1.1
prepStmtCacheSize	If prepared statement caching is enabled, how many prepared statements should be cached?	25	3.0.10
prepStmtCacheSqlLimit	If prepared statement caching is enabled, what's the largest SQL the driver will cache the parsing for?	256	3.0.10
useCursorFetch	If connected to MySQL > 5.0.2, and <code>setFetchSize() &gt; 0</code> on a statement, should that statement use cursor-based fetching to retrieve rows?	false	5.0.0
blobSendChunkSize	Chunk to use when sending BLOB/CLOBs via ServerPreparedStatements	1048576	3.1.9
cacheCallableStmts	Should the driver cache the parsing stage of CallableStatements	false	3.1.2
cachePrepStmts	Should the driver cache the parsing stage of PreparedStatements of client-side prepared statements, the check for suitability of server-side prepared and server-side prepared statements themselves?	false	3.0.10
cacheResultSetMetadata	Should the driver cache ResultSetMetaData for Statements and PreparedStatements? (Req. JDK-1.4+, true/false, default 'false')	false	3.1.1
cacheServerConfiguration	Should the driver cache the results of <code>SHOW VARIABLES</code> and <code>SHOW COLLATION</code> on a per-URL basis?	false	3.1.5
defaultFetchSize	The driver will call <code>setFetchSize(n)</code> with this value on all newly-created Statements	0	3.1.9
dontTrackOpenResources	The JDBC specification requires the driver to automatically track and close resources, however if your application doesn't do a good job of explicitly calling <code>close()</code> on statements or result sets, this can cause memory leakage. Setting this property to true relaxes this constraint, and can be more memory efficient for some applications.	false	3.1.7
dynamicCalendars	Should the driver retrieve the default calendar	false	3.1.5

	when required, or cache it per connection/session?		
elideSetAutoCommits	If using MySQL-4.1 or newer, should the driver only issue 'set autocommit=n' queries when the server's state doesn't match the requested state by <code>Connection.setAutoCommit(boolean)</code> ?	false	3.1.3
holdResultsOpenOverStatementClose	Should the driver close result sets on <code>Statement.close()</code> as required by the JDBC specification?	false	3.1.7
locatorFetchBufferSize	If 'emulateLocators' is configured to 'true', what size buffer should be used when fetching BLOB data for <code>getBinaryInputStream</code> ?	1048576	3.2.1
rewriteBatchedStatements	Should the driver use multiqueries (irregardless of the setting of <code>allowMultiQueries</code> ) as well as rewriting of prepared statements for <code>INSERT</code> into multi-value inserts when <code>executeBatch()</code> is called? Notice that this has the potential for SQL injection if using plain <code>java.sql.Statements</code> and your code doesn't sanitize input correctly. Notice that for prepared statements, server-side prepared statements can not currently take advantage of this rewrite option, and that if you don't specify stream lengths when using <code>PreparedStatement.set*Stream()</code> , the driver won't be able to determine the optimum number of parameters per batch and you might receive an error from the driver that the resultant packet is too large. <code>Statement.getGeneratedKeys()</code> for these rewritten statements only works when the entire batch includes <code>INSERT</code> statements.	false	3.1.13
useFastIntParsing	Use internal String->Integer conversion routines to avoid excessive object creation?	true	3.1.4
useJvmCharsetConverters	Always use the character encoding routines built into the JVM, rather than using lookup tables for single-byte character sets? (The default of "true" for this is appropriate for newer JVMs)	true	5.0.1
useLocalSessionState	Should the driver refer to the internal values of autocommit and transaction isolation that are set by <code>Connection.setAutoCommit()</code> and <code>Connection.setTransactionIsolation()</code> , rather than querying the database?	false	3.1.7
useReadAheadInput	Use newer, optimized non-blocking, buffered input stream when reading from the server?	true	3.1.5

**Debugging/Profiling.**

Property Name	Definition	Default Value	Since Version
logger	The name of a class that implements 'com.mysql.jdbc.log.Log' that will be used to log messages to. (default is 'com.mysql.jdbc.log.StandardLogger', which logs to <code>STDERR</code> )	com.mysql.jdbc.log.StandardLogger	3.1.1
profileSQL	Trace queries and their execution/fetch times to the	false	3.1.0

	configured logger (true/false) defaults to 'false'		
reportMetricsIntervalMillis	If 'gatherPerfMetrics' is enabled, how often should they be logged (in ms)?	30000	3.1.2
maxQuerySizeToLog	Controls the maximum length/size of a query that will get logged when profiling or tracing	2048	3.1.3
packetDebugBufferSize	The maximum number of packets to retain when 'enablePacketDebug' is true	20	3.1.3
slowQueryThresholdMillis	If 'logSlowQueries' is enabled, how long should a query (in ms) before it is logged as 'slow'?	2000	3.1.2
useUsageAdvisor	Should the driver issue 'usage' warnings advising proper and efficient usage of JDBC and MySQL Connector/J to the log (true/false, defaults to 'false')?	false	3.1.1
autoGenerateTestcaseScript	Should the driver dump the SQL it is executing, including server-side prepared statements to STDERR?	false	3.1.9
dumpMetadataOnColumnNotFound	Should the driver dump the field-level metadata of a result set into the exception message when ResultSet.findColumn() fails?	false	3.1.13
dumpQueriesOnException	Should the driver dump the contents of the query sent to the server in the message for SQLExceptions?	false	3.1.3
enablePacketDebug	When enabled, a ring-buffer of 'packetDebugBufferSize' packets will be kept, and dumped when exceptions are thrown in key areas in the driver's code	false	3.1.3
explainSlowQueries	If 'logSlowQueries' is enabled, should the driver automatically issue an 'EXPLAIN' on the server and send the results to the configured log at a WARN level?	false	3.1.2
logSlowQueries	Should queries that take longer than 'slowQueryThresholdMillis' be logged?	false	3.1.2
traceProtocol	Should trace-level network protocol be logged?	false	3.1.2

**Miscellaneous.**

Property Name	Definition	Default Value	Since Version
useUnicode	Should the driver use Unicode character encodings when handling strings? Should only be used when the driver can't determine the character set mapping, or you are trying to 'force' the driver to use a character set that MySQL either doesn't natively support (such as UTF-8), true/false, defaults to 'true'	true	1.1g
characterEncoding	If 'useUnicode' is set to true, what character encoding should the driver use when dealing with strings? (defaults is to 'autodetect')		1.1g
characterSetResults	Character set to tell the server to return results as.		3.0.13
connectionCollation	If set, tells the server to use this collation via 'set'		3.0.13

	collation_connection'		
sessionVariables	A comma-separated list of name/value pairs to be sent as SET SESSION ... to the server when the driver connects.		3.1.8
allowNanAndInf	Should the driver allow NaN or +/- INF values in PreparedStatement.setDouble()?	false	3.1.5
autoClosePstmtStreams	Should the driver automatically call .close() on streams/readers passed as arguments via set*() methods?	false	3.1.12
autoDeserialize	Should the driver automatically detect and de-serialize objects stored in BLOB fields?	false	3.1.5
capitalizeTypeNames	Capitalize type names in DatabaseMetaData? (usually only useful when using WebObjects, true/false, defaults to 'false')	false	2.0.7
clobCharacterEncoding	The character encoding to use for sending and retrieving TEXT, MEDIUMTEXT and LONGTEXT values instead of the configured connection characterEncoding		5.0.0
clobberStreamingResults	This will cause a 'streaming' ResultSet to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server.	false	3.0.9
continueBatchOnError	Should the driver continue processing batch commands if one statement fails. The JDBC spec allows either way (defaults to 'true').	true	3.0.3
createDatabaseIfNotExist	Creates the database given in the URL if it doesn't yet exist. Assumes the configured user has permissions to create databases.	false	3.1.9
emptyStringsConvertToZero	Should the driver allow conversions from empty string fields to numeric values of '0'?	true	3.1.8
emulateLocators	N/A	false	3.1.0
emulateUnsupportedPstmts	Should the driver detect prepared statements that are not supported by the server, and replace them with client-side emulated versions?	true	3.1.7
ignoreNonTxTables	Ignore non-transactional table warning for roll-back? (defaults to 'false').	false	3.0.9
jdbcCompliantTruncation	Should the driver throw java.sql.DataTruncation exceptions when data is truncated as is required by the JDBC specification when connected to a server that supports warnings(MySQL 4.1.0 and newer)?	true	3.1.2
maxRows	The maximum number of rows to return (0, the default means return all rows).	-1	all versions
noAccessToProcedureBodies	When determining procedure parameter types for CallableStatements, and the connected user can't access procedure bodies through "SHOW CREATE PROCEDURE" or select on mysql.proc should the driver instead create basic metadata (all parameters reported as INOUT VARCHARs) instead of throwing an exception?	false	5.0.3
noDatetimeStringSync	Don't ensure that Result-	false	3.1.7

	<code>Set.getDatetimeType().toString().equals(ResultSet.getString())</code>		
noTimezoneConversionForTimeType	Don't convert TIME values using the server timezone if 'useTimezone'='true'	false	5.0.0
nullCatalogMeansCurrent	When DatabaseMetadataMethods ask for a 'catalog' parameter, does the value null mean use the current catalog? (this is not JDBC-compliant, but follows legacy behavior from earlier versions of the driver)	true	3.1.8
nullNamePatternMatchesAll	Should DatabaseMetaData methods that accept *pattern parameters treat null the same as '%' (this is not JDBC-compliant, however older versions of the driver accepted this departure from the specification)	true	3.1.8
overrideSupportsIntegrityEnhancementFacility	Should the driver return "true" for DatabaseMetaData.supportsIntegrityEnhancementFacility() even if the database doesn't support it to work-around applications that require this method to return "true" to signal support of foreign keys, even though the SQL specification states that this facility contains much more than just foreign key support (one such application being OpenOffice)?	false	3.1.12
pedantic	Follow the JDBC spec to the letter.	false	3.0.0
pinGlobalTxToPhysicalConnection	When using XAConnections, should the driver ensure that operations on a given XID are always routed to the same physical connection? This allows the XAConnection to support "XA START ... JOIN" after "XA END" has been called	false	5.0.1
processEscapeCodesForPrepStmts	Should the driver process escape codes in queries that are prepared?	true	3.1.12
relaxAutoCommit	If the version of MySQL the driver connects to does not support transactions, still allow calls to commit(), rollback() and setAutoCommit() (true/false, defaults to 'false')?	false	2.0.13
retainStatementAfterResultSetClose	Should the driver retain the Statement reference in a ResultSet after ResultSet.close() has been called. This is not JDBC-compliant after JDBC-4.0.	false	3.1.11
rollbackOnPooledClose	Should the driver issue a rollback() when the logical connection in a pool is closed?	true	3.0.15
runningCTS13	Enables workarounds for bugs in Sun's JDBC compliance testsuite version 1.3	false	3.1.7
serverTimezone	Override detection/mapping of timezone. Used when timezone from server doesn't map to Java timezone		3.0.2
strictFloatingPoint	Used only in older versions of compliance test	false	3.0.0
strictUpdates	Should the driver do strict checking (all primary keys selected) of updatable result sets (true, false, defaults to 'true')?	true	3.0.4
tinyInt1isBit	Should the driver treat the datatype TINYINT(1) as the BIT type (because the server silently converts BIT -> TINYINT(1) when creating tables)?	true	3.0.16

transformedBitIsBoolean	If the driver converts TINYINT(1) to a different type, should it use BOOLEAN instead of BIT for future compatibility with MySQL-5.0, as MySQL-5.0 has a BIT type?	false	3.1.9
ultraDevHack	Create PreparedStatements for prepareCall() when required, because UltraDev is broken and issues a prepareCall() for _all_ statements? (true/false, defaults to 'false')	false	2.0.3
useGmtMillisForDatetimes	Convert between session timezone and GMT before creating Date and Timestamp instances (value of "false" is legacy behavior, "true" leads to more JDBC-compliant behavior.	false	3.1.12
useHostsInPrivileges	Add '@hostname' to users in DatabaseMetaData.getColumn/TablePrivileges() (true/false), defaults to 'true'.	true	3.0.2
useInformationSchema	When connected to MySQL-5.0.7 or newer, should the driver use the INFORMATION_SCHEMA to derive information used by DatabaseMetaData?	false	5.0.0
useJDBCCompliant-TimezoneShift	Should the driver use JDBC-compliant rules when converting TIME/TIMESTAMP/DATETIME values' timezone information for those JDBC arguments which take a java.util.Calendar argument? (Notice that this option is exclusive of the "use-Timezone=true" configuration option.)	false	5.0.0
useOldUTF8Behavior	Use the UTF-8 behavior the driver did when communicating with 4.0 and older servers	false	3.1.6
useOnlyServerErrorMessages	Don't prepend 'standard' SQLState error messages to error messages returned by the server.	true	3.0.15
useServerPrepStmts	Use server-side prepared statements if the server supports them? (defaults to 'true').	true	3.1.0
useSqlStateCodes	Use SQL Standard state codes instead of 'legacy' X/Open/SQL state codes (true/false), default is 'true'	true	3.1.3
useStreamLengthsInPrepStmts	Honor stream length parameter in PreparedStatement/ResultSet.setXXXStream() method calls (true/false, defaults to 'true')?	true	3.0.2
useTimezone	Convert time/date types between client and server timezones (true/false, defaults to 'false')?	false	3.0.2
useUnbufferedInput	Don't use BufferedInputStream for reading data from the server	true	3.0.11
yearIsDateType	Should the JDBC driver treat the MySQL type "YEAR" as a java.sql.Date, or as a SHORT?	true	3.1.9
zeroDateTimeBehavior	What should happen when the driver encounters DATETIME values that are composed entirely of zeroes (used by MySQL to represent invalid dates)? Valid values are 'exception', 'round' and 'convertToNull'.	exception	3.1.4

Connector/J also supports access to MySQL via named pipes on Windows NT/2000/XP using the NamedPipeSocketFactory as a plugin-socket factory via the socketFactory property. If you don't use a namedPipePath property, the default of '\\.\pipe\MySQL' will be used. If you use the [Named-](#)

`PipeSocketFactory`, the hostname and port number values in the JDBC url will be ignored. You can enable this feature using:

```
socketFactory=com.mysql.jdbc.NamedPipeSocketFactory
```

Named pipes only work when connecting to a MySQL server on the same physical machine as the one the JDBC driver is being used on. In simple performance tests, it appears that named pipe access is between 30%-50% faster than the standard TCP/IP access.

You can create your own socket factories by following the example code in `com.mysql.jdbc.NamedPipeSocketFactory`, or `com.mysql.jdbc.StandardSocketFactory`.

### 18.3.4.2. JDBC API Implementation Notes

MySQL Connector/J passes all of the tests in the publicly-available version of Sun's JDBC compliance test suite. However, in many places the JDBC specification is vague about how certain functionality should be implemented, or the specification allows leeway in implementation.

This section gives details on a interface-by-interface level about how certain implementation decisions may affect how you use MySQL Connector/J.

- Blob

The Blob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the corresponding `PreparedStatement.setBlob()` or `ResultSet.updateBlob()` (in the case of updatable result sets) methods to save changes back to the database.

Starting with Connector/J version 3.1.0, you can emulate Blobs with locators by adding the property 'emulateLocators=true' to your JDBC URL. You must then use a column alias with the value of the column set to the actual name of the Blob column in the `SELECT` that you write to retrieve the Blob. The `SELECT` must also reference only one table, the table must have a primary key, and the `SELECT` must cover all columns that make up the primary key. The driver will then delay loading the actual Blob data until you retrieve the Blob and call retrieval methods (`getInputStream()`, `getBytes()`, and so forth) on it.

- CallableStatement

Starting with Connector/J 3.1.1, stored procedures are supported when connecting to MySQL version 5.0 or newer via the `CallableStatement` interface. Currently, the `getParameterMetaData()` method of `CallableStatement` is not supported.

- Clob

The Clob implementation does not allow in-place modification (they are copies, as reported by the `DatabaseMetaData.locatorsUpdateCopies()` method). Because of this, you should use the `PreparedStatement.setClob()` method to save changes back to the database. The JDBC API does not have a `ResultSet.updateClob()` method.

- Connection

Unlike older versions of MM.MySQL the `isClosed()` method does not ping the server to determine if it is alive. In accordance with the JDBC specification, it only returns true if `closed()` has been called on the connection. If you need to determine if the connection is still valid, you should issue a simple query, such as `SELECT 1`. The driver will throw an exception if the connection is no longer valid.

- DatabaseMetaData

Foreign Key information (`getImportedKeys()`/`getExportedKeys()` and `getCrossReference()`) is only available from InnoDB tables. However, the driver uses `SHOW CREATE TABLE` to retrieve this information, so when other storage engines support foreign keys, the driver will transparently support them as well.

- PreparedStatement

PreparedStatements are implemented by the driver, as MySQL does not have a prepared statement feature. Because of this, the driver does not implement `getParameterMetaData()` or `getMetaData()` as it would require the driver to have a complete SQL parser in the client.

Starting with version 3.1.0 MySQL Connector/J, server-side prepared statements and binary-encoded result sets are used when the server supports them.

Take care when using a server-side prepared statement with **large** parameters that are set via `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()`, or `setClob()`. If you want to re-execute the statement with any large parameter changed to a non-large parameter, it is necessary to call `clearParameters()` and set all parameters again. The reason for this is as follows:

- The driver streams the large data out-of-band to the prepared statement on the server side when the parameter is set (before execution of the prepared statement).
- Once that has been done, the stream used to read the data on the client side is closed (as per the JDBC spec), and can't be read from again.
- If a parameter changes from large to non-large, the driver must reset the server-side state of the prepared statement to allow the parameter that is being changed to take the place of the prior large value. This removes all of the large data that has already been sent to the server, thus requiring the data to be re-sent, via the `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()`, `setBlob()` or `setClob()` methods.

Consequently, if you want to change the type of a parameter to a non-large one, you must call `clearParameters()` and set all parameters of the prepared statement again before it can be re-executed.

- ResultSet

By default, ResultSets are completely retrieved and stored in memory. In most cases this is the most efficient way to operate, and due to the design of the MySQL network protocol is easier to implement. If you are working with ResultSets that have a large number of rows or large values, and can not allocate heap space in your JVM for the memory required, you can tell the driver to stream the results back one row at a time.

To enable this functionality, you need to create a Statement instance in the following manner:

```
stmt = conn.createStatement( java.sql.ResultSet.TYPE_FORWARD_ONLY,
                             java.sql.ResultSet.CONCUR_READ_ONLY );
stmt.setFetchSize( Integer.MIN_VALUE );
```

The combination of a forward-only, read-only result set, with a fetch size of `Integer.MIN_VALUE` serves as a signal to the driver to stream result sets row-by-row. After this any result sets created with the statement will be retrieved row-by-row.

There are some caveats with this approach. You will have to read all of the rows in the result set (or close it) before you can issue any other queries on the connection, or an exception will be thrown.

The earliest the locks these statements hold can be released (whether they be [MyISAM](#) table-level locks or row-level locks in some other storage engine such as [InnoDB](#)) is when the statement completes.

If the statement is within scope of a transaction, then locks are released when the transaction completes (which implies that the statement needs to complete first). As with most other databases, statements are not complete until all the results pending on the statement are read or the active result set for the statement is closed.

Therefore, if using streaming results, you should process them as quickly as possible if you want to maintain concurrent access to the tables referenced by the statement producing the result set.

- `ResultSetMetaData`

The `isAutoIncrement()` method only works when using MySQL servers 4.0 and newer.

- `Statement`

When using versions of the JDBC driver earlier than 3.2.1, and connected to server versions earlier than 5.0.3, the `setFetchSize()` method has no effect, other than to toggle result set streaming as described above.

MySQL does not support SQL cursors, and the JDBC driver doesn't emulate them, so `setCursorName()` has no effect.

### 18.3.4.3. Java, JDBC and MySQL Types

MySQL Connector/J is flexible in the way it handles conversions between MySQL data types and Java data types.

In general, any MySQL data type can be converted to a `java.lang.String`, and any numerical type can be converted to any of the Java numerical types, although round-off, overflow, or loss of precision may occur.

Starting with Connector/J 3.1.0, the JDBC driver will issue warnings or throw `DataTruncation` exceptions as is required by the JDBC specification unless the connection was configured not to do so by using the property `jdbcCompliantTruncation` and setting it to `false`.

The conversions that are always guaranteed to work are listed in the following table:

#### Connection Properties - Miscellaneous.

These MySQL Data Types	Can always be converted to these Java types
<code>CHAR</code> , <code>VARCHAR</code> , <code>BLOB</code> , <code>TEXT</code> , <code>ENUM</code> , and <code>SET</code>	<code>java.lang.String</code> , <code>java.io.InputStream</code> , <code>java.io.Reader</code> , <code>java.sql.Blob</code> , <code>java.sql.Clob</code>
<code>FLOAT</code> , <code>REAL</code> , <code>DOUBLE PRECISION</code> , <code>NUMERIC</code> , <code>DECIMAL</code> , <code>TINYINT</code> , <code>SMALLINT</code> , <code>MEDIUMINT</code> , <code>INTEGER</code> , <code>BIGINT</code>	<code>java.lang.String</code> , <code>java.lang.Short</code> , <code>java.lang.Integer</code> , <code>java.lang.Long</code> , <code>java.lang.Double</code> , <code>java.math.BigDecimal</code>
<code>DATE</code> , <code>TIME</code> , <code>DATETIME</code> , <code>TIMESTAMP</code>	<code>java.lang.String</code> , <code>java.sql.Date</code> , <code>java.sql.Timestamp</code>

**Note:** round-off, overflow or loss of precision may occur if you choose a Java numeric data type that has less precision or capacity than the MySQL data type you are converting to/from.

The `ResultSet.getObject()` method uses the type conversions between MySQL and Java types, following the JDBC specification where appropriate. The value returned by `ResultSet-  
MetaData.getColumnClassName()` is also shown below. For more information on the `java.sql.Types` classes see [Java 2 Platform Types](http://java.sun.com/j2se/1.4.2/docs/api/java/sql/Types.html) [http://java.sun.com/j2se/1.4.2/docs/api/java/sql/Types.html].

#### MySQL Types to Java Types for `ResultSet.getObject()`.

MySQL Type Name	Return value of <code>getColumnClassName</code>
TINYINT	TINYINT
BOOL, BOOLEAN	TINYINT
SMALLINT[(M)] [UNSIGNED]	SMALLINT [UNSIGNED]
MEDIUMINT[(M)] [UNSIGNED]	MEDIUMINT [UNSIGNED]
INT,INTEGER[(M)] [UNSIGNED]	INTEGER [UNSIGNED]
BIGINT[(M)] [UNSIGNED]	BIGINT [UNSIGNED]
FLOAT[(M,D)]	FLOAT
DOUBLE[(M,B)]	DOUBLE
DECIMAL[(M[,D])]	DECIMAL
DATE	DATE
DATETIME	DATETIME
TIMESTAMP[(M)]	TIMESTAMP
TIME	TIME
YEAR[(2 4)]	YEAR
CHAR(M)	CHAR
VARCHAR(M) [BINARY]	VARCHAR
BINARY(M)	BINARY
VARBINARY(M)	VARBINARY
TINYBLOB	TINYBLOB
TINYTEXT	VARCHAR
BLOB	BLOB
TEXT	VARCHAR
MEDIUMBLOB	MEDIUMBLOB
MEDIUMTEXT	VARCHAR
LOBLOB	LOBLOB
LONGTEXT	VARCHAR
ENUM('value1','value2',...)	CHAR
SET('value1','value2',...)	CHAR

#### 18.3.4.4. Using Character Sets and Unicode

All strings sent from the JDBC driver to the server are converted automatically from native Java Unicode form to the client character encoding, including all queries sent via `Statement.execute()`,

`Statement.executeUpdate()`, `Statement.executeQuery()` as well as all `PreparedStatement` and `CallableStatement` parameters with the exclusion of parameters set using `setBytes()`, `setBinaryStream()`, `setAsciiStream()`, `setUnicodeStream()` and `setBlob()`.

Prior to MySQL Server 4.1, Connector/J supported a single character encoding per connection, which could either be automatically detected from the server configuration, or could be configured by the user through the `useUnicode` and "`characterEncoding`" properties.

Starting with MySQL Server 4.1, Connector/J supports a single character encoding between client and server, and any number of character encodings for data returned by the server to the client in `ResultSet`.

The character encoding between client and server is automatically detected upon connection. The encoding used by the driver is specified on the server via the `character_set` system variable for server versions older than 4.1.0 and `character_set_server` for server versions 4.1.0 and newer. For more information, see [Section 10.3.1, "Server Character Set and Collation"](#).

To override the automatically-detected encoding on the client side, use the `characterEncoding` property in the URL used to connect to the server.

When specifying character encodings on the client side, Java-style names should be used. The following table lists Java-style names for MySQL character sets:

#### MySQL to Java Encoding Name Translations.

MySQL Character Set Name	Java-Style Character Encoding Name
ascii	US-ASCII
big5	Big5
gbk	GBK
sjis	SJIS (or Cp932 or MS932 for MySQL Server < 4.1.11)
cp932	Cp932 or MS932 (MySQL Server > 4.1.11)
gb2312	EUC_CN
ujis	EUC_JP
euckr	EUC_KR
latin1	ISO8859_1
latin2	ISO8859_2
greek	ISO8859_7
hebrew	ISO8859_8
cp866	Cp866
tis620	TIS620
cp1250	Cp1250
cp1251	Cp1251
cp1257	Cp1257
macroman	MacRoman
macce	MacCentralEurope
utf8	UTF-8
ucs2	UnicodeBig

**Warning.** Do not issue the query 'set names' with Connector/J, as the driver will not detect that the character set has changed, and will continue to use the character set detected during the initial connection setup.

To allow multiple character sets to be sent from the client, the UTF-8 encoding should be used, either by configuring `utf8` as the default server character set, or by configuring the JDBC driver to use UTF-8 through the `characterEncoding` property.

### 18.3.4.5. Connecting Securely Using SSL

SSL in MySQL Connector/J encrypts all data (other than the initial handshake) between the JDBC driver and the server. The performance penalty for enabling SSL is an increase in query processing time between 35% and 50%, depending on the size of the query, and the amount of data it returns.

For SSL Support to work, you must have the following:

- A JDK that includes JSSE (Java Secure Sockets Extension), like JDK-1.4.1 or newer. SSL does not currently work with a JDK that you can add JSSE to, like JDK-1.2.x or JDK-1.3.x due to the following JSSE bug: <http://developer.java.sun.com/developer/bugParade/bugs/4273544.html>
- A MySQL server that supports SSL and has been compiled and configured to do so, which is MySQL-4.0.4 or later, see [Section 5.8.7, “Using Secure Connections”](#), for more information.
- A client certificate (covered later in this section)

You will first need to import the MySQL server CA Certificate into a Java truststore. A sample MySQL server CA Certificate is located in the [SSL](#) subdirectory of the MySQL source distribution. This is what SSL will use to determine if you are communicating with a secure MySQL server.

To use Java's `keytool` to create a truststore in the current directory, and import the server's CA certificate (`cacert.pem`), you can do the following (assuming that `keytool` is in your path. The `keytool` should be located in the `bin` subdirectory of your JDK or JRE):

```
shell> keytool -import -alias mysqlServerCACert -file cacert.pem -keystore truststore
```

Keytool will respond with the following information:

```
Enter keystore password: *****
Owner: EMAILADDRESS=walrus@example.com, CN=Walrus, O=MySQL AB, L=Orenburg, ST=Some-
State, C=RU
Issuer: EMAILADDRESS=walrus@example.com, CN=Walrus, O=MySQL AB, L=Orenburg, ST=Som
e-State, C=RU
Serial number: 0
Valid from: Fri Aug 02 16:55:53 CDT 2002 until: Sat Aug 02 16:55:53 CDT 2003
Certificate fingerprints:
    MD5:  61:91:A0:F2:03:07:61:7A:81:38:66:DA:19:C4:8D:AB
    SHA1: 25:77:41:05:D5:AD:99:8C:14:8C:CA:68:9C:2F:B8:89:C3:34:4D:6C
Trust this certificate? [no]: yes
Certificate was added to keystore
```

You will then need to generate a client certificate, so that the MySQL server knows that it is talking to a secure client:

```
shell> keytool -genkey -keyalg rsa -alias mysqlClientCertificate -keystore keystore
```

Keytool will prompt you for the following information, and create a keystore named `keystore` in the current directory.

You should respond with information that is appropriate for your situation:

```

Enter keystore password: *****
What is your first and last name?
  [Unknown]: Matthews
What is the name of your organizational unit?
  [Unknown]: Software Development
What is the name of your organization?
  [Unknown]: MySQL AB
What is the name of your City or Locality?
  [Unknown]: Flossmoor
What is the name of your State or Province?
  [Unknown]: IL
What is the two-letter country code for this unit?
  [Unknown]: US
Is <CN=Matthews, OU=Software Development, O=MySQL AB,
L=Flossmoor, ST=IL, C=US> correct?
  [no]: y

Enter key password for <mysqlClientCertificate>
      (RETURN if same as keystore password):

```

Finally, to get JSSE to use the keystore and truststore that you have generated, you need to set the following system properties when you start your JVM, replacing `path_to_keystore_file` with the full path to the keystore file you created, `path_to_truststore_file` with the path to the truststore file you created, and using the appropriate password values for each property.

```

-Djavax.net.ssl.keyStore=path_to_keystore_file
-Djavax.net.ssl.keyStorePassword=*****
-Djavax.net.ssl.trustStore=path_to_truststore_file
-Djavax.net.ssl.trustStorePassword=*****

```

You will also need to set `useSSL` to `true` in your connection parameters for MySQL Connector/J, either by adding `useSSL=true` to your URL, or by setting the property `useSSL` to `true` in the `java.util.Properties` instance you pass to `DriverManager.getConnection()`.

You can test that SSL is working by turning on JSSE debugging (as detailed below), and look for the following key events:

```

...

```

JSSE provides debugging (to STDOUT) when you set the following system property: -

`Djavax.net.debug=all` This will tell you what keystores and truststores are being used, as well as what is going on during the SSL handshake and certificate exchange. It will be helpful when trying to determine what is not working when trying to get an SSL connection to happen.

### 18.3.4.6. Using Master/Slave Replication with ReplicationConnection

Starting with Connector/J 3.1.7, we've made available a variant of the driver that will automatically send queries to a read/write master, or a failover or round-robin loadbalanced set of slaves based on the state of `Connection.getReadOnly()`.

An application signals that it wants a transaction to be read-only by calling `Connection.setReadOnly(true)`, this replication-aware connection will use one of the slave connections, which are load-balanced per-vm using a round-robin scheme (a given connection is sticky to a slave unless that slave is removed from service). If you have a write transaction, or if you have a read that is time-sensitive (remember, replication in MySQL is asynchronous), set the connection to be not read-only, by calling `Connection.setReadOnly(false)` and the driver will ensure that further calls are sent to the master MySQL server. The driver takes care of propagating the current state of auto-commit, isolation level, and catalog between all of the connections that it uses to accomplish this load balancing functionality.

To enable this functionality, use the "`com.mysql.jdbc.ReplicationDriver`" class when configuring your application server's connection pool or when creating an instance of a JDBC driver for your standalone application. Because it accepts the same URL format as the standard MySQL JDBC driver, `ReplicationDriver` does not currently work with `java.sql.DriverManager`-based connection creation unless it is the only MySQL JDBC driver registered with the `DriverManager`.

Here is a short, simple example of how `ReplicationDriver` might be used in a standalone application.

```
import java.sql.Connection;
import java.sql.ResultSet;
import java.util.Properties;

import com.mysql.jdbc.ReplicationDriver;

public class ReplicationDriverDemo {

    public static void main(String[] args) throws Exception {
        ReplicationDriver driver = new ReplicationDriver();

        Properties props = new Properties();

        // We want this for failover on the slaves
        props.put("autoReconnect", "true");

        // We want to load balance between the slaves
        props.put("roundRobinLoadBalance", "true");

        props.put("user", "foo");
        props.put("password", "bar");

        //
        // Looks like a normal MySQL JDBC url, with a comma-separated list
        // of hosts, the first being the 'master', the rest being any number
        // of slaves that the driver will load balance against
        //
        Connection conn =
            driver.connect("jdbc:mysql://master,slave1,slave2,slave3/test",
                props);

        //
        // Perform read/write work on the master
        // by setting the read-only flag to "false"
        //
        conn.setReadOnly(false);
        conn.setAutoCommit(false);
        conn.createStatement().executeUpdate("UPDATE some_table ...");
        conn.commit();

        //
    }
}
```

```

// Now, do a query from a slave, the driver automatically picks one
// from the list
//
conn.setReadOnly(true);

ResultSet rs = conn.createStatement().executeQuery("SELECT a,b,c FROM some_other_table");
    .....
}
}

```

## 18.3.5. Connector/J Notes and Tips

### 18.3.5.1. Basic JDBC Concepts

This section provides some general JDBC background.

#### 18.3.5.1.1. Connecting to MySQL Using the [DriverManager](#) Interface

When you are using JDBC outside of an application server, the [DriverManager](#) class manages the establishment of Connections.

The [DriverManager](#) needs to be told which JDBC drivers it should try to make Connections with. The easiest way to do this is to use [Class.forName\(\)](#) on the class that implements the [java.sql.Driver](#) interface. With MySQL Connector/J, the name of this class is [com.mysql.jdbc.Driver](#). With this method, you could use an external configuration file to supply the driver class name and driver parameters to use when connecting to a database.

The following section of Java code shows how you might register MySQL Connector/J from the [main\(\)](#) method of your application:

```

import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

// Notice, do not import com.mysql.jdbc.*
// or you will have problems!

public class LoadDriver {
    public static void main(String[] args) {
        try {
            // The newInstance() call is a work around for some
            // broken Java implementations

            Class.forName("com.mysql.jdbc.Driver").newInstance();
        } catch (Exception ex) {
            // handle the error
        }
    }
}

```

After the driver has been registered with the [DriverManager](#), you can obtain a [Connection](#) instance that is connected to a particular database by calling [DriverManager.getConnection\(\)](#):

#### Example 18.1. Obtaining a connection from the [DriverManager](#)

This example shows how you can obtain a [Connection](#) instance from the [DriverManager](#). There are a few different signatures for the [getConnection\(\)](#) method. You should see the API documentation that comes with your JDK for more specific information on how to use them.

```

import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.SQLException;

```

```

... try {
    Connection conn = DriverManager.getConnection("jdbc:mysql://localhost/test?user=monty&passw

    // Do something with the Connection

    ....
} catch (SQLException ex) {
    // handle any errors
    System.out.println("SQLException: " + ex.getMessage());
    System.out.println("SQLState: " + ex.getSQLState());
    System.out.println("VendorError: " + ex.getErrorCode());
}

```

Once a [Connection](#) is established, it can be used to create [Statement](#) and [PreparedStatement](#) objects, as well as retrieve metadata about the database. This is explained in the following sections.

### 18.3.5.1.2. Using Statements to Execute SQL

[Statement](#) objects allow you to execute basic SQL queries and retrieve the results through the [ResultSet](#) class which is described later.

To create a [Statement](#) instance, you call the `createStatement()` method on the [Connection](#) object you have retrieved via one of the `DriverManager.getConnection()` or `DataSource.getConnection()` methods described earlier.

Once you have a [Statement](#) instance, you can execute a [SELECT](#) query by calling the `executeQuery(String)` method with the SQL you want to use.

To update data in the database, use the `executeUpdate(String SQL)` method. This method returns the number of rows affected by the update statement.

If you don't know ahead of time whether the SQL statement will be a [SELECT](#) or an [UPDATE/INSERT](#), then you can use the `execute(String SQL)` method. This method will return true if the SQL query was a [SELECT](#), or false if it was an [UPDATE](#), [INSERT](#), or [DELETE](#) statement. If the statement was a [SELECT](#) query, you can retrieve the results by calling the `getResultSet()` method. If the statement was an [UPDATE](#), [INSERT](#), or [DELETE](#) statement, you can retrieve the affected rows count by calling `getUpdateCount()` on the [Statement](#) instance.

#### Example 18.2. Using `java.sql.Statement` to execute a [SELECT](#) query

```

// assume that conn is an already created JDBC connection
Statement stmt = null;
ResultSet rs = null;

try {
    stmt = conn.createStatement();
    rs = stmt.executeQuery("SELECT foo FROM bar");

    // or alternatively, if you don't know ahead of time that
    // the query will be a SELECT...

    if (stmt.execute("SELECT foo FROM bar")) {
        rs = stmt.getResultSet();
    }

    // Now do something with the ResultSet ....
} finally {
    // it is a good idea to release
    // resources in a finally{} block
    // in reverse-order of their creation
    // if they are no-longer needed

    if (rs != null) {
        try {
            rs.close();

```

```

    } catch (SQLException sqlEx) { // ignore }
    rs = null;
}
if (stmt != null) {
    try {
        stmt.close();
    } catch (SQLException sqlEx) { // ignore }
    stmt = null;
}
}

```

### 18.3.5.1.3. Using `CallableStatements` to Execute Stored Procedures

Starting with MySQL server version 5.0 when used with Connector/J 3.1.1 or newer, the `java.sql.CallableStatement` interface is fully implemented with the exception of the `getParameterMetaData()` method.

Connector/J exposes stored procedure functionality through JDBC's `CallableStatement` interface.

**Note.** Current versions of MySQL server do not return enough information for the JDBC driver to provide result set metadata for callable statements. This means that when using `CallableStatement`, `ResultSetMetaData` may return `NULL`.

The following example shows a stored procedure that returns the value of `inOutParam` incremented by 1, and the string passed in via `inputParam` as a `ResultSet`:

#### Example 18.3. Stored Procedures

```

CREATE PROCEDURE demoSp(IN inputParam VARCHAR(255), INOUT inOutParam INT)
BEGIN
    DECLARE z INT;
    SET z = inOutParam + 1;
    SET inOutParam = z;

    SELECT inputParam;

    SELECT CONCAT('zyxw', inputParam);
END

```

To use the `demoSp` procedure with Connector/J, follow these steps:

1. Prepare the callable statement by using `Connection.prepareCall()`.

Notice that you have to use JDBC escape syntax, and that the parentheses surrounding the parameter placeholders are not optional:

#### Example 18.4. Using `Connection.prepareCall()`

```

import java.sql.CallableStatement;
...

//
// Prepare a call to the stored procedure 'demoSp'
// with two parameters
//
// Notice the use of JDBC-escape syntax ({call ...})
//

```

```
CallableStatement cStmt = conn.prepareCall("{call demoSp(?, ?)}");

cStmt.setString(1, "abcdefg");
```

**Note.** `Connection.prepareCall()` is an expensive method, due to the metadata retrieval that the driver performs to support output parameters. For performance reasons, you should try to minimize unnecessary calls to `Connection.prepareCall()` by reusing `CallableStatement` instances in your code.

## 2. Register the output parameters (if any exist)

To retrieve the values of output parameters (parameters specified as `OUT` or `INOUT` when you created the stored procedure), JDBC requires that they be specified before statement execution using the various `registerOutputParameter()` methods in the `CallableStatement` interface:

### Example 18.5. Registering output parameters

```
import java.sql.Types;
...
//
// Connector/J supports both named and indexed
// output parameters. You can register output
// parameters using either method, as well
// as retrieve output parameters using either
// method, regardless of what method was
// used to register them.
//
// The following examples show how to use
// the various methods of registering
// output parameters (you should of course
// use only one registration per parameter).
//
//
// Registers the second parameter as output, and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter(2, Types.INTEGER);

//
// Registers the named parameter 'inOutParam', and
// uses the type 'INTEGER' for values returned from
// getObject()
//
cStmt.registerOutParameter("inOutParam", Types.INTEGER);
...
```

## 3. Set the input parameters (if any exist)

Input and in/out parameters are set as for `PreparedStatement` objects. However, `CallableStatement` also supports setting parameters by name:

### Example 18.6. Setting `CallableStatement` input parameters

```
...
//
// Set a parameter by index
```

```

//
cStmt.setString(1, "abcdefg");

//
// Alternatively, set a parameter using
// the parameter name
//
cStmt.setString("inputParameter", "abcdefg");

//
// Set the 'in/out' parameter using an index
//
cStmt.setInt(2, 1);

//
// Alternatively, set the 'in/out' parameter
// by name
//
cStmt.setInt("inOutParam", 1);

...

```

4. Execute the `CallableStatement`, and retrieve any result sets or output parameters.

Although `CallableStatement` supports calling any of the `Statement` execute methods (`executeUpdate()`, `executeQuery()` or `execute()`), the most flexible method to call is `execute()`, as you do not need to know ahead of time if the stored procedure returns result sets:

#### Example 18.7. Retrieving results and output parameter values

```

...
boolean hadResults = cStmt.execute();

//
// Process all returned result sets
//
while (hadResults) {
    ResultSet rs = cStmt.getResultSet();

    // process result set
    ...

    hadResults = rs.getMoreResults();
}

//
// Retrieve output parameters
//
// Connector/J supports both index-based and
// name-based retrieval
//
int outputValue = cStmt.getInt(2); // index-based
outputValue = cStmt.getInt("inOutParam"); // name-based

...

```

#### 18.3.5.1.4. Retrieving `AUTO_INCREMENT` Column Values

Before version 3.0 of the JDBC API, there was no standard way of retrieving key values from databases

that supported auto increment or identity columns. With older JDBC drivers for MySQL, you could always use a MySQL-specific method on the `Statement` interface, or issue the query `SELECT LAST_INSERT_ID()` after issuing an `INSERT` to a table that had an `AUTO_INCREMENT` key. Using the MySQL-specific method call isn't portable, and issuing a `SELECT` to get the `AUTO_INCREMENT` key's value requires another round-trip to the database, which isn't as efficient as possible. The following code snippets demonstrate the three different ways to retrieve `AUTO_INCREMENT` values. First, we demonstrate the use of the new JDBC-3.0 method `getGeneratedKeys()` which is now the preferred method to use if you need to retrieve `AUTO_INCREMENT` keys and have access to JDBC-3.0. The second example shows how you can retrieve the same value using a standard `SELECT LAST_INSERT_ID()` query. The final example shows how updatable result sets can retrieve the `AUTO_INCREMENT` value when using the `insertRow()` method.

### Example 18.8. Retrieving `AUTO_INCREMENT` column values using `Statement.getGeneratedKeys()`

```
Statement stmt = null;
ResultSet rs = null;

try {

    //
    // Create a Statement instance that we can use for
    // 'normal' result sets assuming you have a
    // Connection 'conn' to a MySQL database already
    // available

    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
                                java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ("
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Insert one row that will generate an AUTO INCREMENT
    // key in the 'priKey' field
    //

    stmt.executeUpdate(
        "INSERT INTO autoIncTutorial (dataField) "
        + "values ('Can I Get the Auto Increment Field?')",
        Statement.RETURN_GENERATED_KEYS);

    //
    // Example of using Statement.getGeneratedKeys()
    // to retrieve the value of an auto-increment
    // value
    //

    int autoIncKeyFromApi = -1;

    rs = stmt.getGeneratedKeys();

    if (rs.next()) {
        autoIncKeyFromApi = rs.getInt(1);
    } else {
        // throw an exception from here
    }

    rs.close();

    rs = null;

    System.out.println("Key returned from getGeneratedKeys():"
        + autoIncKeyFromApi);
} finally {
```

```

if (rs != null) {
    try {
        rs.close();
    } catch (SQLException ex) {
        // ignore
    }
}

if (stmt != null) {
    try {
        stmt.close();
    } catch (SQLException ex) {
        // ignore
    }
}
}

```

### Example 18.9. Retrieving `AUTO_INCREMENT` column values using `SELECT LAST_INSERT_ID()`

```

Statement stmt = null;
ResultSet rs = null;

try {
    //
    // Create a Statement instance that we can use for
    // 'normal' result sets.

    stmt = conn.createStatement();

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ("
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Insert one row that will generate an AUTO INCREMENT
    // key in the 'priKey' field
    //

    stmt.executeUpdate(
        "INSERT INTO autoIncTutorial (dataField) "
        + "values ('Can I Get the Auto Increment Field?')");

    //
    // Use the MySQL LAST_INSERT_ID()
    // function to do the same thing as getGeneratedKeys()
    //

    int autoIncKeyFromFunc = -1;
    rs = stmt.executeQuery("SELECT LAST_INSERT_ID()");

    if (rs.next()) {
        autoIncKeyFromFunc = rs.getInt(1);
    } else {
        // throw an exception from here
    }

    rs.close();

    System.out.println("Key returned from " + "SELECT LAST_INSERT_ID()': "
        + autoIncKeyFromFunc);
} finally {
    if (rs != null) {
        try {
            rs.close();

```

```

        } catch (SQLException ex) {
            // ignore
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException ex) {
            // ignore
        }
    }
}

```

### Example 18.10. Retrieving `AUTO_INCREMENT` column values in `Updatable ResultSets`

```

Statement stmt = null;
ResultSet rs = null;

try {

    //
    // Create a Statement instance that we can use for
    // 'normal' result sets as well as an 'updatable'
    // one, assuming you have a Connection 'conn' to
    // a MySQL database already available
    //

    stmt = conn.createStatement(java.sql.ResultSet.TYPE_FORWARD_ONLY,
                               java.sql.ResultSet.CONCUR_UPDATABLE);

    //
    // Issue the DDL queries for the table for this example
    //

    stmt.executeUpdate("DROP TABLE IF EXISTS autoIncTutorial");
    stmt.executeUpdate(
        "CREATE TABLE autoIncTutorial ( "
        + "priKey INT NOT NULL AUTO_INCREMENT, "
        + "dataField VARCHAR(64), PRIMARY KEY (priKey))");

    //
    // Example of retrieving an AUTO INCREMENT key
    // from an updatable result set
    //

    rs = stmt.executeQuery("SELECT priKey, dataField "
        + "FROM autoIncTutorial");

    rs.moveToInsertRow();

    rs.updateString("dataField", "AUTO INCREMENT here?");
    rs.insertRow();

    //
    // the driver adds rows at the end
    //

    rs.last();

    //
    // We should now be on the row we just inserted
    //

    int autoIncKeyFromRS = rs.getInt("priKey");

    rs.close();

    rs = null;

    System.out.println("Key returned for inserted row: "
        + autoIncKeyFromRS);

} finally {

```

```

if (rs != null) {
    try {
        rs.close();
    } catch (SQLException ex) {
        // ignore
    }
}

if (stmt != null) {
    try {
        stmt.close();
    } catch (SQLException ex) {
        // ignore
    }
}
}

```

When you run the preceding example code, you should get the following output: Key returned from `getGeneratedKeys()`: 1 Key returned from `SELECT LAST_INSERT_ID()`: 1 Key returned for inserted row: 2 You should be aware, that at times, it can be tricky to use the `SELECT LAST_INSERT_ID()` query, as that function's value is scoped to a connection. So, if some other query happens on the same connection, the value will be overwritten. On the other hand, the `getGeneratedKeys()` method is scoped by the `Statement` instance, so it can be used even if other queries happen on the same connection, but not on the same `Statement` instance.

## 18.3.5.2. Using Connector/J with J2EE and Other Java Frameworks

This section describes how to use Connector/J in several contexts.

### 18.3.5.2.1. General J2EE Concepts

This section provides general background on J2EE concepts that pertain to use of Connector/J.

#### 18.3.5.2.1.1. Understanding Connection Pooling

Connection pooling is a technique of creating and managing a pool of connections that are ready for use by any thread that needs them.

This technique of pooling connections is based on the fact that most applications only need a thread to have access to a JDBC connection when they are actively processing a transaction, which usually take only milliseconds to complete. When not processing a transaction, the connection would otherwise sit idle. Instead, connection pooling allows the idle connection to be used by some other thread to do useful work.

In practice, when a thread needs to do work against a MySQL or other database with JDBC, it requests a connection from the pool. When the thread is finished using the connection, it returns it to the pool, so that it may be used by any other threads that want to use it.

When the connection is loaned out from the pool, it is used exclusively by the thread that requested it. From a programming point of view, it is the same as if your thread called `DriverManager.getConnection()` every time it needed a JDBC connection, however with connection pooling, your thread may end up using either a new, or already-existing connection.

Connection pooling can greatly increase the performance of your Java application, while reducing overall resource usage. The main benefits to connection pooling are:

- Reduced connection creation time

Although this is not usually an issue with the quick connection setup that MySQL offers compared

to other databases, creating new JDBC connections still incurs networking and JDBC driver overhead that will be avoided if connections are recycled.

- Simplified programming model

When using connection pooling, each individual thread can act as though it has created its own JDBC connection, allowing you to use straight-forward JDBC programming techniques.

- Controlled resource usage

If you don't use connection pooling, and instead create a new connection every time a thread needs one, your application's resource usage can be quite wasteful and lead to unpredictable behavior under load.

Remember that each connection to MySQL has overhead (memory, CPU, context switches, and so forth) on both the client and server side. Every connection limits how many resources there are available to your application as well as the MySQL server. Many of these resources will be used whether or not the connection is actually doing any useful work!

Connection pools can be tuned to maximize performance, while keeping resource utilization below the point where your application will start to fail rather than just run slower.

Luckily, Sun has standardized the concept of connection pooling in JDBC through the JDBC-2.0 Optional interfaces, and all major application servers have implementations of these APIs that work fine with MySQL Connector/J.

Generally, you configure a connection pool in your application server configuration files, and access it via the Java Naming and Directory Interface (JNDI). The following code shows how you might use a connection pool from an application deployed in a J2EE application server:

### Example 18.11. Using a connection pool with a J2EE application server

```
import java.sql.Connection;
import java.sql.SQLException;
import java.sql.Statement;

import javax.naming.InitialContext;
import javax.sql.DataSource;

public class MyServletJspOrEjb {

    public void doSomething() throws Exception {
        /*
         * Create a JNDI Initial context to be able to
         * lookup the DataSource
         *
         * In production-level code, this should be cached as
         * an instance or static variable, as it can
         * be quite expensive to create a JNDI context.
         *
         * Note: This code only works when you are using servlets
         * or EJBs in a J2EE application server. If you are
         * using connection pooling in standalone Java code, you
         * will have to create/configure datasources using whatever
         * mechanisms your particular connection pooling library
         * provides.
         */

        InitialContext ctx = new InitialContext();

        /*
         * Lookup the DataSource, which will be backed by a pool
         * that the application server provides. DataSource instances
         * are also a good candidate for caching as an instance
         */
    }
}
```

```

    * variable, as JNDI lookups can be expensive as well.
    */

    DataSource ds = (DataSource)ctx.lookup("java:comp/env/jdbc/MySQLDB");

    /*
    * The following code is what would actually be in your
    * Servlet, JSP or EJB 'service' method...where you need
    * to work with a JDBC connection.
    */

    Connection conn = null;
    Statement stmt = null;

    try {
        conn = ds.getConnection();

        /*
        * Now, use normal JDBC programming to work with
        * MySQL, making sure to close each resource when you're
        * finished with it, which allows the connection pool
        * resources to be recovered as quickly as possible
        */

        stmt = conn.createStatement();
        stmt.execute("SOME SQL QUERY");

        stmt.close();
        stmt = null;

        conn.close();
        conn = null;
    } finally {
        /*
        * close any jdbc instances here that weren't
        * explicitly closed during normal code path, so
        * that we don't 'leak' resources...
        */

        if (stmt != null) {
            try {
                stmt.close();
            } catch (SQLException sqlex) {
                // ignore -- as we can't do anything about it here
            }

            stmt = null;
        }

        if (conn != null) {
            try {
                conn.close();
            } catch (SQLException sqlex) {
                // ignore -- as we can't do anything about it here
            }

            conn = null;
        }
    }
}

```

As shown in the example above, after obtaining the JNDI InitialContext, and looking up the DataSource, the rest of the code should look familiar to anyone who has done JDBC programming in the past.

The most important thing to remember when using connection pooling is to make sure that no matter what happens in your code (exceptions, flow-of-control, and so forth), connections, and anything created by them (such as statements or result sets) are closed, so that they may be re-used, otherwise they will be stranded, which in the best case means that the MySQL server resources they represent (such as buffers, locks, or sockets) may be tied up for some time, or worst case, may be tied up forever.

What's the Best Size for my Connection Pool?

As with all other configuration rules-of-thumb, the answer is: it depends. Although the optimal size de-

depends on anticipated load and average database transaction time, the optimum connection pool size is smaller than you might expect. If you take Sun's Java Petstore blueprint application for example, a connection pool of 15-20 connections can serve a relatively moderate load (600 concurrent users) using MySQL and Tomcat with response times that are acceptable.

To correctly size a connection pool for your application, you should create load test scripts with tools such as Apache JMeter or The Grinder, and load test your application.

An easy way to determine a starting point is to configure your connection pool's maximum number of connections to be unbounded, run a load test, and measure the largest amount of concurrently used connections. You can then work backward from there to determine what values of minimum and maximum pooled connections give the best performance for your particular application.

### 18.3.5.2.2. Using Connector/J with Tomcat

The following instructions are based on the instructions for Tomcat-5.x, available at <http://jakarta.apache.org/tomcat/tomcat-5.0-doc/jndi-datasource-examples-howto.html> which is current at the time this document was written.

First, install the .jar file that comes with Connector/J in `$_CATALINA_HOME/common/lib` so that it is available to all applications installed in the container.

Next, Configure the JNDI DataSource by adding a declaration resource to `$_CATALINA_HOME/conf/server.xml` in the context that defines your web application:

```
<Context ....>
  ...
  <Resource name="jdbc/MySQLDB"
            auth="Container"
            type="javax.sql.DataSource"/>

  <!-- The name you used above, must match _exactly_ here!

         The connection pool will be bound into JNDI with the name
         "java:/comp/env/jdbc/MySQLDB"
  -->

  <ResourceParams name="jdbc/MySQLDB">
    <parameter>
      <name>factory</name>
      <value>org.apache.commons.dbcp.BasicDataSourceFactory</value>
    </parameter>

    <!-- Don't set this any higher than max_connections on your
         MySQL server, usually this should be a 10 or a few 10's
         of connections, not hundreds or thousands -->

    <parameter>
      <name>maxActive</name>
      <value>10</value>
    </parameter>

    <!-- You don't want to many idle connections hanging around
         if you can avoid it, only enough to soak up a spike in
         the load -->

    <parameter>
      <name>maxIdle</name>
      <value>5</value>
    </parameter>

    <!-- Don't use autoReconnect=true, it's going away eventually
         and it's a crutch for older connection pools that couldn't
         test connections. You need to decide whether your application is
         supposed to deal with SQLExceptions (hint, it should), and
         how much of a performance penalty you're willing to pay
         to ensure 'freshness' of the connection -->

    <parameter>
```

```
<name>validationQuery</name>
<value>SELECT 1</value>
</parameter>

<!-- The most conservative approach is to test connections
before they're given to your application. For most applications
this is okay, the query used above is very small and takes
no real server resources to process, other than the time used
to traverse the network.

If you have a high-load application you'll need to rely on
something else. -->

<parameter>
  <name>testOnBorrow</name>
  <value>true</value>
</parameter>

<!-- Otherwise, or in addition to testOnBorrow, you can test
while connections are sitting idle -->

<parameter>
  <name>testWhileIdle</name>
  <value>true</value>
</parameter>

<!-- You have to set this value, otherwise even though
you've asked connections to be tested while idle,
the idle evicter thread will never run -->

<parameter>
  <name>timeBetweenEvictionRunsMillis</name>
  <value>10000</value>
</parameter>

<!-- Don't allow connections to hang out idle too long,
never longer than what wait_timeout is set to on the
server...A few minutes or even fraction of a minute
is sometimes okay here, it depends on your application
and how much spikey load it will see -->

<parameter>
  <name>minEvictableIdleTimeMillis</name>
  <value>60000</value>
</parameter>

<!-- Username and password used when connecting to MySQL -->

<parameter>
  <name>username</name>
  <value>someuser</value>
</parameter>

<parameter>
  <name>password</name>
  <value>somepass</value>
</parameter>

<!-- Class name for the Connector/J driver -->

<parameter>
  <name>driverClassName</name>
  <value>com.mysql.jdbc.Driver</value>
</parameter>

<!-- The JDBC connection url for connecting to MySQL, notice
that if you want to pass any other MySQL-specific parameters
you should pass them here in the URL, setting them using the
parameter tags above will have no effect, you will also
need to use & to separate parameter values as the
ampersand is a reserved character in XML -->

<parameter>
  <name>url</name>
  <value>jdbc:mysql://localhost:3306/test</value>
</parameter>

</ResourceParams>
</Context>
```

In general, you should follow the installation instructions that come with your version of Tomcat, as the way you configure datasources in Tomcat changes from time-to-time, and unfortunately if you use the wrong syntax in your XML file, you will most likely end up with an exception similar to the following:

```
Error: java.sql.SQLException: Cannot load JDBC driver class 'null ' SQL
state: null
```

### 18.3.5.2.3. Using Connector/J with JBoss

These instructions cover JBoss-4.x. To make the JDBC driver classes available to the application server, copy the .jar file that comes with Connector/J to the `lib` directory for your server configuration (which is usually called `default`). Then, in the same configuration directory, in the subdirectory named `deploy`, create a datasource configuration file that ends with `-ds.xml`, which tells JBoss to deploy this file as a JDBC Datasource. The file should have the following contents:

```
<datasources>
  <local-tx-datasource>
    <!-- This connection pool will be bound into JNDI with the name
         "java:/MySQLDB" -->

    <jndi-name>MySQLDB</jndi-name>
    <connection-url>jdbc:mysql://localhost:3306/dbname</connection-url>
    <driver-class>com.mysql.jdbc.Driver</driver-class>
    <user-name>user</user-name>
    <password>pass</password>

    <min-pool-size>5</min-pool-size>

    <!-- Don't set this any higher than max_connections on your
         MySQL server, usually this should be a 10 or a few 10's
         of connections, not hundreds or thousands -->

    <max-pool-size>20</max-pool-size>

    <!-- Don't allow connections to hang out idle too long,
         never longer than what wait_timeout is set to on the
         server...A few minutes is usually okay here,
         it depends on your application
         and how much spikey load it will see -->

    <idle-timeout-minutes>5</idle-timeout-minutes>

    <!-- If you're using Connector/J 3.1.8 or newer, you can use
         our implementation of these to increase the robustness
         of the connection pool. -->

    <exception-sorter-class-name>com.mysql.jdbc.integration.jboss.ExtendedMysqlExceptionSorter</ex
    <valid-connection-checker-class-name>com.mysql.jdbc.integration.jboss.MysqlValidConnectionCheck

  </local-tx-datasource>
</datasources>
```

### 18.3.5.3. Common Problems and Solutions

There are a few issues that seem to be commonly encountered often by users of MySQL Connector/J. This section deals with their symptoms, and their resolutions.

#### Questions

- [19.3.5.3.1](#): When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

What's going on? I can connect just fine with the MySQL command-line client.

- [19.3.5.3.2](#): My application throws an `SQLException` 'No Suitable Driver'. Why is this happening?
- [19.3.5.3.3](#): I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
Is there a MySQL server running on the machine/port you
are trying to connect to?

(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

- [19.3.5.3.4](#): I have a servlet/application that works fine for a day, and then stops working overnight
- [19.3.5.3.5](#): I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.

## Questions and Answers

### 19.3.5.3.1: When I try to connect to the database with MySQL Connector/J, I get the following exception:

```
SQLException: Server configuration denies access to data source
SQLState: 08001
VendorError: 0
```

#### What's going on? I can connect just fine with the MySQL command-line client.

MySQL Connector/J must use TCP/IP sockets to connect to MySQL, as Java does not support Unix Domain Sockets. Therefore, when MySQL Connector/J connects to MySQL, the security manager in MySQL server will use its grant tables to determine whether the connection should be allowed.

You must add the necessary security credentials to the MySQL server for this to happen, using the [GRANT](#) statement to your MySQL Server. See [Section 13.5.1.2, "GRANT Syntax"](#), for more information.

**Note.** Testing your connectivity with the `mysql` command-line client will not work unless you add the `--host` flag, and use something other than `localhost` for the host. The `mysql` command-line client will use Unix domain sockets if you use the special hostname `localhost`. If you are testing connectivity to `localhost`, use `127.0.0.1` as the hostname instead.

**Warning.** Changing privileges and permissions improperly in MySQL can potentially cause your server installation to not have optimal security properties.

### 19.3.5.3.2: My application throws an `SQLException` 'No Suitable Driver'. Why is this happening?

There are three possible causes for this error:

- The Connector/J driver is not in your `CLASSPATH`, see [Section 18.3.2, "Installing Connector/J"](#).
- The format of your connection URL is incorrect, or you are referencing the wrong JDBC driver.
- When using `DriverManager`, the `jdbc.drivers` system property has not been populated with the location of the Connector/J driver.

### 19.3.5.3.3: I'm trying to use MySQL Connector/J in an applet or application and I get an exception similar to:

```
SQLException: Cannot connect to MySQL server on host:3306.
```

```
Is there a MySQL server running on the machine/port you
are trying to connect to?
```

```
(java.security.AccessControlException)
SQLState: 08S01
VendorError: 0
```

Either you're running an Applet, your MySQL server has been installed with the "--skip-networking" option set, or your MySQL server has a firewall sitting in front of it.

Applets can only make network connections back to the machine that runs the web server that served the .class files for the applet. This means that MySQL must run on the same machine (or you must have some sort of port re-direction) for this to work. This also means that you will not be able to test applets from your local file system, you must always deploy them to a web server.

MySQL Connector/J can only communicate with MySQL using TCP/IP, as Java does not support Unix domain sockets. TCP/IP communication with MySQL might be affected if MySQL was started with the "--skip-networking" flag, or if it is firewalled.

If MySQL has been started with the "--skip-networking" option set (the Debian Linux package of MySQL server does this for example), you need to comment it out in the file /etc/mysql/my.cnf or /etc/my.cnf. Of course your my.cnf file might also exist in the `data` directory of your MySQL server, or anywhere else (depending on how MySQL was compiled for your system). Binaries created by MySQL AB always look in /etc/my.cnf and [datadir]/my.cnf. If your MySQL server has been firewalled, you will need to have the firewall configured to allow TCP/IP connections from the host where your Java code is running to the MySQL server on the port that MySQL is listening to (by default, 3306).

#### 19.3.5.3.4: I have a servlet/application that works fine for a day, and then stops working overnight

MySQL closes connections after 8 hours of inactivity. You either need to use a connection pool that handles stale connections or use the "autoReconnect" parameter (see [Section 18.3.4.1, "Driver/Datasource Class Names, URL Syntax and Configuration Properties for Connector/J"](#)).

Also, you should be catching SQLExceptions in your application and dealing with them, rather than propagating them all the way until your application exits, this is just good programming practice. MySQL Connector/J will set the SQLState (see `java.sql.SQLException.getSQLState()` in your APIDOCs) to "08S01" when it encounters network-connectivity issues during the processing of a query. Your application code should then attempt to re-connect to MySQL at this point.

The following (simplistic) example shows what code that can handle these exceptions might look like:

#### Example 18.12. Example of transaction with retry logic

```
public void doBusinessOp() throws SQLException {
    Connection conn = null;
    Statement stmt = null;
    ResultSet rs = null;

    //
    // How many times do you want to retry the transaction
    // (or at least _getting_ a connection)?
    //
    int retryCount = 5;

    boolean transactionCompleted = false;

    do {
        try {
            conn = getConnection(); // assume getting this from a
                                   // javax.sql.DataSource, or the
                                   // java.sql.DriverManager

            conn.setAutoCommit(false);
```

```
//
// Okay, at this point, the 'retry-ability' of the
// transaction really depends on your application logic,
// whether or not you're using autocommit (in this case
// not), and whether you're using transaccational storage
// engines
//
// For this example, we'll assume that it's not safe
// to retry the entire transaction, so we set retry count
// to 0 at this point
//
// If you were using exclusively transaction-safe tables,
// or your application could recover from a connection going
// bad in the middle of an operation, then you would not
// touch 'retryCount' here, and just let the loop repeat
// until retryCount == 0.
//
retryCount = 0;

stmt = conn.createStatement();

String query = "SELECT foo FROM bar ORDER BY baz";

rs = stmt.executeQuery(query);

while (rs.next()) {
}

rs.close();
rs = null;

stmt.close();
stmt = null;

conn.commit();
conn.close();
conn = null;

transactionCompleted = true;
} catch (SQLException sqlEx) {

//
// The two SQL states that are 'retry-able' are 08S01
// for a communications error, and 40001 for deadlock.
//
// Only retry if the error was due to a stale connection,
// communications problem or deadlock
//

String sqlState = sqlEx.getSQLState();

if ("08S01".equals(sqlState) || "40001".equals(sqlState)) {
    retryCount--;
} else {
    retryCount = 0;
}
} finally {
    if (rs != null) {
        try {
            rs.close();
        } catch (SQLException sqlEx) {
            // You'd probably want to log this . . .
        }
    }

    if (stmt != null) {
        try {
            stmt.close();
        } catch (SQLException sqlEx) {
            // You'd probably want to log this as well . . .
        }
    }

    if (conn != null) {
        try {
            //
            // If we got here, and conn is not null, the
            // transaction should be rolled back, as not
            // all work has been done

```

```

        try {
            conn.rollback();
        } finally {
            conn.close();
        }
    } catch (SQLException sqlEx) {
        //
        // If we got an exception here, something
        // pretty serious is going on, so we better
        // pass it up the stack, rather than just
        // logging it. . .
        throw sqlEx;
    }
}
} while (!transactionCompleted && (retryCount > 0));
}
}

```

**Note.** Use of the `autoReconnect` option is not recommended because there is no safe method of re-connecting to the MySQL server without risking some corruption of the connection state or database state information. Instead, you should use a connection pool which will enable your application to connect to the MySQL server using an available connection from the pool. The `autoReconnect` facility is deprecated, and may be removed in a future release.

#### 19.3.5.3.5: I'm trying to use JDBC-2.0 updatable result sets, and I get an exception saying my result set is not updatable.

Because MySQL does not have row identifiers, MySQL Connector/J can only update result sets that have come from queries on tables that have at least one primary key, the query must select every primary key and the query can only span one table (that is, no joins). This is outlined in the JDBC specification.

Note that this issue only occurs when using updatable result sets, and is caused because Connector/J is unable to guarantee that it can identify the correct rows within the result set to be updated without having a unique reference to each row. There is no requirement to have a unique field on a table if you are using `UPDATE` or `DELETE` statements on a table where you can individually specify the criteria to be matched using a `WHERE` clause.

## 18.3.6. Connector/J Support

### 18.3.6.1. Connector/J Community Support

MySQL AB provides assistance to the user community by means of its mailing lists. For Connector/J related issues, you can get help from experienced users by using the MySQL and Java mailing list. Archives and subscription information is available online at <http://lists.mysql.com/java>.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See Section 1.7.1, “MySQL Mailing Lists”.

Community support from experienced users is also available through the [JDBC Forum](http://forums.mysql.com/list.php?39) [http://forums.mysql.com/list.php?39]. You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See Section 1.7.2, “MySQL Community Support at the MySQL Forums”.

### 18.3.6.2. How to Report Connector/J Bugs or Problems

The normal place to report bugs is <http://bugs.mysql.com/>, which is the address for our bugs database. This database is public, and can be browsed and searched by anyone. If you log in to the system, you will also be able to enter new reports.

If you have found a sensitive security bug in MySQL, you can send email to [security\\_at\\_mysql.com](mailto:security_at_mysql.com) [mailto:security\_at\_mysql.com].

Writing a good bug report takes patience, but doing it right the first time saves time both for us and for yourself. A good bug report, containing a full test case for the bug, makes it very likely that we will fix the bug in the next release.

This section will help you write your report correctly so that you don't waste your time doing things that may not help us much or at all.

If you have a repeatable bug report, please report it to the bugs database at <http://bugs.mysql.com/>. Any bug that we are able to repeat has a high chance of being fixed in the next MySQL release.

To report other problems, you can use one of the MySQL mailing lists.

Remember that it is possible for us to respond to a message containing too much information, but not to one containing too little. People often omit facts because they think they know the cause of a problem and assume that some details don't matter.

A good principle is this: If you are in doubt about stating something, state it. It is faster and less troublesome to write a couple more lines in your report than to wait longer for the answer if we must ask you to provide information that was missing from the initial report.

The most common errors made in bug reports are (a) not including the version number of Connector/J or MySQL used, and (b) not fully describing the platform on which Connector/J is installed (including the JVM version, and the platform type and version number that MySQL itself is installed on).

This is highly relevant information, and in 99 cases out of 100, the bug report is useless without it. Very often we get questions like, "Why doesn't this work for me?" Then we find that the feature requested wasn't implemented in that MySQL version, or that a bug described in a report has already been fixed in newer MySQL versions.

Sometimes the error is platform-dependent; in such cases, it is next to impossible for us to fix anything without knowing the operating system and the version number of the platform.

If at all possible, you should create a repeatable, standalone testcase that doesn't involve any third-party classes.

To streamline this process, we ship a base class for testcases with Connector/J, named `com.mysql.jdbc.util.BaseBugReport`. To create a testcase for Connector/J using this class, create your own class that inherits from `com.mysql.jdbc.util.BaseBugReport` and override the methods `setUp()`, `tearDown()` and `runTest()`.

In the `setUp()` method, create code that creates your tables, and populates them with any data needed to demonstrate the bug.

In the `runTest()` method, create code that demonstrates the bug using the tables and data you created in the `setUp` method.

In the `tearDown()` method, drop any tables you created in the `setUp()` method.

In any of the above three methods, you should use one of the variants of the `getConnection()` method to create a JDBC connection to MySQL:

- `getConnection()` - Provides a connection to the JDBC URL specified in `getUrl()`. If a connection already exists, that connection is returned, otherwise a new connection is created.
- `getNewConnection()` - Use this if you need to get a new connection for your bug report (i.e.

there's more than one connection involved).

- `getConnection(String url)` - Returns a connection using the given URL.
- `getConnection(String url, Properties props)` - Returns a connection using the given URL and properties.

If you need to use a JDBC URL that is different from 'jdbc:mysql://test', override the method `getUrl()` as well.

Use the `assertTrue(boolean expression)` and `assertTrue(String failureMessage, boolean expression)` methods to create conditions that must be met in your testcase demonstrating the behavior you are expecting (vs. the behavior you are observing, which is why you are most likely filing a bug report).

Finally, create a `main()` method that creates a new instance of your testcase, and calls the `run` method:

```
public static void main(String[] args) throws Exception {
    new MyBugReport().run();
}
```

Once you have finished your testcase, and have verified that it demonstrates the bug you are reporting, upload it with your bug report to <http://bugs.mysql.com/>.

### 18.3.6.3. Connector/J Change History

The Connector/J Change History (Changelog) is located with the main Changelog for MySQL. See [Section D.8, “MySQL Connector/J Change History”](#).

## 18.4. MySQL Connector/MXJ

MySQL Connector/MXJ is a solution for deploying the MySQL database engine (`mysqld`) intelligently from within a Java package.

### 18.4.1. Introduction to Connector/MXJ

MySQL Connector/MXJ is a Java Utility package for deploying and managing a MySQL database. Deploying and using MySQL can be as easy as adding an additional parameter to the JDBC connection url, which will result in the database being started when the first connection is made. This makes it easy for Java developers to deploy applications which require a database by reducing installation barriers for their end-users.

MySQL Connector/MXJ makes the MySQL database appear to be a java-based component. It does this by determining what platform the system is running on, selecting the appropriate binary, and launching the executable. It will also optionally deploy an initial database, with any specified parameters.

Included are instructions for use with a JDBC driver and deploying as a JMX MBean to JBoss.

You can download sources and binaries from: <http://dev.mysql.com/downloads/connector/mxj/>

This a beta release and feedback is welcome and encouraged.

Please send questions or comments to the [MySQL and Java mailing list](http://lists.mysql.com/java) [<http://lists.mysql.com/java>].

#### 18.4.1.1. Connector/MXJ Versions

## Connector/MX

- Connector/MXJ 5.x, currently in beta status, includes `mysqld` version 5.0.22 and includes binaries for Linux x86, Mac OS X PPC, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 5.x requires the Connector/J 5.x package.
- Connector/MXJ 1.x includes `mysqld` version 4.1.13 and includes binaries for Linux x86, Windows XP/NT/2000 x86 and Solaris SPARC. Connector/MXJ 1.x requires the Connector/J 3.x package.

This guide provides information on the Connector/MXJ 5.x release. For information on using the older releases, please see the documentation included with the appropriate distribution.

### 18.4.1.2. Connector/MXJ Overview

Connector/MXJ consists of a Java class, a copy of the `mysqld` binary for a specific list of platforms, and associated files and support utilities. The Java class controls the initialization of an instance of the embedded `mysqld` binary, and the ongoing management of the `mysqld` process. The entire sequence and management can be controlled entirely from within Java using the Connector/MXJ Java classes. You can see an overview of the contents of the Connector/MXJ package in the figure below.

Connector/MXJ Package		
Connector/MXJ Management Class	mysqld Binaries	MySQL Base Databases
	Linux x86	MySQL Stub Data
	Windows XP/NT/2000	
	Solaris SPARC	Support Tools
	MacOS X PowerPC	

It is important to note that Connector/MXJ is not an embedded version of MySQL, or a version of MySQL written as part of a Java class. Connector/MXJ works through the use of an embedded, compiled binary of `mysqld` as would normally be used when deploying a standard MySQL installation.

It is the Connector/MXJ wrapper, support classes and tools, that enable Connector/MXJ to appear as a MySQL instance.

When Connector/MXJ is initialized, the corresponding `mysqld` binary for the current platform is extracted, along with a pre-configured data directed. Both are contained within the Connector/MXJ JAR file. The `mysqld` instance is then started, with any additional options as specified during the initialization, and the MySQL database becomes accessible.

Because Connector/MXJ works in combination with Connector/J, you can access and integrate with the MySQL instance through a JDBC connection. When you have finished with the server, the instance is terminated, and, by default, any data created during the session is retained within the temporary directory created when the instance was started.

Connector/MXJ and the embedded `mysqld` instance can be deployed in a number of environments where relying on an existing database, or installing a MySQL instance would be impossible, including CD-ROM embedded database applications and temporary database requirements within a Java-based application environment.

## 18.4.2. Installing Connector/MXJ

Connector/MXJ does not have an installation application or process, but there are some steps you can follow to make the installation and deployment of Connector/MXJ easier.

Before you start, there are some baseline requirements for

- Java Runtime Environment (v1.4.0 or newer) if you are only going to deploy the package.
- Java Development Kit (v1.4.0 or newer) if you want to build Connector/MXJ from source.
- Connector/J 5.0 or newer.

Depending on your target installation/deployment environment you may also require:

- JBoss - 4.0rc1 or newer
- Apache Tomcat - 5.0 or newer
- Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>)

### 18.4.2.1. Supported Platforms

Connector/MXJ is compatible with any platform supporting Java and MySQL. By default, Connector/MXJ incorporates the `mysqld` binary for a select number of platforms, as outlined below.

- Linux, i386
- Windows NT, Windows 2000, Windows XP, x86
- Solaris 8, SPARC 32 (compatible with Solaris 8, Solaris 9 and Solaris 10 on SPARC 32-bit and 64-bit platforms)
- Mac OS X, PowerPC

For more information on packaging your own Connector/MXJ with the platforms you require, see [Section 18.4.5.1, “Creating your own Connector/MXJ Package”](#)

### 18.4.2.2. Connector/MXJ Base Installation

Because there is no formal installation process, the method, installation directory, and access methods you use for Connector/MXJ are entirely up to your individual requirements.

To perform a basic installation, choose a target directory for the files included in the Connector/MXJ package. On Unix/Linux systems you may opt to use a directory such as `/usr/local/connector-mxj`; On Windows, you may want to install the files in the base directory, `C:\Connector-MXJ`, or within the `Program Files` directory.

To install the files:

1. Download the Connector/MXJ package, either in Tar/Gzip format (ideal for Unix/Linux systems)

or Zip format (Windows).

2. Extract the files from the package. This will create a directory `connector-mxj`. Copy and optionally rename this directory to your desired location.
3. For best results, you should update your global `CLASSPATH` variable with the location of the Connector/MXJ JAR (`connector-mxj.jar`). You will also need to add the AspectJ Runtime, located in `lib/aspectjrt.jar`.

Within Unix/Linux you can do this globally by editing the global shell profile, or on a user by user basis by editing their individual shell profile.

On Windows 2000, Windows NT and Windows XP, you can edit the global `CLASSPATH` by editing the `Environment Variables` configured through the `System` control panel.

### 18.4.2.3. Connector/MXJ Quick Start Guide

Once you have extracted the Connector/MXJ and Connector/J components you can run one of the sample applications that initiates a MySQL instance. You can test the installation by running the `ConnectorMXJUrlTestExample`:

```
java ConnectorMXJUrlTestExample
jdbc:mysql:mxj://localhost:3336/test?server.baseDir=/var/tmp/test-mxj
[MysqldResource] launching mysqld (getOptions)
[/var/tmp/test-mxj/bin/mysqld][--no-defaults][--pid-file=/var/tmp/test-mxj/data/MysqldResource.pid][--
[MysqldResource] launching mysqld (driver_launched_mysqld_1)
InnoDB: The first specified data file ./ibdata1 did not exist:
InnoDB: a new database to be created!
060726 15:40:42 InnoDB: Setting file ./ibdata1 size to 10 MB
InnoDB: Database physically writes the file full: wait...
060726 15:40:43 InnoDB: Log file ./ib_logfile0 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile0 size to 5 MB
InnoDB: Database physically writes the file full: wait...
060726 15:40:43 InnoDB: Log file ./ib_logfile1 did not exist: new to be created
InnoDB: Setting log file ./ib_logfile1 size to 5 MB
InnoDB: Database physically writes the file full: wait...
InnoDB: Doublewrite buffer not found: creating new
InnoDB: Doublewrite buffer created
InnoDB: Creating foreign key constraint system tables
InnoDB: Foreign key constraint system tables created
060726 15:40:44 InnoDB: Started; log sequence number 0 0
060726 15:40:44 [Note] /var/tmp/test-mxj/bin/mysqld: ready for connections.
Version: '5.0.22-max' socket: 'mysql.sock' port: 3336 MySQL Community Edition - Experimental (GPL)
[MysqldResource] mysqld running as process: 1210
-----
5.0.22-max
-----
[MysqldResource] stopping mysqld (process: 1210)
060726 15:40:44 [Note] /var/tmp/test-mxj/bin/mysqld: Normal shutdown

060726 15:40:45 InnoDB: Starting shutdown...
060726 15:40:48 InnoDB: Shutdown completed; log sequence number 0 43655
060726 15:40:48 [Note] /var/tmp/test-mxj/bin/mysqld: Shutdown complete

[MysqldResource] clearing options
[MysqldResource] shutdown complete
```

The above output shows an instance of MySQL starting, the necessary files being created (log files, InnoDB data files) and the MySQL database entering the running state. The instance is then shutdown by Connector/MXJ before the example terminates.

### 18.4.2.4. Deploying Connector/MXJ using Driver Launch

Connector/MXJ and Connector/J work together to enable you to launch an instance of the `mysqld`

server through the use of a keyword in the JDBC connection string. Deploying Connector/MXJ within a Java application can be automated through this method, making the deployment of Connector/MXJ a simple process:

1. Download and unzip Connector/MXJ, add `connector-mxj.jar` to the `CLASSPATH`.
2. To the JDBC connection string, embed the `mxj` keyword, for example: `jdbc:mysql:mxj://localhost:PORT/DBNAME`.

For more details, see [Section 18.4.3, “Connector/MXJ Configuration”](#).

### 18.4.2.5. Deploying Connector/MXJ within JBoss

For deployment within a JBoss environment, you must configure the JBoss environment to use the Connector/MXJ component within the JDBC parameters:

1. Download Connector/MXJ copy the `connector-mxj.jar` file to the `$JBOSS_HOME/server/default/lib` directory.
2. Download Connector/J copy the `connector-mxj.jar` file to the `$JBOSS_HOME/server/default/lib` directory.
3. Create an MBean service xml file in the `$JBOSS_HOME/server/default/deploy` directory with any attributes set, for instance the `datadir` and `autostart`.
4. Set the JDBC parameters of your web application to use:

```
String driver = "com.mysql.jdbc.Driver";
String url = "jdbc:mysql:///test?propertiesTransform="+
            "com.mysql.management.jmx.ConnectorMXJPropertiesTransform";
String user = "root";
String password = "";
Class.forName(driver);
Connection conn = DriverManager.getConnection(url, user, password);
```

You may wish to create a separate users and database table spaces for each application, rather than using "root and test".

We highly suggest having a routine backup procedure for backing up the database files in the `datadir`.

### 18.4.2.6. Verifying Installation using JUnit

The best way to ensure that your platform is supported is to run the JUnit tests. These will test the Connector/MXJ classes and the associated components.

#### 18.4.2.6.1. JUnit Test Requirements

The first thing to do is make sure that the components will work on the platform. The `MySQLdRe-source` class is really a wrapper for a native version of MySQL, so not all platforms are supported. At the time of this writing, Linux on the i386 architecture has been tested and seems to work quite well, as does OS X v10.3. There has been limited testing on Windows and Solaris.

Requirements:

1. JDK-1.4 or newer (or the JRE if you aren't going to be compiling the source or JSPs).

2. MySQL Connector/J version 5.0 or newer (from <http://dev.mysql.com/downloads/connector/j/>) installed and available via your CLASSPATH.
3. The `javax.management` classes for JMX version 1.2.1, these are present in the following application servers:
  - JBoss - 4.0rc1 or newer.
  - Apache Tomcat - 5.0 or newer.
  - Sun's JMX reference implementation version 1.2.1 (from <http://java.sun.com/products/JavaManagement/>).
4. JUnit 3.8.1 (from <http://www.junit.org/>).

If building from source, All of the requirements from above, plus:

1. Ant version 1.5 or newer (download from <http://ant.apache.org/>).

#### 18.4.2.6.2. Running the JUnit Tests

1. The tests attempt to launch MySQL on the port 3336. If you have a MySQL running, it may conflict, but this isn't very likely because the default port for MySQL is 3306. However, You may set the "c-mxj\_test\_port" Java property to a port of your choosing. Alternatively, you may wish to start by shutting down any instances of MySQL you have running on the target machine.

The tests suppress output to the console by default. For verbose output, you may set the "c-mxj\_test\_silent" Java property to "false".

2. To run the JUnit test suite, the \$CLASSPATH must include the following:
  - JUnit
  - JMX
  - Connector/J
  - MySQL Connector/MXJ
3. If `connector-mxj.jar` is not present in your download, unzip MySQL Connector/MXJ source archive.

```
cd mysql djmx
ant dist
```

Then add `$TEMP/cmjxj/stage/connector-mxj/connector-mxj.jar` to the CLASSPATH.

4. if you have `junit`, execute the unit tests. From the command line, type:

```
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```

The output should look something like this:

```

.....
.....
Time: 259.438
OK (101 tests)

```

Note that the tests are a bit slow near the end, so please be patient.

## 18.4.3. Connector/MXJ Configuration

### 18.4.3.1. Running as part of the JDBC Driver

A feature of the MySQL Connector/J JDBC driver is the ability to specify a connection to an embedded Connector/MXJ instance through the use of the `mxj` keyword in the JDBC connection string.

In the following example, we have a program which creates a connection, executes a query, and prints the result to the `System.out`. The MySQL database will be deployed and started as part of the connection process, and shutdown as part of the finally block.

You can find this file in the Connector/MXJ package as `src/ConnectorMXJUrlTestExample.java`.

```

import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;

import com.mysql.management.driverlaunched.ServerLauncherSocketFactory;

public class ConnectorMXJUrlTestExample {
    public static String DRIVER = "com.mysql.jdbc.Driver";

    public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "test-mxj");
        int port = 3336;

        String url = "jdbc:mysql:mxj://localhost:" + port + "/test" + "?"
            + "serverbasedir=" + databaseDir;

        System.out.println(url);

        String userName = "root";
        String password = "";

        Class.forName(DRIVER);
        Connection conn = null;
        try {
            conn = DriverManager.getConnection(url, userName, password);
            printQueryResults(conn, "SELECT VERSION()");
        } finally {
            try {
                if (conn != null)
                    conn.close();
            } catch (Exception e) {
                e.printStackTrace();
            }

            ServerLauncherSocketFactory.shutdown(databaseDir, null);
        }
    }

    public static void printQueryResults(Connection conn, String SQLquery)
        throws Exception {
        Statement stmt = conn.createStatement();

```

```

ResultSet rs = stmt.executeQuery(SQLquery);
int columns = rs.getMetaData().getColumnCount();
System.out.println("-----");
System.out.println();
while (rs.next()) {
    for (int i = 1; i <= columns; i++) {
        System.out.println(rs.getString(i));
    }
    System.out.println();
}
rs.close();
stmt.close();
System.out.println("-----");
System.out.flush();
Thread.sleep(100); // wait for System.out to finish flush
}
}

```

To run the above program, be sure to have connector-mxj.jar and Connector/J in the CLASSPATH. Then type:

```
java ConnectorMXJTestExample
```

### 18.4.3.2. Running within a Java Object

If you have a java application and wish to “embed” a MySQL database, make use of the `com.mysql.management.MysqldResource` class directly. This class may be instantiated with the default (no argument) constructor, or by passing in a `java.io.File` object representing the directory you wish the server to be “unzipped” into. It may also be instantiated with printstreams for “stdout” and “stderr” for logging.

Once instantiated, a `java.util.Map`, the object will be able to provide a `java.util.Map` of server options appropriate for the platform and version of MySQL which you will be using.

The `MysqldResource` enables you to “start” MySQL with a `java.util.Map` of server options which you provide, as well as “shutdown” the database. The following example shows a simplistic way to embed MySQL in an application using plain java objects.

You can find this file in the Connector/MXJ package as [src/ConnectorMXJObjectTestExample.java](#).

```

import java.io.File;
import java.sql.Connection;
import java.sql.DriverManager;
import java.sql.ResultSet;
import java.sql.Statement;
import java.util.HashMap;
import java.util.Map;

import com.mysql.management.MysqldResource;

public class ConnectorMXJObjectTestExample {
    public static String DRIVER = "com.mysql.jdbc.Driver";

    public static String JAVA_IO_TMPDIR = "java.io.tmpdir";

    public static void main(String[] args) throws Exception {
        File ourAppDir = new File(System.getProperty(JAVA_IO_TMPDIR));
        File databaseDir = new File(ourAppDir, "mysql-mxj");
        int port = 3336;

        MysqldResource mysqldResource = startDatabase(databaseDir, port);

        String userName = "root";
        String password = "";

        Class.forName(DRIVER);
        Connection conn = null;
        try {

```

```

        String url = "jdbc:mysql://localhost:" + port + "/test";
        conn = DriverManager.getConnection(url, userName, password);
        printQueryResults(conn, "SELECT VERSION()");
    } finally {
        try {
            if (conn != null) {
                conn.close();
            }
        } catch (Exception e) {
            e.printStackTrace();
        }
        try {
            mysqldResource.shutdown();
        } catch (Exception e) {
            e.printStackTrace();
        }
    }
}

public static MysqldResource startDatabase(File databaseDir, int port) {
    MysqldResource mysqldResource = new MysqldResource(databaseDir);

    Map database_options = new HashMap();
    database_options.put("port", Integer.toString(port));
    mysqldResource.start("test-mysqld-thread", database_options);

    if (!mysqldResource.isRunning()) {
        throw new RuntimeException("MySQL did not start.");
    }

    System.out.println("MySQL is running.");

    return mysqldResource;
}

public static void printQueryResults(Connection conn, String SQLquery)
    throws Exception {
    Statement stmt = conn.createStatement();
    ResultSet rs = stmt.executeQuery(SQLquery);
    int columns = rs.getMetaData().getColumnCount();
    System.out.println("-----");
    System.out.println();
    while (rs.next()) {
        for (int i = 1; i <= columns; i++) {
            System.out.println(rs.getString(i));
        }
        System.out.println();
    }
    rs.close();
    stmt.close();
    System.out.println("-----");
    System.out.flush();
    Thread.sleep(100); // wait for System.out to finish flush
}
}

```

### 18.4.3.3. Setting server options

Of course there are many options we may wish to set for a MySQL database. These options may be specified as part of the JDBC connection string simply by prefixing each server option with "server.". In the following example we set two driver parameters and two server parameters:

```

String url = "jdbc:mysql://" + hostColonPort + "/"
    + "?"
    + "cacheServerConfiguration=true"
    + "&"
    + "useLocalSessionState=true"
    + "&"
    + "server.basedir=/opt/myapp/db"
    + "&"
    + "server.datadir=/mnt/bigdisk/myapp/data";

```

## 18.4.4. Connector/MXJ Reference

### 18.4.4.1. MysqldResource API

#### 18.4.4.1.1. MysqldResource Constructors

The `MysqldResource` class supports three different constructor forms:

- `public MysqldResource(File baseDir, File dataDir, String mysqlVersionString, PrintStream out, PrintStream err, Utils util)`

The most detailed constructor, enables you to set the base directory, data directory, select a server by its version string, standard out and standard error and MySQL utilities class.

- `public MysqldResource(File baseDir, File dataDir, String mysqlVersionString, PrintStream out, PrintStream err)`

Enables you to set the base directory, data directory, select a server by its version string, standard out and standard error.

- `public MysqldResource(File baseDir, File dataDir, String mysqlVersionString)`

Enables you to set the base directory, data directory and select a server by its version string. Output for standard out and standard err are directed to `System.out` and `System.err`.

- `public MysqldResource(File baseDir, File dataDir)`

Enables you to set the base directory and data directory. The default MySQL version is selected, and output for standard out and standard err are directed to `System.out` and `System.err`.

- `public MysqldResource(File baseDir);`

Allows the setting of the "basedir" to deploy the MySQL files to. Output for standard out and standard err are directed to `System.out` and `System.err`.

- `public MysqldResource();`

The basedir is defaulted to a subdirectory of the `java.io.tmpdir`. Output for standard out and standard err are directed to `System.out` and `System.err`;

#### 18.4.4.1.2. MysqldResource Methods

`MysqldResource` API includes the following methods:

- `void start(String threadName, Map mysqlArgs);`

Deploys and starts MySQL. The "threadName" string is used to name the thread which actually performs the execution of the MySQL command line. The map is the set of arguments and their values to be passed to the command line.

- `void shutdown();`

Shuts down the MySQL instance managed by the `MysqldResource` object.

- `Map getServerOptions();`

Returns a map of all the options and their current (or default, if not running) options available for the MySQL database.

- `boolean isRunning();`

Returns true if the MySQL database is running.

- `boolean isReadyForConnections();`

Returns true once the database reports that is ready for connections.

- `void setKillDelay(int millis);`

The default “Kill Delay” is 30 seconds. This represents the amount of time to wait between the initial request to shutdown and issuing a “force kill” if the database has not shutdown by itself.

- `void addCompletionListener(Runnable listener);`

Allows for applications to be notified when the server process completes. Each "listener" will be fired off in its own thread.

- `String getVersion();`

Returns the version of MySQL.

- `void setVersion(int MajorVersion, int minorVersion, int patch-Level);`

The standard distribution comes with only one version of MySQL packaged. However, it is possible to package multiple versions, and specify which version to use.

## 18.4.5. Connector/MXJ Notes and Tips

This section contains notes and tips on using the Connector/MXJ component within your applications.

### 18.4.5.1. Creating your own Connector/MXJ Package

If you want to create a custom Connector/MXJ package that includes a specific `mysqld` version or platform then you must extract and rebuild the `connector-mxj.jar` file.

First, you should create a new directory into which you can extract the current `connector-mxj.jar`:

```
shell> mkdir custom-mxj
shell> cd custom-mxj
shell> jar -xf connector-mxj.jar
shell> ls
5-0-22/
ConnectorMXJObjectTestExample.class
ConnectorMXJUrlTestExample.class
META-INF/
TestDb.class
com/
kill.exe
```

The MySQL version directory, `5-0-22` in the above example, contains all of the files used to create an instance of MySQL when Connector/MXJ is executed. All of the files in this directory are required for each version of MySQL that you want to embed. Note as well the format of the version number, which uses hyphens instead of periods to separate the version number components.

Within the version specific directory are the platform specific directories, and archives of the [data](#) and [share](#) directory required by MySQL for the various platforms. For example, here is the listing for the default Connector/MXJ package:

```
shell>> ls
Linux-i386/
META-INF/
Mac_OS_X-ppc/
SunOS-sparc/
Win-x86/
com/
data_dir.jar
share_dir.jar
win_share_dir.jar
```

Platform specific directories are listed by their OS and platform - for example the [mysqld](#) for Mac OS X PowerPC is located within the [Mac\\_OS\\_X-ppc](#) directory. You can delete directories from this location that you do not require, and add new directories for additional platforms that you want to support.

To add a platform specific [mysqld](#), create a new directory with the corresponding name for your operating system/platform. For example, you could add a directory for Mac OS X/Intel using the directory [Mac\\_OS\\_X-i386](#).

On Unix systems, you can determine the platform using [uname](#):

```
shell> uname -p
i386
```

Now you need to download or compile [mysqld](#) for the MySQL version and platform you want to include in your custom [connector-mxj.jar](#) package into the new directory.

Create a file called [version.txt](#) in the OS/platform directory you have just created that contains the version string/path of the [mysqld](#) binary. For example:

```
mysql-5.0.22-osx10.3-i386/bin/mysqld
```

You can now recreate the [connector-mxj.jar](#) file with the added [mysqld](#):

```
shell> cd custom-mxj
shell> jar -cf ../connector-mxj.jar *
```

You should test this package using the steps outlined in [Section 18.4.2.3, “Connector/MXJ Quick Start Guide”](#).

## 18.4.5.2. Deploying Connector/MXJ with a pre-configured database

To include a pre-configured/populated database within your Connector/MXJ JAR file you must create a custom [data\\_dir.jar](#) file, as included within the main [connector-mxj.jar](#) file:

1. First extract the [connector-mxj.jar](#) file, as outlined in the previous section (see [Section 18.4.5.1, “Creating your own Connector/MXJ Package”](#)).
2. First, create your database and populate the database with the information you require in an existing instance of MySQL - including Connector/MXJ instances. Data file formats are compatible across platforms.
3. Shutdown the instance of MySQL.
4. Create a JAR file of the data directory and databases that you want to include your Connector/MXJ

package. You should include the `mysql` database, which includes user authentication information, in addition to the specific databases you want to include. For example, to create a JAR of the `mysql` and `mxjtest` databases:

```
shell> jar -cf ../data_dir.jar mysql mxjtest
```

5. Copy the `data_dir.jar` file into the extracted `connector-mxj.jar` directory, and then create an archive for `connector-mxj.jar`.

Note that if you are create databases using the InnoDB engine, you must include the `ibdata.*` and `ib_logfile*` files within the `data_dir.jar` archive.

### 18.4.5.3. Running within a JMX Agent (custom)

As a JMX MBean, MySQL Connector/MXJ requires a JMX v1.2 compliant MBean container, such as JBoss version 4. The MBean will uses the standard JMX management APIs to present (and allow the setting of) parameters which are appropriate for that platform.

If you are not using the SUN Reference implementation of the JMX libraries, you should skip this section. Or, if you are deploying to JBoss, you also may wish to skip to the next section.

We want to see the `MysqldDynamicMBean` in action inside of a JMX agent. In the `com.mysql.management.jmx.sunri` package is a custom JMX agent with two MBeans:

1. the `MysqldDynamicMBean`, and
2. a `com.sun.jdmk.comm.HtmlAdaptorServer`, which provides a web interface for manipulating the beans inside of a JMX agent.

When this very simple agent is started, it will allow a MySQL database to be started and stopped with a web browser.

1. Complete the testing of the platform as above.
  - current JDK, JUnit, Connector/J, MySQL Connector/MXJ
  - this section *requires* the SUN reference implementation of JMX
  - `PATH`, `JAVA_HOME`, `ANT_HOME`, `CLASSPATH`
2. If not building from source, skip to next step

rebuild with the "sunri.present"

```
ant -Dsunri.present=true dist
re-run tests:
java junit.textui.TestRunner com.mysql.management.AllTestsSuite
```

3. launch the test agent from the command line:

```
java com.mysql.management.jmx.sunri.MysqldTestAgentSunHtmlAdaptor &
```

4. from a browser:

```
http://localhost:9092/
```

5. under MysqlIdAgent,

```
select "name=mysqlId"
```

6. Observe the MBean View
7. scroll to the bottom of the screen press the `startMysqlId` button
8. click `Back to MBean View`
9. scroll to the bottom of the screen press `stopMysqlId` button
10. kill the java process running the Test Agent (jmx server)

#### 18.4.5.4. Deployment in a standard JMX Agent environment (JBoss)

Once there is confidence that the MBean will function on the platform, deploying the MBean inside of a standard JMX Agent is the next step. Included are instructions for deploying to JBoss.

1. Ensure a current version of java development kit (v1.4.x), see above.
  - Ensure `JAVA_HOME` is set (JBoss requires `JAVA_HOME`)
  - Ensure `JAVA_HOME/bin` is in the `PATH` (You will NOT need to set your `CLASSPATH`, nor will you need any of the jars used in the previous tests).
2. Ensure a current version of JBoss (v4.0RC1 or better)

```
http://www.jboss.org/index.html
select "Downloads"
select "jboss-4.0.zip"
pick a mirror
unzip ~/dload/jboss-4.0.zip
create a JBOSS_HOME environment variable set to the unzipped directory
unix only:
cd $JBOSS_HOME/bin
chmod +x *.sh
```

3. Deploy (copy) the `connector-mxj.jar` to `$JBOSS_HOME/server/default/lib`.
4. Deploy (copy) `mysql-connector-java-3.1.4-beta-bin.jar` to `$JBOSS_HOME/server/default/lib`.
5. Create a `mxjtest.war` directory in `$JBOSS_HOME/server/default/deploy`.
6. Deploy (copy) `index.jsp` to `$JBOSS_HOME/server/default/deploy/mxjtest.war`.
7. Create a `mysqlId-service.xml` file in `$JBOSS_HOME/server/default/deploy`.

```
<?xml version="1.0" encoding="UTF-8"?>
<server>
  <mbean code="com.mysql.management.jmx.jboss.JBossMysqlIdDynamicMBean"
    name="mysql:type=service,name=mysqlId">
    <attribute name="datadir">/tmp/xxx_data_xxx</attribute>
    <attribute name="autostart">true</attribute>
  </mbean>
```

```
</server>
```

8. Start jboss:
  - on unix: `$JBOSS_HOME/bin/run.sh`
  - on windows: `%JBOSS_HOME%\bin\run.bat`

Be ready: JBoss sends a lot of output to the screen.
9. When JBoss seems to have stopped sending output to the screen, open a web browser to: <http://localhost:8080/jmx-console>
10. Scroll down to the bottom of the page in the `mysql` section, select the bulleted `mysqld` link.
11. Observe the JMX MBean View page. MySQL should already be running.
12. (If "autostart=true" was set, you may skip this step.) Scroll to the bottom of the screen. You may press the `Invoke` button to stop (or start) MySQL observe `Operation completed successfully without a return value`. Click `Back to MBean View`
13. To confirm MySQL is running, open a web browser to <http://localhost:8080/mxjtest/> and you should see that

```
SELECT 1
```

returned with a result of

```
1
```

14. Guided by the `$JBOSS_HOME/server/default/deploy/mxjtest.war/index.jsp` you will be able to use MySQL in your Web Application. There is a `test` database and a `root` user (no password) ready to experiment with. Try creating a table, inserting some rows, and doing some selects.
15. Shut down MySQL. MySQL will be stopped automatically when JBoss is stopped, or: from the browser, scroll down to the bottom of the MBean View press the stop service `Invoke` button to halt the service. Observe `Operation completed successfully without a return value`. Using `ps` or `task manager` see that MySQL is no longer running

As of 1.0.6-beta version is the ability to have the MBean start the MySQL database upon start up. Also, we've taken advantage of the JBoss life-cycle extension methods so that the database will gracefully shut down when JBoss is shutdown.

## 18.4.6. Connector/MXJ Support

There are a wide variety of options available for obtaining support for using Connector/MXJ. You should contact the Connector/MXJ community for help before reporting a potential bug or problem. See [Section 18.4.6.1, "Connector/MXJ Community Support"](#).

### 18.4.6.1. Connector/MXJ Community Support

MySQL AB provides assistance to the user community by means of a number of mailing lists and web based forums.

You can find help and support through the [MySQL and Java](http://lists.mysql.com/java) [http://lists.mysql.com/java] mailing list.

For information about subscribing to MySQL mailing lists or to browse list archives, visit <http://lists.mysql.com/>. See [Section 1.7.1, “MySQL Mailing Lists”](#).

Community support from experienced users is also available through the [MyODBC Forum](http://forums.mysql.com/list.php?39) [http://forums.mysql.com/list.php?39]. You may also find help from other users in the other MySQL Forums, located at <http://forums.mysql.com>. See [Section 1.7.2, “MySQL Community Support at the MySQL Forums”](#).

### 18.4.6.2. How to Report Connector/MXJ Problems

If you encounter difficulties or problems with Connector/MXJ, contact the Connector/MXJ community [Section 18.4.6.1, “Connector/MXJ Community Support”](#).

If reporting a problem, you should ideally include the following information with the email:

- Operating system and version
- Connector/MXJ version
- MySQL server version
- Copies of error messages or other unexpected output
- Simple reproducible sample

Remember that the more information you can supply to us, the more likely it is that we can fix the problem.

If you believe the problem to be a bug, then you must report the bug through <http://bugs.mysql.com/>.

## 18.5. Connector/PHP

The PHP distribution and documentation are available from the PHP Web site. MySQL provides the `mysql` and `mysql_i` extensions for MySQL versions as of 4.1.16 for the Windows operating system on <http://dev.mysql.com/downloads/connector/php/>. You can find information why you should preferably use the extensions provided by MySQL on that page. For platforms other than Windows, you should use the `mysql` or `mysql_i` extensions shipped with the PHP sources. See [Section 17.3, “MySQL PHP API”](#).

---

# Chapter 19. Extending MySQL

## 19.1. MySQL Internals

This chapter describes a lot of things that you need to know when working on the MySQL code. If you plan to contribute to MySQL development, want to have access to the bleeding-edge versions of the code, or just want to keep track of development, follow the instructions in [Section 2.9.3, “Installing from the Development Source Tree”](#). If you are interested in MySQL internals, you should also subscribe to our `internals` mailing list. This list has relatively low traffic. For details on how to subscribe, please see [Section 1.7.1, “MySQL Mailing Lists”](#). All developers at MySQL AB are on the `internals` list and we help other people who are working on the MySQL code. Feel free to use this list both to ask questions about the code and to send patches that you would like to contribute to the MySQL project!

### 19.1.1. MySQL Threads

The MySQL server creates the following threads:

- One thread manages TCP/IP file connection requests and creates a new dedicated thread to handle the authentication and SQL statement processing for each connection. (On Unix, this thread also manages Unix socket file connection requests.) On Windows, a similar thread manages shared-memory connection requests, and on Windows NT-based systems, a thread manages named-pipe connection requests. Every client connection has its own thread, although the manager threads try to avoid creating threads by consulting the thread cache first to see whether a cached thread can be used for a new connection.
- On Windows NT, there is a named pipe handler thread that does the same work as the TCP/IP connection thread on named pipe connect requests.
- On a master replication server, slave server connections are like client connections: There is one thread per connected slave.
- On a slave replication server, an I/O thread is started to connect to the master server and read updates from it. An SQL thread is started to apply updates read from the master. These two threads run independently and can be started and stopped independently.
- The signal thread handles all signals. This thread also normally handles alarms and calls `process_alarm()` to force timeouts on connections that have been idle too long.
- If `mysqld` is compiled with `-DUSE_ALARM_THREAD`, a dedicated thread that handles alarms is created. This is only used on some systems where there are problems with `sigwait()` or if you want to use the `thr_alarm()` code in your application without a dedicated signal handling thread.
- If the server is started with the `--flush_time=val` option, a dedicated thread is created to flush all tables every `val` seconds.
- Each table for which `INSERT DELAYED` statements are issued gets its own thread.

`mysqladmin processlist` only shows the connection, `INSERT DELAYED`, and replication threads.

### 19.1.2. MySQL Test Suite

The test system that is included in Unix source and binary distributions makes it possible for users and developers to perform regression tests on the MySQL code. These tests can be run on Unix.

The current set of test cases doesn't test everything in MySQL, but it should catch most obvious bugs in the SQL processing code, operating system or library issues, and is quite thorough in testing replication. Our goal is to have the tests cover 100% of the code. We welcome contributions to our test suite. You may especially want to contribute tests that examine the functionality critical to your system because this ensures that all future MySQL releases work well with your applications.

The test system consists of a test language interpreter (`mysqltest`), a shell script to run all tests (`mysql-test-run`), the actual test cases written in a special test language, and their expected results. To run the test suite on your system after a build, type `make test` from the source root directory, or change location to the `mysql-test` directory and type `./mysql-test-run`. If you have installed a binary distribution, change location to the `mysql-test` directory under the installation root directory (for example, `/usr/local/mysql/mysql-test`), and run `./mysql-test-run`. All tests should succeed. If any do not, you should try to find out why and report the problem if it indicates a bug in MySQL. See [Section 1.8, “How to Report Bugs or Problems”](#).

If one test fails, you should run `mysql-test-run` with the `--force` option to check whether any other tests fail.

From MySQL 4.1 on, if you have a copy of `mysqld` running on the machine where you want to run the test suite, you do not have to stop it, as long as it is not using ports `9306` or `9307`. If either of those ports is taken, you should edit `mysql-test-run` and change the values of the master or slave port to one that is available.

Before MySQL 4.1, `mysql-test-run` does not try to run its own server by default but tries to use your currently running server. To override this and cause `mysql-test-run` to start its own server, run it with the `--local` option.

In the `mysql-test` directory, you can run an individual test case with `./mysql-test-run test_name`.

You can use the `mysqltest` language to write your own test cases. This is documented in the MySQL Test Framework manual, available at <http://dev.mysql.com/doc/>.

If you have a question about the test suite, or have a test case to contribute, send an email message to the MySQL [internals](#) mailing list. See [Section 1.7.1, “MySQL Mailing Lists”](#). This list does not accept attachments, so you should FTP all the relevant files to: <ftp://ftp.mysql.com/pub/mysql/upload/>

## 19.2. Adding New Functions to MySQL

There are two ways to add new functions to MySQL:

- You can add functions through the user-defined function (UDF) interface. User-defined functions are compiled as object files and then added to and removed from the server dynamically using the `CREATE FUNCTION` and `DROP FUNCTION` statements. See [Section 19.2.2, “CREATE FUNCTION Syntax”](#).
- You can add functions as native (built-in) MySQL functions. Native functions are compiled into the `mysqld` server and become available on a permanent basis.

Each method has advantages and disadvantages:

- If you write user-defined functions, you must install object files in addition to the server itself. If you compile your function into the server, you don't need to do that.
- Native functions require you to modify a source distribution. UDFs do not. You can add UDFs to a

binary MySQL distribution. No access to MySQL source is necessary.

- If you upgrade your MySQL distribution, you can continue to use your previously installed UDFs, unless you upgrade to a newer version for which the UDF interface changes. (An incompatible change occurred in MySQL 4.1.1 for aggregate functions. A function named `xxx_clear()` must be defined rather than `xxx_reset()`.) For native functions, you must repeat your modifications each time you upgrade.

Whichever method you use to add new functions, they can be invoked in SQL statements just like native functions such as `ABS()` or `SOUNDEX()`.

The following sections describe features of the UDF interface, provide instructions for writing UDFs, discuss security precautions that MySQL takes to prevent UDF misuse, and describe how to add native MySQL functions.

For example source code that illustrates how to write UDFs, take a look at the [sql/udf\\_example.cc](#) file that is provided in MySQL source distributions.

## 19.2.1. Features of the User-Defined Function Interface

The MySQL interface for user-defined functions provides the following features and capabilities:

- Functions can return string, integer, or real values.
- You can define simple functions that operate on a single row at a time, or aggregate functions that operate on groups of rows.
- Information is provided to functions that enables them to check the number and types of the arguments passed to them.
- You can tell MySQL to coerce arguments to a given type before passing them to a function.
- You can indicate that a function returns `NULL` or that an error occurred.

## 19.2.2. CREATE FUNCTION Syntax

```
CREATE [AGGREGATE] FUNCTION function_name RETURNS {STRING|INTEGER|REAL}
SONAME shared_library_name
```

A user-defined function (UDF) is a way to extend MySQL with a new function that works like a native (built-in) MySQL function such as `ABS()` or `CONCAT()`.

*function\_name* is the name that should be used in SQL statements to invoke the function. The `RETURNS` clause indicates the type of the function's return value. *shared\_library\_name* is the base-name of the shared object file that contains the code that implements the function. The file must be located in a directory that is searched by your system's dynamic linker.

To create a function, you must have the `INSERT` privilege for the `mysql` database. This is necessary because `CREATE FUNCTION` adds a row to the `mysql.func` system table that records the function's name, type, and shared library name. If you do not have this table, you should run the `mysql_fix_privilege_tables` script to create it. See [Section 5.5.1](#), “`mysql_fix_privilege_tables` — Upgrade MySQL System Tables”.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with

the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

For instructions on writing user-defined functions, see [Section 19.2.4, “Adding a New User-Defined Function”](#). For the UDF mechanism to work, functions must be written in C or C++ (or another language that can use C calling conventions), your operating system must support dynamic loading and you must have compiled `mysqld` dynamically (not statically).

`AGGREGATE` is a new option for MySQL 3.23. An `AGGREGATE` function works exactly like a native MySQL aggregate (summary) function such as `SUM` or `COUNT()`. For `AGGREGATE` to work, your `mysql.func` table must contain a `type` column. If your `mysql.func` table does not have this column, you should run the `mysql_fix_privilege_tables` script to create it.

### 19.2.3. DROP FUNCTION Syntax

```
DROP FUNCTION function_name
```

This statement drops the user-defined function (UDF) named *function\_name*.

To drop a function, you must have the `DELETE` privilege for the `mysql` database. This is because `DROP FUNCTION` removes a row from the `mysql.func` system table that records the function's name, type, and shared library name.

### 19.2.4. Adding a New User-Defined Function

For the UDF mechanism to work, functions must be written in C or C++ (or another language that can use C calling conventions), and your operating system must support dynamic loading. The MySQL source distribution includes a file `sql/udf_example.cc` that defines 5 new functions. Consult this file to see how UDF calling conventions work. UDF-related symbols and data structures are defined in the `include/mysql_com.h` header file. (You need not include this header file directly because it is included by `mysql.h`.)

A UDF contains code that becomes part of the running server, so when you write a UDF, you are bound by any and all constraints that otherwise apply to writing server code. For example, you may have problems if you attempt to use functions from the `libstdc++` library. Note that these constraints may change in future versions of the server, so it is possible that server upgrades will require revisions to UDFs that were originally written for older servers. For information about these constraints, see [Section 2.9.2, “Typical configure Options”](#), and [Section 2.9.4, “Dealing with Problems Compiling MySQL”](#).

To be able to use UDFs, you need to link `mysqld` dynamically. Don't configure MySQL using `--with-mysqld-ldflags=-all-static`. If you want to use a UDF that needs to access symbols from `mysqld` (for example, the `metaphone` function in `sql/udf_example.cc` that uses `default_charset_info`), you must link the program with `-rdynamic` (see `man dlopen`). If you plan to use UDFs, the rule of thumb is to configure MySQL with `--with-mysqld-ldflags=-rdynamic` unless you have a very good reason not to.

If you must use a precompiled distribution of MySQL, use MySQL-Max, which contains a dynamically linked server that supports dynamic loading.

For each function that you want to use in SQL statements, you should define corresponding C (or C++) functions. In the following discussion, the name “xxx” is used for an example function name. To distinguish between SQL and C/C++ usage, `XXX()` (uppercase) indicates an SQL function call, and `xxx()` (lowercase) indicates a C/C++ function call.

The C/C++ functions that you write to implement the interface for `XXX()` are:

- `xxx()` (required)

The main function. This is where the function result is computed. The correspondence between the SQL function data type and the return type of your C/C++ function is shown here:

SQL Type	C/C++ Type
STRING	char *
INTEGER	long long
REAL	double

- `xxx_init()` (optional)

The initialization function for `xxx()`. It can be used for the following purposes:

- To check the number of arguments to `xxx()`.
- To check that the arguments are of a required type or, alternatively, to tell MySQL to coerce arguments to the types you want when the main function is called.
- To allocate any memory required by the main function.
- To specify the maximum length of the result.
- To specify (for `REAL` functions) the maximum number of decimal places in the result.
- To specify whether the result can be `NULL`.

- `xxx_deinit()` (optional)

The deinitialization function for `xxx()`. It should deallocate any memory allocated by the initialization function.

When an SQL statement invokes `xxx()`, MySQL calls the initialization function `xxx_init()` to let it perform any required setup, such as argument checking or memory allocation. If `xxx_init()` returns an error, MySQL aborts the SQL statement with an error message and does not call the main or deinitialization functions. Otherwise, MySQL calls the main function `xxx()` once for each row. After all rows have been processed, MySQL calls the deinitialization function `xxx_deinit()` so that it can perform any required cleanup.

For aggregate functions that work like `SUM()`, you must also provide the following functions:

- `xxx_reset()` (required before 4.1.1)

Reset the current aggregate value and insert the argument as the initial aggregate value for a new group.

- `xxx_clear()` (required starting from 4.1.1)

Reset the current aggregate value but do not insert the argument as the initial aggregate value for a new group.

- `xxx_add()` (required)

Add the argument to the current aggregate value.

MySQL handles aggregate UDFs as follows:

1. Call `xxx_init()` to let the aggregate function allocate any memory it needs for storing results.
2. Sort the table according to the `GROUP BY` expression.
3. Call `xxx_clear()` for the first row in each new group.
4. Call `xxx_add()` for each new row that belongs in the same group.
5. Call `xxx()` to get the result for the aggregate when the group changes or after the last row has been processed.
6. Repeat 3-5 until all rows has been processed
7. Call `xxx_deinit()` to let the UDF free any memory it has allocated.

All functions must be thread-safe. This includes not just the main function, but the initialization and deinitialization functions as well, and also the additional functions required by aggregate functions. A consequence of this requirement is that you are not allowed to allocate any global or static variables that change! If you need memory, you should allocate it in `xxx_init()` and free it in `xxx_deinit()`.

### 19.2.4.1. UDF Calling Sequences for Simple Functions

This section describes the different functions that you need to define when you create a simple UDF. [Section 19.2.4, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

The main `xxx()` function should be declared as shown in this section. Note that the return type and parameters differ, depending on whether you declare the SQL function `xxx()` to return `STRING`, `INTEGER`, or `REAL` in the `CREATE FUNCTION` statement:

For `STRING` functions:

```
char *xxx(UDF_INIT *initid, UDF_ARGS *args,
         char *result, unsigned long *length,
         char *is_null, char *error);
```

For `INTEGER` functions:

```
long long xxx(UDF_INIT *initid, UDF_ARGS *args,
             char *is_null, char *error);
```

For `REAL` functions:

```
double xxx(UDF_INIT *initid, UDF_ARGS *args,
          char *is_null, char *error);
```

The initialization and deinitialization functions are declared like this:

```
my_bool xxx_init(UDF_INIT *initid, UDF_ARGS *args, char *message);
void xxx_deinit(UDF_INIT *initid);
```

The `initid` parameter is passed to all three functions. It points to a `UDF_INIT` structure that is used to communicate information between functions. The `UDF_INIT` structure members follow. The initialization function should fill in any members that it wishes to change. (To use the default for a member,

leave it unchanged.)

- `my_bool maybe_null`

`xxx_init()` should set `maybe_null` to 1 if `xxx()` can return `NULL`. The default value is 1 if any of the arguments are declared `maybe_null`.

- `unsigned int decimals`

The number of decimal digits to the right of the decimal point. The default value is the maximum number of decimal digits in the arguments passed to the main function. (For example, if the function is passed `1.34`, `1.345`, and `1.3`, the default would be 3, because `1.345` has 3 decimal digits.

- `unsigned int max_length`

The maximum length of the result. The default `max_length` value differs depending on the result type of the function. For string functions, the default is the length of the longest argument. For integer functions, the default is 21 digits. For real functions, the default is 13 plus the number of decimal digits indicated by `initid->decimals`. (For numeric functions, the length includes any sign or decimal point characters.)

If you want to return a blob value, you can set `max_length` to 65KB or 16MB. This memory is not allocated, but the value is used to decide which data type to use if there is a need to temporarily store the data.

- `char *ptr`

A pointer that the function can use for its own purposes. For example, functions can use `initid->ptr` to communicate allocated memory among themselves. `xxx_init()` should allocate the memory and assign it to this pointer:

```
initid->ptr = allocated_memory;
```

In `xxx()` and `xxx_deinit()`, refer to `initid->ptr` to use or deallocate the memory.

### 19.2.4.2. UDF Calling Sequences for Aggregate Functions

This section describes the different functions that you need to define when you create an aggregate UDF. [Section 19.2.4, “Adding a New User-Defined Function”](#), describes the order in which MySQL calls these functions.

- `xxx_reset()`

This function is called when MySQL finds the first row in a new group. It should reset any internal summary variables and then use the given `UDF_ARGS` argument as the first value in your internal summary value for the group. Declare `xxx_reset()` as follows:

```
char *xxx_reset(UDF_INIT *initid, UDF_ARGS *args,
               char *is_null, char *error);
```

`xxx_reset()` is needed only before MySQL 4.1.1. It is *not* needed or used as of MySQL 4.1.1, when the UDF interface changed to use `xxx_clear()` instead. However, you can define both `xxx_reset()` and `xxx_clear()` if you want to have your UDF work both before and after the interface change. (If you do include both functions, the `xxx_reset()` function in many cases can be implemented internally by calling `xxx_clear()` to reset all variables, and then calling `xxx_add()` to add the `UDF_ARGS` argument as the first value in the group.)

- `xxx_clear()`

This function is called when MySQL needs to reset the summary results. It is called at the beginning for each new group but can also be called to reset the values for a query where there were no matching rows. Declare `xxx_clear()` as follows:

```
char *xxx_clear(UDF_INIT *initid, char *is_null, char *error);
```

`is_null` is set to point to `CHAR(0)` before calling `xxx_clear()`.

If something went wrong, you can store a value in the variable to which the `error` argument points. `error` points to a single-byte variable, not to a string buffer.

`xxx_clear()` is required only by MySQL 4.1.1 and above. Before MySQL 4.1.1, use `xxx_reset()` instead.

- `xxx_add()`

This function is called for all rows that belong to the same group, except for the first row. You should use it to add the value in the `UDF_ARGS` argument to your internal summary variable.

```
char *xxx_add(UDF_INIT *initid, UDF_ARGS *args,
             char *is_null, char *error);
```

The `xxx()` function for an aggregate UDF should be declared the same way as for a non-aggregate UDF. See [Section 19.2.4.1, “UDF Calling Sequences for Simple Functions”](#).

For an aggregate UDF, MySQL calls the `xxx()` function after all rows in the group have been processed. You should normally never access its `UDF_ARGS` argument here but instead return a value based on your internal summary variables.

Return value handling in `xxx()` should be done the same way as for a non-aggregate UDF. See [Section 19.2.4.4, “UDF Return Values and Error Handling”](#).

The `xxx_reset()` and `xxx_add()` functions handle their `UDF_ARGS` argument the same way as functions for non-aggregate UDFs. See [Section 19.2.4.3, “UDF Argument Processing”](#).

The pointer arguments to `is_null` and `error` are the same for all calls to `xxx_reset()`, `xxx_clear()`, `xxx_add()` and `xxx()`. You can use this to remember that you got an error or whether the `xxx()` function should return `NULL`. You should not store a string into `*error`! `error` points to a single-byte variable, not to a string buffer.

`*is_null` is reset for each group (before calling `xxx_clear()`). `*error` is never reset.

If `*is_null` or `*error` are set when `xxx()` returns, MySQL returns `NULL` as the result for the group function.

### 19.2.4.3. UDF Argument Processing

The `args` parameter points to a `UDF_ARGS` structure that has the members listed here:

- `unsigned int arg_count`

The number of arguments. Check this value in the initialization function if you require your function to be called with a particular number of arguments. For example:

```
if (args->arg_count != 2)
```

```
{
    strcpy(message, "XXX() requires two arguments");
    return 1;
}
```

- `enum Item_result *arg_type`

A pointer to an array containing the types for each argument. The possible type values are `STRING_RESULT`, `INT_RESULT`, and `REAL_RESULT`.

To make sure that arguments are of a given type and return an error if they are not, check the `arg_type` array in the initialization function. For example:

```
if (args->arg_type[0] != STRING_RESULT ||
    args->arg_type[1] != INT_RESULT)
{
    strcpy(message, "XXX() requires a string and an integer");
    return 1;
}
```

As an alternative to requiring your function's arguments to be of particular types, you can use the initialization function to set the `arg_type` elements to the types you want. This causes MySQL to coerce arguments to those types for each call to `xxx()`. For example, to specify that the first two arguments should be coerced to string and integer, respectively, do this in `xxx_init()`:

```
args->arg_type[0] = STRING_RESULT;
args->arg_type[1] = INT_RESULT;
```

- `char **args`

`args->args` communicates information to the initialization function about the general nature of the arguments passed to your function. For a constant argument `i`, `args->args[i]` points to the argument value. (See below for instructions on how to access the value properly.) For a non-constant argument, `args->args[i]` is 0. A constant argument is an expression that uses only constants, such as `3` or `4*7-2` or `SIN(3.14)`. A non-constant argument is an expression that refers to values that may change from row to row, such as column names or functions that are called with non-constant arguments.

For each invocation of the main function, `args->args` contains the actual arguments that are passed for the row currently being processed.

If argument `i` represents `NULL`, `args->args[i]` is a null pointer (0). If the argument is not `NULL`, functions can refer to it as follows:

- An argument of type `STRING_RESULT` is given as a string pointer plus a length, to allow handling of binary data or data of arbitrary length. The string contents are available as `args->args[i]` and the string length is `args->lengths[i]`. You should not assume that strings are null-terminated.
- For an argument of type `INT_RESULT`, you must cast `args->args[i]` to a `long long` value:

```
long long int_val;
int_val = *((long long*) args->args[i]);
```

- For an argument of type `REAL_RESULT`, you must cast `args->args[i]` to a `double` value:

```
double real_val;
real_val = *((double*) args->args[i]);
```

- `unsigned long *lengths`

For the initialization function, the `lengths` array indicates the maximum string length for each argument. You should not change these. For each invocation of the main function, `lengths` contains the actual lengths of any string arguments that are passed for the row currently being processed. For arguments of types `INT_RESULT` or `REAL_RESULT`, `lengths` still contains the maximum length of the argument (as for the initialization function).

#### 19.2.4.4. UDF Return Values and Error Handling

The initialization function should return `0` if no error occurred and `1` otherwise. If an error occurs, `xxx_init()` should store a null-terminated error message in the `message` parameter. The message is returned to the client. The message buffer is `MYSQL_ERRMSG_SIZE` characters long, but you should try to keep the message to less than 80 characters so that it fits the width of a standard terminal screen.

The return value of the main function `xxx()` is the function value, for `long long` and `double` functions. A string function should return a pointer to the result and set `*result` and `*length` to the contents and length of the return value. For example:

```
memcpy(result, "result string", 13);
*length = 13;
```

The `result` buffer that is passed to the `xxx()` function is 255 bytes long. If your result fits in this, you don't have to worry about memory allocation for results.

If your string function needs to return a string longer than 255 bytes, you must allocate the space for it with `malloc()` in your `xxx_init()` function or your `xxx()` function and free it in your `xxx_deinit()` function. You can store the allocated memory in the `ptr` slot in the `UDF_INIT` structure for reuse by future `xxx()` calls. See Section 19.2.4.1, “UDF Calling Sequences for Simple Functions”.

To indicate a return value of `NULL` in the main function, set `*is_null` to `1`:

```
*is_null = 1;
```

To indicate an error return in the main function, set `*error` to `1`:

```
*error = 1;
```

If `xxx()` sets `*error` to `1` for any row, the function value is `NULL` for the current row and for any subsequent rows processed by the statement in which `xxx()` was invoked. (`xxx()` is not even called for subsequent rows.) **Note:** Before MySQL 3.22.10, you should set both `*error` and `*is_null`:

```
*error = 1;
*is_null = 1;
```

#### 19.2.4.5. Compiling and Installing User-Defined Functions

Files implementing UDFs must be compiled and installed on the host where the server runs. This process is described below for the example UDF file `sql/udf_example.cc` that is included in the MySQL source distribution.

The immediately following instructions are for Unix. Instructions for Windows are given later in this section.

The `udf_example.cc` file contains the following functions:

- `metaphon()` returns a metaphon string of the string argument. This is something like a soundex string, but it's more tuned for English.
- `myfunc_double()` returns the sum of the ASCII values of the characters in its arguments, divided by the sum of the length of its arguments.
- `myfunc_int()` returns the sum of the length of its arguments.
- `sequence([const int])` returns a sequence starting from the given number or 1 if no number has been given.
- `lookup()` returns the IP number for a hostname.
- `reverse_lookup()` returns the hostname for an IP number. The function may be called either with a single string argument of the form '`xxx.xxx.xxx.xxx`' or with four numbers.

A dynamically loadable file should be compiled as a sharable object file, using a command something like this:

```
shell> gcc -shared -o udf_example.so udf_example.cc
```

If you are using `gcc`, you should be able to create `udf_example.so` with a simpler command:

```
shell> make udf_example.so
```

You can easily determine the correct compiler options for your system by running this command in the `sql` directory of your MySQL source tree:

```
shell> make udf_example.o
```

You should run a compile command similar to the one that `make` displays, except that you should remove the `-c` option near the end of the line and add `-o udf_example.so` to the end of the line. (On some systems, you may need to leave the `-c` on the command.)

After you compile a shared object containing UDFs, you must install it and tell MySQL about it. Compiling a shared object from `udf_example.cc` produces a file named something like `udf_example.so` (the exact name may vary from platform to platform). Copy this file to some directory such as `/usr/lib` that searched by your system's dynamic (runtime) linker, or add the directory in which you placed the shared object to the linker configuration file (for example, `/etc/ld.so.conf`).

The dynamic linker name is system-specific (for example, `ld-elf.so.1` on FreeBSD, `ld.so` on Linux, or `dyld` on Mac OS X). Consult your system documentation for information about the linker name and how to configure it.

On many systems, you can also set the `LD_LIBRARY` or `LD_LIBRARY_PATH` environment variable to point at the directory where you have the files for your UDF. The `dlopen` manual page tells you which variable you should use on your system. You should set this in `mysql.server` or `mysqld_safe` startup scripts and restart `mysqld`.

On some systems, the `ldconfig` program that configures the dynamic linker does not recognize a shared object unless its name begins with `lib`. In this case you should rename a file such as `udf_example.so` to `libudf_example.so`.

On Windows, you can compile user-defined functions by using the following procedure:

1. You need to obtain the BitKeeper source repository for MySQL 4.0 or higher. See [Section 2.9.3, “Installing from the Development Source Tree”](#).
2. In the source repository, look in the `VC++Files/examples/udf_example` directory. There are files named `udf_example.def`, `udf_example.dsp`, and `udf_example.dsw` there.
3. In the source repository, look in the `sql` directory. Copy the `udf_example.cc` from this directory to the `VC++Files/examples/udf_example` directory and rename the file to `udf_example.cpp`.
4. Open the `udf_example.dsw` file with Visual Studio VC++ and use it to compile the UDFs as a normal project.

After the shared object file has been installed, notify `mysqld` about the new functions with these statements:

```
mysql> CREATE FUNCTION metaphon RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_double RETURNS REAL SONAME 'udf_example.so';
mysql> CREATE FUNCTION myfunc_int RETURNS INTEGER SONAME 'udf_example.so';
mysql> CREATE FUNCTION lookup RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE FUNCTION reverse_lookup
-> RETURNS STRING SONAME 'udf_example.so';
mysql> CREATE AGGREGATE FUNCTION avgcost
-> RETURNS REAL SONAME 'udf_example.so';
```

Functions can be deleted using `DROP FUNCTION`:

```
mysql> DROP FUNCTION metaphon;
mysql> DROP FUNCTION myfunc_double;
mysql> DROP FUNCTION myfunc_int;
mysql> DROP FUNCTION lookup;
mysql> DROP FUNCTION reverse_lookup;
mysql> DROP FUNCTION avgcost;
```

The `CREATE FUNCTION` and `DROP FUNCTION` statements update the `func` system table in the `mysql` database. The function's name, type and shared library name are saved in the table. You must have the `INSERT` and `DELETE` privileges for the `mysql` database to create and drop functions.

You should not use `CREATE FUNCTION` to add a function that has previously been created. If you need to reinstall a function, you should remove it with `DROP FUNCTION` and then reinstall it with `CREATE FUNCTION`. You would need to do this, for example, if you recompile a new version of your function, so that `mysqld` gets the new version. Otherwise, the server continues to use the old version.

An active function is one that has been loaded with `CREATE FUNCTION` and not removed with `DROP FUNCTION`. All active functions are reloaded each time the server starts, unless you start `mysqld` with the `--skip-grant-tables` option. In this case, UDF initialization is skipped and UDFs are unavailable.

### 19.2.4.6. User-Defined Function Security Precautions

MySQL takes the following measures to prevent misuse of user-defined functions.

You must have the `INSERT` privilege to be able to use `CREATE FUNCTION` and the `DELETE` privilege to be able to use `DROP FUNCTION`. This is necessary because these statements add and delete rows from the `mysql.func` table.

UDFs should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. As of MySQL 4.0.24 and 4.1.10a, `mysqld` supports an `--allow-suspicious-udfs` option that controls whether UDFs that have

only an `xxx` symbol can be loaded. By default, the option is off, to prevent attempts at loading functions from shared object files other than those containing legitimate UDFs. If you have older UDFs that contain only the `xxx` symbol and that cannot be recompiled to include an auxiliary symbol, it may be necessary to specify the `--allow-suspicious-udfs` option. Otherwise, you should avoid enabling this capability.

UDF object files cannot be placed in arbitrary directories. They must be located in some system directory that the dynamic linker is configured to search. To enforce this restriction and prevent attempts at specifying pathnames outside of directories searched by the dynamic linker, MySQL checks the shared object file name specified in `CREATE FUNCTION` statements for pathname delimiter characters. As of MySQL 4.0.24 and 4.1.10a, MySQL also checks for pathname delimiters in filenames stored in the `mysql.func` table when it loads functions. This prevents attempts at specifying illegitimate pathnames through direct manipulation of the `mysql.func` table. For information about UDFs and the runtime linker, see [Section 19.2.4.5, “Compiling and Installing User-Defined Functions”](#).

## 19.2.5. Adding a New Native Function

The procedure for adding a new native function is described here. Note that you cannot add native functions to a binary distribution because the procedure involves modifying MySQL source code. You must compile MySQL yourself from a source distribution. Also note that if you migrate to another version of MySQL (for example, when a new version is released), you need to repeat the procedure with the new version.

To add a new native MySQL function, follow these steps:

1. Add one line to `lex.h` that defines the function name in the `sql_functions[]` array.
2. If the function prototype is simple (just takes zero, one, two or three arguments), you should in `lex.h` specify `SYM(FUNC_ARGN)` (where `N` is the number of arguments) as the second argument in the `sql_functions[]` array and add a function that creates a function object in `item_create.cc`. Take a look at `"ABS"` and `create_funcs_abs()` for an example of this.

If the function prototype is complicated (for example, if it takes a variable number of arguments), you should add two lines to `sql_yacc.yy`. One indicates the preprocessor symbol that `yacc` should define (this should be added at the beginning of the file). Then define the function parameters and add an “item” with these parameters to the `simple_expr` parsing rule. For an example, check all occurrences of `ATAN` in `sql_yacc.yy` to see how this is done.

3. In `item_func.h`, declare a class inheriting from `Item_num_func` or `Item_str_func`, depending on whether your function returns a number or a string.
4. In `item_func.cc`, add one of the following declarations, depending on whether you are defining a numeric or string function:

```
double Item_func_newname::val()
longlong Item_func_newname::val_int()
String *Item_func_newname::Str(String *str)
```

If you inherit your object from any of the standard items (like `Item_num_func`), you probably only have to define one of these functions and let the parent object take care of the other functions. For example, the `Item_str_func` class defines a `val()` function that executes `atof()` on the value returned by `::str()`.

5. You should probably also define the following object function:

```
void Item_func_newname::fix_length_and_dec()
```

This function should at least calculate `max_length` based on the given arguments.

`max_length` is the maximum number of characters the function may return. This function should also set `maybe_null = 0` if the main function can't return a `NULL` value. The function can check whether any of the function arguments can return `NULL` by checking the arguments' `maybe_null` variable. You can take a look at `Item_func_mod::fix_length_and_dec` for a typical example of how to do this.

All functions must be thread-safe. In other words, don't use any global or static variables in the functions without protecting them with mutexes)

If you want to return `NULL`, from `::val()`, `::val_int()` or `::str()` you should set `null_value` to 1 and return 0.

For `::str()` object functions, there are some additional considerations to be aware of:

- The `String *str` argument provides a string buffer that may be used to hold the result. (For more information about the `String` type, take a look at the `sql_string.h` file.)
- The `::str()` function should return the string that holds the result or `(char*) 0` if the result is `NULL`.
- All current string functions try to avoid allocating any memory unless absolutely necessary!

## 19.3. Adding New Procedures to MySQL

In MySQL, you can define a procedure in C++ that can access and modify the data in a query before it is sent to the client. The modification can be done on a row-by-row or `GROUP BY` level.

We have created an example procedure in MySQL 3.23 to show you what can be done.

Additionally, we recommend that you take a look at `mysqlua`. With this you can use the LUA language to load a procedure at runtime into `mysqld`.

### 19.3.1. Procedure Analyse

```
analyse([max_elements],[max_memory])
```

This procedure is defined in the `sql/sql_analyse.cc`. This examines the result from your query and returns an analysis of the results:

- `max_elements` (default 256) is the maximum number of distinct values `analyse` does notice per column. This is used by `analyse` to check whether the optimal data type should be of type `ENUM`.
- `max_memory` (default 8192) is the maximum amount of memory that `analyse` should allocate per column while trying to find all distinct values.

```
SELECT ... FROM ... WHERE ... PROCEDURE ANALYSE([max_elements],[max_memory])
```

### 19.3.2. Writing a Procedure

For the moment, the only documentation for this is the source.

You can find all information about procedures by examining the following files:

- `sql/sql_analyse.cc`
- `sql/procedure.h`
- `sql/procedure.cc`
- `sql/sql_select.cc`

---

# Appendix A. Problems and Common Errors

This appendix lists some common problems and error messages that you may encounter. It describes how to determine the causes of the problems and what to do to solve them.

## A.1. How to Determine What Is Causing a Problem

When you run into a problem, the first thing you should do is to find out which program or piece of equipment is causing it:

- If you have one of the following symptoms, then it is probably a hardware problems (such as memory, motherboard, CPU, or hard disk) or kernel problem:
  - The keyboard doesn't work. This can normally be checked by pressing the Caps Lock key. If the Caps Lock light doesn't change, you have to replace your keyboard. (Before doing this, you should try to restart your computer and check all cables to the keyboard.)
  - The mouse pointer doesn't move.
  - The machine doesn't answer to a remote machine's pings.
  - Other programs that are not related to MySQL don't behave correctly.
  - Your system restarted unexpectedly. (A faulty user-level program should never be able to take down your system.)

In this case, you should start by checking all your cables and run some diagnostic tool to check your hardware! You should also check whether there are any patches, updates, or service packs for your operating system that could likely solve your problem. Check also that all your libraries (such as [glibc](#)) are up to date.

It's always good to use a machine with ECC memory to discover memory problems early.

- If your keyboard is locked up, you may be able to recover by logging in to your machine from another machine and executing `kbd_mode -a`.
- Please examine your system log file (`/var/log/messages` or similar) for reasons for your problem. If you think the problem is in MySQL, you should also examine MySQL's log files. See [Section 5.11, "MySQL Server Logs"](#).
- If you don't think you have hardware problems, you should try to find out which program is causing problems. Try using `top`, `ps`, Task Manager, or some similar program, to check which program is taking all CPU or is locking the machine.
- Use `top`, `df`, or a similar program to check whether you are out of memory, disk space, file descriptors, or some other critical resource.
- If the problem is some runaway process, you can always try to kill it. If it doesn't want to die, there is probably a bug in the operating system.

If after you have examined all other possibilities and you have concluded that the MySQL server or a MySQL client is causing the problem, it's time to create a bug report for our mailing list or our support team. In the bug report, try to give a very detailed description of how the system is behaving and what you think is happening. You should also state why you think that MySQL is causing the problem. Take into consideration all the situations in this chapter. State any problems exactly how they appear when

you examine your system. Use the “copy and paste” method for any output and error messages from programs and log files.

Try to describe in detail which program is not working and all symptoms you see. We have in the past received many bug reports that state only “the system doesn't work.” This doesn't provide us with any information about what could be the problem.

If a program fails, it's always useful to know the following information:

- Has the program in question made a segmentation fault (did it dump core)?
- Is the program taking up all available CPU time? Check with `top`. Let the program run for a while, it may simply be evaluating something computationally intensive.
- If the `mysqld` server is causing problems, can you get any response from it with `mysqladmin -u root ping` or `mysqladmin -u root processlist`?
- What does a client program say when you try to connect to the MySQL server? (Try with `mysql`, for example.) Does the client jam? Do you get any output from the program?

When sending a bug report, you should follow the outline described in [Section 1.8, “How to Report Bugs or Problems”](#).

## A.2. Common Errors When Using MySQL Programs

This section lists some errors that users frequently encounter when running MySQL programs. Although the problems show up when you try to run client programs, the solutions to many of the problems involves changing the configuration of the MySQL server.

### A.2.1. Access denied

An `Access denied` error can have many causes. Often the problem is related to the MySQL accounts that the server allows client programs to use when connecting. See [Section 5.7.8, “Causes of Access denied Errors”](#), and [Section 5.7.2, “How the Privilege System Works”](#).

### A.2.2. Can't connect to [local] MySQL server

A MySQL client on Unix can connect to the `mysqld` server in two different ways: By using a Unix socket file to connect through a file in the filesystem (default `/tmp/mysql.sock`), or by using TCP/IP, which connects through a port number. A Unix socket file connection is faster than TCP/IP, but can be used only when connecting to a server on the same computer. A Unix socket file is used if you don't specify a hostname or if you specify the special hostname `localhost`.

If the MySQL server is running on Windows 9x or Me, you can connect only via TCP/IP. If the server is running on Windows NT, 2000, XP, or 2003 and is started with the `--enable-named-pipe` option, you can also connect with named pipes if you run the client on the host where the server is running. The name of the named pipe is `MySQL` by default. If you don't give a hostname when connecting to `mysqld`, a MySQL client first tries to connect to the named pipe. If that doesn't work, it connects to the TCP/IP port. You can force the use of named pipes on Windows by using `.` as the hostname.

The error (2002) `Can't connect to ...` normally means that there is no MySQL server running on the system or that you are using an incorrect Unix socket filename or TCP/IP port number when trying to connect to the server.

The error (2003) `Can't connect to MySQL server on 'server' (10061)` indicates that

the network connection has been refused. You should check that there is a MySQL server running, that it has network connections enabled, the network port you specified is the one configured on the server, and that the TCP/IP port you are using has not been blocked by a firewall or port blocking service.

Start by checking whether there is a process named `mysqld` running on your server host. (Use `ps xa | grep mysqld` on Unix or the Task Manager on Windows.) If there is no such process, you should start the server. See [Section 2.10.2.3](#), “Starting and Troubleshooting the MySQL Server”.

If a `mysqld` process is running, you can check it by trying the following commands. The port number or Unix socket filename might be different in your setup. `host_ip` represents the IP number of the machine where the server is running.

```
shell> mysqladmin version
shell> mysqladmin variables
shell> mysqladmin -h `hostname` version variables
shell> mysqladmin -h `hostname` --port=3306 version
shell> mysqladmin -h host_ip version
shell> mysqladmin --protocol=socket --socket=/tmp/mysql.sock version
```

Note the use of backticks rather than forward quotes with the `hostname` command; these cause the output of `hostname` (that is, the current hostname) to be substituted into the `mysqladmin` command. If you have no `hostname` command or are running on Windows, you can manually type the hostname of your machine (without backticks) following the `-h` option. You can also try `-h 127.0.0.1` to connect with TCP/IP to the local host.

Here are some reasons the `Can't connect to local MySQL server` error might occur:

- `mysqld` is not running. Check your operating system's process list to ensure the `mysqld` process is present.
- You're running a MySQL server on Windows with many TCP/IP connections to it. If you're experiencing that quite often your clients get that error, you can find a workaround here: [Section A.2.2.1](#), “Connection to MySQL Server Failing on Windows”.
- You are running on a system that uses MIT-pthreads. If you are running on a system that doesn't have native threads, `mysqld` uses the MIT-pthreads package. See [Section 2.1.1](#), “Operating Systems Supported by MySQL”. However, not all MIT-pthreads versions support Unix socket files. On a system without socket file support, you must always specify the hostname explicitly when connecting to the server. Try using this command to check the connection to the server:

```
shell> mysqladmin -h `hostname` version
```

- Someone has removed the Unix socket file that `mysqld` uses (`/tmp/mysql.sock` by default). For example, you might have a `cron` job that removes old files from the `/tmp` directory. You can always run `mysqladmin version` to check whether the Unix socket file that `mysqladmin` is trying to use really exists. The fix in this case is to change the `cron` job to not remove `mysql.sock` or to place the socket file somewhere else. See [Section A.4.5](#), “How to Protect or Change the MySQL Unix Socket File”.
- You have started the `mysqld` server with the `--socket=/path/to/socket` option, but forgotten to tell client programs the new name of the socket file. If you change the socket pathname for the server, you must also notify the MySQL clients. You can do this by providing the same `--socket` option when you run client programs. You also need to ensure that clients have permission to access the `mysql.sock` file. To find out where the socket file is, you can do:

```
shell> netstat -ln | grep mysql
```

See [Section A.4.5](#), “How to Protect or Change the MySQL Unix Socket File”.

- You are using Linux and one server thread has died (dumped core). In this case, you must kill the other `mysqld` threads (for example, with `kill` or with the `mysql_zap` script) before you can restart the MySQL server. See [Section A.4.2, “What to Do If MySQL Keeps Crashing”](#).
- The server or client program might not have the proper access privileges for the directory that holds the Unix socket file or the socket file itself. In this case, you must either change the access privileges for the directory or socket file so that the server and clients can access them, or restart `mysqld` with a `--socket` option that specifies a socket filename in a directory where the server can create it and where client programs can access it.

If you get the error message `Can't connect to MySQL server on some_host`, you can try the following things to find out what the problem is:

- Check whether the server is running on that host by executing `telnet some_host 3306` and pressing the Enter key a couple of times. (3306 is the default MySQL port number. Change the value if your server is listening to a different port.) If there is a MySQL server running and listening to the port, you should get a response that includes the server's version number. If you get an error such as `telnet: Unable to connect to remote host: Connection refused`, then there is no server running on the given port.
- If the server is running on the local host, try using `mysqladmin -h localhost variables` to connect using the Unix socket file. Verify the TCP/IP port number that the server is configured to listen to (it is the value of the `port` variable.)
- Make sure that your `mysqld` server was not started with the `--skip-networking` option. If it was, you cannot connect to it using TCP/IP.
- Check to make sure that there is no firewall blocking access to MySQL. Applications such as ZoneAlarm and the Windows XP personal firewall may need to be configured to allow external access to a MySQL server.

### A.2.2.1. Connection to MySQL Server Failing on Windows

When you're running a MySQL server on Windows with many TCP/IP connections to it, and you're experiencing that quite often your clients get a `Can't connect to MySQL server` error, the reason might be that Windows doesn't allow for enough ephemeral (short-lived) ports to serve those connections.

By default, Windows allows 5000 ephemeral (short-lived) TCP ports to the user. After any port is closed it will remain in a `TIME_WAIT` status for 120 seconds. This status allows the connection to be reused at a much lower cost than reinitializing a brand new connection. However, the port will not be available again until this time expires.

With a small stack of available TCP ports (5000) and a high number of TCP ports being open and closed over a short period of time along with the `TIME_WAIT` status you have a good chance for running out of ports. There are two ways to address this problem:

- Reduce the number of TCP ports consumed quickly by investigating connection pooling or persistent connections where possible
- Tune some settings in the Windows registry (see below)

**IMPORTANT: The following procedure involves modifying the Windows registry. Before you modify the registry, make sure to back it up and make sure that you understand how to restore**

the registry if a problem occurs. For information about how to back up, restore, and edit the registry, view the following article in the Microsoft Knowledge Base: <http://support.microsoft.com/kb/256986/EN-US/>.

1. Start Registry Editor ([Regedt32.exe](#)).
2. Locate the following key in the registry:

```
HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Tcpip\Parameters
```

3. On the **Edit** menu, click **Add Value**, and then add the following registry value:

```
Value Name: MaxUserPort  
Data Type: REG_DWORD  
Value: 65534
```

This sets the number of ephemeral ports available to any user. The valid range is between 5000 and 65534 (decimal). The default value is 0x1388 (5000 decimal).

4. On the **Edit** menu, click **Add Value**, and then add the following registry value:

```
Value Name: TcpTimedWaitDelay  
Data Type: REG_DWORD  
Value: 30
```

This sets the number of seconds to hold a TCP port connection in **TIME\_WAIT** state before closing. The valid range is between 0 (zero) and 300 (decimal). The default value is 0x78 (120 decimal).

5. Quit Registry Editor.
6. Reboot the machine.

Note: Undoing the above should be as simple as deleting the registry entries you've created.

### A.2.3. Client does not support authentication protocol

MySQL 4.1 and up uses an authentication protocol based on a password hashing algorithm that is incompatible with that used by older clients. If you upgrade the server from 4.0, attempts to connect to it with an older client may fail with the following message:

```
shell> mysql  
Client does not support authentication protocol requested  
by server; consider upgrading MySQL client
```

To solve this problem, you should use one of the following approaches:

- Upgrade all client programs to use a 4.1.1 or newer client library.
- When connecting to the server with a pre-4.1 client program, use an account that still has a pre-4.1-style password.
- Reset the password to pre-4.1 style for each user that needs to use a pre-4.1 client program. This can be done using the **SET PASSWORD** statement and the **OLD\_PASSWORD()** function:

```
mysql> SET PASSWORD FOR
-> 'some_user'@'some_host' = OLD_PASSWORD('newpwd');
```

Alternatively, use `UPDATE` and `FLUSH PRIVILEGES`:

```
mysql> UPDATE mysql.user SET Password = OLD_PASSWORD('newpwd')
-> WHERE Host = 'some_host' AND User = 'some_user';
mysql> FLUSH PRIVILEGES;
```

Substitute the password you want to use for “*newpwd*” in the preceding examples. MySQL cannot tell you what the original password was, so you'll need to pick a new one.

- Tell the server to use the older password hashing algorithm:
  1. Start `mysqld` with the `--old-passwords` option.
  2. Assign an old-format password to each account that has had its password updated to the longer 4.1 format. You can identify these accounts with the following query:

```
mysql> SELECT Host, User, Password FROM mysql.user
-> WHERE LENGTH>Password) > 16;
```

For each account record displayed by the query, use the `Host` and `User` values and assign a password using the `OLD_PASSWORD()` function and either `SET PASSWORD` or `UPDATE`, as described earlier.

**Note:** In PHP, the standard `mysql` extension does not support the new authentication protocol in MySQL 4.1.1 and higher. This is true regardless of the PHP version being used. If you wish to use the `mysql` extension with MySQL 4.1 or newer, you will need to follow one of the options discussed above for configuring MySQL to work with old clients. The `mysqli` extension (stands for “MySQL, Improved”; new in PHP 5) is compatible with the improved password hashing employed in MySQL 4.1 and higher, and no special configuration of MySQL need be done to use this newer MySQL client library for PHP. For more information about the `mysqli` extension, see <http://php.net/mysqli>.

It may also be possible to compile the older `mysql` extension against the new MySQL client library. This is beyond the scope of this Manual; consult the PHP documentation for more information. You also be able to obtain assistance with these issues in our [MySQL with PHP forum](http://forums.mysql.com/list.php?52) [http://forums.mysql.com/list.php?52].

For additional background on password hashing and authentication, see [Section 5.7.9, “Password Hashing as of MySQL 4.1”](#).

## A.2.4. Password Fails When Entered Interactively

MySQL client programs prompt for a password when invoked with a `--password` or `-p` option that has no following password value:

```
shell> mysql -u user_name -p
Enter password:
```

On some systems, you may find that your password works when specified in an option file or on the command line, but not when you enter it interactively at the `Enter password:` prompt. This occurs when the library provided by the system to read passwords limits password values to a small number of characters (typically eight). That is a problem with the system library, not with MySQL. To work around it, change your MySQL password to a value that is eight or fewer characters long, or put your password in an option file.

## A.2.5. Host '*host\_name*' is blocked

If you get the following error, it means that `mysqld` has received many connect requests from the host '*host\_name*' that have been interrupted in the middle:

```
Host 'host_name' is blocked because of many connection errors.  
Unblock with 'mysqladmin flush-hosts'
```

The number of interrupted connect requests allowed is determined by the value of the `max_connect_errors` system variable. After `max_connect_errors` failed requests, `mysqld` assumes that something is wrong (for example, that someone is trying to break in), and blocks the host from further connections until you execute a `mysqladmin flush-hosts` command or issue a `FLUSH HOSTS` statement. See [Section 5.2.2, “System Variables”](#).

By default, `mysqld` blocks a host after 10 connection errors. You can adjust the value by starting the server like this:

```
shell> mysql_safe --max_connect_errors=10000 &
```

If you get this error message for a given host, you should first verify that there isn't anything wrong with TCP/IP connections from that host. If you are having network problems, it does you no good to increase the value of the `max_connect_errors` variable.

## A.2.6. Too many connections

If you get a `Too many connections` error when you try to connect to the `mysqld` server, this means that all available connections are in use by other clients.

The number of connections allowed is controlled by the `max_connections` system variable. Its default value is 100. If you need to support more connections, you should restart `mysqld` with a larger value for this variable.

`mysqld` actually allows `max_connections+1` clients to connect. The extra connection is reserved for use by accounts that have the `SUPER` privilege. By granting the `SUPER` privilege to administrators and not to normal users (who should not need it), an administrator can connect to the server and use `SHOW PROCESSLIST` to diagnose problems even if the maximum number of unprivileged clients are connected. See [Section 13.5.4.16, “SHOW PROCESSLIST Syntax”](#).

The maximum number of connections MySQL can support depends on the quality of the thread library on a given platform. Linux or Solaris should be able to support 500-1000 simultaneous connections, depending on how much RAM you have and what your clients are doing. Static Linux binaries provided by MySQL AB can support up to 4000 connections.

## A.2.7. Out of memory

If you issue a query using the `mysql` client program and receive an error like the following one, it means that `mysql` does not have enough memory to store the entire query result:

```
mysql: Out of memory at line 42, 'malloc.c'  
mysql: needed 8136 byte (8k), memory in use: 12481367 bytes (12189k)  
ERROR 2008: MySQL client ran out of memory
```

To remedy the problem, first check whether your query is correct. Is it reasonable that it should return so many rows? If not, correct the query and try again. Otherwise, you can invoke `mysql` with the `-quick` option. This causes it to use the `mysql_use_result()` C API function to retrieve the result set, which places less of a load on the client (but more on the server).

## A.2.8. MySQL server has gone away

This section also covers the related `Lost connection to server during query` error.

The most common reason for the `MySQL server has gone away` error is that the server timed out and closed the connection. In this case, you normally get one of the following error codes (which one you get is operating system-dependent):

Error Code	Description
<code>CR_SERVER_GONE_ERROR</code>	The client couldn't send a question to the server.
<code>CR_SERVER_LOST</code>	The client didn't get an error when writing to the server, but it didn't get a full answer (or any answer) to the question.

By default, the server closes the connection after eight hours if nothing has happened. You can change the time limit by setting the `wait_timeout` variable when you start `mysqld`. See [Section 5.2.2, “System Variables”](#).

If you have a script, you just have to issue the query again for the client to do an automatic reconnection. This assumes that you have automatic reconnection in the client enabled (which is the default for the `mysql` command-line client).

Some other common reasons for the `MySQL server has gone away` error are:

- You (or the db administrator) has killed the running thread with a `KILL` statement or a `mysqladmin kill` command.
- You tried to run a query after closing the connection to the server. This indicates a logic error in the application that should be corrected.
- A client application running on a different host does not have the necessary privileges to connect to the MySQL server from that host.
- You got a timeout from the TCP/IP connection on the client side. This may happen if you have been using the commands: `mysql_options(..., MYSQL_OPT_READ_TIMEOUT,...)` or `mysql_options(..., MYSQL_OPT_WRITE_TIMEOUT,...)`. In this case increasing the timeout may help solve the problem.
- You have encountered a timeout on the server side and the automatic reconnection in the client is disabled (the `reconnect` flag in the `MYSQL` structure is equal to 0).
- You are using a Windows client and the server had dropped the connection (probably because `wait_timeout` expired) before the command was issued.

The problem on Windows is that in some cases MySQL doesn't get an error from the OS when writing to the TCP/IP connection to the server, but instead gets the error when trying to read the answer from the connection.

In this case, even if the `reconnect` flag in the `MYSQL` structure is equal to 1, MySQL does not automatically reconnect and re-issue the query as it doesn't know if the server did get the original query or not.

The solution to this is to either do a `mysql_ping` on the connection if there has been a long time since the last query (this is what `MyODBC` does) or set `wait_timeout` on the `mysqld` server so high that it in practice never times out.

- You can also get these errors if you send a query to the server that is incorrect or too large. If

`mysqld` receives a packet that is too large or out of order, it assumes that something has gone wrong with the client and closes the connection. If you need big queries (for example, if you are working with big `BLOB` columns), you can increase the query limit by setting the server's `max_allowed_packet` variable, which has a default value of 1MB. You may also need to increase the maximum packet size on the client end. More information on setting the packet size is given in [Section A.2.9, “Packet too large”](#).

An `INSERT` or `REPLACE` statement that inserts a great many rows can also cause these sorts of errors. Either one of these statements sends a single request to the server irrespective of the number of rows to be inserted; thus, you can often avoid the error by reducing the number of rows sent per `INSERT` or `REPLACE`.

- You also get a lost connection if you are sending a packet 16MB or larger if your client is older than 4.0.8 and your server is 4.0.8 and above, or the other way around.
- It is also possible to see this error if hostname lookups fail (for example, if the DNS server on which your server or network relies goes down). This is because MySQL is dependent on the host system for name resolution, but has no way of knowing whether it is working — from MySQL's point of view the problem is indistinguishable from any other network timeout.

You may also see the `MySQL server has gone away` error if MySQL is started with the `--skip-networking` option.

Another networking issue that can cause this error occurs if the MySQL port (default 3306) is blocked by your firewall, thus preventing any connections at all to the MySQL server.

- You can also encounter this error with applications that fork child processes, all of which try to use the same connection to the MySQL server. This can be avoided by using a separate connection for each child process.
- You have encountered a bug where the server died while executing the query.

You can check whether the MySQL server died and restarted by executing `mysqladmin version` and examining the server's uptime. If the client connection was broken because `mysqld` crashed and restarted, you should concentrate on finding the reason for the crash. Start by checking whether issuing the query again kills the server again. See [Section A.4.2, “What to Do If MySQL Keeps Crashing”](#).

You can get more information about the lost connections by starting `mysqld` with the `--log-warnings=2` option. This logs some of the disconnected errors in the `hostname.err` file. See [Section 5.11.1, “The Error Log”](#).

If you want to create a bug report regarding this problem, be sure that you include the following information:

- Indicate whether the MySQL server died. You can find information about this in the server error log. See [Section A.4.2, “What to Do If MySQL Keeps Crashing”](#).
- If a specific query kills `mysqld` and the tables involved were checked with `CHECK TABLE` before you ran the query, can you provide a reproducible test case? See [Section E.1.6, “Making a Test Case If You Experience Table Corruption”](#).
- What is the value of the `wait_timeout` system variable in the MySQL server? (`mysqladmin variables` gives you the value of this variable.)
- Have you tried to run `mysqld` with the `--log` option to determine whether the problem query appears in the log?

See also [Section A.2.10, “Communication Errors and Aborted Connections”](#), and [Section 1.8, “How to Report Bugs or Problems”](#).

## A.2.9. Packet too large

A communication packet is a single SQL statement sent to the MySQL server or a single row that is sent to the client.

In MySQL 3.23, the largest possible packet is 16MB, due to limits in the client/server protocol. In MySQL 4.0.1 and up, the limit is 1GB.

When a MySQL client or the `mysqld` server receives a packet bigger than `max_allowed_packet` bytes, it issues a `Packet too large` error and closes the connection. With some clients, you may also get a `Lost connection to MySQL server during query` error if the communication packet is too large.

Both the client and the server have their own `max_allowed_packet` variable, so if you want to handle big packets, you must increase this variable both in the client and in the server.

If you are using the `mysql` client program, its default `max_allowed_packet` variable is 16MB. That is also the maximum value before MySQL 4.0. To set a larger value from 4.0 on, start `mysql` like this:

```
shell> mysql --max_allowed_packet=32M
```

That sets the packet size to 32MB.

The server's default `max_allowed_packet` value is 1MB. You can increase this if the server needs to handle big queries (for example, if you are working with big `BLOB` columns). For example, to set the variable to 16MB, start the server like this:

```
shell> mysqld --max_allowed_packet=16M
```

Before MySQL 4.0, use this syntax instead:

```
shell> mysqld --set-variable=max_allowed_packet=16M
```

You can also use an option file to set `max_allowed_packet`. For example, to set the size for the server to 16MB, add the following lines in an option file:

```
[mysqld]
max_allowed_packet=16M
```

Before MySQL 4.0, use this syntax instead:

```
[mysqld]
set-variable = max_allowed_packet=16M
```

It's safe to increase the value of this variable because the extra memory is allocated only when needed. For example, `mysqld` allocates more memory only when you issue a long query or when `mysqld` must return a large result row. The small default value of the variable is a precaution to catch incorrect packets between the client and server and also to ensure that you don't run out of memory by using large packets accidentally.

You can also get strange problems with large packets if you are using large `BLOB` values but have not given `mysqld` access to enough memory to handle the query. If you suspect this is the case, try adding `ulimit -d 256000` to the beginning of the `mysqld_safe` script and restarting `mysqld`.

## A.2.10. Communication Errors and Aborted Connections

The server error log can be a useful source of information about connection problems. See [Section 5.11.1, “The Error Log”](#). Starting with MySQL 3.23.40, if you start the server with the `--warnings` option (or `--log-warnings` from MySQL 4.0.3 on), you might find messages like this in your error log:

```
010301 14:38:23 Aborted connection 854 to db: 'users' user: 'josh'
```

If `Aborted connections` messages appear in the error log, the cause can be any of the following:

- The client program did not call `mysql_close()` before exiting.
- The client had been sleeping more than `wait_timeout` or `interactive_timeout` seconds without issuing any requests to the server. See [Section 5.2.2, “System Variables”](#).
- The client program ended abruptly in the middle of a data transfer.

When any of these things happen, the server increments the `Aborted_clients` status variable.

The server increments the `Aborted_connects` status variable when the following things happen:

- A client doesn't have privileges to connect to a database.
- A client uses an incorrect password.
- A connection packet doesn't contain the right information.
- It takes more than `connect_timeout` seconds to get a connect packet. See [Section 5.2.2, “System Variables”](#).

If these kinds of things happen, it might indicate that someone is trying to break into your server!

Other reasons for problems with aborted clients or aborted connections:

- Use of Ethernet protocol with Linux, both half and full duplex. Many Linux Ethernet drivers have this bug. You should test for this bug by transferring a huge file via FTP between the client and server machines. If a transfer goes in burst-pause-burst-pause mode, you are experiencing a Linux duplex syndrome. The only solution is switching the duplex mode for both your network card and hub/switch to either full duplex or to half duplex and testing the results to determine the best setting.
- Some problem with the thread library that causes interrupts on reads.
- Badly configured TCP/IP.
- Faulty Ethernets, hubs, switches, cables, and so forth. This can be diagnosed properly only by replacing hardware.
- The `max_allowed_packet` variable value is too small or queries require more memory than you have allocated for `mysqld`. See [Section A.2.9, “Packet too large”](#).

See also [Section A.2.8, “MySQL server has gone away”](#).

## A.2.11. The table is full

There are several ways a full-table error can occur:

- You are using a MySQL server older than 3.23 and an in-memory temporary table becomes larger than `tmp_table_size` bytes. To avoid this problem, you can use the `--tmp_table_size=val` option to make `mysqld` increase the temporary table size or use the SQL option `SQL_BIG_TABLES` before you issue the problematic query. See [Section 13.5.3, “SET Syntax”](#).

You can also start `mysqld` with the `--big-tables` option. This is exactly the same as using `SQL_BIG_TABLES` for all queries.

As of MySQL 3.23, this problem should not occur. If an in-memory temporary table becomes larger than `tmp_table_size`, the server automatically converts it to a disk-based `MyISAM` table.

- You are using `InnoDB` tables and run out of room in the `InnoDB` tablespace. In this case, the solution is to extend the `InnoDB` tablespace. See [Section 14.2.8, “Adding and Removing InnoDB Data and Log Files”](#).
- You are using `ISAM` or `MyISAM` tables on an operating system that supports files only up to 2GB in size and you have hit this limit for the data file or index file.
- You are using a `MyISAM` table and the space required for the table exceeds what is allowed by the internal pointer size. If you don't specify the `MAX_ROWS` table option when you create a table, MySQL uses the `myisam_data_pointer_size` system variable. The default value is 4 bytes, which is enough to allow only 4GB of data. See [Section 5.2.2, “System Variables”](#).

You can check the maximum data/index sizes by using this statement:

```
SHOW TABLE STATUS FROM database LIKE 'tbl_name';
```

You also can use `myisamchk -dv /path/to/table-index-file`.

If the pointer size is too small, you can fix the problem by using `ALTER TABLE`:

```
ALTER TABLE tbl_name MAX_ROWS=1000000000 AVG_ROW_LENGTH=nnn;
```

You have to specify `AVG_ROW_LENGTH` only for tables with `BLOB` or `TEXT` columns; in this case, MySQL can't optimize the space required based only on the number of rows.

## A.2.12. Can't create/write to file

If you get an error of the following type for some queries, it means that MySQL cannot create a temporary file for the result set in the temporary directory:

```
Can't create/write to file '\\sqla3fe_0.ism'.
```

The preceding error is a typical message for Windows; the Unix message is similar.

One fix is to start `mysqld` with the `--tmpdir` option or to add the option to the `[mysqld]` section of your option file. For example, to specify a directory of `C:\temp`, use these lines:

```
[mysqld]
tmpdir=C:/temp
```

The `C:\temp` directory must exist and have sufficient space for the MySQL server to write to. See [Section 4.3.2, “Using Option Files”](#).

Another cause of this error can be permissions issues. Make sure that the MySQL server can write to the `tmpdir` directory.

Check also the error code that you get with `pererror`. One reason the server cannot write to a table is that the filesystem is full:

```
shell> pererror 28
Error code 28: No space left on device
```

## A.2.13. Commands out of sync

If you get `Commands out of sync; you can't run this command now` in your client code, you are calling client functions in the wrong order.

This can happen, for example, if you are using `mysql_use_result()` and try to execute a new query before you have called `mysql_free_result()`. It can also happen if you try to execute two queries that return data without calling `mysql_use_result()` or `mysql_store_result()` in between.

## A.2.14. Ignoring user

If you get the following error, it means that when `mysqld` was started or when it reloaded the grant tables, it found an account in the `user` table that had an invalid password.

```
Found wrong password for user 'some_user'@'some_host'; ignoring user
```

As a result, the account is simply ignored by the permission system.

The following list indicates possible causes of and fixes for this problem:

- You may be running a new version of `mysqld` with an old `user` table. You can check this by executing `mysqlshow mysql user` to see whether the `Password` column is shorter than 16 characters. If so, you can correct this condition by running the `scripts/add_long_password` script.
- The account has an old password (eight characters long) and you didn't start `mysqld` with the `--old-protocol` option. Update the account in the `user` table to have a new password or restart `mysqld` with the `--old-protocol` option.
- You have specified a password in the `user` table without using the `PASSWORD()` function. Use `mysql` to update the account in the `user` table with a new password, making sure to use the `PASSWORD()` function:

```
mysql> UPDATE user SET Password=PASSWORD('newpwd')
-> WHERE User='some_user' AND Host='some_host';
```

## A.2.15. Table '`tbl_name`' doesn't exist

If you get either of the following errors, it usually means that no table exists in the default database with the given name:

```
Table 'tbl_name' doesn't exist
Can't find file: 'tbl_name' (errno: 2)
```

In some cases, it may be that the table does exist but that you are referring to it incorrectly:

- Because MySQL uses directories and files to store databases and tables, database and table names are case sensitive if they are located on a filesystem that has case-sensitive filenames.
- Even for filesystems that are not case sensitive, such as on Windows, all references to a given table within a query must use the same lettercase.

You can check which tables are in the default database with `SHOW TABLES`. See [Section 13.5.4](#), “`SHOW Syntax`”.

## A.2.16. Can't initialize character set

You might see an error like this if you have character set problems:

```
MySQL Connection Failed: Can't initialize character set charset_name
```

This error can have any of the following causes:

- The character set is a multi-byte character set and you have no support for the character set in the client. In this case, you need to recompile the client by running `configure` with the `-with-charset=charset_name` or `--with-extra-charsets=charset_name` option. See [Section 2.9.2](#), “`Typical configure Options`”.

All standard MySQL binaries are compiled with `-with-extra-character-sets=complex`, which enables support for all multi-byte character sets. See [Section 5.10.1](#), “`The Character Set Used for Data and Sorting`”.

- The character set is a simple character set that is not compiled into `mysqld`, and the character set definition files are not in the place where the client expects to find them.

In this case, you need to use one of the following methods to solve the problem:

- Recompile the client with support for the character set. See [Section 2.9.2](#), “`Typical configure Options`”.
- Specify to the client the directory where the character set definition files are located. For many clients, you can do this with the `--character-sets-dir` option.
- Copy the character definition files to the path where the client expects them to be.

## A.2.17. File Not Found

If you get `ERROR '...' not found (errno: 23), Can't open file: ... (errno: 24)`, or any other error with `errno 23` or `errno 24` from MySQL, it means that you haven't allocated enough file descriptors for the MySQL server. You can use the `perror` utility to get a description of what the error number means:

```
shell> perror 23
Error code 23: File table overflow
shell> perror 24
Error code 24: Too many open files
shell> perror 11
Error code 11: Resource temporarily unavailable
```

The problem here is that `mysqld` is trying to keep open too many files simultaneously. You can either tell `mysqld` not to open so many files at once or increase the number of file descriptors available to `mysqld`.

To tell `mysqld` to keep open fewer files at a time, you can make the table cache smaller by reducing the value of the `table_cache` system variable (the default value is 64). Reducing the value of `max_connections` also reduces the number of open files (the default value is 100).

To change the number of file descriptors available to `mysqld`, you can use the `--open-files-limit` option to `mysqld_safe` or (as of MySQL 3.23.30) set the `open_files_limit` system variable. See [Section 5.2.2, “System Variables”](#). The easiest way to set these values is to add an option to your option file. See [Section 4.3.2, “Using Option Files”](#). If you have an old version of `mysqld` that doesn't support setting the open files limit, you can edit the `mysqld_safe` script. There is a commented-out line `ulimit -n 256` in the script. You can remove the `#` character to uncomment this line, and change the number `256` to set the number of file descriptors to be made available to `mysqld`.

`--open-files-limit` and `ulimit` can increase the number of file descriptors, but only up to the limit imposed by the operating system. There is also a “hard” limit that can be overridden only if you start `mysqld_safe` or `mysqld` as `root` (just remember that you also need to start the server with the `--user` option in this case so that it does not continue to run as `root` after it starts up). If you need to increase the operating system limit on the number of file descriptors available to each process, consult the documentation for your system.

**Note:** If you run the `tcsh` shell, `ulimit` does not work! `tcsh` also reports incorrect values when you ask for the current limits. In this case, you should start `mysqld_safe` using `sh`.

## A.3. Installation-Related Issues

### A.3.1. Problems Linking to the MySQL Client Library

When you are linking an application program to use the MySQL client library, you might get undefined reference errors for symbols that start with `mysql_`, such as those shown here:

```
/tmp/ccFKsdPa.o: In function `main':  
/tmp/ccFKsdPa.o(.text+0xb): undefined reference to `mysql_init'  
/tmp/ccFKsdPa.o(.text+0x31): undefined reference to `mysql_real_connect'  
/tmp/ccFKsdPa.o(.text+0x57): undefined reference to `mysql_real_connect'  
/tmp/ccFKsdPa.o(.text+0x69): undefined reference to `mysql_error'  
/tmp/ccFKsdPa.o(.text+0x9a): undefined reference to `mysql_close'
```

You should be able to solve this problem by adding `-Ldir_path -lmysqlclient` at the end of your link command, where `dir_path` represents the pathname of the directory where the client library is located. To determine the correct directory, try this command:

```
shell> mysql_config --libs
```

The output from `mysql_config` might indicate other libraries that should be specified on the link command as well.

If you get `undefined reference` errors for the `uncompress` or `compress` function, add `-lz` to the end of your link command and try again.

If you get `undefined reference` errors for a function that should exist on your system, such as `connect`, check the manual page for the function in question to determine which libraries you should add to the link command.

You might get `undefined reference` errors such as the following for functions that don't exist on

your system:

```
mf_format.o(.text+0x201): undefined reference to `__lxstat'
```

This usually means that your MySQL client library was compiled on a system that is not 100% compatible with yours. In this case, you should download the latest MySQL source distribution and compile MySQL yourself. See [Section 2.9, “MySQL Installation Using a Source Distribution”](#).

You might get undefined reference errors at runtime when you try to execute a MySQL program. If these errors specify symbols that start with `mysql_` or indicate that the `mysqlclient` library can't be found, it means that your system can't find the shared `libmysqlclient.so` library. The fix for this is to tell your system to search for shared libraries where the library is located. Use whichever of the following methods is appropriate for your system:

- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY_PATH` environment variable.
- Add the path to the directory where `libmysqlclient.so` is located to the `LD_LIBRARY` environment variable.
- Copy `libmysqlclient.so` to some directory that is searched by your system, such as `/lib`, and update the shared library information by executing `ldconfig`.

Another way to solve this problem is by linking your program statically with the `-static` option, or by removing the dynamic MySQL libraries before linking your code. Before trying the second method, you should be sure that no other programs are using the dynamic libraries.

## A.3.2. Problems with File Permissions

If you have problems with file permissions, the `UMASK` environment variable might be set incorrectly when `mysqld` starts. For example, MySQL might issue the following error message when you create a table:

```
ERROR: Can't find file: 'path/with/filename.frm' (Errcode: 13)
```

The default `UMASK` value is `0660`. You can change this behavior by starting `mysqld_safe` as follows:

```
shell> UMASK=384 # = 600 in octal
shell> export UMASK
shell> mysqld_safe &
```

By default, MySQL creates database and `RAID` directories with an access permission value of `0700`. You can modify this behavior by setting the `UMASK_DIR` variable. If you set its value, new directories are created with the combined `UMASK` and `UMASK_DIR` values. For example, if you want to give group access to all new directories, you can do this:

```
shell> UMASK_DIR=504 # = 770 in octal
shell> export UMASK_DIR
shell> mysqld_safe &
```

In MySQL 3.23.25 and above, MySQL assumes that the value for `UMASK` and `UMASK_DIR` is in octal if it starts with a zero.

See [Appendix F, \*Environment Variables\*](#).

## A.4. Administration-Related Issues

### A.4.1. How to Reset the Root Password

If you have never set a `root` password for MySQL, the server does not require a password at all for connecting as `root`. However, it is recommended to set a password for each account. See [Section 5.6.1, “General Security Guidelines”](#).

If you set a `root` password previously, but have forgotten what it was, you can set a new password. The following procedure is for Windows systems. The procedure for Unix systems is given later in this section.

The procedure under Windows:

1. Log on to your system as Administrator.
2. Stop the MySQL server if it is running. For a server that is running as a Windows service, go to the Services manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Then find the MySQL service in the list, and stop it.

If your server is not running as a service, you may need to use the Task Manager to force it to stop.

3. Create a text file and place the following command within it on a single line:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPassword');
```

Save the file with any name. For this example the file will be `C:\mysql-init.txt`.

4. Open a console window to get to the DOS command prompt:

```
Start Menu -> Run -> cmd
```

5. We are assuming that you installed MySQL to `C:\mysql`. If you installed MySQL to another location, adjust the following commands accordingly.

At the DOS command prompt, execute this command:

```
C:\> C:\mysql\bin\mysqld-nt --init-file=C:\mysql-init.txt
```

The contents of the file named by the `--init-file` option are executed at server startup, changing the `root` password. After the server has started successfully, you should delete `C:\mysql-init.txt`.

Users of MySQL 4.1 and higher who install MySQL using the MySQL Installation Wizard may need to specify a `--defaults-file` option:

```
C:\> "C:\Program Files\MySQL\MySQL Server 4.1\bin\mysqld-nt.exe"  
--defaults-file="C:\Program Files\MySQL\MySQL Server 4.1\my.ini"  
--init-file=C:\mysql-init.txt
```

The appropriate `--defaults-file` setting can be found using the Services Manager:

```
Start Menu -> Control Panel -> Administrative Tools -> Services
```

Find the MySQL service in the list, right-click on it, and choose the [Properties](#) option. The [Path to executable](#) field contains the `--defaults-file` setting.

6. Stop the MySQL server, then restart it in normal mode again. If you run the server as a service, start it from the Windows Services window. If you start the server manually, use whatever command you normally use.
7. You should be able to connect using the new password.

In a Unix environment, the procedure for resetting the `root` password is as follows:

1. Log on to your system as either the Unix `root` user or as the same user that the `mysqld` server runs as.
2. Locate the `.pid` file that contains the server's process ID. The exact location and name of this file depend on your distribution, hostname, and configuration. Common locations are `/var/lib/mysql/`, `/var/run/mysqld/`, and `/usr/local/mysql/data/`. Generally, the filename has the extension of `.pid` and begins with either `mysqld` or your system's hostname.

You can stop the MySQL server by sending a normal `kill` (not `kill -9`) to the `mysqld` process, using the pathname of the `.pid` file in the following command:

```
shell> kill `cat /mysql-data-directory/host_name.pid`
```

Note the use of backticks rather than forward quotes with the `cat` command; these cause the output of `cat` to be substituted into the `kill` command.

3. Create a text file and place the following command within it on a single line:

```
SET PASSWORD FOR 'root'@'localhost' = PASSWORD('MyNewPassword');
```

Save the file with any name. For this example the file will be `~/mysql-init`.

4. Restart the MySQL server with the special `--init-file=~/mysql-init` option:

```
shell> mysqld_safe --init-file=~/mysql-init &
```

The contents of the init-file are executed at server startup, changing the root password. After the server has started successfully you should delete `~/mysql-init`.

5. You should be able to connect using the new password.

Alternatively, on any platform, you can set the new password using the `mysql` client (but this approach is less secure):

1. Stop `mysqld` and restart it with the `--skip-grant-tables --user=root` options (Windows users omit the `--user=root` portion).
2. Connect to the `mysqld` server with this command:

```
shell> mysql -u root
```

3. Issue the following statements in the `mysql` client:

```
mysql> UPDATE mysql.user SET Password=PASSWORD('newpwd')
-> WHERE User='root';
mysql> FLUSH PRIVILEGES;
```

Replace “*newpwd*” with the actual `root` password that you want to use.

4. You should be able to connect using the new password.

## A.4.2. What to Do If MySQL Keeps Crashing

Each MySQL version is tested on many platforms before it is released. This doesn't mean that there are no bugs in MySQL, but if there are bugs, they should be very few and can be hard to find. If you have a problem, it always helps if you try to find out exactly what crashes your system, because you have a much better chance of getting the problem fixed quickly.

First, you should try to find out whether the problem is that the `mysqld` server dies or whether your problem has to do with your client. You can check how long your `mysqld` server has been up by executing `mysqladmin version`. If `mysqld` has died and restarted, you may find the reason by looking in the server's error log. See [Section 5.11.1, “The Error Log”](#).

On some systems, you can find in the error log a stack trace of where `mysqld` died that you can resolve with the `resolve_stack_dump` program. See [Section E.1.4, “Using a Stack Trace”](#). Note that the variable values written in the error log may not always be 100% correct.

Many server crashes are caused by corrupted data files or index files. MySQL updates the files on disk with the `write()` system call after every SQL statement and before the client is notified about the result. (This is not true if you are running with `--delay-key-write`, in which case data files are written but not index files.) This means that data file contents are safe even if `mysqld` crashes, because the operating system ensures that the unflushed data is written to disk. You can force MySQL to flush everything to disk after every SQL statement by starting `mysqld` with the `--flush` option.

The preceding means that normally you should not get corrupted tables unless one of the following happens:

- The MySQL server or the server host was killed in the middle of an update.
- You have found a bug in `mysqld` that caused it to die in the middle of an update.
- Some external program is manipulating data files or index files at the same time as `mysqld` without locking the table properly.
- You are running many `mysqld` servers using the same data directory on a system that doesn't support good filesystem locks (normally handled by the `lockd` lock manager), or you are running multiple servers with external locking disabled.
- You have a crashed data file or index file that contains very corrupt data that confused `mysqld`.
- You have found a bug in the data storage code. This isn't likely, but it's at least possible. In this case, you can try to change the storage engine to another engine by using `ALTER TABLE` on a repaired copy of the table.

Because it is very difficult to know why something is crashing, first try to check whether things that work for others crash for you. Please try the following things:

- Stop the `mysqld` server with `mysqladmin shutdown`, run `myisamchk --silent --force */* .MYI` from the data directory to check all MyISAM tables, and restart `mysqld`. This ensures that you are running from a clean state. See [Chapter 5, Database Administration](#).
- Start `mysqld` with the `--log` option and try to determine from the information written to the log whether some specific query kills the server. About 95% of all bugs are related to a particular query. Normally, this is one of the last queries in the log file just before the server restarts. See [Section 5.11.2, “The General Query Log”](#). If you can repeatedly kill MySQL with a specific query, even when you have checked all tables just before issuing it, then you have been able to locate the bug and should submit a bug report for it. See [Section 1.8, “How to Report Bugs or Problems”](#).
- Try to make a test case that we can use to repeat the problem. See [Section E.1.6, “Making a Test Case If You Experience Table Corruption”](#).
- Try running the tests in the `mysql-test` directory and the MySQL benchmarks. See [Section 19.1.2, “MySQL Test Suite”](#). They should test MySQL rather well. You can also add code to the benchmarks that simulates your application. The benchmarks can be found in the `sql-bench` directory in a source distribution or, for a binary distribution, in the `sql-bench` directory under your MySQL installation directory.
- Try the `fork_big.pl` script. (It is located in the `tests` directory of source distributions.)
- If you configure MySQL for debugging, it is much easier to gather information about possible errors if something goes wrong. Configuring MySQL for debugging causes a safe memory allocator to be included that can find some errors. It also provides a lot of output about what is happening. Reconfigure MySQL with the `--with-debug` or `--with-debug=full` option to `configure` and then recompile. See [Section E.1, “Debugging a MySQL Server”](#).
- Make sure that you have applied the latest patches for your operating system.
- Use the `--skip-external-locking` option to `mysqld`. On some systems, the `lockd` lock manager does not work properly; the `--skip-external-locking` option tells `mysqld` not to use external locking. (This means that you cannot run two `mysqld` servers on the same data directory and that you must be careful if you use `myisamchk`. Nevertheless, it may be instructive to try the option as a test.)
- Have you tried `mysqladmin -u root processlist` when `mysqld` appears to be running but not responding? Sometimes `mysqld` is not comatose even though you might think so. The problem may be that all connections are in use, or there may be some internal lock problem. `mysqladmin -u root processlist` usually is able to make a connection even in these cases, and can provide useful information about the current number of connections and their status.
- Run the command `mysqladmin -i 5 status` or `mysqladmin -i 5 -r status` in a separate window to produce statistics while you run your other queries.
- Try the following:
  1. Start `mysqld` from `gdb` (or another debugger). See [Section E.1.3, “Debugging mysqld under gdb”](#).
  2. Run your test scripts.
  3. Print the backtrace and the local variables at the three lowest levels. In `gdb`, you can do this with the following commands when `mysqld` has crashed inside `gdb`:

```
backtrace
info local
up
info local
up
```

```
info local
```

With `gdb`, you can also examine which threads exist with `info threads` and switch to a specific thread with `thread N`, where `N` is the thread ID.

- Try to simulate your application with a Perl script to force MySQL to crash or misbehave.
- Send a normal bug report. See [Section 1.8, “How to Report Bugs or Problems”](#). Be even more detailed than usual. Because MySQL works for many people, it may be that the crash results from something that exists only on your computer (for example, an error that is related to your particular system libraries).
- If you have a problem with tables containing dynamic-length rows and you are using only `VARCHAR` columns (not `BLOB` or `TEXT` columns), you can try to change all `VARCHAR` to `CHAR` with `ALTER TABLE`. This forces MySQL to use fixed-size rows. Fixed-size rows take a little extra space, but are much more tolerant to corruption.

The current dynamic row code has been in use at MySQL AB for several years with very few problems, but dynamic-length rows are by nature more prone to errors, so it may be a good idea to try this strategy to see whether it helps.

- Do not rule out your server hardware when diagnosing problems. Defective hardware can be the cause of data corruption. Particular attention should be paid to both RAMS and hard-drives when troubleshooting hardware.

### A.4.3. How MySQL Handles a Full Disk

This section describes how MySQL responds to disk-full errors (such as “no space left on device”), and, as of MySQL 4.0.22, to quota-exceeded errors (such as “write failed” or “user block limit reached”).

This section is relevant for writes to `MyISAM` tables. As of MySQL 4.1.9, it also applies for writes to binary log files and binary log index file, except that references to “row” and “record” should be understood to mean “event.”

When a disk-full condition occurs, MySQL does the following:

- It checks once every minute to see whether there is enough space to write the current row. If there is enough space, it continues as if nothing had happened.
- Every 10 minutes it writes an entry to the log file, warning about the disk-full condition.

To alleviate the problem, you can take the following actions:

- To continue, you only have to free enough disk space to insert all records.
- To abort the thread, you must use `mysqladmin kill`. The thread is aborted the next time it checks the disk (in one minute).
- Other threads might be waiting for the table that caused the disk-full condition. If you have several “locked” threads, killing the one thread that is waiting on the disk-full condition allows the other threads to continue.

Exceptions to the preceding behavior are when you use `REPAIR TABLE` or `OPTIMIZE TABLE` or when the indexes are created in a batch after `LOAD DATA INFILE` or after an `ALTER TABLE` statement. All of these statements may create large temporary files that, if left to themselves, would cause big problems for the rest of the system. If the disk becomes full while MySQL is doing any of these operations, it removes the big temporary files and mark the table as crashed. The exception is that for `ALTER TABLE`, the old table is left unchanged.

## A.4.4. Where MySQL Stores Temporary Files

MySQL uses the value of the `TMPDIR` environment variable as the pathname of the directory in which to store temporary files. If you don't have `TMPDIR` set, MySQL uses the system default, which is normally `/tmp`, `/var/tmp`, or `/usr/tmp`. If the filesystem containing your temporary file directory is too small, you can use the `--tmpdir` option to `mysqld` to specify a directory in a filesystem where you have enough space.

Starting from MySQL 4.1, the `--tmpdir` option can be set to a list of several paths that are used in round-robin fashion. Paths should be separated by colon characters (':') on Unix and semicolon characters (;) on Windows, NetWare, and OS/2. **Note:** To spread the load effectively, these paths should be located on different *physical* disks, not different partitions of the same disk.

If the MySQL server is acting as a replication slave, you should not set `--tmpdir` to point to a directory on a memory-based filesystem or to a directory that is cleared when the server host restarts. A replication slave needs some of its temporary files to survive a machine restart so that it can replicate temporary tables or `LOAD DATA INFILE` operations. If files in the temporary file directory are lost when the server restarts, replication fails.

MySQL creates all temporary files as hidden files. This ensures that the temporary files are removed if `mysqld` is terminated. The disadvantage of using hidden files is that you do not see a big temporary file that fills up the filesystem in which the temporary file directory is located.

When sorting (`ORDER BY` or `GROUP BY`), MySQL normally uses one or two temporary files. The maximum disk space required is determined by the following expression:

```
(length of what is sorted + sizeof(row pointer))
* number of matched rows
* 2
```

The row pointer size is usually four bytes, but may grow in the future for really big tables.

For some `SELECT` queries, MySQL also creates temporary SQL tables. These are not hidden and have names of the form `SQL_*`.

`ALTER TABLE` creates a temporary table in the same directory as the original table.

## A.4.5. How to Protect or Change the MySQL Unix Socket File

The default location for the Unix socket file that the server uses for communication with local clients is `/tmp/mysql.sock`. (For some distribution formats, the directory might be different, such as `/var/lib/mysql` for RPMs.)

On some versions of Unix, anyone can delete files in the `/tmp` directory or other similar directories used for temporary files. If the socket file is located in such a directory on your system, this might cause problems.

On most versions of Unix, you can protect your `/tmp` directory so that files can be deleted only by their owners or the superuser (`root`). To do this, set the `sticky` bit on the `/tmp` directory by logging in as `root` and using the following command:

```
shell> chmod +t /tmp
```

You can check whether the `sticky` bit is set by executing `ls -ld /tmp`. If the last permission character is `t`, the bit is set.

Another approach is to change the place where the server creates the Unix socket file. If you do this, you should also let client programs know the new location of the file. You can specify the file location in several ways:

- Specify the path in a global or local option file. For example, put the following lines in `/etc/my.cnf`:

```
[mysqld]
socket=/path/to/socket

[client]
socket=/path/to/socket
```

See [Section 4.3.2, “Using Option Files”](#).

- Specify a `--socket` option on the command line to `mysqld_safe` and when you run client programs.
- Set the `MYSQL_UNIX_PORT` environment variable to the path of the Unix socket file.
- Recompile MySQL from source to use a different default Unix socket file location. Define the path to the file with the `--with-unix-socket-path` option when you run `configure`. See [Section 2.9.2, “Typical configure Options”](#).

You can test whether the new socket location works by attempting to connect to the server with this command:

```
shell> mysqladmin --socket=/path/to/socket version
```

## A.4.6. Time Zone Problems

If you have a problem with `SELECT NOW()` returning values in UTC and not your local time, you have to tell the server your current time zone. The same applies if `UNIX_TIMESTAMP()` returns the wrong value. This should be done for the environment in which the server runs; for example, in `mysqld_safe` or `mysql.server`. See [Appendix F, \*Environment Variables\*](#).

You can set the time zone for the server with the `--timezone=timezone_name` option to `mysqld_safe`. You can also set it by setting the `TZ` environment variable before you start `mysqld`.

The allowable values for `--timezone` or `TZ` are system-dependent. Consult your operating system documentation to see what values are acceptable.

## A.5. Query-Related Issues

### A.5.1. Case Sensitivity in Searches

By default, MySQL searches are not case sensitive (although there are some character sets that are never case insensitive, such as `czech`). This means that if you search with `col_name LIKE 'a%'`, you get all column values that start with `A` or `a`. If you want to make this search case sensitive, make sure that one of the operands has a case sensitive or binary collation. For example, if you are comparing a

column and a string that both have the `latin1` character set, you can use the `COLLATE` operator to cause either operand to have the `latin1_general_cs` or `latin1_bin` collation. For example:

```
col_name COLLATE latin1_general_cs LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_general_cs
col_name COLLATE latin1_bin LIKE 'a%'
col_name LIKE 'a%' COLLATE latin1_bin
```

If you want a column always to be treated in case-sensitive fashion, declare it with a case sensitive or binary collation. See [Section 13.1.5, “CREATE TABLE Syntax”](#).

Before MySQL 4.1, `COLLATE` is unavailable. Use the `BINARY` operator in expressions to treat a string as a binary string: `BINARY col_name LIKE 'a%'` or `col_name LIKE BINARY 'a%'`. In column declarations, use the `BINARY` attribute.

Simple comparison operations (`>=`, `>`, `=`, `<`, `<=`, sorting, and grouping) are based on each character’s “sort value.” Characters with the same sort value (such as ‘E’, ‘e’, and ‘Ã#Â©’) are treated as the same character.

## A.5.2. Problems Using `DATE` Columns

The format of a `DATE` value is ‘YYYY-MM-DD’. According to standard SQL, no other format is allowed. You should use this format in `UPDATE` expressions and in the `WHERE` clause of `SELECT` statements. For example:

```
mysql> SELECT * FROM tbl_name WHERE date >= '2003-05-05';
```

As a convenience, MySQL automatically converts a date to a number if the date is used in a numeric context (and vice versa). It is also smart enough to allow a “relaxed” string form when updating and in a `WHERE` clause that compares a date to a `TIMESTAMP`, `DATE`, or `DATETIME` column. (“Relaxed form” means that any punctuation character may be used as the separator between parts. For example, ‘2004-08-15’ and ‘2004#08#15’ are equivalent.) MySQL can also convert a string containing no separators (such as ‘20040815’), provided it makes sense as a date.

When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` to a constant string with the `<`, `<=`, `=`, `>=`, `>`, or `BETWEEN` operators, MySQL normally converts the string to an internal long integer for faster comparison (and also for a bit more “relaxed” string checking). However, this conversion is subject to the following exceptions:

- When you compare two columns
- When you compare a `DATE`, `TIME`, `DATETIME`, or `TIMESTAMP` column to an expression
- When you use any other comparison method than those just listed, such as `IN` or `STRCMP()`.

For these exceptional cases, the comparison is done by converting the objects to strings and performing a string comparison.

To keep things safe, assume that strings are compared as strings and use the appropriate string functions if you want to compare a temporal value to a string.

The special date ‘0000-00-00’ can be stored and retrieved as ‘0000-00-00’. When using a ‘0000-00-00’ date through MyODBC, it is automatically converted to `NULL` in MyODBC 2.50.12 and above, because ODBC can’t handle this kind of date.

Because MySQL performs the conversions described above, the following statements work:

```
mysql> INSERT INTO tbl_name (idate) VALUES (19970505);
```

```
mysql> INSERT INTO tbl_name (idate) VALUES ('19970505');
mysql> INSERT INTO tbl_name (idate) VALUES ('97-05-05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997.05.05');
mysql> INSERT INTO tbl_name (idate) VALUES ('1997 05 05');
mysql> INSERT INTO tbl_name (idate) VALUES ('0000-00-00');

mysql> SELECT idate FROM tbl_name WHERE idate >= '1997-05-05';
mysql> SELECT idate FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT MOD(idate,100) FROM tbl_name WHERE idate >= 19970505;
mysql> SELECT idate FROM tbl_name WHERE idate >= '19970505';
```

However, the following does not work:

```
mysql> SELECT idate FROM tbl_name WHERE STRCMP(idate,'20030505')=0;
```

`STRCMP()` is a string function, so it converts `idate` to a string in 'YYYY-MM-DD' format and performs a string comparison. It does not convert '20030505' to the date '2003-05-05' and perform a date comparison.

If the date cannot be converted to any reasonable value, a 0 is stored in the `DATE` column, which is retrieved as '0000-00-00'. This is both a speed and a convenience issue. We believe that the database server's responsibility is to retrieve the same date you stored (even if the data was not logically correct in all cases). We think it is up to the application and not the server to check the dates.

### A.5.3. Problems with `NULL` Values

The concept of the `NULL` value is a common source of confusion for newcomers to SQL, who often think that `NULL` is the same thing as an empty string ''. This is not the case. For example, the following statements are completely different:

```
mysql> INSERT INTO my_table (phone) VALUES (NULL);
mysql> INSERT INTO my_table (phone) VALUES ('');
```

Both statements insert a value into the `phone` column, but the first inserts a `NULL` value and the second inserts an empty string. The meaning of the first can be regarded as “phone number is not known” and the meaning of the second can be regarded as “the person is known to have no phone, and thus no phone number.”

To help with `NULL` handling, you can use the `IS NULL` and `IS NOT NULL` operators and the `IFNULL()` function.

In SQL, the `NULL` value is never true in comparison to any other value, even `NULL`. An expression that contains `NULL` always produces a `NULL` value unless otherwise indicated in the documentation for the operators and functions involved in the expression. All columns in the following example return `NULL`:

```
mysql> SELECT NULL, 1+NULL, CONCAT('Invisible',NULL);
```

If you want to search for column values that are `NULL`, you cannot use an `expr = NULL` test. The following statement returns no rows, because `expr = NULL` is never true for any expression:

```
mysql> SELECT * FROM my_table WHERE phone = NULL;
```

To look for `NULL` values, you must use the `IS NULL` test. The following statements show how to find the `NULL` phone number and the empty phone number:

```
mysql> SELECT * FROM my_table WHERE phone IS NULL;
mysql> SELECT * FROM my_table WHERE phone = '';
```

See [Section 3.3.4.6, “Working with `NULL` Values”](#), for additional information and examples.

You can add an index on a column that can have `NULL` values if you are using MySQL 3.23.2 or newer and are using the `MyISAM`, `InnoDB`, or `BDB` storage engine. As of MySQL 4.0.2, the `MEMORY` storage engine also supports `NULL` values in indexes. Otherwise, you must declare an indexed column `NOT NULL` and you cannot insert `NULL` into the column.

When reading data with `LOAD DATA INFILE`, empty or missing columns are updated with `' '`. If you want a `NULL` value in a column, you should use `\N` in the data file. The literal word `"NULL"` may also be used under some circumstances. See [Section 13.2.5, "LOAD DATA INFILE Syntax"](#).

When using `DISTINCT`, `GROUP BY`, or `ORDER BY`, all `NULL` values are regarded as equal.

When using `ORDER BY`, `NULL` values are presented first, or last if you specify `DESC` to sort in descending order. Exception: In MySQL 4.0.2 through 4.0.10, `NULL` values sort first regardless of sort order.

Aggregate (summary) functions such as `COUNT()`, `MIN()`, and `SUM()` ignore `NULL` values. The exception to this is `COUNT(*)`, which counts rows and not individual column values. For example, the following statement produces two counts. The first is a count of the number of rows in the table, and the second is a count of the number of non-`NULL` values in the `age` column:

```
mysql> SELECT COUNT(*), COUNT(age) FROM person;
```

For some data types, MySQL handles `NULL` values specially. If you insert `NULL` into a `TIMESTAMP` column, the current date and time is inserted. If you insert `NULL` into an integer column that has the `AUTO_INCREMENT` attribute, the next number in the sequence is inserted.

## A.5.4. Problems with Column Aliases

You can use an alias to refer to a column in `GROUP BY`, `ORDER BY`, or `HAVING` clauses. Aliases can also be used to give columns better names:

```
SELECT SQRT(a*b) AS root FROM tbl_name GROUP BY root HAVING root > 0;
SELECT id, COUNT(*) AS cnt FROM tbl_name GROUP BY id HAVING cnt > 0;
SELECT id AS 'Customer identity' FROM tbl_name;
```

Standard SQL doesn't allow you to refer to a column alias in a `WHERE` clause. This restriction is imposed because when the `WHERE` code is executed, the column value may not yet be determined. For example, the following query is illegal:

```
SELECT id, COUNT(*) AS cnt FROM tbl_name WHERE cnt > 0 GROUP BY id;
```

The `WHERE` statement is executed to determine which rows should be included in the `GROUP BY` part, whereas `HAVING` is used to decide which rows from the result set should be used.

## A.5.5. Rollback Failure for Non-Transactional Tables

If you receive the following message when trying to perform a `ROLLBACK`, it means that one or more of the tables you used in the transaction do not support transactions:

```
Warning: Some non-transactional changed tables couldn't be rolled back
```

These non-transactional tables are not affected by the `ROLLBACK` statement.

If you were not deliberately mixing transactional and non-transactional tables within the transaction, the most likely cause for this message is that a table you thought was transactional actually is not. This can happen if you try to create a table using a transactional storage engine that is not supported by your `mysqld` server (or that was disabled with a startup option). If `mysqld` doesn't support a storage engine,

it instead creates the table as a `MyISAM` table, which is non-transactional.

You can check the storage engine for a table by using either of these statements:

```
SHOW TABLE STATUS LIKE 'tbl_name';
SHOW CREATE TABLE tbl_name;
```

See [Section 13.5.4.18, “SHOW TABLE STATUS Syntax”](#), and [Section 13.5.4.5, “SHOW CREATE TABLE Syntax”](#).

You can check which storage engines your `mysqld` server supports by using this statement:

```
SHOW ENGINES;
```

Before MySQL 4.1.2, `SHOW ENGINES` is unavailable. Use the following statement instead and check the value of the variable that is associated with the storage engine in which you are interested:

```
SHOW VARIABLES LIKE 'have_%';
```

For example, to determine whether the `InnoDB` storage engine is available, check the value of the `have_innodb` variable.

See [Section 13.5.4.8, “SHOW ENGINES Syntax”](#), and [Section 13.5.4.20, “SHOW VARIABLES Syntax”](#).

## A.5.6. Deleting Rows from Related Tables

MySQL does not support subqueries prior to version 4.1, or the use of more than one table in the `DELETE` statement prior to version 4.0. If your version of MySQL does not support subqueries or multiple-table `DELETE` statements, you can use the following approach to delete rows from two related tables:

1. `SELECT` the rows based on some `WHERE` condition in the main table.
2. `DELETE` the rows in the main table based on the same condition.
3. `DELETE FROM related_table WHERE related_column IN (selected_rows)`.

If the total length of the `DELETE` statement for `related_table` is more than 1MB (the default value of the `max_allowed_packet` system variable), you should split it into smaller parts and execute multiple `DELETE` statements. You probably get the fastest `DELETE` by specifying only 100 to 1,000 `related_column` values per statement if the `related_column` is indexed. If the `related_column` isn't indexed, the speed is independent of the number of arguments in the `IN` clause.

## A.5.7. Solving Problems with No Matching Rows

If you have a complicated query that uses many tables but that doesn't return any rows, you should use the following procedure to find out what is wrong:

1. Test the query with `EXPLAIN` to check whether you can find something that is obviously wrong. See [Section 7.2.1, “Optimizing Queries with EXPLAIN”](#).
2. Select only those columns that are used in the `WHERE` clause.
3. Remove one table at a time from the query until it returns some rows. If the tables are large, it's a good idea to use `LIMIT 10` with the query.

- Issue a `SELECT` for the column that should have matched a row against the table that was last removed from the query.
- If you are comparing `FLOAT` or `DOUBLE` columns with numbers that have decimals, you can't use equality (`=`) comparisons. This problem is common in most computer languages because not all floating-point values can be stored with exact precision. In some cases, changing the `FLOAT` to a `DOUBLE` fixes this. See [Section A.5.8, "Problems with Floating-Point Comparisons"](#).

Similar problems may be encountered when comparing `DECIMAL` values.

- If you still can't figure out what's wrong, create a minimal test that can be run with `mysql test < query.sql` that shows your problems. You can create a test file by dumping the tables with `mysqldump --quick db_name tbl_name_1 ... tbl_name_n > query.sql`. Open the file in an editor, remove some insert lines (if there are more than needed to demonstrate the problem), and add your `SELECT` statement at the end of the file.

Verify that the test file demonstrates the problem by executing these commands:

```
shell> mysqladmin create test2
shell> mysql test2 < query.sql
```

Attach the test file to a bug report, which you can file using the instructions in [Section 1.8, "How to Report Bugs or Problems"](#).

## A.5.8. Problems with Floating-Point Comparisons

Floating-point numbers sometimes cause confusion because they are approximate. That is, they are not stored as exact values inside computer architecture. What you can see on the screen usually is not the exact value of the number. The `FLOAT` and `DOUBLE` data types are such, and `DECIMAL` operations before MySQL 5.0.3 are approximate as well.

Prior to MySQL 5.0.3, `DECIMAL` columns store values with exact precision because they are represented as strings, but calculations on `DECIMAL` values are done using floating-point operations. As of 5.0.3, MySQL performs `DECIMAL` operations with a precision of 64 decimal digits, which should solve most common inaccuracy problems when it comes to `DECIMAL` columns. (If your server is from MySQL 5.0.3 or higher, but you have `DECIMAL` columns in tables that were created before 5.0.3, the old behavior still applies to those columns. To convert the tables to the newer `DECIMAL` format, dump them with `mysqldump` and reload them.)

The following example (for versions of MySQL older than 5.0.3) demonstrates the problem. It shows that even for older `DECIMAL` columns, calculations that are done using floating-point operations are subject to floating-point error. (Were you to replace the `DECIMAL` columns with `FLOAT`, similar problems would occur for all versions of MySQL.)

```
mysql> CREATE TABLE t1 (i INT, d1 DECIMAL(9,2), d2 DECIMAL(9,2));
mysql> INSERT INTO t1 VALUES (1, 101.40, 21.40), (1, -80.00, 0.00),
-> (2, 0.00, 0.00), (2, -13.20, 0.00), (2, 59.60, 46.40),
-> (2, 30.40, 30.40), (3, 37.00, 7.40), (3, -29.60, 0.00),
-> (4, 60.00, 15.40), (4, -10.60, 0.00), (4, -34.00, 0.00),
-> (5, 33.00, 0.00), (5, -25.80, 0.00), (5, 0.00, 7.20),
-> (6, 0.00, 0.00), (6, -51.40, 0.00);

mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
```

i	a	b
1	21.40	21.40
2	76.80	76.80
3	7.40	7.40
4	15.40	15.40
5	7.20	7.20

```
| 6 | -51.40 | 0.00 |
+-----+-----+
```

The result is correct. Although the first five records look like they should not satisfy the comparison (the values of `a` and `b` do not appear to be different), they may do so because the difference between the numbers shows up around the tenth decimal or so, depending on factors such as computer architecture or the compiler version or optimization level. For example, different CPUs may evaluate floating-point numbers differently.

As of MySQL 5.0.3, you will get only the last row in the above result.

The problem cannot be solved by using `ROUND()` or similar functions, because the result is still a floating-point number:

```
mysql> SELECT i, ROUND(SUM(d1), 2) AS a, ROUND(SUM(d2), 2) AS b
-> FROM t1 GROUP BY i HAVING a <> b;
+-----+-----+
| i | a | b |
+-----+-----+
| 1 | 21.40 | 21.40 |
| 2 | 76.80 | 76.80 |
| 3 | 7.40 | 7.40 |
| 4 | 15.40 | 15.40 |
| 5 | 7.20 | 7.20 |
| 6 | -51.40 | 0.00 |
+-----+-----+
```

This is what the numbers in column `a` look like when displayed with more decimal places:

```
mysql> SELECT i, ROUND(SUM(d1), 2)*1.0000000000000000 AS a,
-> ROUND(SUM(d2), 2) AS b FROM t1 GROUP BY i HAVING a <> b;
+-----+-----+-----+
| i | a | b |
+-----+-----+-----+
| 1 | 21.3999999999999986 | 21.40 |
| 2 | 76.7999999999999972 | 76.80 |
| 3 | 7.4000000000000004 | 7.40 |
| 4 | 15.4000000000000004 | 15.40 |
| 5 | 7.2000000000000002 | 7.20 |
| 6 | -51.399999999999986 | 0.00 |
+-----+-----+-----+
```

Depending on your computer architecture, you may or may not see similar results. For example, on some machines you may get the “correct” results by multiplying both arguments by 1, as the following example shows.

**Warning:** Never use this method in your applications. It is not an example of a trustworthy method!

```
mysql> SELECT i, ROUND(SUM(d1), 2)*1 AS a, ROUND(SUM(d2), 2)*1 AS b
-> FROM t1 GROUP BY i HAVING a <> b;
+-----+-----+
| i | a | b |
+-----+-----+
| 6 | -51.40 | 0.00 |
+-----+-----+
```

The reason that the preceding example seems to work is that on the particular machine where the test was done, CPU floating-point arithmetic happens to round the numbers to the same value. However, there is no rule that any CPU should do so, so this method cannot be trusted.

The correct way to do floating-point number comparison is to first decide on an acceptable tolerance for differences between the numbers and then do the comparison against the tolerance value. For example, if we agree that floating-point numbers should be regarded the same if they are same within a precision of one in ten thousand (0.0001), the comparison should be written to find differences larger than the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) > 0.0001;
+-----+-----+-----+
| i | a | b |
+-----+-----+-----+
| 6 | -51.40 | 0.00 |
+-----+-----+-----+
1 row in set (0.00 sec)
```

Conversely, to get rows where the numbers are the same, the test should find differences within the tolerance value:

```
mysql> SELECT i, SUM(d1) AS a, SUM(d2) AS b FROM t1
-> GROUP BY i HAVING ABS(a - b) <= 0.0001;
+-----+-----+-----+
| i | a | b |
+-----+-----+-----+
| 1 | 21.40 | 21.40 |
| 2 | 76.80 | 76.80 |
| 3 | 7.40 | 7.40 |
| 4 | 15.40 | 15.40 |
| 5 | 7.20 | 7.20 |
+-----+-----+-----+
```

## A.6. Optimizer-Related Issues

MySQL uses a cost-based optimizer to determine the best way to resolve a query. In many cases, MySQL can calculate the best possible query plan, but sometimes MySQL doesn't have enough information about the data at hand and has to make "educated" guesses about the data.

For the cases when MySQL does not do the "right" thing, tools that you have available to help MySQL are:

- Use the `EXPLAIN` statement to get information about how MySQL processes a query. To use it, just add the keyword `EXPLAIN` to the front of your `SELECT` statement:

```
mysql> EXPLAIN SELECT * FROM t1, t2 WHERE t1.i = t2.i;
```

`EXPLAIN` is discussed in more detail in [Section 7.2.1, "Optimizing Queries with EXPLAIN"](#).

- Use `ANALYZE TABLE tbl_name` to update the key distributions for the scanned table. See [Section 13.5.2.1, "ANALYZE TABLE Syntax"](#).
- Use `FORCE INDEX` for the scanned table to tell MySQL that table scans are very expensive compared to using the given index. See [Section 13.2.7, "SELECT Syntax"](#).

```
SELECT * FROM t1, t2 FORCE INDEX (index_for_column)
WHERE t1.col_name=t2.col_name;
```

`USE INDEX` and `IGNORE INDEX` may also be useful.

- Global and table-level `STRAIGHT_JOIN`. See [Section 13.2.7, "SELECT Syntax"](#).
- You can tune global or thread-specific system variables. For example, Start `mysqld` with the `--max-seeks-for-key=1000` option or use `SET max_seeks_for_key=1000` to tell the optimizer to assume that no key scan causes more than 1,000 key seeks. See [Section 5.2.2, "System Variables"](#).

## A.7. Table Definition-Related Issues

## A.7.1. Problems with `ALTER TABLE`

`ALTER TABLE` changes a table to the current character set. If you get a duplicate-key error during `ALTER TABLE`, the cause is either that the new character sets maps two keys to the same value or that the table is corrupted. In the latter case, you should run `REPAIR TABLE` on the table.

If `ALTER TABLE` dies with the following error, the problem may be that MySQL crashed during an earlier `ALTER TABLE` operation and there is an old table named `A-xxx` or `B-xxx` lying around:

```
Error on rename of './database/name.frm'
to './database/B-xxx.frm' (Errcode: 17)
```

In this case, go to the MySQL data directory and delete all files that have names starting with `A-` or `B-`. (You may want to move them elsewhere instead of deleting them.)

`ALTER TABLE` works in the following way:

- Create a new table named `A-xxx` with the requested structural changes.
- Copy all rows from the original table to `A-xxx`.
- Rename the original table to `B-xxx`.
- Rename `A-xxx` to your original table name.
- Delete `B-xxx`.

If something goes wrong with the renaming operation, MySQL tries to undo the changes. If something goes seriously wrong (although this shouldn't happen), MySQL may leave the old table as `B-xxx`. A simple rename of the table files at the system level should get your data back.

If you use `ALTER TABLE` on a transactional table or if you are using Windows or OS/2, `ALTER TABLE` unlocks the table if you had done a `LOCK TABLE` on it. This is done because `InnoDB` and these operating systems cannot drop a table that is in use.

## A.7.2. How to Change the Order of Columns in a Table

First, consider whether you really need to change the column order in a table. The whole point of SQL is to abstract the application from the data storage format. You should always specify the order in which you wish to retrieve your data. The first of the following statements returns columns in the order `col_name1, col_name2, col_name3`, whereas the second returns them in the order `col_name1, col_name3, col_name2`:

```
mysql> SELECT col_name1, col_name2, col_name3 FROM tbl_name;
mysql> SELECT col_name1, col_name3, col_name2 FROM tbl_name;
```

If you decide to change the order of table columns anyway, you can do so as follows:

1. Create a new table with the columns in the new order.
2. Execute this statement:

```
mysql> INSERT INTO new_table
-> SELECT columns-in-new-order FROM old_table;
```

3. Drop or rename `old_table`.

4. Rename the new table to the original name:

```
mysql> ALTER TABLE new_table RENAME old_table;
```

`SELECT *` is quite suitable for testing queries. However, in an application, you should *never* rely on using `SELECT *` and retrieving the columns based on their position. The order and position in which columns are returned does not remain the same if you add, move, or delete columns. A simple change to your table structure could cause your application to fail.

### A.7.3. TEMPORARY TABLE Problems

The following list indicates limitations on the use of `TEMPORARY` tables:

- A `TEMPORARY` table can only be of type `HEAP`, `ISAM`, `MyISAM`, `MERGE`, or `InnoDB`.

Temporary tables are not supported for MySQL Cluster.

- You cannot refer to a `TEMPORARY` table more than once in the same query. For example, the following does not work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The `SHOW TABLES` statement does not list `TEMPORARY` tables.
- You cannot use `RENAME` to rename a `TEMPORARY` table. However, you can use `ALTER TABLE` instead:

```
mysql> ALTER TABLE orig_name RENAME new_name;
```

- There are known issues in using temporary tables with replication. See [Section 6.7, “Replication Features and Known Problems”](#), for more information.

## A.8. Known Issues in MySQL

This section is a list of the known issues in recent versions of MySQL.

For information about platform-specific issues, see the installation and porting instructions in [Section 2.13, “Operating System-Specific Notes”](#), and [Appendix E, \*Porting to Other Systems\*](#).

### A.8.1. Issues in MySQL 3.23 Fixed in a Later MySQL Version

The following known issues have not been fixed in MySQL 3.23 for various reasons, and are not classified as critical.

- Fixed in MySQL 4.0: Avoid using spaces at the end of column names because this can cause unexpected behavior. ([Bug#4196](#) [<http://bugs.mysql.com/4196>])
- Fixed in MySQL 4.0.12: You can get a deadlock (hung thread) if you use `LOCK TABLE` to lock multiple tables and then in the same connection use `DROP TABLE` to drop one of them while another thread is trying to lock it. (To break the deadlock, you can use `KILL` to terminate any of the threads involved.)

- Fixed in MySQL 4.0.11: `SELECT MAX(key_column) FROM t1,t2,t3...` where one of the tables are empty doesn't return `NULL` but instead returns the maximum value for the column.
- `DELETE FROM heap_table` without a `WHERE` clause doesn't work on a locked `HEAP` table.

## A.8.2. Issues in MySQL 4.0 Fixed in a Later Version

The following known issues have not been fixed in MySQL 4.0 for various reasons, and are not classified as critical.

- Fixed in MySQL 4.1.10: Using `HAVING`, you can get a crash or wrong result if you use an alias to a `RAND()` function. This will not be fixed in 4.0 because the fix may break compatibility with some applications.
- Fixed in MySQL 4.1.1: In a `UNION`, the first `SELECT` determines the type, `max_length`, and `NULL` properties for the resulting columns.
- Fixed in MySQL 4.1: In `DELETE` with many tables, you can't refer to tables to be deleted through an alias.
- Fixed in MySQL 4.1.2: You cannot mix `UNION ALL` and `UNION DISTINCT` in the same query. If you use `ALL` for one `UNION`, it is used for all of them.
- `FLUSH TABLES WITH READ LOCK` does not block `CREATE TABLE`, which may cause a problem with the binary log position when doing a full backup of tables and the binary log.
- Fixed in MySQL 4.1.8: `mysqldump --single-transaction --master-data` behaved like `mysqldump --master-data`, so the dump was a blocking one.
- When using the `RPAD()` function (or any function adding spaces to the right) in a query that had to be resolved by using a temporary table, all resulting strings had rightmost spaces removed (i.e. `RPAD()` did not work).

## A.8.3. Issues in MySQL 4.1 Fixed in a Later Version

The following known issues have not been fixed in MySQL 4.1 for various reasons, and are not classified as critical.

- Fixed in 5.0.3: `VARCHAR` and `VARBINARY` did not remember end space.

## A.8.4. Open Issues in MySQL

The following problems are known and fixing them is a high priority:

- If you compare a `NULL` value to a subquery using `ALL/ANY/SOME` and the subquery returns an empty result, the comparison might evaluate to the non-standard result of `NULL` rather than to `TRUE` or `FALSE`. This will be fixed in MySQL 5.1.
- Subquery optimization for `IN` is not as effective as for `=`.
- Even if you use `lower_case_table_names=2` (which enables MySQL to remember the case used for databases and table names), MySQL does not remember the case used for database names

for the function `DATABASE()` or within the various logs (on case-insensitive systems).

- Dropping a `FOREIGN KEY` constraint doesn't work in replication because the constraint may have another name on the slave.
- `REPLACE` (and `LOAD DATA` with the `REPLACE` option) does not trigger `ON DELETE CASCADE`.
- `DISTINCT` with `ORDER BY` doesn't work inside `GROUP_CONCAT()` if you don't use all and only those columns that are in the `DISTINCT` list.
- If one user has a long-running transaction and another user drops a table that is updated in the transaction, there is small chance that the binary log may contain the `DROP TABLE` command before the table is used in the transaction itself. We plan to fix this by having the `DROP TABLE` command wait until the table is not being used in any transaction.
- When inserting a big integer value (between  $2^{63}$  and  $2^{64}-1$ ) into a decimal or string column, it is inserted as a negative value because the number is evaluated in a signed integer context.
- `FLUSH TABLES WITH READ LOCK` does not block `COMMIT` if the server is running without binary logging, which may cause a problem (of consistency between tables) when doing a full backup.
- `ANALYZE TABLE` on a `BDB` table may in some cases make the table unusable until you restart `mysqld`. If this happens, look for errors of the following form in the MySQL error file:

```
001207 22:07:56 bdb: log_flush: LSN past current end-of-log
```

- Don't execute `ALTER TABLE` on a `BDB` table on which you are running multiple-statement transactions until all those transactions complete. (The transaction might be ignored.)
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, and `REPAIR TABLE` may cause problems on tables for which you are using `INSERT DELAYED`.
- Performing `LOCK TABLE ...` and `FLUSH TABLES ...` doesn't guarantee that there isn't a half-finished transaction in progress on the table.
- `BDB` tables are relatively slow to open. If you have many `BDB` tables in a database, it takes a long time to use the `mysql` client on the database if you are not using the `-A` option or if you are using `rehash`. This is especially noticeable when you have a large table cache.
- Replication uses query-level logging: The master writes the executed queries to the binary log. This is a very fast, compact, and efficient logging method that works perfectly in most cases.

It is possible for the data on the master and slave to become different if a query is designed in such a way that the data modification is non-deterministic (generally not a recommended practice, even outside of replication).

For example:

- `CREATE ... SELECT` or `INSERT ... SELECT` statements that insert zero or `NULL` values into an `AUTO_INCREMENT` column.
- `DELETE` if you are deleting rows from a table that has foreign keys with `ON DELETE CASCADE` properties.
- `REPLACE ... SELECT`, `INSERT IGNORE ... SELECT` if you have duplicate key values in the inserted data.

**If and only if the preceding queries have no `ORDER BY` clause guaranteeing a deterministic or-**

der.

For example, for `INSERT ... SELECT` with no `ORDER BY`, the `SELECT` may return rows in a different order (which results in a row having different ranks, hence getting a different number in the `AUTO_INCREMENT` column), depending on the choices made by the optimizers on the master and slave.

A query is optimized differently on the master and slave only if:

- The files used by the two queries are not exactly the same; for example, `OPTIMIZE TABLE` was run on the master tables and not on the slave tables. (To fix this, `OPTIMIZE TABLE`, `ANALYZE TABLE`, and `REPAIR TABLE` are written to the binary log as of MySQL 4.1.1).
- The table is stored using a different storage engine on the master than on the slave. (It is possible to use different storage engines on the master and slave. For example, you can use `InnoDB` on the master, but `MyISAM` on the slave if the slave has less available disk space.)
- MySQL buffer sizes (`key_buffer_size`, and so on) are different on the master and slave.
- The master and slave run different MySQL versions, and the optimizer code differs between these versions.

This problem may also affect database restoration using `mysqlbinlog|mysql`.

The easiest way to avoid this problem is to add an `ORDER BY` clause to the aforementioned non-deterministic queries to ensure that the rows are always stored or modified in the same order.

In future MySQL versions, we will automatically add an `ORDER BY` clause when needed.

The following issues are known and will be fixed in due time:

- Log filenames are based on the server hostname (if you don't specify a filename with the startup option). You have to use options such as `--log-bin=old_host_name-bin` if you change your hostname to something else. Another option is to rename the old files to reflect your hostname change (if these are binary logs, you need to edit the binary log index file and fix the binlog names there as well). See [Section 5.2.1, "Command Options"](#).
- `mysqlbinlog` does not delete temporary files left after a `LOAD DATA INFILE` command. See [Section 8.10, "mysqlbinlog — Utility for Processing Binary Log Files"](#).
- `RENAME` doesn't work with `TEMPORARY` tables or tables used in a `MERGE` table.
- Due to the way table format (`.frm`) files are stored, you cannot use character 255 (`CHAR(255)`) in table names, column names, or enumerations. This is scheduled to be fixed in version 5.1 when we implement new table definition format files.
- When using `SET CHARACTER SET`, you can't use translated characters in database, table, and column names.
- You can't use `'_'` or `'%'` with `ESCAPE` in `LIKE ... ESCAPE`.
- If you have a `DECIMAL` column in which the same number is stored in different formats (for example, `+01.00`, `1.00`, `01.00`), `GROUP BY` may regard each value as a different value.
- You cannot build the server in another directory when using MIT-pthreads. Because this requires changes to MIT-pthreads, we are not likely to fix this. See [Section 2.9.5, "MIT-pthreads Notes"](#).

- `BLOB` and `TEXT` values can't “reliably” be used in `GROUP BY`, `ORDER BY` or `DISTINCT`. Only the first `max_sort_length` bytes are used when comparing `BLOB` values in these cases. The default value of `max_sort_length` value is 1024 and can be changed at server startup time. As of MySQL 4.0.3, it can be changed at runtime. For older versions, a workaround is to use a substring. For example:

```
SELECT DISTINCT LEFT(blob_col,2048) FROM tbl_name;
```

- Numeric calculations are done with `BIGINT` or `DOUBLE` (both are normally 64 bits long). Which precision you get depends on the function. The general rule is that bit functions are performed with `BIGINT` precision, `IF` and `ELT()` with `BIGINT` or `DOUBLE` precision, and the rest with `DOUBLE` precision. You should try to avoid using unsigned long long values if they resolve to be larger than 63 bits (9223372036854775807) for anything other than bit fields. MySQL Server 4.0 has better `BIGINT` handling than 3.23.
- You can have up to 255 `ENUM` and `SET` columns in one table.
- In `MIN()`, `MAX()`, and other aggregate functions, MySQL currently compares `ENUM` and `SET` columns by their string value rather than by the string's relative position in the set.
- `mysqld_safe` redirects all messages from `mysqld` to the `mysqld` log. One problem with this is that if you execute `mysqladmin refresh` to close and reopen the log, `stdout` and `stderr` are still redirected to the old log. If you use `--log` extensively, you should edit `mysqld_safe` to log to `host_name.err` instead of `host_name.log` so that you can easily reclaim the space for the old log by deleting it and executing `mysqladmin refresh`.
- In an `UPDATE` statement, columns are updated from left to right. If you refer to an updated column, you get the updated value instead of the original value. For example, the following statement increments `KEY` by 2, not 1:

```
mysql> UPDATE tbl_name SET KEY=KEY+1,KEY=KEY+1;
```

- You can refer to multiple temporary tables in the same query, but you cannot refer to any given temporary table more than once. For example, the following doesn't work:

```
mysql> SELECT * FROM temp_table, temp_table AS t2;
ERROR 1137: Can't reopen table: 'temp_table'
```

- The optimizer may handle `DISTINCT` differently when you are using “hidden” columns in a join than when you are not. In a join, hidden columns are counted as part of the result (even if they are not shown), whereas in normal queries, hidden columns don't participate in the `DISTINCT` comparison. We will probably change this in the future to never compare the hidden columns when executing `DISTINCT`.

An example of this is:

```
SELECT DISTINCT mp3id FROM band_downloads
WHERE userid = 9 ORDER BY id DESC;
```

and

```
SELECT DISTINCT band_downloads.mp3id
FROM band_downloads,band_mp3
WHERE band_downloads.userid = 9
AND band_mp3.id = band_downloads.mp3id
ORDER BY band_downloads.id DESC;
```

In the second case, using MySQL Server 3.23.x, you may get two identical rows in the result set

(because the values in the hidden `id` column may differ).

Note that this happens only for queries where that do not have the `ORDER BY` columns in the result.

- If you execute a `PROCEDURE` on a query that returns an empty set, in some cases the `PROCEDURE` does not transform the columns.
- Creation of a table of type `MERGE` doesn't check whether the underlying tables are compatible types.
- If you use `ALTER TABLE` to add a `UNIQUE` index to a table used in a `MERGE` table and then add a normal index on the `MERGE` table, the key order is different for the tables if there was an old, non-`UNIQUE` key in the table. This is because `ALTER TABLE` puts `UNIQUE` indexes before normal indexes to be able to detect duplicate keys as early as possible.

---

# Appendix B. Error Codes and Messages

This appendix lists the errors that may appear when you call MySQL from any host language. The first list displays server error messages. The second list displays client program messages.

## B.1. Server Error Codes and Messages

MySQL programs have access to several types of error information when the server returns an error. For example, the `mysql` client program displays errors using the following format:

```
shell> SELECT * FROM no_such_table;
ERROR 1146 (42S02): Table 'test.no_such_table' doesn't exist
```

The message displayed contains three types of information:

- A numeric error value (`1146`). This number is MySQL-specific and is not portable to other database systems.
- A five-character SQLSTATE value (`'42S02'`). The values are specified by ANSI SQL and ODBC and are more standardized. Not all MySQL error numbers are mapped to SQLSTATE error codes. The value `'HY000'` (general error) is used for unmapped errors.
- A string that provides a textual description of the error.

Server error information comes from the following source files. For details about the way that error information is defined, see the MySQL Internals manual, available at <http://dev.mysql.com/doc/>.

- The Error values and the symbols in parentheses correspond to definitions in the `include/mysql_d_error.h` MySQL source file.
- The SQLSTATE values correspond to definitions in the `include/sql_state.h` MySQL source file.

SQLSTATE error codes are displayed only if you use MySQL version 4.1 and up. SQLSTATE codes were added for compatibility with X/Open, ANSI, and ODBC behavior.

- The Message values correspond to the error messages that are listed in the `sql/share/errmsg.txt` file. `%d` and `%s` represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: `1000` SQLSTATE: `HY000` (`ER_HASHCHK`)  
Message: hashchk
- Error: `1001` SQLSTATE: `HY000` (`ER_NISAMCHK`)  
Message: isamchk
- Error: `1002` SQLSTATE: `HY000` (`ER_NO`)

Message: NO

- Error: 1003 SQLSTATE: HY000 (ER\_YES)

Message: YES

- Error: 1004 SQLSTATE: HY000 (ER\_CANT\_CREATE\_FILE)

Message: Can't create file '%s' (errno: %d)

- Error: 1005 SQLSTATE: HY000 (ER\_CANT\_CREATE\_TABLE)

Message: Can't create table '%s' (errno: %d)

- Error: 1006 SQLSTATE: HY000 (ER\_CANT\_CREATE\_DB)

Message: Can't create database '%s' (errno: %d)

- Error: 1007 SQLSTATE: HY000 (ER\_DB\_CREATE\_EXISTS)

Message: Can't create database '%s'; database exists

- Error: 1008 SQLSTATE: HY000 (ER\_DB\_DROP\_EXISTS)

Message: Can't drop database '%s'; database doesn't exist

- Error: 1009 SQLSTATE: HY000 (ER\_DB\_DROP\_DELETE)

Message: Error dropping database (can't delete '%s', errno: %d)

- Error: 1010 SQLSTATE: HY000 (ER\_DB\_DROP\_RMDIR)

Message: Error dropping database (can't rmdir '%s', errno: %d)

- Error: 1011 SQLSTATE: HY000 (ER\_CANT\_DELETE\_FILE)

Message: Error on delete of '%s' (errno: %d)

- Error: 1012 SQLSTATE: HY000 (ER\_CANT\_FIND\_SYSTEM\_REC)

Message: Can't read record in system table

- Error: 1013 SQLSTATE: HY000 (ER\_CANT\_GET\_STAT)

Message: Can't get status of '%s' (errno: %d)

- Error: 1014 SQLSTATE: HY000 (ER\_CANT\_GET\_WD)

Message: Can't get working directory (errno: %d)

- Error: 1015 SQLSTATE: HY000 (ER\_CANT\_LOCK)

Message: Can't lock file (errno: %d)

- Error: 1016 SQLSTATE: HY000 (ER\_CANT\_OPEN\_FILE)

Message: Can't open file: '%s' (errno: %d)

- Error: 1017 SQLSTATE: HY000 (ER\_FILE\_NOT\_FOUND)

- Message: Can't find file: '%s' (errno: %d)

  - Error: 1018 SQLSTATE: HY000 (ER\_CANT\_READ\_DIR)  
Message: Can't read dir of '%s' (errno: %d)
  - Error: 1019 SQLSTATE: HY000 (ER\_CANT\_SET\_WD)  
Message: Can't change dir to '%s' (errno: %d)
  - Error: 1020 SQLSTATE: HY000 (ER\_CHECKREAD)  
Message: Record has changed since last read in table '%s'
  - Error: 1021 SQLSTATE: HY000 (ER\_DISK\_FULL)  
Message: Disk full (%s); waiting for someone to free some space...
  - Error: 1022 SQLSTATE: 23000 (ER\_DUP\_KEY)  
Message: Can't write; duplicate key in table '%s'
  - Error: 1023 SQLSTATE: HY000 (ER\_ERROR\_ON\_CLOSE)  
Message: Error on close of '%s' (errno: %d)
  - Error: 1024 SQLSTATE: HY000 (ER\_ERROR\_ON\_READ)  
Message: Error reading file '%s' (errno: %d)
  - Error: 1025 SQLSTATE: HY000 (ER\_ERROR\_ON\_RENAME)  
Message: Error on rename of '%s' to '%s' (errno: %d)
  - Error: 1026 SQLSTATE: HY000 (ER\_ERROR\_ON\_WRITE)  
Message: Error writing file '%s' (errno: %d)
  - Error: 1027 SQLSTATE: HY000 (ER\_FILE\_USED)  
Message: '%s' is locked against change
  - Error: 1028 SQLSTATE: HY000 (ER\_FILSORT\_ABORT)  
Message: Sort aborted
  - Error: 1029 SQLSTATE: HY000 (ER\_FORM\_NOT\_FOUND)  
Message: View '%s' doesn't exist for '%s'
  - Error: 1030 SQLSTATE: HY000 (ER\_GET\_ERRNO)  
Message: Got error %d from storage engine
  - Error: 1031 SQLSTATE: HY000 (ER\_ILLEGAL\_HA)  
Message: Table storage engine for '%s' doesn't have this option
  - Error: 1032 SQLSTATE: HY000 (ER\_KEY\_NOT\_FOUND)

Message: Can't find record in '%s'

- Error: 1033 SQLSTATE: HY000 (ER\_NOT\_FORM\_FILE)

Message: Incorrect information in file: '%s'

- Error: 1034 SQLSTATE: HY000 (ER\_NOT\_KEYFILE)

Message: Incorrect key file for table '%s'; try to repair it

- Error: 1035 SQLSTATE: HY000 (ER\_OLD\_KEYFILE)

Message: Old key file for table '%s'; repair it!

- Error: 1036 SQLSTATE: HY000 (ER\_OPEN\_AS\_READONLY)

Message: Table '%s' is read only

- Error: 1037 SQLSTATE: HY001 (ER\_OUTOFMEMORY)

Message: Out of memory; restart server and try again (needed %d bytes)

- Error: 1038 SQLSTATE: HY001 (ER\_OUT\_OF\_SORTMEMORY)

Message: Out of sort memory; increase server sort buffer size

- Error: 1039 SQLSTATE: HY000 (ER\_UNEXPECTED\_EOF)

Message: Unexpected EOF found when reading file '%s' (errno: %d)

- Error: 1040 SQLSTATE: 08004 (ER\_CON\_COUNT\_ERROR)

Message: Too many connections

- Error: 1041 SQLSTATE: HY000 (ER\_OUT\_OF\_RESOURCES)

Message: Out of memory; check if mysqld or some other process uses all available memory; if not, you may have to use 'ulimit' to allow mysqld to use more memory or you can add more swap space

- Error: 1042 SQLSTATE: 08S01 (ER\_BAD\_HOST\_ERROR)

Message: Can't get hostname for your address

- Error: 1043 SQLSTATE: 08S01 (ER\_HANDSHAKE\_ERROR)

Message: Bad handshake

- Error: 1044 SQLSTATE: 42000 (ER\_DBACCESS\_DENIED\_ERROR)

Message: Access denied for user '%s'@'%s' to database '%s'

- Error: 1045 SQLSTATE: 28000 (ER\_ACCESS\_DENIED\_ERROR)

Message: Access denied for user '%s'@'%s' (using password: %s)

- Error: 1046 SQLSTATE: 3D000 (ER\_NO\_DB\_ERROR)

Message: No database selected

- Error: 1047 SQLSTATE: 08S01 (ER\_UNKNOWN\_COM\_ERROR)  
Message: Unknown command
- Error: 1048 SQLSTATE: 23000 (ER\_BAD\_NULL\_ERROR)  
Message: Column '%s' cannot be null
- Error: 1049 SQLSTATE: 42000 (ER\_BAD\_DB\_ERROR)  
Message: Unknown database '%s'
- Error: 1050 SQLSTATE: 42S01 (ER\_TABLE\_EXISTS\_ERROR)  
Message: Table '%s' already exists
- Error: 1051 SQLSTATE: 42S02 (ER\_BAD\_TABLE\_ERROR)  
Message: Unknown table '%s'
- Error: 1052 SQLSTATE: 23000 (ER\_NON\_UNIQ\_ERROR)  
Message: Column '%s' in %s is ambiguous
- Error: 1053 SQLSTATE: 08S01 (ER\_SERVER\_SHUTDOWN)  
Message: Server shutdown in progress
- Error: 1054 SQLSTATE: 42S22 (ER\_BAD\_FIELD\_ERROR)  
Message: Unknown column '%s' in '%s'
- Error: 1055 SQLSTATE: 42000 (ER\_WRONG\_FIELD\_WITH\_GROUP)  
Message: '%s' isn't in GROUP BY
- Error: 1056 SQLSTATE: 42000 (ER\_WRONG\_GROUP\_FIELD)  
Message: Can't group on '%s'
- Error: 1057 SQLSTATE: 42000 (ER\_WRONG\_SUM\_SELECT)  
Message: Statement has sum functions and columns in same statement
- Error: 1058 SQLSTATE: 21S01 (ER\_WRONG\_VALUE\_COUNT)  
Message: Column count doesn't match value count
- Error: 1059 SQLSTATE: 42000 (ER\_TOO\_LONG\_IDENT)  
Message: Identifier name '%s' is too long
- Error: 1060 SQLSTATE: 42S21 (ER\_DUP\_FIELDNAME)  
Message: Duplicate column name '%s'
- Error: 1061 SQLSTATE: 42000 (ER\_DUP\_KEYNAME)  
Message: Duplicate key name '%s'

- Error: 1062 SQLSTATE: 23000 (ER\_DUP\_ENTRY)  
Message: Duplicate entry '%s' for key %d
- Error: 1063 SQLSTATE: 42000 (ER\_WRONG\_FIELD\_SPEC)  
Message: Incorrect column specifier for column '%s'
- Error: 1064 SQLSTATE: 42000 (ER\_PARSE\_ERROR)  
Message: %s near '%s' at line %d
- Error: 1065 SQLSTATE: HY000 (ER\_EMPTY\_QUERY)  
Message: Query was empty
- Error: 1066 SQLSTATE: 42000 (ER\_NONUNIQ\_TABLE)  
Message: Not unique table/alias: '%s'
- Error: 1067 SQLSTATE: 42000 (ER\_INVALID\_DEFAULT)  
Message: Invalid default value for '%s'
- Error: 1068 SQLSTATE: 42000 (ER\_MULTIPLE\_PRI\_KEY)  
Message: Multiple primary key defined
- Error: 1069 SQLSTATE: 42000 (ER\_TOO\_MANY\_KEYS)  
Message: Too many keys specified; max %d keys allowed
- Error: 1070 SQLSTATE: 42000 (ER\_TOO\_MANY\_KEY\_PARTS)  
Message: Too many key parts specified; max %d parts allowed
- Error: 1071 SQLSTATE: 42000 (ER\_TOO\_LONG\_KEY)  
Message: Specified key was too long; max key length is %d bytes
- Error: 1072 SQLSTATE: 42000 (ER\_KEY\_COLUMN\_DOES\_NOT\_EXISTS)  
Message: Key column '%s' doesn't exist in table
- Error: 1073 SQLSTATE: 42000 (ER\_BLOB\_USED\_AS\_KEY)  
Message: BLOB column '%s' can't be used in key specification with the used table type
- Error: 1074 SQLSTATE: 42000 (ER\_TOO\_BIG\_FIELDLENGTH)  
Message: Column length too big for column '%s' (max = %d); use BLOB or TEXT instead
- Error: 1075 SQLSTATE: 42000 (ER\_WRONG\_AUTO\_KEY)  
Message: Incorrect table definition; there can be only one auto column and it must be defined as a key
- Error: 1076 SQLSTATE: HY000 (ER\_READY)  
Message: %s: ready for connections. Version: '%s' socket: '%s' port: %d

- Error: 1077 SQLSTATE: HY000 (ER\_NORMAL\_SHUTDOWN)  
Message: %s: Normal shutdown
- Error: 1078 SQLSTATE: HY000 (ER\_GOT\_SIGNAL)  
Message: %s: Got signal %d. Aborting!
- Error: 1079 SQLSTATE: HY000 (ER\_SHUTDOWN\_COMPLETE)  
Message: %s: Shutdown complete
- Error: 1080 SQLSTATE: 08S01 (ER\_FORCING\_CLOSE)  
Message: %s: Forcing close of thread %ld user: '%s'
- Error: 1081 SQLSTATE: 08S01 (ER\_IPSOCKET\_ERROR)  
Message: Can't create IP socket
- Error: 1082 SQLSTATE: 42S12 (ER\_NO\_SUCH\_INDEX)  
Message: Table '%s' has no index like the one used in CREATE INDEX; recreate the table
- Error: 1083 SQLSTATE: 42000 (ER\_WRONG\_FIELD\_TERMINATORS)  
Message: Field separator argument is not what is expected; check the manual
- Error: 1084 SQLSTATE: 42000 (ER\_BLOBS\_AND\_NO\_TERMINATED)  
Message: You can't use fixed rowlength with BLOBs; please use 'fields terminated by'
- Error: 1085 SQLSTATE: HY000 (ER\_TEXTFILE\_NOT\_READABLE)  
Message: The file '%s' must be in the database directory or be readable by all
- Error: 1086 SQLSTATE: HY000 (ER\_FILE\_EXISTS\_ERROR)  
Message: File '%s' already exists
- Error: 1087 SQLSTATE: HY000 (ER\_LOAD\_INFO)  
Message: Records: %ld Deleted: %ld Skipped: %ld Warnings: %ld
- Error: 1088 SQLSTATE: HY000 (ER\_ALTER\_INFO)  
Message: Records: %ld Duplicates: %ld
- Error: 1089 SQLSTATE: HY000 (ER\_WRONG\_SUB\_KEY)  
Message: Incorrect sub part key; the used key part isn't a string, the used length is longer than the key part, or the storage engine doesn't support unique sub keys
- Error: 1090 SQLSTATE: 42000 (ER\_CANT\_REMOVE\_ALL\_FIELDS)  
Message: You can't delete all columns with ALTER TABLE; use DROP TABLE instead
- Error: 1091 SQLSTATE: 42000 (ER\_CANT\_DROP\_FIELD\_OR\_KEY)  
Message: Can't DROP '%s'; check that column/key exists

- Error: 1092 SQLSTATE: HY000 (ER\_INSERT\_INFO)  
Message: Records: %ld Duplicates: %ld Warnings: %ld
- Error: 1093 SQLSTATE: HY000 (ER\_UPDATE\_TABLE\_USED)  
Message: You can't specify target table '%s' for update in FROM clause
- Error: 1094 SQLSTATE: HY000 (ER\_NO\_SUCH\_THREAD)  
Message: Unknown thread id: %lu
- Error: 1095 SQLSTATE: HY000 (ER\_KILL\_DENIED\_ERROR)  
Message: You are not owner of thread %lu
- Error: 1096 SQLSTATE: HY000 (ER\_NO\_TABLES\_USED)  
Message: No tables used
- Error: 1097 SQLSTATE: HY000 (ER\_TOO\_BIG\_SET)  
Message: Too many strings for column %s and SET
- Error: 1098 SQLSTATE: HY000 (ER\_NO\_UNIQUE\_LOGFILE)  
Message: Can't generate a unique log-filename %s.(1-999)
- Error: 1099 SQLSTATE: HY000 (ER\_TABLE\_NOT\_LOCKED\_FOR\_WRITE)  
Message: Table '%s' was locked with a READ lock and can't be updated
- Error: 1100 SQLSTATE: HY000 (ER\_TABLE\_NOT\_LOCKED)  
Message: Table '%s' was not locked with LOCK TABLES
- Error: 1101 SQLSTATE: 42000 (ER\_BLOB\_CANT\_HAVE\_DEFAULT)  
Message: BLOB/TEXT column '%s' can't have a default value
- Error: 1102 SQLSTATE: 42000 (ER\_WRONG\_DB\_NAME)  
Message: Incorrect database name '%s'
- Error: 1103 SQLSTATE: 42000 (ER\_WRONG\_TABLE\_NAME)  
Message: Incorrect table name '%s'
- Error: 1104 SQLSTATE: 42000 (ER\_TOO\_BIG\_SELECT)  
Message: The SELECT would examine more than MAX\_JOIN\_SIZE rows; check your WHERE and use SET SQL\_BIG\_SELECTS=1 or SET SQL\_MAX\_JOIN\_SIZE=# if the SELECT is okay
- Error: 1105 SQLSTATE: HY000 (ER\_UNKNOWN\_ERROR)  
Message: Unknown error
- Error: 1106 SQLSTATE: 42000 (ER\_UNKNOWN\_PROCEDURE)  
Message: Unknown procedure '%s'

Message: Incorrect parameter count to procedure '%s'
- Error: [1108 SQLSTATE: HY000 \(ER\\_WRONG\\_PARAMETERS\\_TO\\_PROCEDURE\)](#)  
Message: Incorrect parameters to procedure '%s'
- Error: [1109 SQLSTATE: 42S02 \(ER\\_UNKNOWN\\_TABLE\)](#)  
Message: Unknown table '%s' in %s
- Error: [1110 SQLSTATE: 42000 \(ER\\_FIELD\\_SPECIFIED\\_TWICE\)](#)  
Message: Column '%s' specified twice
- Error: [1111 SQLSTATE: HY000 \(ER\\_INVALID\\_GROUP\\_FUNC\\_USE\)](#)  
Message: Invalid use of group function
- Error: [1112 SQLSTATE: 42000 \(ER\\_UNSUPPORTED\\_EXTENSION\)](#)  
Message: Table '%s' uses an extension that doesn't exist in this MySQL version
- Error: [1113 SQLSTATE: 42000 \(ER\\_TABLE\\_MUST\\_HAVE\\_COLUMNS\)](#)  
Message: A table must have at least 1 column
- Error: [1114 SQLSTATE: HY000 \(ER\\_RECORD\\_FILE\\_FULL\)](#)  
Message: The table '%s' is full
- Error: [1115 SQLSTATE: 42000 \(ER\\_UNKNOWN\\_CHARACTER\\_SET\)](#)  
Message: Unknown character set: '%s'
- Error: [1116 SQLSTATE: HY000 \(ER\\_TOO\\_MANY\\_TABLES\)](#)  
Message: Too many tables; MySQL can only use %d tables in a join
- Error: [1117 SQLSTATE: HY000 \(ER\\_TOO\\_MANY\\_FIELDS\)](#)  
Message: Too many columns
- Error: [1118 SQLSTATE: 42000 \(ER\\_TOO\\_BIG\\_ROWSIZE\)](#)  
Message: Row size too large. The maximum row size for the used table type, not counting BLOBs, is %ld. You have to change some columns to TEXT or BLOBs
- Error: [1119 SQLSTATE: HY000 \(ER\\_STACK\\_OVERRUN\)](#)  
Message: Thread stack overrun: Used: %ld of a %ld stack. Use 'mysqld -O thread\_stack=#' to specify a bigger stack if needed
- Error: [1120 SQLSTATE: 42000 \(ER\\_WRONG\\_OUTER\\_JOIN\)](#)  
Message: Cross dependency found in OUTER JOIN; examine your ON conditions
- Error: [1121 SQLSTATE: 42000 \(ER\\_NULL\\_COLUMN\\_IN\\_INDEX\)](#)

Message: Column '%s' is used with UNIQUE or INDEX but is not defined as NOT NULL

- Error: 1122 SQLSTATE: HY000 (ER\_CANT\_FIND\_UDF)

Message: Can't load function '%s'

- Error: 1123 SQLSTATE: HY000 (ER\_CANT\_INITIALIZE\_UDF)

Message: Can't initialize function '%s'; %s

- Error: 1124 SQLSTATE: HY000 (ER\_UDF\_NO\_PATHS)

Message: No paths allowed for shared library

- Error: 1125 SQLSTATE: HY000 (ER\_UDF\_EXISTS)

Message: Function '%s' already exists

- Error: 1126 SQLSTATE: HY000 (ER\_CANT\_OPEN\_LIBRARY)

Message: Can't open shared library '%s' (errno: %d %s)

- Error: 1127 SQLSTATE: HY000 (ER\_CANT\_FIND\_DL\_ENTRY)

Message: Can't find function '%s' in library

- Error: 1128 SQLSTATE: HY000 (ER\_FUNCTION\_NOT\_DEFINED)

Message: Function '%s' is not defined

- Error: 1129 SQLSTATE: HY000 (ER\_HOST\_IS\_BLOCKED)

Message: Host '%s' is blocked because of many connection errors; unblock with 'mysqladmin flush-hosts'

- Error: 1130 SQLSTATE: HY000 (ER\_HOST\_NOT\_PRIVILEGED)

Message: Host '%s' is not allowed to connect to this MySQL server

- Error: 1131 SQLSTATE: 42000 (ER\_PASSWORD\_ANONYMOUS\_USER)

Message: You are using MySQL as an anonymous user and anonymous users are not allowed to change passwords

- Error: 1132 SQLSTATE: 42000 (ER\_PASSWORD\_NOT\_ALLOWED)

Message: You must have privileges to update tables in the mysql database to be able to change passwords for others

- Error: 1133 SQLSTATE: 42000 (ER\_PASSWORD\_NO\_MATCH)

Message: Can't find any matching row in the user table

- Error: 1134 SQLSTATE: HY000 (ER\_UPDATE\_INFO)

Message: Rows matched: %ld Changed: %ld Warnings: %ld

- Error: 1135 SQLSTATE: HY000 (ER\_CANT\_CREATE\_THREAD)

Message: Can't create a new thread (errno %d); if you are not out of available memory, you can consult the manual for a possible OS-dependent bug

- Error: 1136 SQLSTATE: 21S01 (ER\_WRONG\_VALUE\_COUNT\_ON\_ROW)

Message: Column count doesn't match value count at row %ld

- Error: 1137 SQLSTATE: HY000 (ER\_CANT\_REOPEN\_TABLE)

Message: Can't reopen table: '%s'

- Error: 1138 SQLSTATE: 42000 (ER\_INVALID\_USE\_OF\_NULL)

Message: Invalid use of NULL value

- Error: 1139 SQLSTATE: 42000 (ER\_REGEXP\_ERROR)

Message: Got error '%s' from regexp

- Error: 1140 SQLSTATE: 42000 (ER\_MIX\_OF\_GROUP\_FUNC\_AND\_FIELDS)

Message: Mixing of GROUP columns (MIN(),MAX(),COUNT(),...) with no GROUP columns is illegal if there is no GROUP BY clause

- Error: 1141 SQLSTATE: 42000 (ER\_NONEXISTING\_GRANT)

Message: There is no such grant defined for user '%s' on host '%s'

- Error: 1142 SQLSTATE: 42000 (ER\_TABLEACCESS\_DENIED\_ERROR)

Message: %s command denied to user '%s'@'%s' for table '%s'

- Error: 1143 SQLSTATE: 42000 (ER\_COLUMNACCESS\_DENIED\_ERROR)

Message: %s command denied to user '%s'@'%s' for column '%s' in table '%s'

- Error: 1144 SQLSTATE: 42000 (ER\_ILLEGAL\_GRANT\_FOR\_TABLE)

Message: Illegal GRANT/REVOKE command; please consult the manual to see which privileges can be used

- Error: 1145 SQLSTATE: 42000 (ER\_GRANT\_WRONG\_HOST\_OR\_USER)

Message: The host or user argument to GRANT is too long

- Error: 1146 SQLSTATE: 42S02 (ER\_NO\_SUCH\_TABLE)

Message: Table '%s.%s' doesn't exist

- Error: 1147 SQLSTATE: 42000 (ER\_NONEXISTING\_TABLE\_GRANT)

Message: There is no such grant defined for user '%s' on host '%s' on table '%s'

- Error: 1148 SQLSTATE: 42000 (ER\_NOT\_ALLOWED\_COMMAND)

Message: The used command is not allowed with this MySQL version

- Error: 1149 SQLSTATE: 42000 (ER\_SYNTAX\_ERROR)

Message: You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use

- Error: 1150 SQLSTATE: HY000 (ER\_DELAYED\_CANT\_CHANGE\_LOCK)

Message: Delayed insert thread couldn't get requested lock for table %s

- Error: 1151 SQLSTATE: HY000 (ER\_TOO\_MANY\_DELAYED\_THREADS)

Message: Too many delayed threads in use

- Error: 1152 SQLSTATE: 08S01 (ER\_ABORTING\_CONNECTION)

Message: Aborted connection %ld to db: '%s' user: '%s' (%s)

- Error: 1153 SQLSTATE: 08S01 (ER\_NET\_PACKET\_TOO\_LARGE)

Message: Got a packet bigger than 'max\_allowed\_packet' bytes

- Error: 1154 SQLSTATE: 08S01 (ER\_NET\_READ\_ERROR\_FROM\_PIPE)

Message: Got a read error from the connection pipe

- Error: 1155 SQLSTATE: 08S01 (ER\_NET\_FCNTL\_ERROR)

Message: Got an error from fcntl()

- Error: 1156 SQLSTATE: 08S01 (ER\_NET\_PACKETS\_OUT\_OF\_ORDER)

Message: Got packets out of order

- Error: 1157 SQLSTATE: 08S01 (ER\_NET\_UNCOMPRESS\_ERROR)

Message: Couldn't uncompress communication packet

- Error: 1158 SQLSTATE: 08S01 (ER\_NET\_READ\_ERROR)

Message: Got an error reading communication packets

- Error: 1159 SQLSTATE: 08S01 (ER\_NET\_READ\_INTERRUPTED)

Message: Got timeout reading communication packets

- Error: 1160 SQLSTATE: 08S01 (ER\_NET\_ERROR\_ON\_WRITE)

Message: Got an error writing communication packets

- Error: 1161 SQLSTATE: 08S01 (ER\_NET\_WRITE\_INTERRUPTED)

Message: Got timeout writing communication packets

- Error: 1162 SQLSTATE: 42000 (ER\_TOO\_LONG\_STRING)

Message: Result string is longer than 'max\_allowed\_packet' bytes

- Error: 1163 SQLSTATE: 42000 (ER\_TABLE\_CANT\_HANDLE\_BLOB)

Message: The used table type doesn't support BLOB/TEXT columns

- Error: [1164 SQLSTATE: 42000 \(ER\\_TABLE\\_CANT\\_HANDLE\\_AUTO\\_INCREMENT\)](#)  
Message: The used table type doesn't support AUTO\_INCREMENT columns
- Error: [1165 SQLSTATE: HY000 \(ER\\_DELAYED\\_INSERT\\_TABLE\\_LOCKED\)](#)  
Message: INSERT DELAYED can't be used with table '%s' because it is locked with LOCK TABLES
- Error: [1166 SQLSTATE: 42000 \(ER\\_WRONG\\_COLUMN\\_NAME\)](#)  
Message: Incorrect column name '%s'
- Error: [1167 SQLSTATE: 42000 \(ER\\_WRONG\\_KEY\\_COLUMN\)](#)  
Message: The used storage engine can't index column '%s'
- Error: [1168 SQLSTATE: HY000 \(ER\\_WRONG\\_MRG\\_TABLE\)](#)  
Message: All tables in the MERGE table are not identically defined
- Error: [1169 SQLSTATE: 23000 \(ER\\_DUP\\_UNIQUE\)](#)  
Message: Can't write, because of unique constraint, to table '%s'
- Error: [1170 SQLSTATE: 42000 \(ER\\_BLOB\\_KEY\\_WITHOUT\\_LENGTH\)](#)  
Message: BLOB/TEXT column '%s' used in key specification without a key length
- Error: [1171 SQLSTATE: 42000 \(ER\\_PRIMARY\\_CANT\\_HAVE\\_NULL\)](#)  
Message: All parts of a PRIMARY KEY must be NOT NULL; if you need NULL in a key, use UNIQUE instead
- Error: [1172 SQLSTATE: 42000 \(ER\\_TOO\\_MANY\\_ROWS\)](#)  
Message: Result consisted of more than one row
- Error: [1173 SQLSTATE: 42000 \(ER\\_REQUIRES\\_PRIMARY\\_KEY\)](#)  
Message: This table type requires a primary key
- Error: [1174 SQLSTATE: HY000 \(ER\\_NO\\_RAID\\_COMPILED\)](#)  
Message: This version of MySQL is not compiled with RAID support
- Error: [1175 SQLSTATE: HY000 \(ER\\_UPDATE\\_WITHOUT\\_KEY\\_IN\\_SAFE\\_MODE\)](#)  
Message: You are using safe update mode and you tried to update a table without a WHERE that uses a KEY column
- Error: [1176 SQLSTATE: HY000 \(ER\\_KEY\\_DOES\\_NOT\\_EXISTS\)](#)  
Message: Key '%s' doesn't exist in table '%s'
- Error: [1177 SQLSTATE: 42000 \(ER\\_CHECK\\_NO\\_SUCH\\_TABLE\)](#)  
Message: Can't open table
- Error: [1178 SQLSTATE: 42000 \(ER\\_CHECK\\_NOT\\_IMPLEMENTED\)](#)

Message: The storage engine for the table doesn't support %s

- Error: 1179 SQLSTATE: 25000 (ER\_CANT\_DO\_THIS\_DURING\_AN\_TRANSACTION)

Message: You are not allowed to execute this command in a transaction

- Error: 1180 SQLSTATE: HY000 (ER\_ERROR\_DURING\_COMMIT)

Message: Got error %d during COMMIT

- Error: 1181 SQLSTATE: HY000 (ER\_ERROR\_DURING\_ROLLBACK)

Message: Got error %d during ROLLBACK

- Error: 1182 SQLSTATE: HY000 (ER\_ERROR\_DURING\_FLUSH\_LOGS)

Message: Got error %d during FLUSH\_LOGS

- Error: 1183 SQLSTATE: HY000 (ER\_ERROR\_DURING\_CHECKPOINT)

Message: Got error %d during CHECKPOINT

- Error: 1184 SQLSTATE: 08S01 (ER\_NEW\_ABORTING\_CONNECTION)

Message: Aborted connection %ld to db: '%s' user: '%s' host: '%s' (%s)

- Error: 1185 SQLSTATE: HY000 (ER\_DUMP\_NOT\_IMPLEMENTED)

Message: The storage engine for the table does not support binary table dump

- Error: 1186 SQLSTATE: HY000 (ER\_FLUSH\_MASTER\_BINLOG\_CLOSED)

Message: Binlog closed, cannot RESET MASTER

- Error: 1187 SQLSTATE: HY000 (ER\_INDEX\_REBUILD)

Message: Failed rebuilding the index of dumped table '%s'

- Error: 1188 SQLSTATE: HY000 (ER\_MASTER)

Message: Error from master: '%s'

- Error: 1189 SQLSTATE: 08S01 (ER\_MASTER\_NET\_READ)

Message: Net error reading from master

- Error: 1190 SQLSTATE: 08S01 (ER\_MASTER\_NET\_WRITE)

Message: Net error writing to master

- Error: 1191 SQLSTATE: HY000 (ER\_FT\_MATCHING\_KEY\_NOT\_FOUND)

Message: Can't find FULLTEXT index matching the column list

- Error: 1192 SQLSTATE: HY000 (ER\_LOCK\_OR\_ACTIVE\_TRANSACTION)

Message: Can't execute the given command because you have active locked tables or an active transaction

- Error: 1193 SQLSTATE: HY000 (ER\_UNKNOWN\_SYSTEM\_VARIABLE)  
Message: Unknown system variable '%s'
- Error: 1194 SQLSTATE: HY000 (ER\_CRASHED\_ON\_USAGE)  
Message: Table '%s' is marked as crashed and should be repaired
- Error: 1195 SQLSTATE: HY000 (ER\_CRASHED\_ON\_REPAIR)  
Message: Table '%s' is marked as crashed and last (automatic?) repair failed
- Error: 1196 SQLSTATE: HY000 (ER\_WARNING\_NOT\_COMPLETE\_ROLLBACK)  
Message: Some non-transactional changed tables couldn't be rolled back
- Error: 1197 SQLSTATE: HY000 (ER\_TRANS\_CACHE\_FULL)  
Message: Multi-statement transaction required more than 'max\_binlog\_cache\_size' bytes of storage; increase this mysqld variable and try again
- Error: 1198 SQLSTATE: HY000 (ER\_SLAVE\_MUST\_STOP)  
Message: This operation cannot be performed with a running slave; run STOP SLAVE first
- Error: 1199 SQLSTATE: HY000 (ER\_SLAVE\_NOT\_RUNNING)  
Message: This operation requires a running slave; configure slave and do START SLAVE
- Error: 1200 SQLSTATE: HY000 (ER\_BAD\_SLAVE)  
Message: The server is not configured as slave; fix in config file or with CHANGE MASTER TO
- Error: 1201 SQLSTATE: HY000 (ER\_MASTER\_INFO)  
Message: Could not initialize master info structure; more error messages can be found in the MySQL error log
- Error: 1202 SQLSTATE: HY000 (ER\_SLAVE\_THREAD)  
Message: Could not create slave thread; check system resources
- Error: 1203 SQLSTATE: 42000 (ER\_TOO\_MANY\_USER\_CONNECTIONS)  
Message: User %s has already more than 'max\_user\_connections' active connections
- Error: 1204 SQLSTATE: HY000 (ER\_SET\_CONSTANTS\_ONLY)  
Message: You may only use constant expressions with SET
- Error: 1205 SQLSTATE: HY000 (ER\_LOCK\_WAIT\_TIMEOUT)  
Message: Lock wait timeout exceeded; try restarting transaction
- Error: 1206 SQLSTATE: HY000 (ER\_LOCK\_TABLE\_FULL)  
Message: The total number of locks exceeds the lock table size
- Error: 1207 SQLSTATE: 25000 (ER\_READ\_ONLY\_TRANSACTION)

Message: Update locks cannot be acquired during a READ UNCOMMITTED transaction

- Error: 1208 SQLSTATE: HY000 (ER\_DROP\_DB\_WITH\_READ\_LOCK)

Message: DROP DATABASE not allowed while thread is holding global read lock

- Error: 1209 SQLSTATE: HY000 (ER\_CREATE\_DB\_WITH\_READ\_LOCK)

Message: CREATE DATABASE not allowed while thread is holding global read lock

- Error: 1210 SQLSTATE: HY000 (ER\_WRONG\_ARGUMENTS)

Message: Incorrect arguments to %s

- Error: 1211 SQLSTATE: 42000 (ER\_NO\_PERMISSION\_TO\_CREATE\_USER)

Message: '%s'@'%s' is not allowed to create new users

- Error: 1212 SQLSTATE: HY000 (ER\_UNION\_TABLES\_IN\_DIFFERENT\_DIR)

Message: Incorrect table definition; all MERGE tables must be in the same database

- Error: 1213 SQLSTATE: 40001 (ER\_LOCK\_DEADLOCK)

Message: Deadlock found when trying to get lock; try restarting transaction

- Error: 1214 SQLSTATE: HY000 (ER\_TABLE\_CANT\_HANDLE\_FT)

Message: The used table type doesn't support FULLTEXT indexes

- Error: 1215 SQLSTATE: HY000 (ER\_CANNOT\_ADD\_FOREIGN)

Message: Cannot add foreign key constraint

- Error: 1216 SQLSTATE: 23000 (ER\_NO\_REFERENCED\_ROW)

Message: Cannot add or update a child row: a foreign key constraint fails

- Error: 1217 SQLSTATE: 23000 (ER\_ROW\_IS\_REFERENCED)

Message: Cannot delete or update a parent row: a foreign key constraint fails

- Error: 1218 SQLSTATE: 08S01 (ER\_CONNECT\_TO\_MASTER)

Message: Error connecting to master: %s

- Error: 1219 SQLSTATE: HY000 (ER\_QUERY\_ON\_MASTER)

Message: Error running query on master: %s

- Error: 1220 SQLSTATE: HY000 (ER\_ERROR\_WHEN\_EXECUTING\_COMMAND)

Message: Error when executing command %s: %s

- Error: 1221 SQLSTATE: HY000 (ER\_WRONG\_USAGE)

Message: Incorrect usage of %s and %s

- Error: 1222 SQLSTATE: 21000 (ER\_WRONG\_NUMBER\_OF\_COLUMNS\_IN\_SELECT)

Message: The used SELECT statements have a different number of columns

- Error: 1223 SQLSTATE: HY000 (ER\_CANT\_UPDATE\_WITH\_READLOCK)

Message: Can't execute the query because you have a conflicting read lock

- Error: 1224 SQLSTATE: HY000 (ER\_MIXING\_NOT\_ALLOWED)

Message: Mixing of transactional and non-transactional tables is disabled

- Error: 1225 SQLSTATE: HY000 (ER\_DUP\_ARGUMENT)

Message: Option '%s' used twice in statement

- Error: 1226 SQLSTATE: 42000 (ER\_USER\_LIMIT\_REACHED)

Message: User '%s' has exceeded the '%s' resource (current value: %ld)

- Error: 1227 SQLSTATE: HY000 (ER\_SPECIFIC\_ACCESS\_DENIED\_ERROR)

Message: Access denied; you need the %s privilege for this operation

- Error: 1228 SQLSTATE: HY000 (ER\_LOCAL\_VARIABLE)

Message: Variable '%s' is a SESSION variable and can't be used with SET GLOBAL

- Error: 1229 SQLSTATE: HY000 (ER\_GLOBAL\_VARIABLE)

Message: Variable '%s' is a GLOBAL variable and should be set with SET GLOBAL

- Error: 1230 SQLSTATE: 42000 (ER\_NO\_DEFAULT)

Message: Variable '%s' doesn't have a default value

- Error: 1231 SQLSTATE: 42000 (ER\_WRONG\_VALUE\_FOR\_VAR)

Message: Variable '%s' can't be set to the value of '%s'

- Error: 1232 SQLSTATE: 42000 (ER\_WRONG\_TYPE\_FOR\_VAR)

Message: Incorrect argument type to variable '%s'

- Error: 1233 SQLSTATE: HY000 (ER\_VAR\_CANT\_BE\_READ)

Message: Variable '%s' can only be set, not read

- Error: 1234 SQLSTATE: 42000 (ER\_CANT\_USE\_OPTION\_HERE)

Message: Incorrect usage/placement of '%s'

- Error: 1235 SQLSTATE: 42000 (ER\_NOT\_SUPPORTED\_YET)

Message: This version of MySQL doesn't yet support '%s'

- Error: 1236 SQLSTATE: HY000 (ER\_MASTER\_FATAL\_ERROR\_READING\_BINLOG)

Message: Got fatal error %d: '%s' from master when reading data from binary log

- Error: 1237 SQLSTATE: HY000 (ER\_SLAVE\_IGNORED\_TABLE)

- Message: Slave SQL thread ignored the query because of replicate-*\**-table rules
- Error: 1238 SQLSTATE: HY000 (ER\_INCORRECT\_GLOBAL\_LOCAL\_VAR)  
Message: Variable '%s' is a %s variable
  - Error: 1239 SQLSTATE: 42000 (ER\_WRONG\_FK\_DEF)  
Message: Incorrect foreign key definition for '%s': %s
  - Error: 1240 SQLSTATE: HY000 (ER\_KEY\_REF\_DO\_NOT\_MATCH\_TABLE\_REF)  
Message: Key reference and table reference don't match
  - Error: 1241 SQLSTATE: 21000 (ER\_OPERAND\_COLUMNS)  
Message: Operand should contain %d column(s)
  - Error: 1242 SQLSTATE: 21000 (ER\_SUBQUERY\_NO\_1\_ROW)  
Message: Subquery returns more than 1 row
  - Error: 1243 SQLSTATE: HY000 (ER\_UNKNOWN\_STMT\_HANDLER)  
Message: Unknown prepared statement handler (%.\*s) given to %s
  - Error: 1244 SQLSTATE: HY000 (ER\_CORRUPT\_HELP\_DB)  
Message: Help database is corrupt or does not exist
  - Error: 1245 SQLSTATE: HY000 (ER\_CYCLIC\_REFERENCE)  
Message: Cyclic reference on subqueries
  - Error: 1246 SQLSTATE: HY000 (ER\_AUTO\_CONVERT)  
Message: Converting column '%s' from %s to %s
  - Error: 1247 SQLSTATE: 42S22 (ER\_ILLEGAL\_REFERENCE)  
Message: Reference '%s' not supported (%s)
  - Error: 1248 SQLSTATE: 42000 (ER\_DERIVED\_MUST\_HAVE\_ALIAS)  
Message: Every derived table must have its own alias
  - Error: 1249 SQLSTATE: 01000 (ER\_SELECT\_REDUCED)  
Message: Select %u was reduced during optimization
  - Error: 1250 SQLSTATE: 42000 (ER\_TABLENAME\_NOT\_ALLOWED\_HERE)  
Message: Table '%s' from one of the SELECTs cannot be used in %s
  - Error: 1251 SQLSTATE: 08004 (ER\_NOT\_SUPPORTED\_AUTH\_MODE)  
Message: Client does not support authentication protocol requested by server; consider upgrading MySQL client

- Error: 1252 SQLSTATE: 42000 (ER\_SPATIAL\_CANT\_HAVE\_NULL)  
Message: All parts of a SPATIAL index must be NOT NULL
- Error: 1253 SQLSTATE: 42000 (ER\_COLLATION\_CHARSET\_MISMATCH)  
Message: COLLATION '%s' is not valid for CHARACTER SET '%s'
- Error: 1254 SQLSTATE: HY000 (ER\_SLAVE\_WAS\_RUNNING)  
Message: Slave is already running
- Error: 1255 SQLSTATE: HY000 (ER\_SLAVE\_WAS\_NOT\_RUNNING)  
Message: Slave has already been stopped
- Error: 1256 SQLSTATE: HY000 (ER\_TOO\_BIG\_FOR\_UNCOMPRESS)  
Message: Uncompressed data size too large; the maximum size is %d (probably, length of uncompressed data was corrupted)
- Error: 1257 SQLSTATE: HY000 (ER\_ZLIB\_Z\_MEM\_ERROR)  
Message: ZLIB: Not enough memory
- Error: 1258 SQLSTATE: HY000 (ER\_ZLIB\_Z\_BUF\_ERROR)  
Message: ZLIB: Not enough room in the output buffer (probably, length of uncompressed data was corrupted)
- Error: 1259 SQLSTATE: HY000 (ER\_ZLIB\_Z\_DATA\_ERROR)  
Message: ZLIB: Input data corrupted
- Error: 1260 SQLSTATE: HY000 (ER\_CUT\_VALUE\_GROUP\_CONCAT)  
Message: %d line(s) were cut by GROUP\_CONCAT()
- Error: 1261 SQLSTATE: 01000 (ER\_WARN\_TOO\_FEW\_RECORDS)  
Message: Row %ld doesn't contain data for all columns
- Error: 1262 SQLSTATE: 01000 (ER\_WARN\_TOO\_MANY\_RECORDS)  
Message: Row %ld was truncated; it contained more data than there were input columns
- Error: 1263 SQLSTATE: 01000 (ER\_WARN\_NULL\_TO\_NOTNULL)  
Message: Data truncated; NULL supplied to NOT NULL column '%s' at row %ld
- Error: 1264 SQLSTATE: 01000 (ER\_WARN\_DATA\_OUT\_OF\_RANGE)  
Message: Data truncated; out of range for column '%s' at row %ld
- Error: 1265 SQLSTATE: 01000 (ER\_WARN\_DATA\_TRUNCATED)  
Message: Data truncated for column '%s' at row %ld
- Error: 1266 SQLSTATE: HY000 (ER\_WARN\_USING\_OTHER\_HANDLER)

Message: Using storage engine %s for table '%s'

- Error: 1267 SQLSTATE: HY000 (ER\_CANT\_AGGREGATE\_2COLLATIONS)

Message: Illegal mix of collations (%s,%s) and (%s,%s) for operation '%s'

- Error: 1268 SQLSTATE: HY000 (ER\_DROP\_USER)

Message: Can't drop one or more of the requested users

- Error: 1269 SQLSTATE: HY000 (ER\_REVOKE\_GRANTS)

Message: Can't revoke all privileges, grant for one or more of the requested users

- Error: 1270 SQLSTATE: HY000 (ER\_CANT\_AGGREGATE\_3COLLATIONS)

Message: Illegal mix of collations (%s,%s), (%s,%s), (%s,%s) for operation '%s'

- Error: 1271 SQLSTATE: HY000 (ER\_CANT\_AGGREGATE\_NCOLLATIONS)

Message: Illegal mix of collations for operation '%s'

- Error: 1272 SQLSTATE: HY000 (ER\_VARIABLE\_IS\_NOT\_STRUCT)

Message: Variable '%s' is not a variable component (can't be used as XXXX.variable\_name)

- Error: 1273 SQLSTATE: HY000 (ER\_UNKNOWN\_COLLATION)

Message: Unknown collation: '%s'

- Error: 1274 SQLSTATE: HY000 (ER\_SLAVE\_IGNORED\_SSL\_PARAMS)

Message: SSL parameters in CHANGE MASTER are ignored because this MySQL slave was compiled without SSL support; they can be used later if MySQL slave with SSL is started

- Error: 1275 SQLSTATE: HY000 (ER\_SERVER\_IS\_IN\_SECURE\_AUTH\_MODE)

Message: Server is running in --secure-auth mode, but '%s'@'%s' has a password in the old format; please change the password to the new format

- Error: 1276 SQLSTATE: HY000 (ER\_WARN\_FIELD\_RESOLVED)

Message: Field or reference '%s%s%s%s%s' of SELECT #d was resolved in SELECT #d

- Error: 1277 SQLSTATE: HY000 (ER\_BAD\_SLAVE\_UNTIL\_COND)

Message: Incorrect parameter or combination of parameters for START SLAVE UNTIL

- Error: 1278 SQLSTATE: HY000 (ER\_MISSING\_SKIP\_SLAVE)

Message: It is recommended to use --skip-slave-start when doing step-by-step replication with START SLAVE UNTIL; otherwise, you will get problems if you get an unexpected slave's mysqld restart

- Error: 1279 SQLSTATE: HY000 (ER\_UNTIL\_COND\_IGNORED)

Message: SQL thread is not to be started so UNTIL options are ignored

- Error: 1280 SQLSTATE: 42000 (ER\_WRONG\_NAME\_FOR\_INDEX)

Message: Incorrect index name '%s'

- Error: 1281 SQLSTATE: 42000 (ER\_WRONG\_NAME\_FOR\_CATALOG)

Message: Incorrect catalog name '%s'

- Error: 1282 SQLSTATE: HY000 (ER\_WARN\_QC\_RESIZE)

Message: Query cache failed to set size %lu; new query cache size is %lu

- Error: 1283 SQLSTATE: HY000 (ER\_BAD\_FT\_COLUMN)

Message: Column '%s' cannot be part of FULLTEXT index

- Error: 1284 SQLSTATE: HY000 (ER\_UNKNOWN\_KEY\_CACHE)

Message: Unknown key cache '%s'

- Error: 1285 SQLSTATE: HY000 (ER\_WARN\_HOSTNAME\_WONT\_WORK)

Message: MySQL is started in --skip-name-resolve mode; you must restart it without this switch for this grant to work

- Error: 1286 SQLSTATE: 42000 (ER\_UNKNOWN\_STORAGE\_ENGINE)

Message: Unknown table engine '%s'

- Error: 1287 SQLSTATE: HY000 (ER\_WARN\_DEPRECATED\_SYNTAX)

Message: '%s' is deprecated; use '%s' instead

- Error: 1288 SQLSTATE: HY000 (ER\_NON\_UPDATABLE\_TABLE)

Message: The target table %s of the %s is not updatable

- Error: 1289 SQLSTATE: HY000 (ER\_FEATURE\_DISABLED)

Message: The '%s' feature is disabled; you need MySQL built with '%s' to have it working

- Error: 1290 SQLSTATE: HY000 (ER\_OPTION\_PREVENTS\_STATEMENT)

Message: The MySQL server is running with the %s option so it cannot execute this statement

- Error: 1291 SQLSTATE: HY000 (ER\_DUPLICATED\_VALUE\_IN\_TYPE)

Message: Column '%s' has duplicated value '%s' in %s

- Error: 1292 SQLSTATE: HY000 (ER\_TRUNCATED\_WRONG\_VALUE)

Message: Truncated incorrect %s value: '%s'

- Error: 1293 SQLSTATE: HY000 (ER\_TOO\_MUCH\_AUTO\_TIMESTAMP\_COLS)

Message: Incorrect table definition; there can be only one TIMESTAMP column with CURRENT\_TIMESTAMP in DEFAULT or ON UPDATE clause

- Error: 1294 SQLSTATE: HY000 (ER\_INVALID\_ON\_UPDATE)

Message: Invalid ON UPDATE clause for '%s' column

- Error: [1295](#) SQLSTATE: [HY000](#) ([ER\\_UNSUPPORTED\\_PS](#))  
Message: This command is not supported in the prepared statement protocol yet
- Error: [1296](#) SQLSTATE: [HY000](#) ([ER\\_GET\\_ERRMSG](#))  
Message: Got error %d '%s' from %s
- Error: [1297](#) SQLSTATE: [HY000](#) ([ER\\_GET\\_TEMPORARY\\_ERRMSG](#))  
Message: Got temporary error %d '%s' from %s
- Error: [1298](#) SQLSTATE: [HY000](#) ([ER\\_UNKNOWN\\_TIME\\_ZONE](#))  
Message: Unknown or incorrect time zone: '%s'
- Error: [1299](#) SQLSTATE: [HY000](#) ([ER\\_WARN\\_INVALID\\_TIMESTAMP](#))  
Message: Invalid `TIMESTAMP` value in column '%s' at row %ld
- Error: [1300](#) SQLSTATE: [HY000](#) ([ER\\_INVALID\\_CHARACTER\\_STRING](#))  
Message: Invalid %s character string: '%s'
- Error: [1301](#) SQLSTATE: [HY000](#) ([ER\\_WARN\\_ALLOWED\\_PACKET\\_OVERFLOWED](#))  
Message: Result of %s() was larger than `max_allowed_packet` (%ld) - truncated
- Error: [1302](#) SQLSTATE: [HY000](#) ([ER\\_CONFLICTING\\_DECLARATIONS](#))  
Message: Conflicting declarations: '%s%s' and '%s%s'

## B.2. Client Error Codes and Messages

Client error information comes from the following source files:

- The Error values and the symbols in parentheses correspond to definitions in the [include/errormsg.h](#) MySQL source file.
- The Message values correspond to the error messages that are listed in the [libmysql/errmsg.c](#) file. %d and %s represent numbers and strings, respectively, that are substituted into the messages when they are displayed.

Because updates are frequent, it is possible that those files will contain additional error information not listed here.

- Error: [2000](#) ([CR\\_UNKNOWN\\_ERROR](#))  
Message: Unknown MySQL error
- Error: [2001](#) ([CR\\_SOCKET\\_CREATE\\_ERROR](#))  
Message: Can't create UNIX socket (%d)
- Error: [2002](#) ([CR\\_CONNECTION\\_ERROR](#))

- Message: Can't connect to local MySQL server through socket '%s' (%d)
- Error: 2003 (CR\_CONN\_HOST\_ERROR)  
Message: Can't connect to MySQL server on '%s' (%d)
- Error: 2004 (CR\_IPSOCK\_ERROR)  
Message: Can't create TCP/IP socket (%d)
- Error: 2005 (CR\_UNKNOWN\_HOST)  
Message: Unknown MySQL server host '%s' (%d)
- Error: 2006 (CR\_SERVER\_GONE\_ERROR)  
Message: MySQL server has gone away
- Error: 2007 (CR\_VERSION\_ERROR)  
Message: Protocol mismatch; server version = %d, client version = %d
- Error: 2008 (CR\_OUT\_OF\_MEMORY)  
Message: MySQL client ran out of memory
- Error: 2009 (CR\_WRONG\_HOST\_INFO)  
Message: Wrong host info
- Error: 2010 (CR\_LOCALHOST\_CONNECTION)  
Message: Localhost via UNIX socket
- Error: 2011 (CR\_TCP\_CONNECTION)  
Message: %s via TCP/IP
- Error: 2012 (CR\_SERVER\_HANDSHAKE\_ERR)  
Message: Error in server handshake
- Error: 2013 (CR\_SERVER\_LOST)  
Message: Lost connection to MySQL server during query
- Error: 2014 (CR\_COMMANDS\_OUT\_OF\_SYNC)  
Message: Commands out of sync; you can't run this command now
- Error: 2015 (CR\_NAMEDPIPE\_CONNECTION)  
Message: Named pipe: %s
- Error: 2016 (CR\_NAMEDPIPEWAIT\_ERROR)  
Message: Can't wait for named pipe to host: %s pipe: %s (%lu)
- Error: 2017 (CR\_NAMEDPIPEOPEN\_ERROR)

- Message: Can't open named pipe to host: %s pipe: %s (%lu)
- Error: 2018 (CR\_NAMEDPIPESETSTATE\_ERROR)  
Message: Can't set state of named pipe to host: %s pipe: %s (%lu)
- Error: 2019 (CR\_CANT\_READ\_CHARSET)  
Message: Can't initialize character set %s (path: %s)
- Error: 2020 (CR\_NET\_PACKET\_TOO\_LARGE)  
Message: Got packet bigger than 'max\_allowed\_packet' bytes
- Error: 2021 (CR\_EMBEDDED\_CONNECTION)  
Message: Embedded server
- Error: 2022 (CR\_PROBE\_SLAVE\_STATUS)  
Message: Error on SHOW SLAVE STATUS:
- Error: 2023 (CR\_PROBE\_SLAVE\_HOSTS)  
Message: Error on SHOW SLAVE HOSTS:
- Error: 2024 (CR\_PROBE\_SLAVE\_CONNECT)  
Message: Error connecting to slave:
- Error: 2025 (CR\_PROBE\_MASTER\_CONNECT)  
Message: Error connecting to master:
- Error: 2026 (CR\_SSL\_CONNECTION\_ERROR)  
Message: SSL connection error
- Error: 2027 (CR\_MALFORMED\_PACKET)  
Message: Malformed packet
- Error: 2028 (CR\_WRONG\_LICENSE)  
Message: This client library is licensed only for use with MySQL servers having '%s' license
- Error: 2029 (CR\_NULL\_POINTER)  
Message: Invalid use of null pointer
- Error: 2030 (CR\_NO\_PREPARE\_STMT)  
Message: Statement not prepared
- Error: 2031 (CR\_PARAMS\_NOT\_BOUND)  
Message: No data supplied for parameters in prepared statement
- Error: 2032 (CR\_DATA\_TRUNCATED)

Message: Data truncated

- Error: 2033 (CR\_NO\_PARAMETERS\_EXISTS)

Message: No parameters exist in the statement

- Error: 2034 (CR\_INVALID\_PARAMETER\_NO)

Message: Invalid parameter number

- Error: 2035 (CR\_INVALID\_BUFFER\_USE)

Message: Can't send long data for non-string/non-binary data types (parameter: %d)

- Error: 2036 (CR\_UNSUPPORTED\_PARAM\_TYPE)

Message: Using unsupported buffer type: %d (parameter: %d)

- Error: 2037 (CR\_SHARED\_MEMORY\_CONNECTION)

Message: Shared memory: %s

- Error: 2038 (CR\_SHARED\_MEMORY\_CONNECT\_REQUEST\_ERROR)

Message: Can't open shared memory; client could not create request event (%lu)

- Error: 2039 (CR\_SHARED\_MEMORY\_CONNECT\_ANSWER\_ERROR)

Message: Can't open shared memory; no answer event received from server (%lu)

- Error: 2040 (CR\_SHARED\_MEMORY\_CONNECT\_FILE\_MAP\_ERROR)

Message: Can't open shared memory; server could not allocate file mapping (%lu)

- Error: 2041 (CR\_SHARED\_MEMORY\_CONNECT\_MAP\_ERROR)

Message: Can't open shared memory; server could not get pointer to file mapping (%lu)

- Error: 2042 (CR\_SHARED\_MEMORY\_FILE\_MAP\_ERROR)

Message: Can't open shared memory; client could not allocate file mapping (%lu)

- Error: 2043 (CR\_SHARED\_MEMORY\_MAP\_ERROR)

Message: Can't open shared memory; client could not get pointer to file mapping (%lu)

- Error: 2044 (CR\_SHARED\_MEMORY\_EVENT\_ERROR)

Message: Can't open shared memory; client could not create %s event (%lu)

- Error: 2045 (CR\_SHARED\_MEMORY\_CONNECT\_ABANDONED\_ERROR)

Message: Can't open shared memory; no answer from server (%lu)

- Error: 2046 (CR\_SHARED\_MEMORY\_CONNECT\_SET\_ERROR)

Message: Can't open shared memory; cannot send request event to server (%lu)

- Error: 2047 (CR\_CONN\_UNKNOW\_PROTOCOL)

Message: Wrong or unknown protocol

- Error: 2048 (CR\_INVALID\_CONN\_HANDLE)

Message: Invalid connection handle

- Error: 2049 (CR\_SECURE\_AUTH)

Message: Connection using old (pre-4.1.1) authentication protocol refused (client option 'secure\_auth' enabled)

- Error: 2050 (CR\_FETCH\_CANCELED)

Message: Row retrieval was canceled by mysql\_stmt\_close() call

- Error: 2051 (CR\_NO\_DATA)

Message: Attempt to read column without prior row fetch

- Error: 2052 (CR\_NO\_STMT\_METADATA)

Message: Prepared statement contains no metadata

---

# Appendix C. Credits

This appendix lists the developers, contributors, and supporters that have helped to make MySQL what it is today.

## C.1. Developers at MySQL AB

These are the developers that are or have been employed by MySQL AB to work on the [MySQL](#) database software, roughly in the order they started to work with us. Following each developer is a small list of the tasks that the developer is responsible for, or the accomplishments they have made. All developers are involved in support.

- Michael (Monty) Widenius
  - Lead developer and main author of the MySQL server ([mysqld](#)).
  - New functions for the string library.
  - Most of the [mysys](#) library.
  - The [ISAM](#) and [MyISAM](#) libraries (B-tree index file handlers with index compression and different record formats).
  - The [HEAP](#) library. A memory table system with our superior full dynamic hashing. In use since 1981 and published around 1984.
  - The [replace](#) program (take a look at it, it's **COOL!**).
  - Connector/ODBC (MyODBC), the ODBC driver for Windows.
  - Fixing bugs in MIT-pthreads to get it to work for MySQL Server. And also Unireg, a curses-based application tool with many utilities.
  - Porting of [mSQL](#) tools like [msqlperl](#), [DBD/DBI](#), and [DB2mysql](#).
  - Most of [crash-me](#) and the foundation for the MySQL benchmarks.
- David Axmark
  - Initial main writer of the **Reference Manual**, including enhancements to [texi2html](#).
  - Automatic Web site updating from the manual.
  - Initial Autoconf, Automake, and Libtool support.
  - Licensing.
  - Parts of all the text files. (Nowadays only the [README](#) is left. The rest ended up in the manual.)
  - Lots of testing of new features.
  - Our in-house Free Software legal expert.
  - Mailing list maintainer (who never has the time to do it right...).
  - Our original portability code (now more than 10 years old). Nowadays only some parts of [mysys](#) are left.

- Someone for Monty to call in the middle of the night when he just got that new feature to work.
- Chief "Open Sourcerer" (MySQL community relations).
- Jani Tolonen
  - `mysqlimport`
  - A lot of extensions to the command-line clients.
  - `PROCEDURE ANALYSE()`
- Sinisa Milivojevic (now in support)
  - Compression (with `zlib`) in the client/server protocol.
  - Perfect hashing for the lexical analyzer phase.
  - Multi-row `INSERT`
  - `mysqldump -e` option
  - `LOAD DATA LOCAL INFILE`
  - `SQL_CALC_FOUND_ROWS SELECT` option
  - `--max-user-connections=...` option
  - `net_read` and `net_write_timeout`
  - `GRANT/REVOKE` and `SHOW GRANTS FOR`
  - New client/server protocol for 4.0
  - `UNION` in 4.0
  - Multiple-table `DELETE/UPDATE`
  - Subqueries in the `FROM` clause (4.1).
  - User resources management
  - Initial developer of the `MySQL++` C++ API and the `MySQLGUI` client.
- Tonu Samuel (past developer)
  - VIO interface (the foundation for the encrypted client/server protocol).
  - MySQL Filesystem (a way to use MySQL databases as files and directories).
  - The `CASE` expression.
  - The `MD5()` and `COALESCE()` functions.
  - `RAID` support for `MyISAM` tables.
- Sasha Pachev (past developer)
  - Initial implementation of replication (up to version 4.0).

- `SHOW CREATE TABLE`.
- `mysql-bench`
- Matt Wagner
  - MySQL test suite.
  - Webmaster (until 2002).
- Miguel Solorzano (now in support)
  - Win32 development and release builds.
  - Windows NT server code.
  - WinMySQLAdmin
- Timothy Smith (now in support)
  - Dynamic character sets support.
  - configure, RPMs and other parts of the build system.
  - Initial developer of `libmysqld`, the embedded server.
- Sergei Golubchik
  - Full-text search.
  - Added keys to the `MERGE` library.
  - Precision math.
- Jeremy Cole (past developer)
  - Proofreading and editing this fine manual.
  - `ALTER TABLE ... ORDER BY ....`
  - `UPDATE ... ORDER BY ....`
  - `DELETE ... ORDER BY ....`
- Indrek Siitan
  - Designing/programming of our Web interface.
  - Author of our newsletter management system.
- Jorge del Conde (now in support)
  - `MySQLCC (MySQL Control Center)`
  - Win32 development
  - Initial implementation of the Web site portals.
- Venu Anuganti (past developer)

- MyODBC 3.51
- New client/server protocol for 4.1 (for prepared statements).
- Arjen Lentz (also handled community, 2004-2006; now works in Support)
  - Maintainer of the MySQL Reference Manual (2001-2004).
  - Preparing the O'Reilly printed edition of the manual (2002).
- Alexander (Bar) Barkov, Alexey (Holyfoot) Botchkov, and Ramil Kalimullin
  - Spatial data (GIS) and R-Trees implementation for 4.1
  - Unicode and character sets for 4.1; documentation for same
- Oleksandr (Sanja) Byelkin
  - Query cache in 4.0
  - Implementation of subqueries (4.1).
  - Implementation of views (5.0).
- Aleksey (Walrus) Kishkin and Alexey (Ranger) Stroganov
  - Benchmarks design and analysis.
  - Maintenance of the MySQL test suite.
- Zak Greant (past employee)
  - Open Source advocate, MySQL community relations.
- Carsten Pedersen
  - The MySQL Certification program.
- Lenz Grimmer
  - Production (build and release) engineering.
- Peter Zaitsev
  - [SHA1\(\)](#), [AES\\_ENCRYPT\(\)](#) and [AES\\_DECRYPT\(\)](#) functions.
  - Debugging, cleaning up various features.
- Alexander (Salle) Keremidarski
  - Support.
  - Debugging.
- Per-Erik Martin
  - Lead developer for stored procedures (5.0).
- Jim Winstead

- Former lead Web developer.
- Improving server, fixing bugs.
- Mark Matthews
  - Connector/J driver (Java).
- Peter Gulutzan
  - SQL standards compliance.
  - Documentation of existing MySQL code/algorithms.
  - Character set documentation.
- Guilhem Bichot
  - Replication, from [MySQL](#) version 4.0.
  - Fixed handling of exponents for [DECIMAL](#).
  - Author of [mysql\\_tableinfo](#).
  - Backup (in 5.1).
- Antony T. Curtis
  - Porting of the MySQL Database software to OS/2.
- Mikael Ronstrom
  - Much of the initial work on NDB Cluster until 2000. Roughly half the code base at that time. Transaction protocol, node recovery, system restart and restart code and parts of the API functionality.
  - Lead Architect, developer, debugger of NDB Cluster 1994-2004
  - Lots of optimizations
- Jonas Oreland
  - On-line Backup
  - The automatic test environment of MySQL Cluster
  - Portability Library for NDB Cluster
  - Lots of other things
- Pekka Nouisiainen
  - Ordered index implementation of MySQL Cluster
  - BLOB support in MySQL Cluster
  - Charset support in MySQL Cluster
- Martin Skold

- Unique index implementation of MySQL Cluster
- Integration of NDB Cluster into MySQL
- Magnus Svensson
  - The test framework for MySQL Cluster
  - Integration of NDB Cluster into MySQL
- Tomas Ulin
  - Lots of work on configuration changes for simple installation and use of MySQL Cluster
- Konstantin Osipov
  - Prepared statements.
  - Cursors.
- Dmitri Lenev
  - Time zone support.
  - Triggers (in 5.0).

## C.2. Contributors to MySQL

Although MySQL AB owns all copyrights in the [MySQL server](#) and the [MySQL manual](#), we wish to recognize those who have made contributions of one kind or another to the [MySQL distribution](#). Contributors are listed here, in somewhat random order:

- Gianmassimo Vigazzola <[qwertg@mbx.vol.it](mailto:qwertg@mbx.vol.it)> or <[qwertg@tin.it](mailto:qwertg@tin.it)>

The initial port to Win32/NT.

- Per Eric Olsson

For more or less constructive criticism and real testing of the dynamic record format.

- Irena Pancirov <[irena@mail.yacc.it](mailto:irena@mail.yacc.it)>

Win32 port with Borland compiler. [mysqlshutdown.exe](#) and [mysqlwatch.exe](#)

- David J. Hughes

For the effort to make a shareware SQL database. At TcX, the predecessor of MySQL AB, we started with [mSQL](#), but found that it couldn't satisfy our purposes so instead we wrote an SQL interface to our application builder Unireg. [mysqladmin](#) and [mysql](#) client are programs that were largely influenced by their [mSQL](#) counterparts. We have put a lot of effort into making the MySQL syntax a superset of [mSQL](#). Many of the API's ideas are borrowed from [mSQL](#) to make it easy to port free [mSQL](#) programs to the MySQL API. The MySQL software doesn't contain any code from [mSQL](#). Two files in the distribution ([client/insert\\_test.c](#) and [client/select\\_test.c](#)) are based on the corresponding (non-copyrighted) files in the [mSQL](#) distribution, but are modified as examples showing the changes necessary to convert code from [mSQL](#) to MySQL Server. ([mSQL](#) is copyrighted David J. Hughes.)

- Patrick Lynch  
For helping us acquire <http://www.mysql.com/>.
- Fred Lindberg  
For setting up qmail to handle the MySQL mailing list and for the incredible help we got in managing the MySQL mailing lists.

Providing invaluable information and feedback about the QNX port.
- Previous developers of NDB Cluster  
  
Lots of people were involved in various ways summer students, master thesis students, employees. In total more than 100 people so too many to mention here. Notable name is Ataullah Dabaghi who up until 1999 contributed around a third of the code base. A special thanks also to developers of the AXE system which provided much of the architectural foundations for NDB Cluster with blocks, signals and crash tracing functionality. Also credit should be given to those who believed in the ideas enough to allocate of their budgets for its development from 1992 to present time.

Other contributors, bugfinders, and testers: James H. Thompson, Maurizio Menghini, Wojciech Tryc, Luca Berra, Zarko Mocnik, Wim Bonis, Elmar Haneke, <[jehamby@lightside](mailto:jehamby@lightside)>, <[psmith@BayNetworks.com](mailto:psmith@BayNetworks.com)>, <[duane@connect.com.au](mailto:duane@connect.com.au)>, Ted Deppner <[ted@psyber.com](mailto:ted@psyber.com)>, Mike Simons, Jaakko Hyvatti.

And lots of bug report/patches from the folks on the mailing list.

A big tribute goes to those that help us answer questions on the MySQL mailing lists:

- Daniel Koch <[dkoch@amcity.com](mailto:dkoch@amcity.com)>  
Irix setup.

- Luuk de Boer <luuk@wxs.nl>  
Benchmark questions.

DBD, Linux, some SQL syntax questions.

### C.3. Documenters and translators

The following people have helped us with writing the MySQL documentation and translating the docu-

mentation or error messages in MySQL.

- Paul DuBois

Ongoing help with making this manual correct and understandable. That includes rewriting Monty's and David's attempts at English into English as other people know it.

- Kim Aldale

Helped to rewrite Monty's and David's early attempts at English into English.

- Michael J. Miller Jr. <[mke@terrapin.turbolift.com](mailto:mke@terrapin.turbolift.com)>

For the first MySQL manual. And a lot of spelling/language fixes for the FAQ (that turned into the MySQL manual a long time ago).

- Yan Cailin

First translator of the MySQL Reference Manual into simplified Chinese in early 2000 on which the Big5 and HK coded (<http://mysql.hitstar.com/>) versions were based. [Personal home page at linuxdb.yeah.net](http://linuxdb.yeah.net) [<http://linuxdb.yeah.net>].

- Jay Flaherty <[fty@mediapulse.com](mailto:fty@mediapulse.com)>

Big parts of the Perl `DBI/DBD` section in the manual.

- Paul Southworth <[pauls@etext.org](mailto:pauls@etext.org)>, Ray Loyzaga <[yar@cs.su.oz.au](mailto:yar@cs.su.oz.au)>

Proof-reading of the Reference Manual.

- Therrien Gilbert <[gilbert@ican.net](mailto:gilbert@ican.net)>, Jean-Marc Pouyot <[jmp@scalaire.fr](mailto:jmp@scalaire.fr)>

French error messages.

- Petr Snajdr, <[snajdr@pvt.net](mailto:snajdr@pvt.net)>

Czech error messages.

- Jaroslaw Lewandowski <[jotel@itnet.com.pl](mailto:jotel@itnet.com.pl)>

Polish error messages.

- Miguel Angel Fernandez Roiz

Spanish error messages.

- Roy-Magne Mo <[rmo@www.hivolda.no](mailto:rmo@www.hivolda.no)>

Norwegian error messages and testing of MySQL 3.21.xx.

- Timur I. Bakeyev <[root@timur.tatarstan.ru](mailto:root@timur.tatarstan.ru)>

Russian error messages.

- <[brenno@dewinter.com](mailto:brenno@dewinter.com)> & Filippo Grassilli <[phil@hyppo.com](mailto:phil@hyppo.com)>

Italian error messages.

- Dirk Munzinger <[dirk@trinity.saar.de](mailto:dirk@trinity.saar.de)>

German error messages.

- Billik Stefan <[billik@sun.uniag.sk](mailto:billik@sun.uniag.sk)>

Slovak error messages.

- Stefan Saroiu <[tzoompy@cs.washington.edu](mailto:tzoompy@cs.washington.edu)>

Romanian error messages.

- Peter Feher

Hungarian error messages.

- Roberto M. Serqueira

Portuguese error messages.

- Carsten H. Pedersen

Danish error messages.

- Arjen Lentz

Dutch error messages, completing earlier partial translation (also work on consistency and spelling).

## C.4. Libraries used by and included with MySQL

The following is a list of the creators of the libraries we have included with the MySQL server source to make it easy to compile and install MySQL. We are very thankful to all individuals that have created these and it has made our life much easier.

- Fred Fish

For his excellent C debugging and trace library. Monty has made a number of smaller improvements to the library (speed and additional options).

- Richard A. O'Keefe

For his public domain string library.

- Henry Spencer

For his regex library, used in `WHERE column REGEXP regexp`.

- Chris Provenzano

Portable user level pthreads. From the copyright: This product includes software developed by Chris Provenzano, the University of California, Berkeley, and contributors. We are currently using version 1\_60\_beta6 patched by Monty (see [mit-pthreads/Changes-mysql](#)).

- Jean-loup Gailly and Mark Adler

For the zlib library (used on MySQL on Windows).

- Bjorn Benson

For his `safe_malloc` (memory checker) package which is used in when you configure MySQL with `-debug`.

- Free Software Foundation

The `readline` library (used by the `mysql` command-line client).

- The NetBSD foundation

The `libedit` package (optionally used by the `mysql` command-line client).

## C.5. Packages that support MySQL

The following is a list of creators/maintainers of some of the most important API/packages/applications that a lot of people use with MySQL.

We can't list every possible package here because the list would then be way to hard to maintain. For other packages, please refer to the software portal at <http://solutions.mysql.com/software/>.

- Tim Bunce, Alligator Descartes

For the `DBD` (Perl) interface.

- Andreas Koenig <[a.koenig@mind.de](mailto:a.koenig@mind.de)>

For the Perl interface for MySQL Server.

- Jochen Wiedmann <[wiedmann@neckar-alb.de](mailto:wiedmann@neckar-alb.de)>

For maintaining the Perl `DBD::mysql` module.

- Eugene Chan <[eugene@acenet.com.sg](mailto:eugene@acenet.com.sg)>

For porting PHP for MySQL Server.

- Georg Richter

MySQL 4.1 testing and bug hunting. New PHP 5.0 `mysqli` extension (API) for use with MySQL 4.1 and up.

- Giovanni Maruzzelli <[maruzz@matrice.it](mailto:maruzz@matrice.it)>

For porting iODBC (Unix ODBC).

- Xavier Leroy <[Xavier.Leroy@inria.fr](mailto:Xavier.Leroy@inria.fr)>

The author of LinuxThreads (used by the MySQL Server on Linux).

## C.6. Tools that were used to create MySQL

The following is a list of some of the tools we have used to create MySQL. We use this to express our thanks to those that has created them as without these we could not have made MySQL what it is today.

- Free Software Foundation

From whom we got an excellent compiler ([gcc](#)), an excellent debugger ([gdb](#) and the [libc](#) library (from which we have borrowed [strto.c](#) to get some code working in Linux).

- Free Software Foundation & The XEmacs development team

For a really great editor/environment used by almost everybody at MySQL AB.

- Julian Seward

Author of [valgrind](#), an excellent memory checker tool that has helped us find a lot of otherwise hard to find bugs in MySQL.

- Dorothea Lütkehaus and Andreas Zeller

For [DDD](#) (The Data Display Debugger) which is an excellent graphical front end to [gdb](#)).

## C.7. Supporters of MySQL

Although MySQL AB owns all copyrights in the [MySQL server](#) and the [MySQL manual](#), we wish to recognize the following companies, which helped us finance the development of the [MySQL server](#), such as by paying us for developing a new feature or giving us hardware for development of the [MySQL server](#).

- VA Linux / Andover.net

Funded replication.

- NuSphere

Editing of the MySQL manual.

- Stork Design studio

The MySQL Web site in use between 1998-2000.

- Intel

Contributed to development on Windows and Linux platforms.

- Compaq

Contributed to Development on Linux/Alpha.

- SWSOft

Development on the embedded [mysqld](#) version.

- FutureQuest

[--skip-show-database](#)

---

# Appendix D. MySQL Change History

This appendix lists the changes from version to version in the MySQL source code through the latest version of MySQL 4.1.

We are working actively on MySQL 4.1 and 5.0, and provide only critical bugfixes for MySQL 4.0. We update this section as we add new features, so that everybody can follow the development.

Note that we tend to update the manual at the same time we make changes to MySQL. If you find a recent version of MySQL listed here that you can't find on our download page (<http://dev.mysql.com/downloads/>), it means that the version has not yet been released.

The date mentioned with a release version is the date of the last BitKeeper ChangeSet on which the release was based, not the date when the packages were made available. The binaries are usually made available a few days after the date of the tagged ChangeSet, because building and testing all packages takes some time.

The manual included in the source and binary distributions may not be fully accurate when it comes to the release changelog entries, because the integration of the manual happens at build time. For the most up-to-date release changelog, please refer to the online version instead.

## D.1. Changes in release 4.1.x (Production)

Version 4.1 of the MySQL server includes many enhancements and new features. Binaries for this version are available for download at <http://dev.mysql.com/downloads/mysql-4.1.html>.

- The `SUBSTRING()` function can now take a negative value for the `pos` (position) argument. See [Section 12.3, “String Functions”](#).
- Subqueries and derived tables (unnamed views). See [Section 13.2.8, “Subquery Syntax”](#).
- `INSERT ... ON DUPLICATE KEY UPDATE ...` syntax. This allows you to `UPDATE` an existing row if the insert would cause a duplicate value in a `PRIMARY` or `UNIQUE` key. (`REPLACE` allows you to overwrite an existing row, which is something entirely different.) See [Section 13.2.4, “INSERT Syntax”](#).
- A newly designed `GROUP_CONCAT()` aggregate function. See [Section 12.10, “Functions and Modifiers for Use with GROUP BY Clauses”](#).
- Extensive Unicode (UTF8) support.
- Table names and column names now are stored in `UTF8`. This makes MySQL more flexible, but might cause some problems upgrading if you have table or column names that use characters outside of the standard 7-bit US-ASCII range. See [Section 2.11.1, “Upgrading from MySQL 4.0 to 4.1”](#).
- Character sets can be defined per column, table, and database.
- New key cache for `MyISAM` tables with many tunable parameters. You can have multiple key caches, preload index into caches for batches...
- `BTREE` index on `HEAP` tables.
- Support for OpenGIS spatial types (geographical data). See [Chapter 16, \*Spatial Extensions\*](#).
- `SHOW WARNINGS` shows warnings for the last command. See [Section 13.5.4.21, “SHOW WARNINGS Syntax”](#).

- Faster binary protocol with prepared statements and parameter binding. See [Section 17.2.4, “C API Prepared Statements”](#).
- You can now issue multiple statements with a single C API call and then read the results in one go. See [Section 17.2.9, “C API Handling of Multiple Statement Execution”](#).
- Create Table: `CREATE [TEMPORARY] TABLE [IF NOT EXISTS] table2 LIKE table1`.
- Server based `HELP` command that can be used in the `mysql` command-line client (and other clients) to get help for SQL statements.

For a full list of changes, please refer to the changelog sections for each individual 4.1.x release.

### D.1.1. Changes in release 4.1.22 (Not yet released)

This is a bugfix release for the recent production release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Network* (a commercial MySQL offering). For more details please see <http://www.mysql.com/network/advisors.html>.

Functionality added or changed:

- The `mysqld` manpage has been reclassified from volume 1 to volume 8. ([Bug#21220](#) [<http://bugs.mysql.com/21220>])
- MySQL now can do stack dumps on `x86_64` and `i386/NTPL` systems. ([Bug#21250](#) [<http://bugs.mysql.com/21250>])
- The `LOAD DATA FROM MASTER` and `LOAD TABLE FROM MASTER` statements are deprecated. See [Section 13.6.2.2, “LOAD DATA FROM MASTER Syntax”](#), for recommended alternatives. ([Bug#18822](#) [<http://bugs.mysql.com/18822>])

Bugs fixed:

- For `INSERT ... ON DUPLICATE KEY UPDATE`, use of `VALUES(col_name)` within the `UPDATE` clause sometimes was handled incorrectly. ([Bug#21555](#) [<http://bugs.mysql.com/21555>])
- Table aliases in multiple-table `DELETE` statements sometimes were not resolved. ([Bug#21392](#) [<http://bugs.mysql.com/21392>])
- `EXPORT_SET()` did not accept arguments with coercible character sets. ([Bug#21531](#) [<http://bugs.mysql.com/21531>])
- The `--collation-server` server option was being ignored. With the fix for this problem, if you choose a non-default character set with `--character-set-server`, you should also use `--collation-server` to specify the collation. ([Bug#15276](#) [<http://bugs.mysql.com/15276>])
- A subquery that uses an index for both the `WHERE` and `ORDER BY` clauses produced an empty result. ([Bug#21180](#) [<http://bugs.mysql.com/21180>])
- Queries containing a subquery that used aggregate functions could return incorrect results. ([Bug#16792](#) [<http://bugs.mysql.com/16792>])

- The `MD5()`, `SHA1()`, and `ENCRYPT()` functions should return a binary string, but the result sometimes was converted to the character set of the argument. `MAKE_SET()` and `EXPORT_SET()` now use the correct character set for their default separators, resulting in consistent result strings which can be coerced according to normal character set rules. (Bug#20536 [http://bugs.mysql.com/20536])
- Use of `mysampack` or `mysamchk` on a table with `FULLTEXT` indexing resulted in table corruption. (Bug#19702 [http://bugs.mysql.com/19702])
- The optimizer could produce an incorrect result after `AND` with collations such as `latin1_german2_ci`, `utf8_czech_ci`, and `utf8_lithianian_ci`. (Bug#9509 [http://bugs.mysql.com/9509])
- `character_set_results` can be `NULL` to signify “no conversion,” but some code did not check for `NULL`, resulting in a server crash. (Bug#21913 [http://bugs.mysql.com/21913])
- The `ndb_mgm` program was included in both the `MySQL-ndb-tools` and `MySQL-ndb-management` RPM packages, resulting in a conflict if both were installed. Now `ndb_mgm` is included only in `MySQL-ndb-tools`. (Bug#21058 [http://bugs.mysql.com/21058])
- The `mysam_stats_method` variable was mishandled when set from an option file or on the command line. (Bug#21054 [http://bugs.mysql.com/21054])
- `libmysqld` produced some warnings to `stderr` which could not be silenced. These warnings now are suppressed. (Bug#13717 [http://bugs.mysql.com/13717])
- If a column definition contained a character set declaration, but a `DEFAULT` value began with an introducer, the introducer character set was used as the column character set. (Bug#20695 [http://bugs.mysql.com/20695])
- Some Linux-x86\_64-icc packages (of previous releases) mistakenly contained 32-bit binaries. Only `ICC` builds are affected, not `gcc` builds. Solaris and FreeBSD x86\_64 builds are not affected. (Bug#22238 [http://bugs.mysql.com/22238])
- For `TIME_FORMAT()`, the `%H` and `%k` format specifiers can return values larger than two digits (if the hour is greater than 99), but for some query results that contained three-character hours, column values were truncated. (Bug#19844 [http://bugs.mysql.com/19844])
- For table-format output, `mysql` did not always calculate columns widths correctly for columns containing multi-byte characters in the column name or contents. (Bug#17939 [http://bugs.mysql.com/17939])
- Views could not be updated within a stored function or trigger. (Bug#17591 [http://bugs.mysql.com/17591])
- Usernames have a maximum length of 16 characters (even if they contain multi-byte characters), but were being truncated to 16 bytes. (Bug#20393 [http://bugs.mysql.com/20393])
- Database and table names have a maximum length of 64 characters (even if they contain multi-byte characters), but were being truncated to 64 bytes. (Bug#21432 [http://bugs.mysql.com/21432])
- When using tables created under MySQL 4.1 with a 5.0 server, if the tables contained `VARCHAR` columns, for some queries the metadata sent to the client could have an empty column name. (Bug#14897 [http://bugs.mysql.com/14897])
- On 64-bit systems, use of the `cp1250` character set with a primary key column in a `LIKE` clause caused a server crash for patterns having letters in the range 128..255. (Bug#19741 [http://bugs.mysql.com/19741])
- A subquery in the `WHERE` clause of the outer query and using `IN` and `GROUP BY` returned an incor-

rect result. ([Bug#16255](http://bugs.mysql.com/16255) [<http://bugs.mysql.com/16255>])

- `COUNT( * )` queries with `ORDER BY` and `LIMIT` could return the wrong result. ([Bug#21787](http://bugs.mysql.com/21787) [<http://bugs.mysql.com/21787>])

**Note:** This problem was introduced by the fix for [Bug#9676](http://bugs.mysql.com/9676) [<http://bugs.mysql.com/9676>], which limited the rows stored in a temporary table to the `LIMIT` clause. This optimization is not applicable to non-group queries with aggregate functions. The current fix disables the optimization in such cases.

- Running `SHOW MASTER LOGS` at the same time as binary log files were being switched would cause `mysqld` to hang. ([Bug#21965](http://bugs.mysql.com/21965) [<http://bugs.mysql.com/21965>])
- Adding `ORDER BY` to a `SELECT DISTINCT(expr)` query could produce incorrect results. ([Bug#21456](http://bugs.mysql.com/21456) [<http://bugs.mysql.com/21456>])
- For `InnoDB` tables, the server could crash when executing `NOT IN ( )` subqueries. ([Bug#21077](http://bugs.mysql.com/21077) [<http://bugs.mysql.com/21077>])
- `mysqld --flush` failed to flush changes to disk following an `UPDATE` statement for which no updated column had an index. ([Bug#20060](http://bugs.mysql.com/20060) [<http://bugs.mysql.com/20060>])
- Setting `myisam_repair_threads` caused any repair operation on the table to fail to update the cardinality of indexes, instead making them always equal to 1. ([Bug#18874](http://bugs.mysql.com/18874) [<http://bugs.mysql.com/18874>])
- The `--with-collation` option was not honored for client connections. ([Bug#7192](http://bugs.mysql.com/7192) [<http://bugs.mysql.com/7192>])
- `NDB Cluster`: `ndb_size.pl` and `ndb_error_reporter` were missing from RPM packages. ([Bug#20426](http://bugs.mysql.com/20426) [<http://bugs.mysql.com/20426>])
- `NDB Cluster`: Setting `TransactionDeadlockDetectionTimeout` to a value greater than 12000 would cause scans to deadlock, time out, fail to release scan records, until the cluster ran out of scan records and stopped processing. ([Bug#21800](http://bugs.mysql.com/21800) [<http://bugs.mysql.com/21800>])
- `NDB Cluster`: The server provided a non-descriptive error message when encountering a fatally corrupted REDO log. ([Bug#21615](http://bugs.mysql.com/21615) [<http://bugs.mysql.com/21615>])
- `NDB Cluster`: A partial rollback could lead to node restart failures. ([Bug#21536](http://bugs.mysql.com/21536) [<http://bugs.mysql.com/21536>])
- `NDB Cluster`: The failure of a unique index read due to an invalid schema version could be handled incorrectly in some cases, leading to unpredictable results. ([Bug#21384](http://bugs.mysql.com/21384) [<http://bugs.mysql.com/21384>])
- `NDB Cluster`: In a cluster with more than 2 replicas, a manual restart of one of the data nodes could fail and cause the other nodes in its nodegroup to shut down. ([Bug#21213](http://bugs.mysql.com/21213) [<http://bugs.mysql.com/21213>])
- `NDB Cluster`: When the redo buffer ran out of space, a Pointer too large error was raised and the cluster could become unusable until restarted with `--initial`. ([Bug#20892](http://bugs.mysql.com/20892) [<http://bugs.mysql.com/20892>])
- `NDB Cluster`: In some situations with a high disk-load, writing of the redo log could hang, causing a crash with the error message GCP STOP detected. ([Bug#20904](http://bugs.mysql.com/20904) [<http://bugs.mysql.com/20904>])
- `NDB Cluster`: `ndb_size.pl` and `ndb_error_reporter` were missing from RPM pack-

- ages. ([Bug#20426](http://bugs.mysql.com/20426) [<http://bugs.mysql.com/20426>])
- **NDB Cluster**: The server failed with a non-descriptive error message when out of data memory. ([Bug#18475](http://bugs.mysql.com/18475) [<http://bugs.mysql.com/18475>])
  - **NDB Cluster**: `SELECT ... FOR UPDATE` failed to lock the selected rows. ([Bug#18184](http://bugs.mysql.com/18184) [<http://bugs.mysql.com/18184>])
  - **NDB Cluster**: Some queries involving joins on very large **NDB** tables could crash the MySQL server. ([Bug#21059](http://bugs.mysql.com/21059) [<http://bugs.mysql.com/21059>])
  - Character set collation was ignored in `GROUP BY` clauses. ([Bug#20709](http://bugs.mysql.com/20709) [<http://bugs.mysql.com/20709>])
  - A query using `WHERE column = constant OR column IS NULL` did not return consistent results on successive invocations. The `column` in each part of the `WHERE` clause could be either the same column, or two different columns, for the effect to be observed. ([Bug#21091](http://bugs.mysql.com/21091) [<http://bugs.mysql.com/21091>])
  - A query using `WHERE NOT (column < ANY (subquery))` yielded a different result from the same query using the same `column` and `subquery` with `WHERE (column > ANY (subquery))`. ([Bug#20975](http://bugs.mysql.com/20975) [<http://bugs.mysql.com/20975>])
  - Using the extended syntax for `TRIM()` — that is, `TRIM(... FROM ...)` — caused erroneous output from `EXPLAIN EXTENDED` statements. ([Bug#17526](http://bugs.mysql.com/17526) [<http://bugs.mysql.com/17526>])
  - `DELETE` with `WHERE` condition on a **BTREE**-indexed column for a **MEMORY** table deleted only the first matched row. ([Bug#9719](http://bugs.mysql.com/9719) [<http://bugs.mysql.com/9719>])
  - For cross-database multiple-table `UPDATE` statements, a user with all privileges for the default database could update tables in another database for which the user did not have `UPDATE` privileges. ([Bug#7391](http://bugs.mysql.com/7391) [<http://bugs.mysql.com/7391>])
  - `mysql_install_db` incorrectly had a blank first line. ([Bug#20721](http://bugs.mysql.com/20721) [<http://bugs.mysql.com/20721>])
  - Under heavy load (executing more than 1024 simultaneous complex queries), a problem in the code that handles internal temporary tables could lead to writing beyond allocated space and memory corruption. ([Bug#21206](http://bugs.mysql.com/21206) [<http://bugs.mysql.com/21206>])
  - Multiple invocations of the `REVERSE()` function could return different results. ([Bug#18243](http://bugs.mysql.com/18243) [<http://bugs.mysql.com/18243>])
  - Conversion of `TIMESTAMP` values between UTC and the local time zone resulted in some values having the year 2069 rather than 1969. ([Bug#16327](http://bugs.mysql.com/16327) [<http://bugs.mysql.com/16327>])
  - Under certain circumstances, `AVG(key_val)` returned a value but `MAX(key_val)` returned an empty set due to incorrect application of `MIN()/MAX()` optimization. ([Bug#20954](http://bugs.mysql.com/20954) [<http://bugs.mysql.com/20954>])
  - Using aggregate functions in subqueries yielded incorrect results under certain circumstances due to incorrect application of `MIN()/MAX()` optimization. ([Bug#20792](http://bugs.mysql.com/20792) [<http://bugs.mysql.com/20792>])
  - Using `> ALL` with subqueries that return no rows yielded incorrect results under certain circumstances due to incorrect application of `MIN()/MAX()` optimization. ([Bug#18503](http://bugs.mysql.com/18503) [<http://bugs.mysql.com/18503>])
  - Using `ANY` with “non-table” subqueries such as `SELECT 1` yielded incorrect results under certain circumstances due to incorrect application of `MIN()/MAX()` optimization. ([Bug#16302](http://bugs.mysql.com/16302) [<http://bugs.mysql.com/16302>])

[<http://bugs.mysql.com/16302>])

- The use of `WHERE col_name IS NULL` in `SELECT` statements reset the value of `LAST_INSERT_ID( )` to zero. (Bug#14553 [<http://bugs.mysql.com/14553>])
- Use of the join cache in favor of an index for `ORDER BY` operations could cause incorrect result sorting. (Bug#17212 [<http://bugs.mysql.com/17212>])
- `libmysqld` returned `TEXT` columns to the client as number of bytes, not number of characters (which can be different for multi-byte character sets). (Bug#19983 [<http://bugs.mysql.com/19983>])

## D.1.2. Changes in release 4.1.21 (19 July 2006)

This is a bugfix release for the recent production release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Network* (a commercial MySQL offering). For more details please see <http://www.mysql.com/network/advisors.html>.

Functionality added or changed:

- For spatial data types, the server formerly returned these as `VARSTRING` values with a binary collation. Now the server returns spatial values as `BLOB` values. (Bug#10166 [<http://bugs.mysql.com/10166>])
- Added the `--set-charset` option to `mysqlbinlog` to allow the character set to be specified for processing binary log files. (Bug#18351 [<http://bugs.mysql.com/18351>])
- For a table with an `AUTO_INCREMENT` column, `SHOW CREATE TABLE` now shows the next `AUTO_INCREMENT` value to be generated. (Bug#19025 [<http://bugs.mysql.com/19025>])
- A warning now is issued if the client attempts to set the `SQL_LOG_OFF` variable without the `SUPER` privilege. (Bug#16180 [<http://bugs.mysql.com/16180>])
- The `mysqldumpslow` script has been moved from client RPM packages to server RPM packages. This corrects a problem where `mysqldumpslow` could not be used with a client-only RPM install, because it depends on `my_print_defaults` which is in the server RPM. (Bug#20216 [<http://bugs.mysql.com/20216>])

Bugs fixed:

- **Security fix:** On Linux, and possibly other platforms using case-sensitive filesystems, it was possible for a user granted rights on a database to create or access a database whose name differed only from that of the first by the case of one or more letters. (CVE-2006-4226 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-4226>], Bug#17647 [<http://bugs.mysql.com/17647>])
- **Security fix:** If a user has access to `MyISAM` table `t`, that user can create a `MERGE` table `m` that accesses `t`. However, if the user's privileges on `t` are subsequently revoked, the user can continue to access `t` by doing so through `m`. If this behavior is undesirable, you can start the server with the new `--skip-merge` option to disable the `MERGE` storage engine. (Bug#15195 [<http://bugs.mysql.com/15195>])
- **Security fix:** Invalid arguments to `DATE_FORMAT( )` caused a server crash. (CVE-2006-3469

[<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-3469>], [Bug#20729](#) [<http://bugs.mysql.com/20729>]) Thanks to Jean-David Maillefer for discovering and reporting this problem to the Debian project and to Christian Hammers from the Debian Team for notifying us of it.

- Closing of temporary tables failed if binary logging was not enabled. ([Bug#20919](#) [<http://bugs.mysql.com/20919>])
- Repeated `DROP TABLE` statements in a stored procedure could sometimes cause the server to crash. ([Bug#19399](#) [<http://bugs.mysql.com/19399>])
- `DATE_ADD()` and `DATE_SUB()` returned `NULL` when the result date was on the day '9999-12-31'. ([Bug#12356](#) [<http://bugs.mysql.com/12356>])
- For a `DATE` parameter sent via a `MYSQL_TIME` data structure, `mysql_stmt_execute()` zeroed the hour, minute, and second members of the structure rather than treating them as read-only. ([Bug#20152](#) [<http://bugs.mysql.com/20152>])
- The `DATA DIRECTORY` table option did not work for `TEMPORARY` tables. ([Bug#8706](#) [<http://bugs.mysql.com/8706>])
- The `mysql` client did not ignore client-specific commands (such as `use` or `help`) that occurred as the first word on a line within multiple-line `/* ... */` comments. ([Bug#20432](#) [<http://bugs.mysql.com/20432>])
- The `mysql` client did not understand `help` commands that had spaces at the end. ([Bug#20328](#) [<http://bugs.mysql.com/20328>])
- Failure to account for a `NULL` table pointer on big-endian machines could cause a server crash during type conversion. ([Bug#21135](#) [<http://bugs.mysql.com/21135>])
- Some memory leaks in the `libmysqld` embedded server were corrected. ([Bug#16017](#) [<http://bugs.mysql.com/16017>])
- When `mysqldump` disabled keys and locked a `MyISAM` table, the lock operation happened second. If another client performed a query on the table in the interim, it could take a long time due to indexes not being used. Now the lock operation happens first. ([Bug#15977](#) [<http://bugs.mysql.com/15977>])
- The length of the pattern string prefix for `LIKE` operations was calculated incorrectly for multi-byte character sets. As a result, the scanned range was wider than necessary if the prefix contained any multi-byte characters. ([Bug#16674](#) [<http://bugs.mysql.com/16674>], [Bug#18359](#) [<http://bugs.mysql.com/18359>])
- For very complex `SELECT` statements could create temporary tables that were too big, but for which the temporary files did not get removed, causing subsequent queries to fail. ([Bug#11824](#) [<http://bugs.mysql.com/11824>])
- Using `SELECT` and a table join while running a concurrent `INSERT` operation would join incorrect rows. ([Bug#14400](#) [<http://bugs.mysql.com/14400>])
- Using `SELECT` on a corrupt table using the dynamic record format could cause a server crash. ([Bug#19835](#) [<http://bugs.mysql.com/19835>])
- Checking a spatial table (using `CHECK TABLE`) with an index and only one row would indicate a table corruption. ([Bug#17877](#) [<http://bugs.mysql.com/17877>])
- For `SELECT ... FOR UPDATE` statements that used `DISTINCT` or `GROUP BY` over all key parts of a unique index (or primary key), the optimizer unnecessarily created a temporary table, thus

losing the linkage to the underlying unique index values. This caused a `Result set not updatable` error. (The temporary table is unnecessary because under these circumstances the distinct or grouped columns must also be unique.) ([Bug#16458](http://bugs.mysql.com/16458) [<http://bugs.mysql.com/16458>])

- Concatenating the results of multiple constant subselects produced incorrect results. ([Bug#16716](http://bugs.mysql.com/16716) [<http://bugs.mysql.com/16716>])
- The use of `MIN()` and `MAX()` on columns with a partial index produced incorrect results in some queries. ([Bug#18206](http://bugs.mysql.com/18206) [<http://bugs.mysql.com/18206>])
- Use of `MIN()` or `MAX()` with `GROUP BY` on a `ucs2` column could cause a server crash. ([Bug#20076](http://bugs.mysql.com/20076) [<http://bugs.mysql.com/20076>])
- `INSERT INTO ... SELECT ... LIMIT 1` could be slow because the `LIMIT` was ignored when selecting candidate rows. ([Bug#9676](http://bugs.mysql.com/9676) [<http://bugs.mysql.com/9676>])
- **NDB Cluster:** A Cluster whose storage nodes were installed from the `MySQL-ndb-storage-*` RPMs could not perform `CREATE` or `ALTER` operations that made use of non-default character sets or collations. ([Bug#14918](http://bugs.mysql.com/14918) [<http://bugs.mysql.com/14918>])
- **NDB Cluster:** The repeated creating and dropping of a table would eventually lead to `NDB Error 826, Too many tables and attributes ... Insufficient space.` ([Bug#20847](http://bugs.mysql.com/20847) [<http://bugs.mysql.com/20847>])
- **NDB Cluster:** When attempting to restart the cluster following a data import, the cluster would fail during Phase 4 of the restart with Error 2334: Job buffer congestion. ([Bug#20774](http://bugs.mysql.com/20774) [<http://bugs.mysql.com/20774>])
- **NDB Cluster:** A node failure during a scan could sometime cause the node to crash when restarting too quickly following the failure. ([Bug#20197](http://bugs.mysql.com/20197) [<http://bugs.mysql.com/20197>])
- **NDB Cluster:** It was possible to use port numbers greater than 65535 for `ServerPort` in the `config.ini` file. ([Bug#19164](http://bugs.mysql.com/19164) [<http://bugs.mysql.com/19164>])
- The omission of leading zeros in dates could lead to erroneous results when these were compared with the output of certain date and time functions. ([Bug#16377](http://bugs.mysql.com/16377) [<http://bugs.mysql.com/16377>])
- Certain queries having a `WHERE` clause that included conditions on multi-part keys with more than 2 key parts could produce incorrect results and send [Note] Use\_count: Wrong count for key at... messages to `STDERR`. ([Bug#16168](http://bugs.mysql.com/16168) [<http://bugs.mysql.com/16168>])
- An invalid comparison between keys in partial indexes over multi-byte character fields could lead to incorrect result sets if the selected query execution plan used a range scan by a partial index over a `UTF8` character field. This also caused incorrect results under similar circumstances with many other character sets. ([Bug#14896](http://bugs.mysql.com/14896) [<http://bugs.mysql.com/14896>])
- **NDB Cluster:** The cluster's data nodes would fail while trying to load data when `NoOfFragmentLogFiles` was equal to 1. ([Bug#19894](http://bugs.mysql.com/19894) [<http://bugs.mysql.com/19894>])
- **NDB Cluster:** A problem with error handling when `ndb_use_exact_count` was enabled could lead to incorrect values returned from queries using `COUNT()`. A warning is now returned in such cases. ([Bug#19202](http://bugs.mysql.com/19202) [<http://bugs.mysql.com/19202>])
- **NDB Cluster:** `LOAD DATA LOCAL` failed to ignore duplicate keys in Cluster tables. ([Bug#19496](http://bugs.mysql.com/19496) [<http://bugs.mysql.com/19496>])
- **NDB Cluster:** Repeated `CREATE - INSERT - DROP` operations tables could in some circumstances cause the MySQL table definition cache to become corrupt, so that some `mysqld` processes could access table information but others could not. ([Bug#18595](http://bugs.mysql.com/18595) [<http://bugs.mysql.com/18595>])

- **NDB Cluster:** The `mgm` client command `ALL CLUSTERLOG STATISTICS=15;` had no effect. (Bug#20336 [http://bugs.mysql.com/20336])
- **NDB Cluster:** `TRUNCATE TABLE` failed to reset the `AUTO_INCREMENT` counter. (Bug#18864 [http://bugs.mysql.com/18864])
- **NDB Cluster:** The failure of a data node when preparing to commit a transaction (that is, while the node's status was `CS_PREPARE_TO_COMMIT`) could cause the failure of other cluster data nodes. (Bug#20185 [http://bugs.mysql.com/20185])
- **NDB Cluster:** Renaming a table in such a way as to move it to a different database failed to move the table's indexes. (Bug#19967 [http://bugs.mysql.com/19967])
- **NDB Cluster:** Resources for unique indexes on Cluster table columns were incorrectly allocated, so that only one-fourth as many unique indexes as indicated by the value of `UniqueHashIndexes` could be created. (Bug#19623 [http://bugs.mysql.com/19623])
- **NDB Cluster (NDBAPI):** On big-endian platforms, `NdbOperation::write_attr()` did not update 32-bit fields correctly. (Bug#19537 [http://bugs.mysql.com/19537])
- **NDB Cluster:** Some queries having a `WHERE` clause of the form `c1=val1 OR c2 LIKE 'val2'` were not evaluated correctly. (Bug # 17421)
- **NDB Cluster:** Using “stale” `mysqld .FRM` files could cause a newly-restored cluster to fail. This situation could arise when restarting a MySQL Cluster using the `--initial` option while leaving connected `mysqld` processes running. (Bug#16875 [http://bugs.mysql.com/16875])
- **NDB Cluster:** Repeated use of the `SHOW` and `ALL STATUS` commands in the `ndb_mgm` client could cause the `mgmd` process to crash. (Bug#18591 [http://bugs.mysql.com/18591])
- **NDB Cluster:** An issue with `ndb_mgmd` prevented more than 27 `mysqld` processes from connecting to a single cluster at one time. (Bug#17150 [http://bugs.mysql.com/17150])
- **NDB Cluster:** Data node failures could cause excessive CPU usage by `ndb_mgmd`. (Bug#13987 [http://bugs.mysql.com/13987])
- **NDB Cluster:** `TRUNCATE` failed on tables having `BLOB` or `TEXT` columns with the error Lock wait timeout exceeded. (Bug#19201 [http://bugs.mysql.com/19201])
- A cast problem caused incorrect results for prepared statements that returned float values when MySQL was compiled with `gcc 4.0`. (Bug#19694 [http://bugs.mysql.com/19694])
- Improper character set initialization in the embedded server could result in a server crash. (Bug#20318 [http://bugs.mysql.com/20318])
- Some queries that used `ORDER BY` and `LIMIT` performed quickly in MySQL 3.23, but slowly in MySQL 4.x/5.x due to an optimizer problem. (Bug#4981 [http://bugs.mysql.com/4981])
- Queries using an indexed column as the argument for the `MIN()` and `MAX()` functions following an `ALTER TABLE ... DISABLE KEYS` statement returned Got error 124 from storage engine until `ALTER TABLE ... ENABLE KEYS` was run on the table. (Bug#20357 [http://bugs.mysql.com/20357])
- A number of dependency issues in the RPM `bench` and `test` packages caused installation of these packages to fail. (Bug#20078 [http://bugs.mysql.com/20078])
- The `MD5()` and `SHA()` functions treat their arguments as case-sensitive strings. But when they are compared, their arguments were compared as case-insensitive strings, which leads to two function calls with different arguments (and thus different results) compared as being identical. This can lead

- to a wrong decision made in the range optimizer and thus to an incorrect result set. (Bug#15351 [<http://bugs.mysql.com/15351>])
- InnoDB unlocked its data directory before committing a transaction, potentially resulting in non-recoverable tables if a server crash occurred before the commit. (Bug#19727 [<http://bugs.mysql.com/19727>])
  - Multiple-table DELETE statements containing a subquery that selected from one of the tables being modified caused a server crash. (Bug#19225 [<http://bugs.mysql.com/19225>])
  - The ARCHIVE storage engine does not support TRUNCATE TABLE, but the server was not returning an appropriate error when truncation of an ARCHIVE table was attempted. (Bug#15558 [<http://bugs.mysql.com/15558>])
  - An update that used a join of a table to itself and modified the table on both sides of the join reported the table as crashed. (Bug#18036 [<http://bugs.mysql.com/18036>])
  - The fill\_help\_tables.sql file did not load properly if the ANSI\_QUOTES SQL mode was enabled. (Bug#20542 [<http://bugs.mysql.com/20542>])
  - The fill\_help\_tables.sql file did not contain a SET NAMES 'utf8' statement to indicate its encoding. This caused problems for some settings of the MySQL character set such as big5. (Bug#20551 [<http://bugs.mysql.com/20551>])
  - The MySQL server startup script /etc/init.d/mysql (created from mysql.server) is now marked to ensure that the system services ypbind, nscd, ldap, and NTP are started first (if these are configured on the machine). (Bug#18810 [<http://bugs.mysql.com/18810>])
  - For a reference to a non-existent index in FORCE INDEX, the error message referred to a column, not an index. (Bug#17873 [<http://bugs.mysql.com/17873>])
  - In a multiple-row INSERT statement, LAST\_INSERT\_ID() should return the same value for each row. However, in some cases, the value could change if the table being inserted into had its own AUTO\_INCREMENT column. (Bug#6880 [<http://bugs.mysql.com/6880>])
  - Invalid escape sequences in option files caused MySQL programs that read them to abort. (Bug#15328 [<http://bugs.mysql.com/15328>])
  - Binary log lacked character set information for table name when dropping temporary tables. (Bug#14157 [<http://bugs.mysql.com/14157>])
  - InnoDB did not increment the handler\_read\_prev counter. (Bug#19542 [<http://bugs.mysql.com/19542>])
  - Slave SQL thread cleanup was not handled properly on Mac OS X when a statement was killed, resulting in a slave crash. (Bug#16900 [<http://bugs.mysql.com/16900>])
  - mysqldump did not respect the order of tables named with the --tables option. (Bug#18536 [<http://bugs.mysql.com/18536>])
  - The server no longer uses a signal handler for signal 0 because it could cause a crash on some platforms. (Bug#15869 [<http://bugs.mysql.com/15869>])
  - LOAD\_FILE() returned an error if the file did not exist, rather than NULL as it should according to the manual. (Bug#10418 [<http://bugs.mysql.com/10418>])
  - Use of uninitialized user variables in a subquery in the FROM clause results in bad entries in the binary log. (Bug#19136 [<http://bugs.mysql.com/19136>])

- `IS_USED_LOCK()` could return an incorrect connection identifier. (Bug#16501 [<http://bugs.mysql.com/16501>])
- Concurrent reading and writing of privilege structures could crash the server. (Bug#16372 [<http://bugs.mysql.com/16372>])
- A statement containing `GROUP BY` and `HAVING` clauses could return incorrect results when the `HAVING` clause contained logic that returned `FALSE` for every row. (Bug#14927 [<http://bugs.mysql.com/14927>])
- `MONTHNAME(STR_TO_DATE(NULL, '%m'))` could cause a server crash. (Bug#18501 [<http://bugs.mysql.com/18501>])
- The `ref` optimizer could choose the `ref_or_null` access method in cases where it was not applicable. This could cause inconsistent `EXPLAIN` or `SELECT` results for a given statement. (Bug#16798 [<http://bugs.mysql.com/16798>])
- `ANALYZE TABLE` for `TEMPORARY` tables had no effect. (Bug#15225 [<http://bugs.mysql.com/15225>])
- When `myisamchk` needed to rebuild a table, `AUTO_INCREMENT` information was lost. (Bug#10405 [<http://bugs.mysql.com/10405>])
- No error message was being issued for storage engines that do not support `ALTER TABLE`. Now an `ER_NOT_SUPPORTED_YET` error occurs. (Bug#7643 [<http://bugs.mysql.com/7643>])
- The binary log would create an incorrect `DROP` query when creating temporary tables during replication. (Bug#17263 [<http://bugs.mysql.com/17263>])
- `SHOW CREATE TABLE` did not display the `AUTO_INCREMENT` column attribute if the SQL mode was `MYSQL323` or `MYSQL40`. This also affected `mysqldump`, which uses `SHOW CREATE TABLE` to get table definitions. (Bug#14515 [<http://bugs.mysql.com/14515>])

### D.1.3. Changes in release 4.1.20 (24 May 2006)

This is a security fix release for the previous production release family.

This release includes the security fix described later in this section and a few other changes to resolve build problems, relative to the last official MySQL release (4.1.19). If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Network* (a commercial MySQL offering). For more details please see <http://www.mysql.com/network/advisors.html>.

Bugs fixed:

- **Security fix:** An SQL-injection security hole has been found in multi-byte encoding processing. The bug was in the server, incorrectly parsing the string escaped with the `mysql_real_escape_string()` C API function. (CVE-2006-2753 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-2753>], Bug#8378 [<http://bugs.mysql.com/8378>])

This vulnerability was discovered and reported by Josh Berkus <[josh@postgresql.org](mailto:josh@postgresql.org)> and Tom Lane <[tgl@sss.pgh.pa.us](mailto:tgl@sss.pgh.pa.us)> as part of the inter-project security collaboration of the OS-DB consortium. For more information about SQL injection, please see the following text.

**Discussion:** An SQL-injection security hole has been found in multi-byte encoding processing. An

SQL-injection security hole can include a situation whereby when a user supplied data to be inserted into a database, the user might inject SQL statements into the data that the server will execute. With regards to this vulnerability, when character set unaware-escaping is used (for example, `addslashes()` in PHP), it is possible to bypass the escaping in some multi-byte character sets (for example, SJIS, BIG5 and GBK). As a result, a function such as `addslashes()` is not able to prevent SQL-injection attacks. It is impossible to fix this on the server side. The best solution is for applications to use character set-aware escaping offered by a function such `mysql_real_escape_string()`.

However, a bug was detected in how the MySQL server parses the output of `mysql_real_escape_string()`. As a result, even when the character set-aware function `mysql_real_escape_string()` was used, SQL injection was possible. This bug has been fixed.

**Workarounds:** If you are unable to upgrade MySQL to a version that includes the fix for the bug in `mysql_real_escape_string()` parsing, but run MySQL 5.0.1 or higher, you can use the `NO_BACKSLASH_ESCAPES` SQL mode as a workaround. (This mode was introduced in MySQL 5.0.1.) `NO_BACKSLASH_ESCAPES` enables an SQL standard compatibility mode, where backslash is not considered a special character. The result will be that queries will fail.

To set this mode for the current connection, enter the following SQL statement:

```
SET sql_mode='NO_BACKSLASH_ESCAPES';
```

You can also set the mode globally for all clients:

```
SET GLOBAL sql_mode='NO_BACKSLASH_ESCAPES';
```

This SQL mode also can be enabled automatically when the server starts by using the command-line option `--sql-mode=NO_BACKSLASH_ESCAPES` or by setting `sql_mode=NO_BACKSLASH_ESCAPES` in the server option file (for example, `my.cnf` or `my.ini`, depending on your system).

- The patch for [Bug#8303](http://bugs.mysql.com/8303) [http://bugs.mysql.com/8303] broke the fix for [Bug#8378](http://bugs.mysql.com/8378) [http://bugs.mysql.com/8378] and was undone. (In string literals with an escape character (`\`) followed by a multi-byte character that has a second byte of (`\`), the literal was not interpreted correctly. The next byte now is escaped, not the entire multi-byte character. This means it a strict reverse of the `mysql_real_escape_string()` function.)
- The dropping of a temporary table whose name contained a backtick (```) character was not correctly replicated. ([Bug#19188](http://bugs.mysql.com/19188) [http://bugs.mysql.com/19188])
- The client libraries had not been compiled for position-independent code on Solaris-SPARC and AMD x86\_64 platforms. ([Bug#13159](http://bugs.mysql.com/13159) [http://bugs.mysql.com/13159], [Bug#14202](http://bugs.mysql.com/14202) [http://bugs.mysql.com/14202], [Bug#18091](http://bugs.mysql.com/18091) [http://bugs.mysql.com/18091])
- Running `myisampack` followed by `myisamchk` with the `--unpack` option would corrupt the `auto_increment` key. ([Bug#12633](http://bugs.mysql.com/12633) [http://bugs.mysql.com/12633])
- RPM packages had spurious dependencies on Perl modules and other programs. ([Bug#13634](http://bugs.mysql.com/13634) [http://bugs.mysql.com/13634])

## D.1.4. Changes in release 4.1.19 (29 April 2006)

This release includes the patches for recently reported security vulnerabilities in the MySQL client-server protocol. We would like to thank Stefano Di Paola <[stefano.dipaola@wisec.it](mailto:stefano.dipaola@wisec.it)> for finding

and reporting these to us.

Functionality added or changed:

- **Security enhancement:** Added the global `max_prepared_stmt_count` system variable to limit the total number of prepared statements in the server. This limits the potential for denial-of-service attacks based on running the server out of memory by preparing huge numbers of statements. The current number of prepared statements is available through the `prepared_stmt_count` system variable. (Bug#16365 [<http://bugs.mysql.com/16365>])
- The `MySQL-shared-compat-4.1.X-.i386.rpm` shared compatibility RPMs no longer contain libraries for MySQL 5.0 and up. It contains libraries for 3.23, 4.0, and 4.1.1. (Bug#19288 [<http://bugs.mysql.com/19288>])
- Creating a table in an InnoDB database with a column name that matched the name of an internal InnoDB column (including `DB_ROW_ID`, `DB_TRX_ID`, `DB_ROLL_PTR` and `DB_MIX_ID`) would cause a crash. MySQL now returns error 1005 (cannot create table) with `errno` set to -1. (Bug#18934 [<http://bugs.mysql.com/18934>])
- InnoDB now caches a list of unflushed files instead of scanning for unflushed files during a table flush operation. This improves performance when `--innodb-file-per-table` is set on a system with a large number of InnoDB tables. (Bug#15653 [<http://bugs.mysql.com/15653>])
- New `charset` command added to `mysql` command-line client. By typing `charset name` or `\C name` (such as `\C UTF8`), the client character set can be changed without reconnecting. (Bug#16217 [<http://bugs.mysql.com/16217>])
- Large file support was re-enabled for the MySQL server binary for the AIX 5.2 platform. (Bug#13571 [<http://bugs.mysql.com/13571>])
- When using the `GROUP_CONCAT()` function where the `group_concat_max_len` system variable was greater than 512, the type of the result was `BLOB` only if the query included an `ORDER BY` clause; otherwise the result was a `VARCHAR`.

The result type of the `GROUP_CONCAT()` function is now `VARCHAR` only if the value of the `group_concat_max_len` system variable is less than or equal to 512. Otherwise, this function returns a `BLOB`. (Bug#14169 [<http://bugs.mysql.com/14169>])

Bugs fixed:

- **Security fix:** A malicious client, using specially crafted invalid login or `COM_TABLE_DUMP` packets was able to read uninitialized memory, which potentially, though unlikely in MySQL, could have led to an information disclosure. (CVE-2006-1516 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-1516>], CVE-2006-1517 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-1517>]) Thanks to Stefano Di Paola <[stefano.dipaola@wisec.it](mailto:stefano.dipaola@wisec.it)> for finding and reporting this bug.
- **NDB Cluster:** A simultaneous `DROP TABLE` and table update operation utilising a table scan could trigger a node failure. (Bug#18597 [<http://bugs.mysql.com/18597>])
- `MySQL-shared-compat-4.1.15-0.i386.rpm`, `MySQL-shared-compat-4.1.16-0.i386.rpm`, and `MySQL-shared-compat-4.1.18-0.i386.rpm` incorrectly depended on `glibc` 2.3 and could not be installed on a `glibc` 2.2 system. (Bug#16539 [<http://bugs.mysql.com/16539>])
- IA-64 RPM packages for Red Hat and SuSE Linux that were built with the `icc` compiler incorrectly depended on `icc` runtime libraries. (Bug#16662 [<http://bugs.mysql.com/16662>])

- Index prefixes for `utf8 VARCHAR` columns did not work for `UPDATE` statements. (Bug#19080 [http://bugs.mysql.com/19080])
- MySQL would not compile on Linux distributions that use the `tinfo` library. (Bug#18912 [http://bugs.mysql.com/18912])
- **NDB Cluster**: Backups could fail for large clusters with many tables, where the number of tables approached `MaxNoOfTables`. (Bug#17607 [http://bugs.mysql.com/17607])
- For single-`SELECT` union constructs of the form `(SELECT ... ORDER BY order_list1 [LIMIT n]) ORDER BY order_list2`, the `ORDER BY` lists were concatenated and the `LIMIT` clause was ignored. (Bug#18767 [http://bugs.mysql.com/18767])
- The `IN-to-EXISTS` transformation was making a reference to a parse tree fragment that was left out of the parse tree. This caused problems with prepared statements. (Bug#18492 [http://bugs.mysql.com/18492])
- Attempting to set the default value of an `ENUM` or `SET` column to `NULL` caused a server crash. (Bug#19145 [http://bugs.mysql.com/19145])
- Index corruption could occur in cases when `key_cache_block_size` was not a multiple of `myisam_block_size` (for example, with `key_cache_block_size=1536` and `myisam_block_size=1024`). (Bug#19079 [http://bugs.mysql.com/19079])
- `UNCOMPRESS(NULL)` could cause subsequent `UNCOMPRESS()` calls to return `NULL` for legal non-`NULL` arguments. (Bug#18643 [http://bugs.mysql.com/18643])
- Conversion of a number to a `CHAR UNICODE` string returned an invalid result. (Bug#18691 [http://bugs.mysql.com/18691])
- A call to `MIN()` with a `CASE` expression as its argument could return a non-minimum value. (Bug#17896 [http://bugs.mysql.com/17896])
- A `LOCK TABLES` statement that failed could cause `MyISAM` not to update table statistics properly, causing a subsequent `CHECK TABLE` to report table corruption. (Bug#18544 [http://bugs.mysql.com/18544])
- Avoid trying to include `<asm/atomic.h>` when it doesn't work in C++ code. (Bug#13621 [http://bugs.mysql.com/13621])
- Executing `SELECT` on a large table that had been compressed within `mysampack` could cause a crash. (Bug#17917 [http://bugs.mysql.com/17917])
- **NDB Cluster**: In a 2-node cluster with a node failure, restarting the node with a low value for `StartPartialTimeout` could cause the cluster to come up partitioned (“split-brain” issue). (Bug#16447 [http://bugs.mysql.com/16447])  
  
A similar issue could occur when the cluster was first started with a sufficiently low value for this parameter. (Bug#18612 [http://bugs.mysql.com/18612])
- **NDB Cluster**: On systems with multiple network interfaces, data nodes would get “stuck” in startup phase 2 if the interface connecting them to the management server was working on node startup while the interface interconnecting the data nodes experienced a temporary outage. (Bug#15695 [http://bugs.mysql.com/15695])
- `mysql_config` returned incorrect libraries on `x86_64` systems. (Bug#13158 [http://bugs.mysql.com/13158])
- `mysql_reconnect()` sent a `SET NAMES` statement to the server, even for pre-4.1 servers that

do not understand the statement. ([Bug#18830](http://bugs.mysql.com/18830) [<http://bugs.mysql.com/18830>])

- During conversion from one character set to `ucs2`, multi-byte characters with no `ucs2` equivalent were converted to multiple characters, rather than to `0x003F QUESTION MARK`. ([Bug#15375](http://bugs.mysql.com/15375) [<http://bugs.mysql.com/15375>])
- The `mysql_close()` C API function leaked handles for share-memory connections on Windows. ([Bug#15846](http://bugs.mysql.com/15846) [<http://bugs.mysql.com/15846>])
- The euro sign (€) was not stored correctly in columns using the `latin1_german1_ci` or `latin1_general_ci` collation. ([Bug#18321](http://bugs.mysql.com/18321) [<http://bugs.mysql.com/18321>])
- The server was always built as though `--with-extra-charsets=complex` had been specified. ([Bug#12076](http://bugs.mysql.com/12076) [<http://bugs.mysql.com/12076>])
- `SELECT ... WHERE column LIKE 'A%'`, when `column` had a key and used the `latin2_czech_cs` collation, caused the wrong number of rows to be returned. ([Bug#17374](http://bugs.mysql.com/17374) [<http://bugs.mysql.com/17374>])
- A query using `WHERE (column_1, column_2) IN ((value_1, value_2)[, (..., ...), ...])` would return incorrect results. ([Bug#16248](http://bugs.mysql.com/16248) [<http://bugs.mysql.com/16248>])
- The `-lmtmalloc` library was removed from the output of `mysql_config` on Solaris, as it caused problems when building `DBD::mysql` (and possibly other applications) on that platform that tried to use `dlopen()` to access the client library. ([Bug#18322](http://bugs.mysql.com/18322) [<http://bugs.mysql.com/18322>])
- When running a query that contained a `GROUP_CONCAT( SELECT GROUP_CONCAT(...) )`, the result was `NULL` except in the `ROLLUP` part of the result, if there was one. ([Bug#15560](http://bugs.mysql.com/15560) [<http://bugs.mysql.com/15560>])
- `CAST(double AS SIGNED INT)` for large `double` values outside the signed integer range truncates the result to be within range, but the result sometimes had the wrong sign. ([Bug#15098](http://bugs.mysql.com/15098) [<http://bugs.mysql.com/15098>])
- `SET` value definitions containing commas were not rejected. Now a definition such as `SET( 'a,b', 'c,d' )` results in an error. ([Bug#15316](http://bugs.mysql.com/15316) [<http://bugs.mysql.com/15316>])
- **MyISAM:** Keys for which the first part of the key was a `CHAR` or `VARCHAR` column using the UTF-8 character set and longer than 254 bytes could become corrupted. ([Bug#17705](http://bugs.mysql.com/17705) [<http://bugs.mysql.com/17705>])
- **NDB Cluster:** A timeout in the handling of an `ABORT` condition with more than 32 operations could yield a node failure. ([Bug#18414](http://bugs.mysql.com/18414) [<http://bugs.mysql.com/18414>])
- **NDB Cluster:** A node restart immediately following a `CREATE TABLE` would fail. **Important:** This fix supports 2-node Clusters only. ([Bug#18385](http://bugs.mysql.com/18385) [<http://bugs.mysql.com/18385>])
- **NDB Cluster:** In event of a node failure during a rollback, a “false” lock could be established on the backup for that node, which lock could not be removed without restarting the node. ([Bug#18352](http://bugs.mysql.com/18352) [<http://bugs.mysql.com/18352>])
- **NDB Cluster:** The cluster created a crashed replica of a table having an ordered index — or when logging was not enabled, of a table having a table or unique index — leading to a crash of the cluster following 8 successive restarts. ([Bug#18298](http://bugs.mysql.com/18298) [<http://bugs.mysql.com/18298>])
- **NDB Cluster:** When replacing a failed master node, the replacement node could cause the cluster to crash from a buffer overflow if it had an excessively large amount of data to write to the cluster log. ([Bug#18118](http://bugs.mysql.com/18118) [<http://bugs.mysql.com/18118>])

- **NDB Cluster**: Restarting nodes were allowed to start and join the cluster too early. ([Bug#16772](http://bugs.mysql.com/16772) [<http://bugs.mysql.com/16772>])
- If **InnoDB** encountered a `HA_ERR_LOCK_TABLE_FULL` error and rolled back a transaction, the transaction was still written to the binary log. ([Bug#18283](http://bugs.mysql.com/18283) [<http://bugs.mysql.com/18283>])
- Connecting to a server with a UCS2 default character set with a client using a non-UCS2 character set crashed the server. ([Bug#18004](http://bugs.mysql.com/18004) [<http://bugs.mysql.com/18004>])
- Character set conversion of string constants for **UNION** of constant and table column was not done when it was safe to do so. ([Bug#15949](http://bugs.mysql.com/15949) [<http://bugs.mysql.com/15949>])
- Use of `TRUNCATE TABLE` for a **TEMPORARY** table on a master server was propagated to slaves properly, but slaves did not decrement the `Slave_open_temp_tables` counter properly. ([Bug#17137](http://bugs.mysql.com/17137) [<http://bugs.mysql.com/17137>])
- `SELECT COUNT( *)` for a **MyISAM** table could return different results depending on whether an index was used. ([Bug#14980](http://bugs.mysql.com/14980) [<http://bugs.mysql.com/14980>])
- Large file support did not work in AIX server binaries. ([Bug#10776](http://bugs.mysql.com/10776) [<http://bugs.mysql.com/10776>])
- Security Improvement: GRANTS to users with wildcards in their host information could be erroneously applied to similar users with the same username and similar wildcards. For example, a privilege granted to `foo@%` are also applied to user `foo@192.%`. ([Bug#14385](http://bugs.mysql.com/14385) [<http://bugs.mysql.com/14385>])
- **NDB Cluster**: Inserting and deleting **BLOB** column values while a backup was in process could cause the loss of an `ndbd` node. ([Bug#14028](http://bugs.mysql.com/14028) [<http://bugs.mysql.com/14028>])
- Setting the `myisam_repair_threads` system variable to a value larger than 1 could cause corruption of large **MyISAM** tables. ([Bug#11527](http://bugs.mysql.com/11527) [<http://bugs.mysql.com/11527>])
- Security improvement: In grant table comparisons, improper use of a `latin1` collation caused some hostname matches to be true that should have been false. Thanks to Deomid Ryabkov for finding this bug and proposing a solution. ([Bug#15756](http://bugs.mysql.com/15756) [<http://bugs.mysql.com/15756>])
- **NDB Cluster**: `ndb_delete_all` would run out of memory on tables containing **BLOB** columns. ([Bug#16693](http://bugs.mysql.com/16693) [<http://bugs.mysql.com/16693>])
- `mysqldump` tried to dump data from a view. (In MySQL 4.1, this applies when connecting to a server from MySQL 5.0 or higher.) ([Bug#16389](http://bugs.mysql.com/16389) [<http://bugs.mysql.com/16389>])
- **NDB Cluster**: An `UPDATE` with an inner join failed to match any records if both tables in the join did not have a primary key. ([Bug#17257](http://bugs.mysql.com/17257) [<http://bugs.mysql.com/17257>])
- **NDB Cluster**: A `DELETE` with a join in the `WHERE` clause failed to retrieve any records if both tables in the join did not have a primary key. ([Bug#17249](http://bugs.mysql.com/17249) [<http://bugs.mysql.com/17249>])
- **NDB Cluster**: In some cases, `LOAD DATA INFILE` did not load all data into **NDB** tables. ([Bug#17081](http://bugs.mysql.com/17081) [<http://bugs.mysql.com/17081>])
- **NDB Cluster**: The `REDO` log would become corrupted (and thus unreadable) in some circumstances, due to a failure in the query handler. ([Bug#17295](http://bugs.mysql.com/17295) [<http://bugs.mysql.com/17295>])
- **NDB Cluster**: No error message was generated for setting `NoOfFragmentLogFiles` too low. ([Bug#13966](http://bugs.mysql.com/13966) [<http://bugs.mysql.com/13966>])
- **NDB Cluster**: No error message was generated for setting `MaxNoOfAttributes` too low. ([Bug#13965](http://bugs.mysql.com/13965) [<http://bugs.mysql.com/13965>])

- Binary distributions for Solaris contained files with group ownership set to the non-existing `wheel` group. Now the `bin` group is used. ([Bug#15562](#) [<http://bugs.mysql.com/15562>])
- Killing a long-running query containing a subquery could cause a server crash. ([Bug#14851](#) [<http://bugs.mysql.com/14851>])
- Repeated invocation of `my_init()` and `my_end()` caused corruption of character set data and connection failure. ([Bug#6536](#) [<http://bugs.mysql.com/6536>])
- A `FULLTEXT` query in a prepared statement could result in unexpected behavior. ([Bug#14496](#) [<http://bugs.mysql.com/14496>])
- A `FULLTEXT` query in a `UNION` could result in unexpected behavior. ([Bug#16893](#) [<http://bugs.mysql.com/16893>])
- Server crash when dropping InnoDB constraints named `TABLENAME_ibfk_0`. ([Bug#16387](#) [<http://bugs.mysql.com/16387>])
- Corrected race condition when dropping the adaptive hash index for a B-tree page in InnoDB. ([Bug#16582](#) [<http://bugs.mysql.com/16582>])
- `LOAD DATA FROM MASTER` produced invalid warnings and Packet out of order errors when the database already existed on the slave. ([Bug#15302](#) [<http://bugs.mysql.com/15302>])
- A key on a `MEMORY` table would sometimes fail to match a row. ([Bug#12796](#) [<http://bugs.mysql.com/12796>])
- `MYSQL_STMT` objects were not preserved following a connection reset. Attempting to operate on them afterwards caused the server to crash. ([Bug#12744](#) [<http://bugs.mysql.com/12744>])

## D.1.5. Changes in release 4.1.18 (27 January 2006)

Functionality added or changed:

- `NDB Cluster`: More descriptive warnings are now issued when inappropriate logging parameters are set in `config.ini`. (Formerly, the warning issued was simply Could not add logfile destination.) ([Bug#11331](#) [<http://bugs.mysql.com/11331>])
- `libmysqlclient` now uses versioned symbols with GNU ld. ([Bug#3074](#) [<http://bugs.mysql.com/3074>])

Bugs fixed:

- The length of a `VARCHAR()` column that used the `utf8` character set would increase each time the table was re-created in a stored procedure or prepared statement, eventually causing the `CREATE TABLE` statement to fail. ([Bug#13134](#) [<http://bugs.mysql.com/13134>])
- RPM packages had an incorrect `zlib` dependency. ([Bug#15223](#) [<http://bugs.mysql.com/15223>])
- `STR_TO_DATE(1, NULL)` caused a server crash. ([CVE-2006-3081](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-3081>], [Bug#15828](#) [<http://bugs.mysql.com/15828>])
- The `--replicate-do` and `--replicate-ignore` options were not being enforced on multiple-table statements. ([Bug#15699](#) [<http://bugs.mysql.com/15699>], [Bug#16487](#))

[<http://bugs.mysql.com/16487>])

- Running out of disk space in the location specified by the `tmpdir` option resulted in incorrect error message. (Bug#14634 [<http://bugs.mysql.com/14634>])
- Test suite `func_math` test returned warnings when server not compiled with InnoDB support. (Bug#15429 [<http://bugs.mysql.com/15429>])
- The `MBROverlaps` GIS function returned incorrect results. (Bug#14320 [<http://bugs.mysql.com/14320>])
- A `CREATE TABLE ... SELECT ...` on an equation involving `DOUBLE` values could result in the table being created with columns too small to hold the equation result. (Bug#9855 [<http://bugs.mysql.com/9855>])
- `UPDATE` statement crashed multi-byte character set `FULLTEXT` index if update value was almost identical to initial value only differing in some spaces being changed to `&nbsp;`. (Bug#16489 [<http://bugs.mysql.com/16489>])
- Single table `UPDATE` statements without `ORDER BY` clauses which updated the same indexed column that was being filtered on were optimized with a full index scan instead of a more appropriate index range scan. (Bug#15935 [<http://bugs.mysql.com/15935>])
- A prepared statement created from a `SELECT ... LIKE` query (such as `PREPARE stmt1 FROM 'SELECT col_1 FROM tadd_test WHERE col_1 LIKE ?';`) would begin to produce erratic results after being executed repeatedly numerous (thousands) of times. (Bug#12734 [<http://bugs.mysql.com/12734>])

## D.1.6. Changes in release 4.1.17 (Not released)

Functionality added or changed:

- In the `latin5_turkish_ci` collation, the order of the characters `A WITH CIRCUMFLEX`, `I WITH CIRCUMFLEX`, and `U WITH CIRCUMFLEX` was changed. If you have used these characters in any indexed columns, you should rebuild those indexes. (Bug#13421 [<http://bugs.mysql.com/13421>])
- Support files for compiling with Visual Studio 6 have been removed. (Bug#15094 [<http://bugs.mysql.com/15094>])
- Internal `sha1_result` function renamed to `mysql_sha1_result` to prevent conflicts with other projects. (Bug#13944 [<http://bugs.mysql.com/13944>])

Bugs fixed:

- `CAST(... AS TIME)` operations returned different results when using versus not using prepared-statement protocol. (Bug#15805 [<http://bugs.mysql.com/15805>])
- Performing a `RENAME TABLE` on an InnoDB table when the server is started with the `-innodb-file-per-table` and the data directory is a symlink caused a server crash. (Bug#15991 [<http://bugs.mysql.com/15991>])
- Characters in the `gb2312` and `euckr` character sets which did not have Unicode mappings were truncated. (Bug#15377 [<http://bugs.mysql.com/15377>])

- Piping the `fill_help_tables.sql` file into `mysqld` resulted in a syntax error. ([Bug#15965](http://bugs.mysql.com/15965) [<http://bugs.mysql.com/15965>])
- **NDBCluster**: Upon the completion of a scan where a key request remained outstanding on the primary replica and a starting node died, the scan did not terminate. This caused incompleted error handling of the failed node. ([Bug#15908](http://bugs.mysql.com/15908) [<http://bugs.mysql.com/15908>])
- Using `CAST()` to convert values with long fractional and/or exponent parts to `TIME` returned wrong results. ([Bug#12440](http://bugs.mysql.com/12440) [<http://bugs.mysql.com/12440>])
- An `INSERT ... SELECT` statement between tables in a `MERGE` set can return errors when statement involves insert into child table from merge table or vice-versa. ([Bug#5390](http://bugs.mysql.com/5390) [<http://bugs.mysql.com/5390>])
- Certain permission management statements could create a `NULL` hostname for a user, resulting in a server crash. ([Bug#15598](http://bugs.mysql.com/15598) [<http://bugs.mysql.com/15598>])
- For **InnoDB** tables, using a column prefix for a `utf8` column in a primary key caused `Cannot find record` errors when attempting to locate records. ([Bug#14056](http://bugs.mysql.com/14056) [<http://bugs.mysql.com/14056>])
- Certain `CREATE TABLE ... AS ...` statements involving `ENUM` columns could cause server crash. ([Bug#12913](http://bugs.mysql.com/12913) [<http://bugs.mysql.com/12913>])
- Using an aggregate function as the argument for a `HAVING` clause would result in the aggregate function always returning `FALSE`. ([Bug#14274](http://bugs.mysql.com/14274) [<http://bugs.mysql.com/14274>])
- The `COALESCE()` function truncated data in a `TINYTEXT` column. ([Bug#15581](http://bugs.mysql.com/15581) [<http://bugs.mysql.com/15581>])
- **InnoDB**: Comparison of indexed `VARCHAR CHARACTER SET ucs2 COLLATE ucs2_bin` columns using `LIKE` could fail. ([Bug#14583](http://bugs.mysql.com/14583) [<http://bugs.mysql.com/14583>])
- Issuing a `DROP USER` command could cause some users to encounter a `hostname is not allowed to connect to this MySQL server` error. ([Bug#15775](http://bugs.mysql.com/15775) [<http://bugs.mysql.com/15775>])
- `Access Denied` error could be erroneously returned with specific grant combinations under high load. ([Bug#7209](http://bugs.mysql.com/7209) [<http://bugs.mysql.com/7209>])
- Symbolic links did not function properly on Windows platforms. ([Bug#14960](http://bugs.mysql.com/14960) [<http://bugs.mysql.com/14960>], [Bug#14310](http://bugs.mysql.com/14310) [<http://bugs.mysql.com/14310>])
- **BDB**: A `DELETE`, `INSERT`, or `UPDATE` of a **BDB** table could cause the server to crash where the query contained a subquery using an index read. ([Bug#15536](http://bugs.mysql.com/15536) [<http://bugs.mysql.com/15536>])
- `DELETE` could report full-text index corruption (`Invalid key for table ...`) if the index was built with repair-by-sort, the data in the full-text index used `UCA` collation, and some word appeared in the data terminated by a `0xC2A0` character as well as by other non-letter characters. ([Bug#11336](http://bugs.mysql.com/11336) [<http://bugs.mysql.com/11336>])
- A race condition when creating temporary files caused a deadlock on Windows with threads in `Opening tables` or `Waiting for table` states. ([Bug#12071](http://bugs.mysql.com/12071) [<http://bugs.mysql.com/12071>])
- **InnoDB**: If `FOREIGN_KEY_CHECKS` was 0, **InnoDB** allowed inconsistent foreign keys to be created. ([Bug#13778](http://bugs.mysql.com/13778) [<http://bugs.mysql.com/13778>])
- **NDB Cluster**: A memory leak occurred when performing ordered index scans using indexes a

columns larger than 32 bytes, which would eventually lead to the forced shutdown of all `mysqld` server processes used with the cluster. (Bug#13078 [<http://bugs.mysql.com/13078>])

- **NDB Cluster:** Under some circumstances, it was possible for a restarting node to undergo a forced shutdown. (Bug#15632 [<http://bugs.mysql.com/15632>])
- **NDB Cluster:** If an abort by the Transaction Coordinator timed out, the abort condition was incorrectly handled, causing the transaction record to be released prematurely. (Bug#15685 [<http://bugs.mysql.com/15685>])
- **NDB Cluster:** A node which failed during cluster startup was sometimes not removed from the internal list of active nodes. (Bug#15587 [<http://bugs.mysql.com/15587>])
- **NDB Cluster:** There was a small window for a node failure to occur during a backup without an error being reported. (Bug#15425 [<http://bugs.mysql.com/15425>])
- Multiple-table update operations were counting updates and not updated rows. As a result, if a row had several updates it was counted several times for the “rows matched” value but updated only once. (Bug#15028 [<http://bugs.mysql.com/15028>])
- **SELECT** queries that began with an opening parenthesis were not being placed in the query cache. (Bug#14652 [<http://bugs.mysql.com/14652>])

## D.1.7. Changes in release 4.1.16 (29 November 2005)

Functionality added or changed:

- The `CHAR ( )` function now takes an optional `USING charset` clause that may be used to produce a result in a specific character set rather than in the connection character set.
- MySQL 4.1 now supports character set conversion for seven additional `cp950` characters into the `big5` character set: `0xF9D6`, `0xF9D7`, `0xF9D8`, `0xF9D9`, `0xF9DA`, `0xF9DB`, and `0xF9DC`. **Note:** If you move data containing these additional characters to an older MySQL installation which does not support them, you may encounter errors. (Bug#12476 [<http://bugs.mysql.com/12476>])
- **NDBCluster:** The `pererror` utility included with the `MySQL-Server` RPM now provides support for the `--ndb` option, and so can be used to obtain error message text for MySQL Cluster error codes. (Bug#13740 [<http://bugs.mysql.com/13740>])
- When executing single-table `UPDATE` or `DELETE` queries containing an `ORDER BY ... LIMIT N` clause, but not having any `WHERE` clause, MySQL can now take advantage of an index to read the first `N` rows in the ordering specified in the query. If an index is used, only the first `N` records will be read, as opposed to scanning the entire table. (Bug#12915 [<http://bugs.mysql.com/12915>])
- The `MySQL-server` RPM now explicitly assigns the `mysql` system user to the `mysql` user group during the postinstallation process. This corrects an issue with upgrading the server on some Linux distributions whereby a previously existing `mysql` user was not changed to the `mysql` group, resulting in wrong groups for files created following the installation. (Bug#12823 [<http://bugs.mysql.com/12823>])
- When a date column is set `NOT NULL` and contains `0000-00-00`, it will be updated for `UPDATE` statements that contains `columnname IS NULL` in the `WHERE` clause. (Bug#14186 [<http://bugs.mysql.com/14186>])

Bugs fixed:

- **NDB Cluster**: `REPLACE` failed when attempting to update a primary key value in a Cluster table. (Bug#14007 [http://bugs.mysql.com/14007])
- When the `DATE_FORMAT( )` function appeared in both the `SELECT` and `ORDER BY` clauses of a query but with arguments that differ by case (i.e. %m and %M), incorrect sorting may have occurred. (Bug#14016 [http://bugs.mysql.com/14016])
- `Make` failed when attempting to build MySQL in different directory than source. (Bug#11827 [http://bugs.mysql.com/11827])
- `PROCEDURE ANALYSE( )` could suggest a data type with a negative display width. (Bug#10716 [http://bugs.mysql.com/10716])
- **InnoDB**: During replication, There was a failure to record events in the binary log that still occurred even in the event of a `ROLLBACK`. For example, this sequence of commands:

```
BEGIN;
CREATE TEMPORARY TABLE t1 (a INT) ENGINE=INNODB;
ROLLBACK;
INSERT INTO t1 VALUES (1);
```

would succeed on the replication master as expected. However, the `INSERT` would fail on the slave because the `ROLLBACK` would (erroneously) cause the `CREATE TEMPORARY TABLE` statement not to be written to the binlog. (Bug#7947 [http://bugs.mysql.com/7947])

- **NDB Cluster**: Creating a table with packed keys failed silently. **NDB** now supports the `PACK_KEYS` option to `CREATE TABLE` correctly. (Bug#14514 [http://bugs.mysql.com/14514])
- `Non-latin1` object names were written with wrong character set to grant tables. (Bug#14406 [http://bugs.mysql.com/14406])
- Issuing `STOP SLAVE` after having acquired a global read lock with `FLUSH TABLES WITH READ LOCK` caused a deadlock. Now `STOP SLAVE` is generates an error in such circumstances. (Bug#10942 [http://bugs.mysql.com/10942])
- Portability fixes to support OpenSSL 0.9.8a. (Bug#14221 [http://bugs.mysql.com/14221])
- Closed a memory leak in the SSL code. (Bug#14780 [http://bugs.mysql.com/14780])
- Perform character set conversion of constant values whenever possible without data loss. (Bug#10446 [http://bugs.mysql.com/10446])
- A `UNION` of `DECIMAL` columns could produce incorrect results. (Bug#14216 [http://bugs.mysql.com/14216])
- **InnoDB**: Pad UTF-8 `VARCHAR` columns with `0x20`. Pad UCS2 `CHAR` columns with `0x0020`. (Bug#10511 [http://bugs.mysql.com/10511])
- Full-text indexing/searching failed for words that end with more than one apostrophe. (Bug#5686 [http://bugs.mysql.com/5686])
- Selecting from a table in both an outer query and a subquery could cause a server crash. (Bug#14482 [http://bugs.mysql.com/14482])
- Creating a table containing an `ENUM` or `SET` column from within a stored procedure or prepared statement caused a server crash later when executing the procedure or statement. (Bug#14410 [http://bugs.mysql.com/14410])
- `mysql_fix_privilege_tables.sql` contained an erroneous comment that resulted in an er-

- ror when the file contents were processed. ([Bug#14469](http://bugs.mysql.com/14469) [<http://bugs.mysql.com/14469>])
- On Windows, the server could crash during shutdown if both replication threads and normal client connection threads were active. (Re-fix of [Bug#11796](http://bugs.mysql.com/11796) [<http://bugs.mysql.com/11796>])
  - A `LIMIT`-related optimization failed to take into account that `MyISAM` table indexes can be disabled, causing Error 124 when it tried to use such an index. ([Bug#14616](http://bugs.mysql.com/14616) [<http://bugs.mysql.com/14616>])
  - For a table that had been opened with `HANDLER OPEN`, issuing `OPTIMIZE TABLE`, `ALTER TABLE`, or `REPAIR TABLE` caused a server crash. ([Bug#14397](http://bugs.mysql.com/14397) [<http://bugs.mysql.com/14397>])
  - `CREATE TABLE tbl_name (...) SELECT ...` could crash the server and write invalid data into the `.frm` file if the `CREATE TABLE` and `SELECT` both contained a column with the same name. Also, if a default value is specified in the column definition, it is now actually used. ([Bug#14480](http://bugs.mysql.com/14480) [<http://bugs.mysql.com/14480>])
  - For `MyISAM` tables, incorrect query results or incorrect updates could occur under these conditions: There is a multiple-column index that includes a `BLOB` column that is not the last column in the index, and the statement performs a lookup on the index using key column values that have `NULL` for the `BLOB` column and that provide values for all columns up to the `BLOB` column and at least the next column in the index. ([Bug#13814](http://bugs.mysql.com/13814) [<http://bugs.mysql.com/13814>])
  - Deletes from a `CSV` table could cause table corruption. ([Bug#14672](http://bugs.mysql.com/14672) [<http://bugs.mysql.com/14672>])
  - An update of a `CSV` table could cause a server crash. ([Bug#13894](http://bugs.mysql.com/13894) [<http://bugs.mysql.com/13894>])
  - `mysqld_safe` did not correctly start the `-max` version of the server (if it was present) if the `-ledir` option was given. ([Bug#13774](http://bugs.mysql.com/13774) [<http://bugs.mysql.com/13774>])
  - The endian byte in for spatial values in WKB format was not consistently respected. ([Bug#12839](http://bugs.mysql.com/12839) [<http://bugs.mysql.com/12839>])
  - An expression in an `ORDER BY` clause failed with `Unknown column 'col_name' in 'order clause'` if the expression referred to a column alias. ([Bug#11694](http://bugs.mysql.com/11694) [<http://bugs.mysql.com/11694>])
  - Statements of the form `CREATE TABLE ... SELECT ...` that created a column with a multi-byte character set could incorrectly calculate the maximum length of the column, resulting in a `Specified key was too long` error. ([Bug#14139](http://bugs.mysql.com/14139) [<http://bugs.mysql.com/14139>])
  - Use of `col_name = VALUES(col_name)` in the `ON DUPLICATE KEY UPDATE` clause of an `INSERT` statement failed with an `Column 'col_name' in field list is ambiguous` error. ([Bug#13392](http://bugs.mysql.com/13392) [<http://bugs.mysql.com/13392>])
  - On Windows, the server was not ignoring hidden or system directories that Windows may have created in the data directory, and would treat them as available databases. ([Bug#4375](http://bugs.mysql.com/4375) [<http://bugs.mysql.com/4375>])
  - `LIKE` operations did not work reliably for the `cp1250` character set. ([Bug#13347](http://bugs.mysql.com/13347) [<http://bugs.mysql.com/13347>])
  - Maximum values were handled incorrectly for command-line options of type `GET_LL`. ([Bug#12925](http://bugs.mysql.com/12925) [<http://bugs.mysql.com/12925>])
  - Use of `WITH ROLLUP PROCEDURE ANALYSE()` could hang the server. ([Bug#14138](http://bugs.mysql.com/14138) [<http://bugs.mysql.com/14138>])
  - `TIMEDIFF()`, `ADDTIME()`, and `STR_TO_DATE()` were not reporting that they could return

- NULL, so functions that invoked them might misinterpret their results. ([Bug#14009](#) [<http://bugs.mysql.com/14009>])
- The example configuration files supplied with MySQL distributions listed the `thread_cache_size` variable as `thread_cache`. ([Bug#13811](#) [<http://bugs.mysql.com/13811>])
  - `LOAD DATA INFILE` would not accept the same character for both the `ESCAPED BY` and the `ENCLOSED BY` clauses. ([Bug#11203](#) [<http://bugs.mysql.com/11203>])
  - `NDB Cluster`: Repeated transactions using unique index lookups could cause a memory leak leading to error 288, `Out of index operations in transaction coordinator`. ([Bug#14199](#) [<http://bugs.mysql.com/14199>])
  - `SELECT DISTINCT CHAR(col_name)` returned incorrect results after `SET NAMES utf8`. ([Bug#13233](#) [<http://bugs.mysql.com/13233>])
  - Character set conversion was not being done for `FIND_IN_SET()`. ([Bug#13751](#) [<http://bugs.mysql.com/13751>])
  - The default value of `query_prealloc_size` was set to 8192, lower than its minimum of 16384. The minimum has been lowered to 8192. ([Bug#13334](#) [<http://bugs.mysql.com/13334>])
  - The server did not take character set into account in checking the width of the `mysql.user.Password` column. As a result, it could incorrectly generate long password hashes even if the column was not long enough to hold them. ([Bug#13064](#) [<http://bugs.mysql.com/13064>])
  - `CAST(1E+300 TO SIGNED INT)` produced an incorrect result on little-endian machines. ([Bug#13344](#) [<http://bugs.mysql.com/13344>])
  - `mysqladmin` and `mysqldump` would hang on SCO OpenServer. ([Bug#13238](#) [<http://bugs.mysql.com/13238>])
  - Specifying `--default-character-set=cp-932` for `mysqld` would cause SQL scripts containing comments written using that character set to fail with a syntax error. ([Bug#13487](#) [<http://bugs.mysql.com/13487>])
  - Given a column `col_name` defined as `NOT NULL`, a `SELECT ... FROM ... WHERE col_name IS NULL` query following `SHOW TABLE STATUS` would erroneously return a non-empty result. ([Bug#13535](#) [<http://bugs.mysql.com/13535>])
  - Corrected a memory-copying problem for `big5` values when using `icc` compiler on Linux IA-64 systems. ([Bug#10836](#) [<http://bugs.mysql.com/10836>])
  - On BSD systems, the system `crypt()` call could return an error for some salt values. The error was not handled, resulting in a server crash. ([Bug#13619](#) [<http://bugs.mysql.com/13619>])
  - Character set file parsing during `mysql_real_connect()` read past the end of a memory buffer. ([Bug#6413](#) [<http://bugs.mysql.com/6413>])
  - The `--interactive-timeout` and `--slave-net-timeout` options for `mysqld` were not being obeyed on Mac OS X and other BSD-based platforms. ([Bug#8731](#) [<http://bugs.mysql.com/8731>])
  - Queries of the form `(SELECT ...) ORDER BY ...` were being treated as a `UNION`. This improperly resulted in only distinct values being returned (because `UNION` by default eliminates duplicate results). Also, references to column aliases in `ORDER BY` clauses following parenthesized `SELECT` statements were not resolved properly. ([Bug#7672](#) [<http://bugs.mysql.com/7672>])

- Multiple update queries using any type of subquery would be ignored by a replication slave when a condition such as `--replicate-ignore-table` like condition was used. (Bug#13236 [<http://bugs.mysql.com/13236>])
- An `UPDATE` query using a join would be executed incorrectly on a replication slave. (Bug#12618 [<http://bugs.mysql.com/12618>])
- `NDBCluster`: Placing multiple `[TCP DEFAULT]` sections in the cluster `config.ini` file crashed `ndb_mgmd`. (The process now exits gracefully with an appropriate error message.) (Bug#13611 [<http://bugs.mysql.com/13611>])
- Multiple race conditions existed in OpenSSL, particularly noticeable on Solaris. (Bug#9270 [<http://bugs.mysql.com/9270>])
- With `--log-slave-updates` `Exec_master_log_pos` of SQL thread lagged IO (Bug#13023 [<http://bugs.mysql.com/13023>])
- `PURGE MASTER LOGS` statement that used subquery for date crashed server. (Bug#10308 [<http://bugs.mysql.com/10308>])

## D.1.8. Changes in release 4.1.15 (13 October 2005)

Functionality added or changed:

The limit of 255 characters on the input buffer for `mysql` on Windows has been lifted. The exact limit depends on what the system allows, but can be up to 64K characters. A typical limit is 16K characters. (Bug#12929 [<http://bugs.mysql.com/12929>])

Added the `myisam_stats_method`, which controls whether `NULL` values in indexes are considered the same or different when collecting statistics for `MyISAM` tables. This influences the query optimizer as described in Section 7.4.7, “`MyISAM` Index Statistics Collection”. (Bug#12232 [<http://bugs.mysql.com/12232>])

- Better detection of connection timeout for replication servers on Windows allows elimination of extraneous `Lost connection` errors in the error log. (Bug#5588 [<http://bugs.mysql.com/5588>])
- When using `IF NOT EXISTS` with `CREATE DATABASE` or `CREATE TABLE`, a warning now is generated if the database or table already exists. (Bug#6008 [<http://bugs.mysql.com/6008>])
- A new command line argument was added to `mysqld` to ignore client character set information sent during handshake, and use server side settings instead, to reproduce 4.0 behavior (Bug#9948 [<http://bugs.mysql.com/9948>]):

```
mysqld --skip-character-set-client-handshake
```

Bugs fixed:

- A prepared statement failed with `Illegal mix of collations` if the client character set was `utf8` and the statement used a table that had a character set of `latin1`. (Bug#12371 [<http://bugs.mysql.com/12371>])
- If special characters such as `'_'`, `'%'`, or the escape character were included within the prefix of a column index, `LIKE` pattern matching on the indexed column did not return the correct result. (Bug#13046 [<http://bugs.mysql.com/13046>], Bug#13919 [<http://bugs.mysql.com/13919>])

- **NDBCluster**: Updating a text-type column during a cluster backup could cause the `ndbd` process to crash, due to the incorrect use of charset-normalized reads for. This could also lead to “wrong” data in the backup if such a column was updated during the backup; for example, supposing that the column used `latin_ci`, then “aAa” might be stored in the backup as “AAA”. (Bug#12950 [<http://bugs.mysql.com/12950>])
- **NDBCluster**: When performing a delete of a great many (tens of thousands of) rows at once from a Cluster table, an improperly dereferenced pointer could cause the `mysqld` process to crash. (Bug#9282 [<http://bugs.mysql.com/9282>])
- Server could over-allocate memory when performing a `FULLTEXT` search for stopwords only. (Bug#13582 [<http://bugs.mysql.com/13582>])
- `UNION` of two `DECIMAL` columns returned wrong field type. (Bug#13372 [<http://bugs.mysql.com/13372>])
- `CHECKSUM TABLE` locked `InnoDB` tables and did not use a consistent read. (Bug#12669 [<http://bugs.mysql.com/12669>])
- `SHOW CREATE TABLE` did not display any `FOREIGN KEY` clauses if a temporary file could not be created. Now `SHOW CREATE TABLE` displays an error message in an SQL comment if this occurs. (Bug#13002 [<http://bugs.mysql.com/13002>])
- Display of the `AUTO_INCREMENT` attribute by `SHOW CREATE TABLE` was not controlled by the `NO_FIELD_OPTIONS` SQL mode as it should have been. (Bug#7977 [<http://bugs.mysql.com/7977>])
- For `VARCHAR` columns with the `ucs2` character set, `InnoDB` trimmed trailing `0x20` bytes rather than `0x0020` words, resulting in incorrect index lookups later. (Bug#12178 [<http://bugs.mysql.com/12178>])
- MySQL programs in binary distributions for Solaris 8/9/10 x86 systems would not run on Pentium III machines. (Bug#6772 [<http://bugs.mysql.com/6772>])
- **NDB Cluster**: Multiple `ndb_mgmd` processes in a cluster would not know each other's IP addresses. (Bug#12037 [<http://bugs.mysql.com/12037>])
- **NDB Cluster**: With two `mgmd` processes in a cluster, `ndb_mgm` output for `SHOW` would display the same IP address for both processes, even when they were on different hosts. (Bug#11595 [<http://bugs.mysql.com/11595>])
- The `--replicate-rewrite-db` and `--replicate-do-table` options did not work for statements in which tables were aliased to names other than those listed by the options. (Bug#11139 [<http://bugs.mysql.com/11139>])
- After running `configure` with the `--with-embedded-privilege-control` option, the embedded server failed to build. (Bug#13501 [<http://bugs.mysql.com/13501>])
- Queries against a `MERGE` table that has a composite index could produce incorrect results. (Bug#9112 [<http://bugs.mysql.com/9112>])
- Comparisons involving row constructors containing constants could cause a server crash. (Bug#13356 [<http://bugs.mysql.com/13356>])
- MySQL would pass an incorrect key length to storage engines for `MIN()`. This could cause warnings such as `InnoDB: Warning: using a partial-field key prefix in search.` in the `.err` log. (Bug#13218 [<http://bugs.mysql.com/13218>], same as Bug#11039 [<http://bugs.mysql.com/11039>] in MySQL 5.0.7)

- `NDB Cluster: LOAD DATA INFILE` with a large data file failed. ([Bug#10694](http://bugs.mysql.com/10694))
- `NDB Cluster`: Adding an index to a table with a large number of columns (more than 100) crashed the storage node. ([Bug#13316](http://bugs.mysql.com/13316))
- Aggregate functions sometimes incorrectly were allowed in the `WHERE` clause of `UPDATE` and `DELETE` statements. ([Bug#13180](http://bugs.mysql.com/13180))
- `MIN()` and `MAX()` sometimes returned a non-`NULL` value for an empty row set (for example, `SELECT MAX(1) FROM empty_table`). ([Bug#12882](http://bugs.mysql.com/12882))
- `LOAD DATA INFILE` did not respect the `NO_AUTO_VALUE_ON_ZERO` SQL mode setting. ([Bug#12053](http://bugs.mysql.com/12053))
- Use of a user-defined function within the `HAVING` clause of a query resulted in an `Unknown column` error. ([Bug#11553](http://bugs.mysql.com/11553))
- The data type for `DECIMAL` columns was not respected when updating the column from another column. For example, updating a `DECIMAL(10,1)` column with the value from a `DECIMAL(10,5)` column resulted in a `DECIMAL(10,5)` value being stored. Similarly, altering a column with a `DECIMAL(10,5)` datatype to a `DECIMAL(10,1)` data type did not properly convert data values. ([Bug#7598](http://bugs.mysql.com/7598))
- `NDB`: A cluster shutdown following the crash of a data node would fail to terminate the remaining node processes, even though `ndb_mgm` showed the shutdown request as having been completed. ([Bug#10938](http://bugs.mysql.com/10938), [Bug#9996](http://bugs.mysql.com/9996), [Bug#11623](http://bugs.mysql.com/11623))
- For queries with `DISTINCT` and `WITH ROLLUP`, the `DISTINCT` should be applied after the rollup operation, but was not always. ([Bug#12887](http://bugs.mysql.com/12887))
- The counters for the `Key_read_requests`, `Key_reads`, `Key_write_requests`, and `Key_writes` status variables were changed from `unsigned long` to `unsigned longlong` to accommodate larger values before the variables roll over and restart from 0. ([Bug#12920](http://bugs.mysql.com/12920))
- A column that can be `NULL` was not handled properly for `WITH ROLLUP` in a subquery or view. ([Bug#12885](http://bugs.mysql.com/12885))
- Shared-memory connections were not working on Windows. ([Bug#12723](http://bugs.mysql.com/12723))
- A concurrency problem for `CREATE ... SELECT` could cause a server crash. ([Bug#12845](http://bugs.mysql.com/12845))
- Performing an `IS NULL` check on the `MIN()` or `MAX()` of an indexed column in a complex query could produce incorrect results. ([Bug#12695](http://bugs.mysql.com/12695))
- The `NDB START BACKUP` command could be interrupted by a `SHOW` command. ([Bug#13054](http://bugs.mysql.com/13054))
- The `LIKE ... ESCAPE` syntax produced invalid results when escape character was larger than one byte. ([Bug#12611](http://bugs.mysql.com/12611))
- A client connection thread cleanup problem caused the server to crash when closing the connection if the binary log was enabled. ([Bug#12517](http://bugs.mysql.com/12517))
- `CHECKSUM TABLE` command returned incorrect results for tables with deleted rows. After upgrad-

- ing, users who used stored checksum information to detect table changes should rebuild their checksum data. (Bug#12296 [<http://bugs.mysql.com/12296>])
- The value of `character_set_results` could be set to `NULL`, but returned the string "NULL" when retrieved. (Bug#12363 [<http://bugs.mysql.com/12363>])
  - `GROUP_CONCAT()` ignored an empty string if it was the first value to occur in the result. (Bug#12863 [<http://bugs.mysql.com/12863>])
  - Outer join elimination was erroneously applied for some queries that used a `NOT BETWEEN` condition, an `IN(value_list)` condition, or an `IF()` condition. (Bug#12101 [<http://bugs.mysql.com/12101>], Bug#12102 [<http://bugs.mysql.com/12102>])
  - Reverted a change introduced in MySQL 4.1.13 to fix a problem of `SHOW FIELDS` truncating the `TYPE` column to 40 characters. This fix was reverted for MySQL 4.1 because it broke existing applications. The fix will be made to MySQL 5.0 instead (5.0.13). (Bug#7142 [<http://bugs.mysql.com/7142>], Bug#12817 [<http://bugs.mysql.com/12817>])
  - On HP-UX 11.x (PA-RISC), the `-L` option caused `mysqlimport` to crash. (Bug#12958 [<http://bugs.mysql.com/12958>])
  - After changing the character set with `SET CHARACTER SET`, the result of the `GROUP_CONCAT()` function was not converted to the proper character set. (Bug#12829 [<http://bugs.mysql.com/12829>])
  - `mysisampack` did not properly pack `BLOB` values larger than  $2^{24}$  bytes. (Bug#4214 [<http://bugs.mysql.com/4214>])
  - The server crashed when one thread resized the query cache while another thread was using it. (Bug#12848 [<http://bugs.mysql.com/12848>])
  - `mysqld_multi` now quotes arguments on command lines that it constructs to avoid problems with arguments that contain shell metacharacters. (Bug#11280 [<http://bugs.mysql.com/11280>])
  - When any `--replicate-wild-*` option is used, the slave ignores `SET ONE_SHOT TIME_ZONE` statements as belonging to a non-replicated table. (Bug#12542 [<http://bugs.mysql.com/12542>])
  - Deadlock occurred when several account management statements were run (particularly between `FLUSH PRIVILEGES/SET PASSWORD` and `GRANT/REVOKE` statements). (Bug#12423 [<http://bugs.mysql.com/12423>])
  - On Windows, the server was preventing tables from being created if the table name was a prefix of a forbidden name. For example, `nul` is a forbidden name because it's the same as a Windows device name, but a table with the name of `n` or `nu` was being forbidden as well. (Bug#12325 [<http://bugs.mysql.com/12325>])
  - `InnoDB` was too permissive with `LOCK TABLE ... READ LOCAL` and allowed new inserts into the table. Now `READ LOCAL` is equivalent to `READ` for `InnoDB`. This will cause slightly more locking in `mysqldump`, but makes `InnoDB` table dumps consistent with `MyISAM` table dumps. (Bug#12410 [<http://bugs.mysql.com/12410>])
  - The `have_innodb` read-only system variable could not be selected with `SELECT @@have_innodb`. (Bug#9613 [<http://bugs.mysql.com/9613>])
  - A `UNION` of long `utf8 VARCHAR` columns was sometimes returned as a column with a `LONG-TEXT` data type rather than `VARCHAR`. This could prevent such queries from working at all if selected into a `MEMORY` table because the `MEMORY` storage engine does not support the `TEXT` data types. (Bug#12537 [<http://bugs.mysql.com/12537>])

- **NDB Cluster**: Corrected the parsing of the `CLUSTERLOG` command by `ndb_mgm` to allow multiple items. (Bug#12833 [<http://bugs.mysql.com/12833>])
- **NDB Cluster**: Improved error messages related to filesystem issues. (Bug#11218 [<http://bugs.mysql.com/11218>])
- **NDB Cluster**: When a schema was detected to be corrupt, `ndb` neglected to close it, resulting in a “file already open” error if the schema was opened again later. written. (Bug#12027 [<http://bugs.mysql.com/12027>])
- **NDB Cluster**: When it could not copy a fragment, `ndbd` exited without printing a message about the condition to the error log. Now the message is written. (Bug#12900 [<http://bugs.mysql.com/12900>])
- **NDB Cluster**: When a disk full condition occurred, `ndbd` exited without printing a message about the condition to the error log. Now the message is written. (Bug#12716 [<http://bugs.mysql.com/12716>])
- If a client has opened an **InnoDB** table for which the `.ibd` file is missing, **InnoDB** would not honor a `DROP TABLE` statement for the table. (Bug#12852 [<http://bugs.mysql.com/12852>])
- `SELECT GROUP_CONCAT( . . . ) FROM DUAL` in a subquery could cause the client to hang. (Bug#12861 [<http://bugs.mysql.com/12861>])
- **NDB Cluster**: Bad values in `config.ini` caused `ndb_mdmd` to crash. (Bug#12043 [<http://bugs.mysql.com/12043>])
- `TRUNCATE TABLE` did not work with **TEMPORARY InnoDB** tables. (Bug#11816 [<http://bugs.mysql.com/11816>])
- `ALTER TABLE db_name.t RENAME t` did not move the table to default database unless the new name was qualified with the database name. (Bug#11493 [<http://bugs.mysql.com/11493>])
- Spatial index corruption could occur during updates. (Bug#9645 [<http://bugs.mysql.com/9645>])
- If a `DROP DATABASE` fails on a master server due to the presence of a non-database file in the database directory, the master have the database tables deleted, but not the slaves. To deal with failed database drops, we now write `DROP TABLE` statements to the binary log for the tables so that they are dropped on slaves. (Bug#4680 [<http://bugs.mysql.com/4680>])
- `DELETE` or `UPDATE` for an indexed **MyISAM** table could fail. This was due to a change in end-space comparison behavior from 4.0 to 4.1. (Bug#12565 [<http://bugs.mysql.com/12565>])
- The **ARCHIVE** storage engine does not support deletes, but it was possible to delete by using `DELETE` or `TRUNCATE TABLE` with a **FEDERATED** table that points to an **ARCHIVE** table. (Bug#12836 [<http://bugs.mysql.com/12836>])
- Queries that created implicit temporary tables could return incorrect data types for some columns. (Bug#11718 [<http://bugs.mysql.com/11718>])
- An optimizer estimate of zero rows for a non-empty **InnoDB** table used in a left or right join could cause incomplete rollback for the table. (Bug#12779 [<http://bugs.mysql.com/12779>])
- A `SELECT DISTINCT` query with a constant value for one of the columns would return only a single row. (Bug#12625 [<http://bugs.mysql.com/12625>])
- Users created using an IP address or other alias rather than a hostname listed in `/etc/hosts` could not set their own passwords. (Bug#12302 [<http://bugs.mysql.com/12302>])

- **NDB Cluster**: An `ALTER TABLE` command caused loss of data stored prior to the issuing of the command. (Bug#12118 [<http://bugs.mysql.com/12118>])
- **MEMORY** tables using **B-Tree** index on 64-bit platforms could produce false table is full errors. (Bug#12460 [<http://bugs.mysql.com/12460>])
- MySQL failed to compile when `--with-ndb-ccflags` was specified. (Bug#11538 [<http://bugs.mysql.com/11538>])
- On Windows when the `--innodb_buffer_pool_ave_mem_mb` option has been given, the server detects whether AWE support is available and has been compiled into the server, and displays an appropriate error message if not. (Bug#6581 [<http://bugs.mysql.com/6581>])

## D.1.9. Changes in release 4.1.14 (17 August 2005)

Functionality added or changed:

- `SHOW CHARACTER SET` and `INFORMATION_SCHEMA` now properly report the `Latin1` character set as `cp1252`. (Bug#11216 [<http://bugs.mysql.com/11216>])
- **MySQL Cluster**: A new `-P` option is available for use with the `ndb_mgmd` client. When called with this option, `ndb_mgmd` prints all configuration data to `stdout`, then exits.
- The output of `perror --help` now displays the `--ndb` option. (Bug#11999 [<http://bugs.mysql.com/11999>])
- **NDB**: Improved handling of the configuration variables `NoOfPagesToDiskDuringRestartACC`, `NoOfPagesToDiskAfterRestartACC`, `NoOfPagesToDiskDuringRestartTUP`, and `NoOfPagesToDiskAfterRestartTUP` should result in noticeably faster start-up times for MySQL Cluster. (Bug#12149 [<http://bugs.mysql.com/12149>])
- Added support of where clause for queries with `FROM DUAL`. (Bug#11745 [<http://bugs.mysql.com/11745>])
- Added an optimization that avoids key access with `NULL` keys for the `ref` method when used in outer joins. (Bug#12144 [<http://bugs.mysql.com/12144>])
- Added new query cache test for the embedded server to the test suite, there are now specific tests for the embedded and non-embedded servers. (Bug#9508 [<http://bugs.mysql.com/9508>])

Bugs fixed:

- If a thread (connection) has tables locked, the query cache is switched off for that thread. This prevents invalid results where the locking thread inserts values between a second thread connecting and selecting from the table. (Bug#12385 [<http://bugs.mysql.com/12385>])
- Prepared statement parameters could cause errors in the binary log if the character set was `cp932`. (Bug#11338 [<http://bugs.mysql.com/11338>])
- Queries with subqueries that contain outer joins could return wrong results. (Bug#11479 [<http://bugs.mysql.com/11479>])
- Slave I/O threads were considered to be in the running state when launched (rather than after successfully connecting to the master server), resulting in incorrect `SHOW SLAVE STATUS` output. (Bug#10780 [<http://bugs.mysql.com/10780>])

- On Windows, the server could crash during shutdown if both replication threads and normal client connection threads were active. (Bug#11796 [http://bugs.mysql.com/11796])
- Some subqueries of the form `SELECT ... WHERE ROW(...) IN (subquery)` were being handled incorrectly. (Bug#11867 [http://bugs.mysql.com/11867])
- The `mysql_info()` C API function could return incorrect data when executed as part of a multi-statement that included a mix of statements that do and do not return information. (Bug#11688 [http://bugs.mysql.com/11688])
- Renamed the `rest()` macro in `my_list.h` to `list_rest()` to avoid name clashes with user code. (Bug#12327 [http://bugs.mysql.com/12327])
- `myisampack` failed to delete `.TMD` temporary files when run with `-T` option. (Bug#12235 [http://bugs.mysql.com/12235])
- Concatenating `USER()/DATABASE()` with a column produces invalid results. (Bug#12351 [http://bugs.mysql.com/12351])
- For PKG installs on Mac OS X, the preinstallation and postinstallation scripts were being run only for new installations and not for upgrade installations, resulting in an incomplete installation process. (Bug#11380 [http://bugs.mysql.com/11380])
- User variables were not automatically cast for comparisons, causing queries to fail if the column and connection character sets differed. Now when mixing strings with different character sets but the same coercibility, allow conversion if one character set is a superset of the other. (Bug#10892 [http://bugs.mysql.com/10892])
- Pathame values for options such as `---basedir` or `--datadir` didn't work on Japanese Windows machines for directory names containing multi-byte characters having a second byte of `0x5C` (`'\``). (Bug#5439 [http://bugs.mysql.com/5439])
- Mishandling of comparison for rows containing `NULL` values against rows produced by an `IN` subquery could cause a server crash. (Bug#12392 [http://bugs.mysql.com/12392])
- `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` could fail with an erroneous "Column '`col_name`' specified twice" error. (Bug#10109 [http://bugs.mysql.com/10109])
- `myisam.test` failed when server compiled using `--without-geometry` option. (Bug#11083 [http://bugs.mysql.com/11083])
- Creation of the `mysql` group account failed during the RPM installation. (Bug#12348 [http://bugs.mysql.com/12348])
- `FLUSH TABLES WITH READ LOCK` combined with `LOCK TABLE ... WRITE` caused deadlock. (Bug#9459 [http://bugs.mysql.com/9459])
- `GROUP_CONCAT` ignores the `DISTINCT` modifier when used in a query joining multiple tables where one of the tables has a single row. (Bug#12095 [http://bugs.mysql.com/12095])
- `UNION` query with `FULLTEXT` could cause server crash. (Bug#11869 [http://bugs.mysql.com/11869])
- Performing `DATE(LEFT(column, 8))` on a `DATE` column produces incorrect results. (Bug#12266 [http://bugs.mysql.com/12266])
- `max_connections_per_hour` setting was being capped by unrelated `max_user_connections` setting. (Bug#9947 [http://bugs.mysql.com/9947])

- `big5` strings were not being stored in `FULLTEXT` index. (Bug#12075 [http://bugs.mysql.com/12075])
- Updated dependency list for RPM builds to include missing dependencies such as `useradd` and `groupadd`. (Bug#12233 [http://bugs.mysql.com/12233])
- Multiplying `ABS()` output by a negative number would return incorrect results. (Bug#11402 [http://bugs.mysql.com/11402])
- `SELECT @@local...` returned `@@session...` in the column header. (Bug#10724 [http://bugs.mysql.com/10724])
- Character data truncated when GBK characters `0xA3A0` and `0xA1` are present. (Bug#11987 [http://bugs.mysql.com/11987])
- Comparisons like `SELECT "A\\" LIKE "A\\";` fail when using `SET NAMES utf8;`. (Bug#11754 [http://bugs.mysql.com/11754])
- Attempting to repair a table having a fulltext index on a column containing words whose length exceeded 21 characters and where `myisam_repair_threads` was greater than 1 would crash the server. (Bug#11684 [http://bugs.mysql.com/11684])
- Two threads could potentially initialize different characters sets and overwrite each other. (Bug#12109 [http://bugs.mysql.com/12109])
- `NDB`: Attempting to create or drop tables during a backup would cause the cluster to shut down. (Bug#11942 [http://bugs.mysql.com/11942])
- `NDB_MGMD` was leaking file descriptors. (Bug#11898 [http://bugs.mysql.com/11898])
- `NDB` ignored the `Hostname` option in the `NDBD DEFAULT` section of the `NDB` configuration file. (Bug#12028 [http://bugs.mysql.com/12028])
- The temporary tables created by an `ALTER TABLE` on a cluster table were visible to all MySQL servers. (Bug#12055 [http://bugs.mysql.com/12055])
- For prepared statements, the SQL parser did not disallow ‘?’ parameter markers immediately adjacent to other tokens, which could result in malformed statements in the binary log. (For example, `SELECT * FROM t WHERE? = 1` could become `SELECT * FROM t WHERE0 = 1.`) (Bug#11299 [http://bugs.mysql.com/11299])
- `GROUP_CONCAT()` sometimes returned a result with a different collation from that of its arguments. (Bug#10201 [http://bugs.mysql.com/10201])
- When two threads compete for the same table, a deadlock could occur if one thread has also a lock on another table through `LOCK TABLES` and the thread is attempting to remove the table in some manner and the other thread want locks on both tables. (Bug#10600 [http://bugs.mysql.com/10600])
- Incorrect error message displayed if user attempted to create a table in a non-existing database using `CREATE database_name.table_name` syntax. (Bug#10407 [http://bugs.mysql.com/10407])
- The `LPAD()` and `RPAD()` functions returned the wrong length to `mysql_fetch_fields()`. (Bug#11311 [http://bugs.mysql.com/11311])
- The C API function `mysql_statement_reset()` did not clear error information. (Bug#11183 [http://bugs.mysql.com/11183])
- Multiple-table `UPDATE` queries using `CONVERT_TZ()` would fail with an error. (Bug#9979 [http://bugs.mysql.com/9979])

- `mysql_fetch_fields()` returned incorrect length information for `MEDIUM` and `LONG TEXT` and `BLOB` columns. (Bug#9735 [<http://bugs.mysql.com/9735>])
- `LIKE` pattern matching using prefix index didn't return correct result. (Bug#11650 [<http://bugs.mysql.com/11650>])
- The MySQL server had issues with certain combinations of `basedir` and `datadir`. (Bug#7249 [<http://bugs.mysql.com/7249>])
- `mysql_next_result()` returns incorrect value if final query in a batch fails. (Bug#12001 [<http://bugs.mysql.com/12001>])
- `SHOW BINARY LOGS` displayed a file size of 0 for all log files but the current one if the files were not located in the data directory. (Bug#12004 [<http://bugs.mysql.com/12004>])
- Server-side prepared statements failed for columns with a character set of `ucs2`. (Bug#9442 [<http://bugs.mysql.com/9442>])
- References to system variables in an SQL statement prepared with `PREPARE` were evaluated during `EXECUTE` to their values at prepare time, not to their values at execution time. (Bug#9359 [<http://bugs.mysql.com/9359>])
- For server shutdown on Windows, error messages of the form `Forcing close of thread n user: 'name'` were being written to the error log. Now connections are closed more gracefully without generating error messages. (Bug#7403 [<http://bugs.mysql.com/7403>])
- Corrected a problem with the optimizer incorrectly adding `NOT NULL` constraints, producing in incorrect results for complex queries. (Bug#11482 [<http://bugs.mysql.com/11482>])
- Corrected an optimizer problem with `NOT NULL` constraints within a subquery in an `UPDATE` statement that resulted in a server crash. (Bug#11868 [<http://bugs.mysql.com/11868>])
- Creating a table with a `SET` or `ENUM` column with the `DEFAULT 0` clause caused a server crash if the table's character set was `utf8`. (Bug#11819 [<http://bugs.mysql.com/11819>])
- In SQL prepared statements, comparisons could fail for values not equally space-padded. For example, `SELECT 'a' = 'a '`; returns 1, but `PREPARE s FROM 'SELECT ?=?'; SET @a = 'a', @b = 'a '; PREPARE s FROM 'SELECT ?=?'; EXECUTE s USING @a, @b;` incorrectly returned 0. (Bug#9379 [<http://bugs.mysql.com/9379>])
- `InnoDB`: Do not flush after each write, not even before setting up the doublewrite buffer. Flushing can be extremely slow on some systems. (Bug#12125 [<http://bugs.mysql.com/12125>])
- `ISO-8601` formatted dates were not being parsed correctly. (Bug#7308 [<http://bugs.mysql.com/7308>])

## D.1.10. Changes in release 4.1.13 (15 July 2005)

Functionality added or changed:

- Security improvement: Applied a patch that addresses a `zlib` data vulnerability that could result in a buffer overflow and code execution. (CVE-2005-2096 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-2096>]) (Bug#11844 [<http://bugs.mysql.com/11844>]). Shortly after MySQL 4.1.13 was released, a second potential `zlib` security flaw was discovered and fixed - the issue is tracked by the Mitre CVE ID (CVE-2005-1849 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-1849>]). A patch for this flaw was ap-

plied on top of the 4.1.13 sources and published as 4.1.13a. The affected binaries have been rebuilt.

- Security improvement: Applied a patch to fix a UDF library-loading vulnerability that could result in a buffer overflow and code execution. (<http://www.appsecinc.com/resources/alerts/mysql/2005-002.html>)
- **Warning: Incompatible change:** Previously, conversion of `DATETIME` values to numeric form by adding zero produced a result in `YYYYMMDDHHMMSS` format. The result of `DATETIME+0` is now in `YYYYMMDDHHMMSS.000000` format. ([Bug#12268](http://bugs.mysql.com/12268) [<http://bugs.mysql.com/12268>])
- Added the `--add-drop-database` option to `mysqldump`. ([Bug#3716](http://bugs.mysql.com/3716) [<http://bugs.mysql.com/3716>])
- Added `mysql_set_character_set()` C API function for setting the default character set of the current connection. This allows clients to affect the character set used by `mysql_real_escape_string()`. ([Bug#8317](http://bugs.mysql.com/8317) [<http://bugs.mysql.com/8317>])
- `MEMORY` tables now support indexes of up to 500 bytes. See [Section 14.4, “The MEMORY \(HEAP\) Storage Engine”](#). ([Bug#10566](http://bugs.mysql.com/10566) [<http://bugs.mysql.com/10566>])
- System variables are now treated as having `SYSVAR` (system constant) coercibility. For example, `@@version` is now treated like `VERSION()` and `@@character_set_client` is now treated like `CHARSET( USER() )`. See [Section 10.5.4, “Some Special Cases Where the Collation Determination Is Tricky”](#). ([Bug#10904](http://bugs.mysql.com/10904) [<http://bugs.mysql.com/10904>])
- The statements `CREATE TABLE`, `TRUNCATE TABLE`, `DROP DATABASE`, and `CREATE DATABASE` cause an implicit commit. ([Bug#6883](http://bugs.mysql.com/6883) [<http://bugs.mysql.com/6883>])
- Added the `--log-slow-admin-statements` server option to request logging of slow administrative statements such as `OPTIMIZE TABLE`, `ANALYZE TABLE`, and `ALTER TABLE` to the slow query log. These statements were logged in MySQL 4.0, but not in 4.1. ([Bug#9141](http://bugs.mysql.com/9141) [<http://bugs.mysql.com/9141>])
- `SHOW BINARY LOGS` now displays a `File_size` column that indicates the size of each file.
- You can again refer to other tables in the `ON DUPLICATE KEY UPDATE` part of an `INSERT ... SELECT` statement as long as there is no `GROUP BY` in the `SELECT` part. One side effect of this is that you may have to qualify non-unique column names in the values part of `ON DUPLICATE KEY UPDATE`. ([Bug#9728](http://bugs.mysql.com/9728) [<http://bugs.mysql.com/9728>], [Bug#8147](http://bugs.mysql.com/8147) [<http://bugs.mysql.com/8147>])
- The `table`, `type`, and `rows` columns of `EXPLAIN` output can now be `NULL`. This is required for using `EXPLAIN` on `SELECT` queries that use no tables, such as `EXPLAIN SELECT 1`. ([Bug#9899](http://bugs.mysql.com/9899) [<http://bugs.mysql.com/9899>])
- Expanded on information provided in general log and slow query log for prepared statements. ([Bug#8367](http://bugs.mysql.com/8367) [<http://bugs.mysql.com/8367>], [Bug#9334](http://bugs.mysql.com/9334) [<http://bugs.mysql.com/9334>])
- **InnoDB:** When creating or extending an InnoDB data file, allocate at most one megabyte at a time for initializing the file. Previously, InnoDB used to allocate and initialize 1 or 8 megabytes of memory, even if a few 16-kilobyte pages were to be written. This fix improves the performance of `CREATE TABLE` in `innodb_file_per_table` mode.

Bugs fixed:

- **Security fix:** On Windows systems, a user with any of the following privileges

- [REFERENCES](#)
- [CREATE TEMPORARY TABLES](#)
- [GRANT OPTION](#)
- [CREATE](#)
- [SELECT](#)

on \*.\* could crash `mysqld` by issuing a `USE LPT1;` or `USE PRN;` command. In addition, any of the commands `USE NUL;`, `USE CON;`, `USE COM1;`, or `USE AUX;` would report success even though the database was not in fact changed. ([Bug#9148](#) [<http://bugs.mysql.com/9148>], [CVE-2005-0799](#) [<http://cve.mitre.org/cvename.cgi?name=CVE-2005-0799>])

- A `CREATE TABLE db_name.tbl_name LIKE ...` statement would crash the server when no database was selected. ([Bug#11028](#) [<http://bugs.mysql.com/11028>])
- IP addresses not shown in `ndb_mgm SHOW` command on second `ndb_mgmd` (or on `ndb_mgmd` restart). ([Bug#11596](#) [<http://bugs.mysql.com/11596>])
- `SHOW FIELDS` truncated the `TYPE` column to 40 characters. ([Bug#7142](#) [<http://bugs.mysql.com/7142>], [Bug#12817](#) [<http://bugs.mysql.com/12817>]) (Note: This fix was reverted in MySQL 4.1.15 because it broke existing applications.)
- Prepared statement with subqueries returned corrupt data. ([Bug#11458](#) [<http://bugs.mysql.com/11458>])
- A `ROLLUP` query could return a wrong result set when its `GROUP BY` clause contained references to the same column. ([Bug#11543](#) [<http://bugs.mysql.com/11543>])
- Queries with subqueries in the `FROM` clause were not being added to the query cache. ([Bug#11522](#) [<http://bugs.mysql.com/11522>])
- Possible crash on Windows when performing `GROUP BY` on a calculated field. ([Bug#11414](#) [<http://bugs.mysql.com/11414>])
- The `mysql_config` script did not handle symbolic linking properly. ([Bug#10986](#) [<http://bugs.mysql.com/10986>])
- When used within a subquery, `SUBSTRING()` returned an empty string. ([Bug#10269](#) [<http://bugs.mysql.com/10269>])
- On Mac OS X, `libmysqlclient_r.a` now is built with `--fno-common` to make it possible to link a shared two-level namespace library against `libmysqlclient_r.a`. ([Bug#10638](#) [<http://bugs.mysql.com/10638>])
- The handling by the `HEX()` function of numbers larger than  $2^{64}$  was improved. ([Bug#9854](#) [<http://bugs.mysql.com/9854>])
- Added a missing mutex when rotating the relay logs. Also, the server now logs an error message if the size of a relay log cannot be read. ([Bug#6987](#) [<http://bugs.mysql.com/6987>])
- Added a missing mutex when rotating the relay logs. Also, the server now logs an error message if the size of a relay log cannot be read. ([Bug#6987](#) [<http://bugs.mysql.com/6987>])
- `mysqldump` could crash for illegal or non-existent table names. ([Bug#9358](#) [<http://bugs.mysql.com/9358>])

- The `--no-data` option for `mysqldump` was being ignored if table names were given after the database name. (Bug#9558 [<http://bugs.mysql.com/9558>])
- `mysqldump` now exports `HASH` index definitions using `USING` rather than `TYPE` when the index name is optional. This corrects a problem when reloading the output for `PRIMARY KEY` definition, because `TYPE` must be preceded an index name, which is not given for a `PRIMARY KEY`. (Bug#11635 [<http://bugs.mysql.com/11635>])
- The `--master-data` option for `mysqldump` resulted in no error if the binary log was not enabled. Now an error occurs unless the `--force` option is given. (Bug#11678 [<http://bugs.mysql.com/11678>])
- Corrected an optimization failure where a query returned an incorrect result for use of a newly populated table until the table was flushed. (Bug#11700 [<http://bugs.mysql.com/11700>])
- Modifying a `CHAR` column with the `utf8` character set to a shorter length did not properly truncate values due to not computing their length in `utf8` character units. (Bug#11591 [<http://bugs.mysql.com/11591>])
- `DES_ENCRYPT()` and `DES_DECRYPT()` require SSL support to be enabled, but were not checking for it. Checking for incorrect arguments or resource exhaustion was also improved for these functions. (Bug#10589 [<http://bugs.mysql.com/10589>])
- Invoking the `DES_ENCRYPT()` function could cause a server crash if the server was started without the `--des-key-file` option. (Bug#11643 [<http://bugs.mysql.com/11643>])
- Selecting the result of an aggregate function for an `ENUM` or `SET` column within a subquery could result in a server crash. (Bug#11821 [<http://bugs.mysql.com/11821>])
- When used in joins, `SUBSTRING()` failed to truncate to zero those string values that could not be converted to numbers. (Bug#10124 [<http://bugs.mysql.com/10124>])
- Error when performing `GROUP BY` on calculated values of a single row table. (Bug#11414 [<http://bugs.mysql.com/11414>])
- `mysqldump --xml` did not format `NULL` column values correctly. (Bug#9657 [<http://bugs.mysql.com/9657>])
- `SHOW WARNINGS` did not properly display warnings generated by executing a cached query. (Bug#9414 [<http://bugs.mysql.com/9414>])
- Temporary tables were created in the data directory instead of `tmpdir`. (Bug#11440 [<http://bugs.mysql.com/11440>])
- `LOAD DATA ... REPLACE INTO ...` on a replication slave failed for an `InnoDB` table having a unique index in addition to the primary key. (Bug#11401 [<http://bugs.mysql.com/11401>])
- MySQL would not compile correctly on QNX due to missing `rint()` function. (Bug#11544 [<http://bugs.mysql.com/11544>])
- Incorrect results when searching using `IN()` where search items included `NULL` and `0`. (Bug#9393 [<http://bugs.mysql.com/9393>])
- NDB Cluster: When trying to open a table that could not be discovered or unpacked, cluster would return error codes which the MySQL server falsely interpreted as operating system errors. (Bug#103651 [<http://bugs.mysql.com/103651>])
- Manually inserting a row with `host=''` into `mysql.tables_priv` and performing a `FLUSH PRIVILEGES` would cause the server to crash. (Bug#11330 [<http://bugs.mysql.com/11330>])

- MySQL sometimes reported erroneously that certain character values had crashed a table when trying to convert other character sets to UTF-8. (Bug#9557 [http://bugs.mysql.com/9557])
- Using `CONCAT_WS()` on a column set `NOT NULL` caused incorrect results when used in a `LEFT JOIN`. (Bug#11469 [http://bugs.mysql.com/11469])
- `mysqld_safe` would sometimes fail to remove the pid file for the old `mysql` process after a crash. As a result, the server would fail to start due to a false `A mysqld process already exists...` error. (Bug#11122 [http://bugs.mysql.com/11122])
- For `MEMORY` tables, it was possible for updates to be performed using outdated key statistics when the updates involved only very small changes in a very few rows. This resulted in the random failures of queries such as `UPDATE t SET col = col + 1 WHERE col_key = 2;` where the same query with no `WHERE` clause would succeed. (Bug#10178 [http://bugs.mysql.com/10178])
- The `NULLIF()` function could produce incorrect results if the first argument was `NULL`. (Bug#11142 [http://bugs.mysql.com/11142])
- Optimizer performed range check when comparing unsigned integers to negative constants, could cause errors. (Bug#11185 [http://bugs.mysql.com/11185])
- Cluster failed to build with `gcc` 4.0. (Bug#11377 [http://bugs.mysql.com/11377])
- The `LAST_DAY()` failed to return `NULL` when supplied with an invalid argument. See Section 12.5, “Date and Time Functions”. (Bug#10568 [http://bugs.mysql.com/10568])
- Setting `@@SQL_MODE = NULL` caused an erroneous error message. (Bug#10732 [http://bugs.mysql.com/10732])
- Server crashed when using `GROUP BY` on the result of a `DIV` operation on a `DATETIME` value. (Bug#11385 [http://bugs.mysql.com/11385])
- Possible `NULL` values in `BLOB` columns could crash server when `BLOB` used in `GROUP BY`. (Bug#11295 [http://bugs.mysql.com/11295])
- Fixed 64 bit compiler warning for packet length in replication. (Bug#11064 [http://bugs.mysql.com/11064])
- `CASE` function returns incorrect result when its arguments are not constants and its return value is put into a regular or temporary table (temporary == created by SQL engine for `UNION`/non-indexed `GROUP BY` and such operations). (Bug#10151 [http://bugs.mysql.com/10151])
- A problem with the `my_global.h` file caused compilation of MySQL to fail on single-processor Linux systems running 2.6 kernels. (Bug#10364 [http://bugs.mysql.com/10364])
- Queries against a table using a compound index based on the length of a UTF-8 text column produced incorrect results. For example, given a table with an index defined as shown:

```
CREATE TABLE t (
  id INT NOT NULL,
  city VARCHAR(20) NOT NULL,
  KEY (city(7),id)
) TYPE=MYISAM CHARACTER SET=utf8;
```

Assuming that suitable data has been inserted into the table, then a query such as `SELECT * FROM t WHERE city = 'Durban';` would fail. (Bug#10253 [http://bugs.mysql.com/10253])

- The `mysqlhotcopy` script was not parsing the output of `SHOW SLAVE STATUS` correctly when called with the `--record_log_pos` option. (Bug#7967 [http://bugs.mysql.com/7967])

- An `UPDATE` query containing a subquery caused replication to fail. (Bug#9361 [<http://bugs.mysql.com/9361>])
- Last insert expected from a query of the form `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` would fail. (Bug#9728 [<http://bugs.mysql.com/9728>])
- `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` produced inaccurate results. (Bug#10886 [<http://bugs.mysql.com/10886>])
- `SELECT DISTINCT ... GROUP BY constant` returned multiple rows (it should return a single row). (Bug#8614 [<http://bugs.mysql.com/8614>])
- Queries of the form `UPDATE ... (SELECT ... ) SET ...` run on a replication master would crash all the slaves. (CVE-2004-4380 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-4380>], Bug#10442 [<http://bugs.mysql.com/10442>])
- `OPTIMIZE` of InnoDB table did not return 'Table is full' if out of tablespace. (Bug#8135 [<http://bugs.mysql.com/8135>])
- Queries with `ROLLUP` returned wrong results for expressions containing `GROUP BY` columns. (Bug#7894 [<http://bugs.mysql.com/7894>])
- Fixed hang/crash with Boolean full-text search where a query contained more query terms than one-third of the query length (it could be achieved with truncation operator: 'a\*b\*c\*d\*'). (Bug#7858 [<http://bugs.mysql.com/7858>])
- The `mysql` client would output a prompt twice following input of very long strings, because it incorrectly assumed that a call to the `_cgets()` function would clear the input buffer. (Bug#10840 [<http://bugs.mysql.com/10840>])
- A bug in `FIELD()` function caused the value list to contain `NULL`. (Bug#10944 [<http://bugs.mysql.com/10944>])
- A three byte buffer overflow in the client functions could cause improper exiting of the client when reading a command from the user. (Bug#10841 [<http://bugs.mysql.com/10841>])
- Fixed a problem with the `cp1250_czech_cs` collation that caused some `LIKE` comparisons to fail. (Bug#9759 [<http://bugs.mysql.com/9759>])
- Fixed a problem resolving table names with `lower_case_table_names=2` when the table name lettercase differed in the `FROM` and `WHERE` clauses. (Bug#9500 [<http://bugs.mysql.com/9500>])
- Fixed server crash due to some internal functions not taking into account that for multi-byte character sets, `CHAR` and `VARCHAR` columns could exceed 255 bytes. (Bug#11167 [<http://bugs.mysql.com/11167>])
- Fixed a portability problem testing for `crypt()` support that caused compilation problems when using OpenSSL/yaSSL on HP-UX and Mac OS X. (Bug#10675 [<http://bugs.mysql.com/10675>], Bug#11150 [<http://bugs.mysql.com/11150>])
- The hostname cache was not working. (Bug#10931 [<http://bugs.mysql.com/10931>])
- For a `MERGE` table with `MyISAM` tables in other, symlinked, databases, `SHOW CREATE TABLE` reported the `MyISAM` tables using the name of the symlinked directory rather than the database name. (Bug#8183 [<http://bugs.mysql.com/8183>])
- Fixed a server crash resulting from an attempt to allocate too much memory when `GROUP BY blob_col` and `COUNT(DISTINCT)` were used. (Bug#11088 [<http://bugs.mysql.com/11088>])

- The incorrect sequence of statements `HANDLER tbl_name READ index_name NEXT` without a preceding `HANDLER tbl_name READ index_name = (value_list)` for an InnoDB table resulted in a server crash rather than an error. (Bug#5373 [<http://bugs.mysql.com/5373>])
- `SHOW WARNINGS` with a `LIMIT 0` clause returned all messages rather than an empty result set. (Bug#11095 [<http://bugs.mysql.com/11095>])
- On Windows, with `lower_case_table_names` set to 2, using `ALTER TABLE` to alter a MEMORY or InnoDB table that had a mixed-case name also improperly changed the name to lower-case. (Bug#9660 [<http://bugs.mysql.com/9660>])
- The server timed out SSL connections too quickly on Windows. (Bug#8572 [<http://bugs.mysql.com/8572>])
- Inserting a `DOUBLE` value into a `utf8` string column crashed the server on Windows. (Bug#10714 [<http://bugs.mysql.com/10714>])
- Executing `LOAD INDEX INTO CACHE` for a table while other threads were selecting from the table caused a deadlock. (Bug#10602 [<http://bugs.mysql.com/10602>])
- Fixed a server crash resulting from `CREATE TABLE ... SELECT` that selected from a table being altered by `ALTER TABLE`. (Bug#10224 [<http://bugs.mysql.com/10224>])
- Fixed a server crash resulting from invalid string pointer when inserting into the `mysql.host` table. (Bug#10181 [<http://bugs.mysql.com/10181>])
- `GROUP_CONCAT()` with `DISTINCT` and `WITH ROLLUP` ignored `DISTINCT` for some rows. (Bug#7405 [<http://bugs.mysql.com/7405>])
- Fixed a problem creating the result set for a `UNION` that involved long string values. Values were not being converted correctly to `TEXT` values. (Bug#10025 [<http://bugs.mysql.com/10025>])
- Locking for `CREATE TABLE ... SELECT` for InnoDB tables was too weak. It allowed `INSERT` statements issued for the created table while the `CREATE TABLE` statement was still running to appear in the binary log before the `CREATE TABLE` statement. (Bug#6678 [<http://bugs.mysql.com/6678>])
- InnoDB: In `DROP DATABASE`, check for all referencing tables from other databases before dropping any tables. (Bug#10335 [<http://bugs.mysql.com/10335>])
- InnoDB: Fix bug: InnoDB wrongly complained in the `.err` log that MySQL is trying to drop a non-existent table, if tablespace ran out. (Bug#10607 [<http://bugs.mysql.com/10607>])
- Fixed an overly strict debugging assertion that caused debug server builds to fail for some `col_name = const_expr`, where `const_expr` was a constant expression such as a subquery. (Bug#10020 [<http://bugs.mysql.com/10020>])
- `SUBSTR()` did not work properly for input in the `ucs2` character set. (Bug#10344 [<http://bugs.mysql.com/10344>])
- Fixed a problem causing an incorrect result for columns that include an aggregate function as part of an expression when `WITH ROLLUP` is added to `GROUP BY`. (Bug#7914 [<http://bugs.mysql.com/7914>])
- Fixed a server crash for `INSERT ... ON DUPLICATE KEY UPDATE` with `MERGE` tables, which do not have unique indexes. (Bug#10400 [<http://bugs.mysql.com/10400>])
- `CREATE TABLE t AS SELECT UUID()` created a `VARCHAR(12)` column, which is too small

to hold the 36-character result from `UUID()`. (Bug#9535 [http://bugs.mysql.com/9535])

- Portability fix for Cygwin: Don't use `#pragma interface` or `#pragma implementation` in source files. (Bug#10241 [http://bugs.mysql.com/10241])
- Fixed a `mysqldump` crash that occurred with the `--complete-insert` option when dumping tables with a large number of long column names. (Bug#10286 [http://bugs.mysql.com/10286])
- `ALTER TABLE ... ENABLE INDEXES` treated `NULL` values as equal when collecting index statistics for `MyISAM` tables, resulting in different statistics from those generated by `ANALYZE TABLE` and causing the optimizer to make poor index choices later. The same problem occurred for bulk insert statistics collection. Now `NULL` values are treated as unequal, just as for `ANALYZE TABLE`. (Bug#9622 [http://bugs.mysql.com/9622])

## D.1.11. Changes in release 4.1.12 (13 May 2005)

**Note:** The fix for interpretation of `MERGE` table `.MRG` files (Bug#10687 [http://bugs.mysql.com/10687]) was made for Windows builds after MySQL 4.1.12 was released and is present in MySQL 4.1.12a.

Functionality added or changed:

- **Incompatible change:** The behavior of `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE` has changed when the `FIELDS TERMINATED BY` and `FIELDS ENCLOSED BY` values both are empty. Formerly, a column was read or written the display width of the column. For example, `INT(4)` was read or written using a field with a width of 4. Now columns are read and written using a field width wide enough to hold all values in the field. However, data files written before this change was made might not be reloaded correctly with `LOAD DATA INFILE` for MySQL 4.1.12 and up. This change also affects data files read by `mysqlimport` and written by `mysqldump --tab`, which use `LOAD DATA INFILE` and `SELECT ... INTO OUTFILE`. For more information, see Section 13.2.5, “`LOAD DATA INFILE` Syntax”. (Bug#12564 [http://bugs.mysql.com/12564])
- Added `--debug` option to `my_print_defaults`.
- When the server cannot read a table because it cannot read the `.frm` file, print a message that the table was created with a different version of MySQL. (This can happen if you create tables that use new features and then downgrade to an older version of MySQL.) (Bug#10435 [http://bugs.mysql.com/10435])
- New `/*>` prompt for `mysql`. This prompt indicates that a `/* ... */` comment was begun on an earlier line and the closing `*/` sequence has not yet been seen. (Bug#9186 [http://bugs.mysql.com/9186])
- Added `cp1250_croatian_ci` collation. (Bug#6505 [http://bugs.mysql.com/6505])
- Updated version of `libedit` to 2.9. (Bug#2596 [http://bugs.mysql.com/2596])
- **InnoDB:** When the maximum length of `SHOW INNODB STATUS` output would be exceeded, truncate the beginning of the list of active transactions, instead of truncating the end of the output. (Bug#5436 [http://bugs.mysql.com/5436])
- **InnoDB:** When `FOREIGN_KEY_CHECKS=0`, `ALTER TABLE` and `RENAME TABLE` will ignore any type incompatibilities between referencing and referenced columns. Thus, it will be possible to convert the character sets of columns that participate in a foreign key. Be sure to convert all tables before modifying any data! (Bug#9802 [http://bugs.mysql.com/9802])

- **InnoDB:** Setting the initial `AUTO_INCREMENT` value for an InnoDB table using `CREATE TABLE ... AUTO_INCREMENT = n` now works, and `ALTER TABLE ... AUTO_INCREMENT = n` resets the current value. (Bug#7061 [http://bugs.mysql.com/7061])
- **InnoDB:** If `innodb_locks_unsafe_for_binlog` option set and isolation level of the transaction is not set to serializable then InnoDB uses a consistent read for select in clauses like `INSERT INTO ... SELECT` and `UPDATE ... (SELECT)` that do not specify `FOR UPDATE` or `IN SHARE MODE`. Thus no locks are set to rows read from selected table.
- Previously in MySQL 4.1, an `Illegal mix of collations` error occurred when mixing strings from same character set when one had a non-binary collation and the other a binary collation. Now the binary collation takes precedence, so that both strings are treated as having the binary collation. This restores compatibility with MySQL 4.0 behavior.
- Added the `cp932` Japanese character set.

Bugs fixed:

- **Security fix:** If `mysqld` was started with `--user=non_existent_user`, it would run using the privileges of the account it was invoked from, even if that was `root`. (Bug#9833 [http://bugs.mysql.com/9833])
- Fixed handling of floats and doubles when using prepared statement API in the embedded server. (Bug#10443 [http://bugs.mysql.com/10443])
- An error in the implementation of the `MyISAM` compression algorithm caused `myisampack` to fail with very large sets of data (total size of all the records in a single column needed to be  $\geq 3$  GB in order to trigger this issue). (Bug#8321 [http://bugs.mysql.com/8321])
- When `SELECT constant` was the final `SELECT` in a `UNION`, a trailing `LIMIT ...` worked, but a trailing `ORDER BY ...` or `ORDER BY ... LIMIT ...` did not. (Bug#10032 [http://bugs.mysql.com/10032])
- `MERGE` tables could fail on Windows due to incorrect interpretation of pathname separator characters for filenames in the `.MRG` file. (Bug#10687 [http://bugs.mysql.com/10687])
- `CHAR` and `VARCHAR` columns that used the `sjis` character set were not being saved correctly, causing the following columns to be corrupted. (Bug#10493 [http://bugs.mysql.com/10493])
- For a user-defined function invoked from within a prepared statement, the UDF's initialization routine was invoked for each execution of the statement, but the deinitialization routine was not. (It was invoked only when the statement was closed.) For UDFs that have an expensive deinit function (such as `myperl`), this bugfix will have negative performance consequences. (Bug#9913 [http://bugs.mysql.com/9913])
- Fix `CREATE TABLE ... LIKE` to work when `lower_case_table_names` is set on a case-sensitive filesystem and the source table name is not given in lowercase. (Bug#9761 [http://bugs.mysql.com/9761])
- `my_print_defaults` was ignoring the `--defaults-extra-file` option or crashing when the option was given. (Bug#9136 [http://bugs.mysql.com/9136], Bug#9851 [http://bugs.mysql.com/9851])
- For `MERGE` tables, avoid writing absolute pathnames in the `.MRG` file for the names of the constituent `MyISAM` tables so that if the data directory is moved, `MERGE` tables will not break. For `mysqld`, write just the `MyISAM` table name if it is in the same database as the `MERGE` table, and a path relative to the data directory otherwise. For the embedded servers, absolute pathnames may still be used.

- ([Bug#5964](http://bugs.mysql.com/5964) [<http://bugs.mysql.com/5964>])
- Corrected the error message for exceeding the `MAX_CONNECTIONS_PER_HOUR` limit to say `max_connections_per_hour` instead of `max_connections`. ([Bug#9947](http://bugs.mysql.com/9947) [<http://bugs.mysql.com/9947>])
  - Fixed incorrect memory block allocation for the query cache in the embedded server. ([Bug#9549](http://bugs.mysql.com/9549) [<http://bugs.mysql.com/9549>])
  - Fixed a `configure` problem in checking for capability of performing atomic operations. ([Bug#7970](http://bugs.mysql.com/7970) [<http://bugs.mysql.com/7970>])
  - `net_read_timeout` and `net_write_timeout` were not being respected on Windows. ([Bug#9721](http://bugs.mysql.com/9721) [<http://bugs.mysql.com/9721>])
  - An error occurred if you specified a default value of `TRUE` or `FALSE` for a `BOOL` column. ([Bug#9666](http://bugs.mysql.com/9666) [<http://bugs.mysql.com/9666>])
  - Corrected some failures of prepared statements for SQL (`PREPARE` plus `EXECUTE`) to return all rows for some `SELECT` statements. ([Bug#9096](http://bugs.mysql.com/9096) [<http://bugs.mysql.com/9096>], [Bug#9777](http://bugs.mysql.com/9777) [<http://bugs.mysql.com/9777>])
  - Remove extra slashes in `--tmpdir` value (for example, convert `/var//tmp` to `/var/tmp`, because they caused various errors. ([Bug#8497](http://bugs.mysql.com/8497) [<http://bugs.mysql.com/8497>])
  - Fixed a sort order problem with the `latin2_croatian_ci` collation. All tables that have indexes that use this collation will be treated as crashed. After upgrading, for each such table, you must use `CHECK TABLE` and possibly repair the table. ([Bug#6505](http://bugs.mysql.com/6505) [<http://bugs.mysql.com/6505>])
  - `mysqld` was not checking whether the PID file was successfully created. ([Bug#5843](http://bugs.mysql.com/5843) [<http://bugs.mysql.com/5843>])
  - With `DISTINCT CONCAT(col, ...)` returned incorrect results when the arguments to `CONCAT()` were columns with an integer data type declared with a display width narrower than the values in the column. (For example, if an `INT(1)` column contain `1111`.) ([Bug#4082](http://bugs.mysql.com/4082) [<http://bugs.mysql.com/4082>])
  - Fixed `configure` to properly recognize whether NTPL is available on Linux. ([Bug#2173](http://bugs.mysql.com/2173) [<http://bugs.mysql.com/2173>])
  - Fixed a portability problem in compiling `mysql.cc` with `VC++` on Windows. ([Bug#10245](http://bugs.mysql.com/10245) [<http://bugs.mysql.com/10245>])
  - `CAST(string_argument AS UNSIGNED)` didn't work for big integers above the signed range. Now this function and `CAST(string_argument AS SIGNED)` also produces warnings for wrong string arguments. ([Bug#7036](http://bugs.mysql.com/7036) [<http://bugs.mysql.com/7036>])
  - Fixed compile problem with MinGW. Thanks to Nils Durner for patch! ([Bug#8872](http://bugs.mysql.com/8872) [<http://bugs.mysql.com/8872>])
  - MySQL no longer automatically blocks IP numbers for which `gethostbyname_r()` fails when the reason is that the DNS server is down. Thanks to Jeremy Cole for patch. ([Bug#8467](http://bugs.mysql.com/8467) [<http://bugs.mysql.com/8467>])
  - Fixed a bug in the key cache that caused a core dump. ([Bug#10167](http://bugs.mysql.com/10167) [<http://bugs.mysql.com/10167>])
  - The `--delimiter` option for the `nds_select` program was non-functional. ([Bug#10287](http://bugs.mysql.com/10287) [<http://bugs.mysql.com/10287>])

- `MAX()` for an `INT UNSIGNED` (unsigned 4-byte integer) column could return negative values if the column contained values larger than  $2^{31}$ . (Bug#9298 [http://bugs.mysql.com/9298])
- Fixed a deadlock resulting from use of `FLUSH TABLES WITH READ LOCK` while an `INSERT DELAYED` statement is in progress. (Bug#7823 [http://bugs.mysql.com/7823])
- Multiple-table updates could produce spurious data-truncation warnings if they used a join across columns that are indexed using a column prefix. (Bug#9103 [http://bugs.mysql.com/9103])
- Use of a subquery that used `WITH ROLLUP` in the `FROM` clause of the main query sometimes resulted in a `Column cannot be null` error. (Bug#9681 [http://bugs.mysql.com/9681])
- `RENAME TABLE` for an `ARCHIVE` table failed if the `.arn` file was not present. (Bug#9911 [http://bugs.mysql.com/9911])
- Fixed an optimizer problem where extraneous comparisons between `NULL` values in indexed columns were being done for operators such as `=` that are never true for `NULL`. (Bug#8877 [http://bugs.mysql.com/8877])
- `SELECT ROUND(expr)` produced a different result from `CREATE TABLE ... SELECT ROUND(expr)`. (Bug#9837 [http://bugs.mysql.com/9837])
- Fixed some `awk` script portability problems in `cmd-line-utils/libedit/makelist.sh`. (Bug#9954 [http://bugs.mysql.com/9954])
- Changed metadata for result of `SHOW KEYS`: Data type for `Sub_part` column now is `SMALLINT` rather than `TINYINT` because key part length can be longer than 255. (Bug#9439 [http://bugs.mysql.com/9439])
- Fixed some problems with `myisampack` on 64-bit systems that resulted in segmentation violations. (Bug#9487 [http://bugs.mysql.com/9487])
- Fixed an optimizer bug in computing the union of two ranges for the `OR` operator. (Bug#9348 [http://bugs.mysql.com/9348])
- Fixed an index corruption problem for `MyISAM` tables that resulted from the 4.1 behavior of padding values with blanks for comparison: Dumping a table with `mysqldump`, reloading it, and then re-running the binary log against it crashed the index and necessitated a repair. (Bug#9188 [http://bugs.mysql.com/9188])
- Fixed a segmentation fault in `mysqlcheck` that occurred when the last table checked in `-auto-repair` mode returned an error (such as the table being a `MERGE` table). (Bug#9492 [http://bugs.mysql.com/9492])
- Fixed the client/server protocol for prepared statements so that reconnection works properly when the connection is killed while `reconnect` is enabled. (Bug#8866 [http://bugs.mysql.com/8866])
- `INSERT ... ON DUPLICATE KEY UPDATE` incorrectly updated a `TIMESTAMP` column to the current timestamp, even if the update list included `col_name = col_name` for that column to prevent the update. (Bug#7806 [http://bugs.mysql.com/7806])
- Starting `mysqld` with the `--skip-innodb` and `--default-storage-engine=innodb` (or `--default-table-type=innodb`) caused a server crash. (Bug#9815 [http://bugs.mysql.com/9815])
- Queries containing `CURRENT_USER()` incorrectly were registered in the query cache. (Bug#9796 [http://bugs.mysql.com/9796])
- A server installed as a Windows service and started with `--shared-memory` could not be

stopped. ([Bug#9665](http://bugs.mysql.com/9665) [<http://bugs.mysql.com/9665>])

- `mysqldump` dumped core when invoked with `--tmp` and `--single-transaction` options and a non-existent table name. ([Bug#9175](http://bugs.mysql.com/9175) [<http://bugs.mysql.com/9175>])
- Additional fix for `mysql_server_init()` and `mysql_server_end()` C API functions so that stopping and restarting the embedded server will not cause a crash. ([Bug#7344](http://bugs.mysql.com/7344) [<http://bugs.mysql.com/7344>])
- `mysql.server` no longer uses non-portable `alias` command or LSB functions. ([Bug#9852](http://bugs.mysql.com/9852) [<http://bugs.mysql.com/9852>])
- Fixed a `readline`-related crash in `mysql` when the user pressed Control-R. ([Bug#9568](http://bugs.mysql.com/9568) [<http://bugs.mysql.com/9568>])
- `TIMEDIFF()` with a negative time first argument and positive time second argument produced incorrect results. ([Bug#8068](http://bugs.mysql.com/8068) [<http://bugs.mysql.com/8068>])
- Fixed a bug that caused concurrent inserts to be allowed into the tables in the `SELECT ... UNION ...` part of `INSERT ... SELECT ... UNION ...`. This could result in the incorrect order of queries in the binary log. ([Bug#9922](http://bugs.mysql.com/9922) [<http://bugs.mysql.com/9922>])
- The warning message from `GROUP_CONCAT()` did not always indicate the correct number of lines. ([Bug#8681](http://bugs.mysql.com/8681) [<http://bugs.mysql.com/8681>])
- InnoDB: `ENUM` and `SET` columns were treated incorrectly as character strings. This bug did not manifest itself with `latin1` collations, but it caused malfunction with `utf8`. Old tables will continue to work. In new tables, `ENUM` and `SET` will be internally stored as unsigned integers. ([Bug#9526](http://bugs.mysql.com/9526) [<http://bugs.mysql.com/9526>])
- InnoDB: Avoid test suite failures caused by a locking conflict between two server instances at server shutdown/startup. This conflict on advisory locks appears to be the result of a bug in the operating system; these locks should be released when the files are closed, but somehow that does not always happen immediately in Linux. ([Bug#9381](http://bugs.mysql.com/9381) [<http://bugs.mysql.com/9381>])
- InnoDB: Prevent `ALTER TABLE` from changing the storage engine if there are foreign key constraints on the table. ([Bug#5574](http://bugs.mysql.com/5574) [<http://bugs.mysql.com/5574>], [Bug#5670](http://bugs.mysql.com/5670) [<http://bugs.mysql.com/5670>])
- InnoDB: Fixed a deadlock without any locking, simple select and update. ([Bug#7975](http://bugs.mysql.com/7975) [<http://bugs.mysql.com/7975>]) InnoDB now takes an exclusive lock when `INSERT ON DUPLICATE KEY UPDATE` is checking duplicate keys.
- InnoDB: Fix a problem in crash recovery of `.ibd` files on Windows if the user used `lower_case_table_names=0` or `2`; the directory scan in crash recovery forgot to put all paths to lower case, so that the tablespace name would be consistent with the internal data dictionary of InnoDB.
- InnoDB: Add fault tolerance in the scan of `.ibd` files at a crash recovery; formerly a single failure of `readdir_get_next` caused the rest of the directory to be skipped.
- InnoDB: Fix assertion failures of type `ut_a(cursor->old_stored == BTR_PCUR_OLD_STORED)` and `prebuilt->template_type == 0`. This bug was introduced in 4.1.10 and 4.0.24. ([Bug#9670](http://bugs.mysql.com/9670) [<http://bugs.mysql.com/9670>])
- InnoDB: Fix a performance bug: At the shutdown, write the latest lsn only to the first pages of the `ibdata` files of the system tablespace, NOT to the `.ibd` files; writing to tens of thousands `.ibd` files can take minutes.

- Fix for auto-increment not working with `INSERT . . SELECT` and NDB storage engine. (Bug#9675 [<http://bugs.mysql.com/9675>])

## D.1.12. Changes in release 4.1.11 (01 April 2005)

Functionality added or changed:

- `ONLY_FULL_GROUP_BY` no longer is included in the `ANSI` composite SQL mode. (Bug#8510 [<http://bugs.mysql.com/8510>])
- `mysqld_safe` will create the directory where the UNIX socket file is to be located if the directory does not exist. This applies only to the last component of the directory pathname. (Bug#8513 [<http://bugs.mysql.com/8513>])
- The coercibility for the return value of functions such as `USER()` or `VERSION()` now is “system constant” rather than “implicit.” This makes these functions more coercible than column values so that comparisons of the two do not result in `Illegal mix of collations` errors. `COERCIBILITY()` was modified to accommodate this new coercibility value. See Section 12.9.3, “Information Functions”.
- User variable coercibility has been changed from “coercible” to “implicit.” That is, user variables have the same coercibility as column values.
- `NULL` now is considered more coercible than string constants. This resolves some `Illegal mix of collations` conflicts.
- Modified the parser to allow `SELECT` statements following the `UNION` keyword to be subqueries in parentheses. (Bug#2435 [<http://bugs.mysql.com/2435>])
- For slave replication servers started with `--replicate-*` options, statements that should not be replicated according those options no longer are written to the slave's general query log. (Bug#8297 [<http://bugs.mysql.com/8297>])
- Added `SQL_NOTES` session variable to cause `Note`-level warnings not to be recorded. (Bug#6662 [<http://bugs.mysql.com/6662>])
- `InnoDB`: Commit after every 10,000 copied rows when executing `CREATE INDEX`, `DROP INDEX` or `OPTIMIZE TABLE`, which are internally implemented as `ALTER TABLE`. This makes it much faster to recover from an aborted operation.
- Added a new global system variable `slave_transaction_retries`: If the replication slave SQL thread fails to execute a transaction because of an `InnoDB` deadlock or exceeded `InnoDB`'s `innodb_lock_wait_timeout` or `NDBCluster`'s `TransactionDeadlockDetectionTimeout` or `TransactionInactiveTimeout`, it automatically retries `slave_transaction_retries` times before stopping with an error. The default in MySQL 4.1 is 0. You must explicitly set the value greater than 0 to enable the “retry” behavior. (In MySQL 5.0.3 or newer, the default is 10.) (Bug#8325 [<http://bugs.mysql.com/8325>])
- Added `--with-big-tables` compilation option to `configure`. (Previously it was necessary to pass `-DBIG_TABLES` to the compiler manually in order to enable large table support.) See Section 2.9.2, “Typical configure Options”, for details.
- Added configuration directives `!include` and `!includedir` for including option files and searching directories for option files. See Section 4.3.2, “Using Option Files”, for usage.

Bugs fixed:

- Disallow use of `SESSION` or `GLOBAL` for user variables. ([Bug#9286](http://bugs.mysql.com/9286) [<http://bugs.mysql.com/9286>])
- The use of `XOR` together with `NOT ISNULL( )` erroneously resulted in some outer joins being converted to inner joins by the optimizer. ([Bug#9017](http://bugs.mysql.com/9017) [<http://bugs.mysql.com/9017>])
- Fixed `utf8_spanish2_ci` and `ucs2_spanish2_ci` collations to not consider ‘r’ equal to ‘rr’. If you upgrade to this version from an earlier version, you should rebuild the indexes of affected tables. ([Bug#9269](http://bugs.mysql.com/9269) [<http://bugs.mysql.com/9269>])
- Allow extra HKSCS and cp950 characters (`big5` extension characters) to be accepted in `big5` columns. ([Bug#9357](http://bugs.mysql.com/9357) [<http://bugs.mysql.com/9357>])
- `BLOB(M)` and `TEXT(M)` columns, with `M` less than 256, were being created as `BLOB` and `TEXT` columns rather than `TINYBLOB` or `TINYTEXT` columns. ([Bug#9303](http://bugs.mysql.com/9303) [<http://bugs.mysql.com/9303>])
- Fixed a problem with `INSERT ... SELECT ... ON DUPLICATE KEY UPDATE` where a column named in the insert list and in the `ON DUPLICATE KEY UPDATE` clause was erroneously declared to be ambiguous. ([Bug#8147](http://bugs.mysql.com/8147) [<http://bugs.mysql.com/8147>])
- In prepared statements, subqueries containing parameters were erroneously treated as `const` tables during preparation, resulting in a server crash. ([Bug#8807](http://bugs.mysql.com/8807) [<http://bugs.mysql.com/8807>])
- Fixed a problem with `OPTIMIZE TABLE` for `InnoDB` tables being written twice to the binary log. ([Bug#9149](http://bugs.mysql.com/9149) [<http://bugs.mysql.com/9149>])
- Provide more informative error messages in clustered setting when a query is issued against a table that has been modified by another `mysqld` server. ([Bug#6762](http://bugs.mysql.com/6762) [<http://bugs.mysql.com/6762>])
- For `MyISAM` tables, `REPAIR TABLE` no longer discard rows that have incorrect checksum. ([Bug#9824](http://bugs.mysql.com/9824) [<http://bugs.mysql.com/9824>])
- Depending on index statistics, `GROUP BY col1, col2, ...` could return incorrect results if the first table processed for a join had several indexes that cover the grouped columns. ([Bug#9213](http://bugs.mysql.com/9213) [<http://bugs.mysql.com/9213>])
- Fixed incorrect evaluation of `ALL/ANY` subqueries that contain a `HAVING` clause. ([Bug#9350](http://bugs.mysql.com/9350) [<http://bugs.mysql.com/9350>])
- Fixed server crash when left expression of `IN/ALL/ANY` comparison was a subquery. ([Bug#8888](http://bugs.mysql.com/8888) [<http://bugs.mysql.com/8888>])
- Fixed option-parsing code for the embedded server to understand `K`, `M`, and `G` suffixes for the `net_buffer_length` and `max_allowed_packet` options. ([Bug#9472](http://bugs.mysql.com/9472) [<http://bugs.mysql.com/9472>])
- Fixed a crash when using `TIMESTAMP` columns with no minute or second parts in `GROUP BY` with the `new` system variable set to 1. ([Bug#9401](http://bugs.mysql.com/9401) [<http://bugs.mysql.com/9401>])
- If a `MyISAM` table on Windows had `INDEX DIRECTORY` or `DATA DIRECTORY` table options, `mysqldump` dumped the directory pathnames with single-backslash pathname separators. This would cause syntax errors when importing the dump file. `mysqldump` now changes ‘\’ to ‘/’ in the pathnames on Windows. ([Bug#6660](http://bugs.mysql.com/6660) [<http://bugs.mysql.com/6660>])
- Fixed a server crash caused by use of `NOW( )` is a subquery. ([Bug#8824](http://bugs.mysql.com/8824) [<http://bugs.mysql.com/8824>])

- Fixed problems with static variables to allow building on Fedora Core 3. ([Bug#6554](#) [<http://bugs.mysql.com/6554>])
- Some user variables were not being handled with “implicit” coercibility. ([Bug#9425](#) [<http://bugs.mysql.com/9425>])
- Setting the `max_error_count` system variable to 0 resulted in a setting of 1. ([Bug#9072](#) [<http://bugs.mysql.com/9072>])
- Fixed a collation coercibility problem that caused a union between binary and non-binary columns to fail. ([Bug#6519](#) [<http://bugs.mysql.com/6519>])
- Fixed a problem with the `tee` command in `mysql` that resulted in `mysql` crashing. ([Bug#8499](#) [<http://bugs.mysql.com/8499>])
- On Windows, create shared memory objects with the proper access rights to make them usable when the client and server are running under different accounts. ([Bug#8226](#) [<http://bugs.mysql.com/8226>])
- Bundled `zlib` in the source distribution was upgraded to 1.2.2. ([Bug#9118](#) [<http://bugs.mysql.com/9118>])
- Fixed server crash resulting from queries that combined `SELECT DISTINCT`, `SUM( )`, and `ROLLUP`. ([Bug#8615](#) [<http://bugs.mysql.com/8615>])
- Incorrect results were returned from queries that combined `SELECT DISTINCT`, `GROUP BY` , and `ROLLUP`. ([Bug#8616](#) [<http://bugs.mysql.com/8616>])
- Fixed a bug that under certain circumstances could allow a privilege escalation via database wildcards in `GRANT`. ([CVE-2004-0957](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0957>])
- Too many rows were returned from queries that combined `ROLLUP` and `LIMIT` if `SQL_CALC_FOUND_ROWS` was given. ([Bug#8617](#) [<http://bugs.mysql.com/8617>])
- `mysqldump` misinterpreted ‘`_`’ and ‘`%`’ characters in the names of tables to be dumped as wildcard characters. ([Bug#9123](#) [<http://bugs.mysql.com/9123>])
- Made the `relay_log_space_limit` system variable show up in the output of `SHOW VARIABLES`. ([Bug#7100](#) [<http://bugs.mysql.com/7100>])
- Use of `GROUP_CONCAT(x)` in a subquery, where `x` was an alias to a column in the outer query, resulted in a server crash. ([Bug#8656](#) [<http://bugs.mysql.com/8656>])
- The `CHARSET( )`, `COLLATION( )`, and `COERCIBILITY( )` functions sometimes returned `NULL`. `CHARSET( )` and `COLLATION( )` returned `NULL` when given any of these arguments that evaluated to `NULL`: A system function such as `DATABASE( )`; a column value; and a user variable. Now `CHARSET( )` and `COLLATION( )` return the system character set and collation; the column character set and collation; and `binary`. `COERCIBILITY(NULL)` now returns “ignorable” coercibility rather than `NULL`. ([Bug#9129](#) [<http://bugs.mysql.com/9129>])
- Expressions involving nested `CONCAT( )` calls and character set conversion of string constants could return an incorrect result. ([Bug#8785](#) [<http://bugs.mysql.com/8785>])
- The `MEMORY` storage engine did not properly increment an `AUTO_INCREMENT` column if there was a second composite index that included the column. ([Bug#8489](#) [<http://bugs.mysql.com/8489>])
- Fixed a bug in the filesort routine such that killing a filesort could cause an assertion failure. ([Bug#8799](#) [<http://bugs.mysql.com/8799>])

- `REPAIR TABLE` did not invalidate query results in the query cache that were generated from the table. (Bug#8480 [http://bugs.mysql.com/8480])
- If `max_join_size` was set, a query containing a subquery that exceeded the examined-rows limit could hang. (Bug#8726 [http://bugs.mysql.com/8726])
- Mixed-case database and table names in the grant tables were ignored for authentication if the `lower_case_table_names` system variable was set. `GRANT` will not create such privileges when `lower_case_table_names` is set, but it is possible to create them by direct manipulation of the grant tables, or that old grant records were present before setting the variable. (Bug#7989 [http://bugs.mysql.com/7989])
- `AES_DECRYPT(col_name, key)` could fail to return `NULL` for invalid values in `col_name`, if `col_name` was declared as `NOT NULL`. (Bug#8669 [http://bugs.mysql.com/8669])
- Ordering by unsigned expression (more complex than a column reference) was treating the value as signed, producing incorrectly sorted results. (Bug#7425 [http://bugs.mysql.com/7425])
- `HAVING` was treating unsigned columns as signed. (Bug#7425 [http://bugs.mysql.com/7425])
- Fixed a problem with boolean full-text searches on `utf8` columns where a double quote in the search string caused a server crash. (Bug#8351 [http://bugs.mysql.com/8351])
- `MIN(col_name)` and `MAX(col_name)` could fail to produce the correct result if `col_name` was contained in multiple indexes and the optimizer did not choose the first index that contained the column. (Bug#8893 [http://bugs.mysql.com/8893])
- Table creation for a `MyISAM` table failed if `DATA DIRECTORY` or `INDEX DIRECTORY` options were given that specified the pathname to the database directory where the table files would be created by default. (Bug#8707 [http://bugs.mysql.com/8707])
- Fixed a problem with `LIKE` pattern-matching for strings with the `cp1251_bin` binary collation. (Bug#8560 [http://bugs.mysql.com/8560])
- A join on two tables failed when each contained a `BIGINT UNSIGNED` column that were compared when their values exceeded  $2^{63} - 1$ . The match failed and the join returned no rows. (Bug#8562 [http://bugs.mysql.com/8562])
- For a query with both `GROUP BY` and `COUNT(DISTINCT)` clauses and a `FROM` clause with a subquery, `NULL` was returned for any `VARCHAR` column selected by the subquery. (Bug#8218 [http://bugs.mysql.com/8218])
- Fixed an optimizer bug that caused incorrectly ordered result from a query that used a `FULLTEXT` index to retrieve rows and there was another index that was usable for `ORDER BY`. For such a query, `EXPLAIN` showed `fulltext` join type, but regular (not `FULLTEXT`) index in the `Key` column. (Bug#6635 [http://bugs.mysql.com/6635])
- For a statement string that contained multiple slow queries, only the last one would be written to the slow query log. (Bug#8475 [http://bugs.mysql.com/8475])
- When the server was started with `--skip-name-resolve`, specifying hostname values that included netmasks in `GRANT` statements did not work. (Bug#8471 [http://bugs.mysql.com/8471])
- The `--set-character-set` option for `myisamchk` was changed to `--set-collation`. The value needed for specifying how to sort indexes is a collation name, not a character set name. (Bug#8349 [http://bugs.mysql.com/8349])
- Hostname matching didn't work if a netmask was specified for table-specific privileges. (Bug#3309 [http://bugs.mysql.com/3309])

- Binary data stored in `BLOB` or `BINARY` columns would be erroneously dumped if `mysqldump` was invoked with `--hex-blob` and `--skip-extended-insert` arguments. This happened if data contained characters larger than `0x7F` ([Bug#8830](#) [<http://bugs.mysql.com/8830>]).
- Corruption of `MyISAM` table indexes could occur with `TRUNCATE TABLE` if the table had already been opened. For example, this was possible if the table had been opened implicitly by selecting from a `MERGE` table that mapped to the `MyISAM` table. The server now issues an error message for `TRUNCATE TABLE` under these conditions. ([Bug#8306](#) [<http://bugs.mysql.com/8306>])
- Fixed handling of table-name matching in `mysqlhotcopy` to accommodate `DBD: :mysql 2.9003` and up (which implement identifier quoting). ([Bug#8136](#) [<http://bugs.mysql.com/8136>])
- In the `mysql_real_escape_string()` C API function, when a multi-byte character is encountered that is illegal in the current character set, escape only the first byte, not each byte. This avoids creating a valid character from an invalid one. ([Bug#8378](#) [<http://bugs.mysql.com/8378>])
- Fixed a problem with the `cp1250_czech_cs` collation that caused empty literal strings not to compare equal to empty character columns. ([Bug#8840](#) [<http://bugs.mysql.com/8840>])
- Fixed a problem in index cost calculation that caused a `USE INDEX` or `FORCE INDEX` hint not to be used properly for a `LEFT JOIN` across indexed `BLOB` columns. ([Bug#7520](#) [<http://bugs.mysql.com/7520>])
- The data type for `MAX(datetime_col)` was returned as `VARCHAR` rather than `DATETIME` if the query included a `GROUP BY` clause. ([Bug#5615](#) [<http://bugs.mysql.com/5615>])
- `FOUND_ROWS()` returned an incorrect value for preceding `SELECT` statements that used no table or view. ([Bug#6089](#) [<http://bugs.mysql.com/6089>])
- In string literals with an escape character (`'\`'`) followed by a multi-byte character that has a second byte of `'\`'`, the literal was not interpreted correctly. The next character now is escaped, not just the next byte. ([Bug#8303](#) [<http://bugs.mysql.com/8303>])
- InnoDB: Work around a problem in AIX 5.1 patched with ML7 security patch: InnoDB would refuse to open its `ibdata` files, complaining about an operating system error 0.
- InnoDB: Fixed a memory corruption bug if one created a table with a primary key that contained at least two column prefixes. An example: `CREATE TABLE t(a char(100), b tinyblob, PRIMARY KEY(a(5), b(10)))`.
- InnoDB: Do not try to space-pad `BLOB` columns containing `ucs2` characters. This avoids an assertion failure that was introduced when fixing [Bug#7350](#) [<http://bugs.mysql.com/7350>]. ([Bug#8771](#) [<http://bugs.mysql.com/8771>])
- InnoDB: Fixed a bug: MySQL 4.1.8 to 4.1.10 could complain that an InnoDB table created with MySQL 3.23.49 or earlier was in the new compact InnoDB table format of 5.0.3 or later, and InnoDB would refuse to use that table. There is nothing wrong with the table, it is `mysqld` that is in error. Workaround: wait that 4.1.11 is released before doing an upgrade, or dump the table and re-create it with any MySQL version `>= 3.23.50` before upgrading.
- InnoDB: Honor the `--tmpdir` startup option when creating temporary files. Previously, InnoDB temporary files were always created in the temporary directory of the operating system. On Netware, InnoDB will continue to ignore `--tmpdir`. ([Bug#5822](#) [<http://bugs.mysql.com/5822>])
- InnoDB: If MySQL wrote to its binlog, but for some reason `trx->update_undo` and `trx->insert_undo` were `NULL` in InnoDB, then `trx->commit_lsn` was garbage, and InnoDB could assert in the log flush of `trx_commit_complete_for_mysql()`. ([Bug#9277](#) [<http://bugs.mysql.com/9277>])

- **InnoDB**: If InnoDB cannot allocate memory, keep retrying for 60 seconds before we intentionally crash `mysqld`; maybe the memory shortage is just temporary.
- **InnoDB**: If one used `LOCK TABLES`, created an InnoDB temp table, and did a multiple-table update where a `MyISAM` table was the update table and the temp table was a read table, then InnoDB asserted in `row0sel.c` because `n_mysql_tables_in_use` was 0. Also, we remove the assertion altogether and just print an error to the `.err` log if this important consistency check fails. ([Bug#8677](http://bugs.mysql.com/8677) [<http://bugs.mysql.com/8677>])
- `mysqldump` now avoids writing `SET NAMES` to the dump output if the server is older than version 4.1 and would not understand that statement. ([Bug#7997](http://bugs.mysql.com/7997) [<http://bugs.mysql.com/7997>])
- Fixed a bug in `my_print_defaults` that made it ignore the `--defaults-extra-file` and `--defaults-file` options.
- Retrieving from a view defined as a `SELECT` that mixed `UNION ALL` and `UNION DISTINCT` resulted in a different result than retrieving from the original `SELECT`. ([Bug#6565](http://bugs.mysql.com/6565) [<http://bugs.mysql.com/6565>])
- Worked around a bug in support for NSS support in `glibc` when static linking is used and LDAP is one of the NSS sources. The workaround is to detect when the bug causes a segmentation fault and issue a diagnostic message with information about the problem. ([Bug#3037](http://bugs.mysql.com/3037) [<http://bugs.mysql.com/3037>], [Bug#4872](http://bugs.mysql.com/4872) [<http://bugs.mysql.com/4872>])
- If the `mysql` prompt was configured to display the default database name, and that database was dropped, `mysql` did not update the prompt. ([Bug#4802](http://bugs.mysql.com/4802) [<http://bugs.mysql.com/4802>])
- `perror` was printing a spurious extra line of output ("Error code ###: Unknown error ###" printed directly before the correct line with the error message). ([Bug#8517](http://bugs.mysql.com/8517) [<http://bugs.mysql.com/8517>])
- The `CHAR ( )` function was not ignoring `NULL` arguments, contrary to the documentation. ([Bug#6317](http://bugs.mysql.com/6317) [<http://bugs.mysql.com/6317>])
- Neither `SHOW ERRORS` nor `SHOW WARNINGS` were displaying Error-level messages. ([Bug#6572](http://bugs.mysql.com/6572) [<http://bugs.mysql.com/6572>])
- Creating a table using a name containing a character that is illegal in `character_set_client` resulted in the character being stripped from the name and no error. The character now is considered an error. ([Bug#8041](http://bugs.mysql.com/8041) [<http://bugs.mysql.com/8041>])
- Fixed a problem with the Cyrillic letters I and SHORT I being treated the same by the `utf8_general_ci` collation. ([Bug#8385](http://bugs.mysql.com/8385) [<http://bugs.mysql.com/8385>])
- The `MAX_CONNECTIONS_PER_HOUR` resource limit was not being reset hourly and thus imposed an absolute limit on number of connections per account until the server is restarted or the limits flushed. ([Bug#8350](http://bugs.mysql.com/8350) [<http://bugs.mysql.com/8350>])
- With a database was dropped with `lower_case_table_names=2`, tables in the database also were dropped but not being flushed properly from the table cache. If the database was re-created, the tables also would appear to have been re-created. ([Bug#8355](http://bugs.mysql.com/8355) [<http://bugs.mysql.com/8355>])
- Changed `mysql_server_end ( )` C API function to restore more variables to their initial state so that a subsequent call to `mysql_server_init ( )` would not cause a client program crash. ([Bug#7344](http://bugs.mysql.com/7344) [<http://bugs.mysql.com/7344>])
- Fixed a problem with accented letters improperly being treated as distinct with the `utf_general_ci` collation. ([Bug#7878](http://bugs.mysql.com/7878) [<http://bugs.mysql.com/7878>])
- `ENUM` and `SET` columns in privilege tables incorrectly had a case-sensitive collation, resulting in

failure of assignments of values that did not have the same lettercase as given in the column definitions. The collation was changed to be case insensitive. ([Bug#7617](#) [<http://bugs.mysql.com/7617>])

- An expression that tested a case-insensitive character column against string constants that differed in lettercase could fail because the constants were treated as having a binary collation. (For example, `WHERE city='London' AND city='london'` could fail.) ([Bug#7098](#) [<http://bugs.mysql.com/7098>], [Bug#8690](#) [<http://bugs.mysql.com/8690>])
- The output of the `STATUS (\s)` command in `mysql` had the values for the server and client character sets reversed. ([Bug#7571](#) [<http://bugs.mysql.com/7571>])
- If the slave was running with `--replicate-*-table` options which excluded one temporary table and included another, and the two tables were used in a single `DROP TEMPORARY TABLE IF EXISTS` statement, as the ones the master automatically writes to its binary log upon client's disconnection when client has not explicitly dropped these, the slave could forget to delete the included replicated temporary table. Only the slave needs to be upgraded. ([Bug#8055](#) [<http://bugs.mysql.com/8055>])
- Treat user variables as having `IMPLICIT` derivation (coercibility) to avoid “Illegal mix of collations” errors when replicating user variables. ([Bug#6676](#) [<http://bugs.mysql.com/6676>])
- When setting integer system variables to a negative value with `SET VARIABLES`, the value was treated as a positive value modulo  $2^{32}$ . ([Bug#6958](#) [<http://bugs.mysql.com/6958>])
- Fixed a bug in bundled `readline` library that caused segmentation fault in `mysql` when user entered Shift+Enter. ([Bug#5672](#) [<http://bugs.mysql.com/5672>])
- Fix conversion of strings `->` double to get higher accuracy for floating point values that are integers, like: `123.45E+02` ([Bug#7840](#) [<http://bugs.mysql.com/7840>]).
- Fixed a bug in `MATCH ... AGAINST` in natural language mode that could cause a server crash if the `FULLTEXT` index was not used in a join (`EXPLAIN` did not show `fulltext` join mode) and the search query matched no rows in the table ([Bug#8522](#) [<http://bugs.mysql.com/8522>]).
- Platform and architecture information in version information produced for `--version` option on Windows was always `Win95/Win98 (i32)`. More accurately determine platform as `Win32` or `Win64` for 32-bit or 64-bit Windows, and architecture as `ia32` for x86, `ia64` for Itanium, and `axp` for Alpha. ([Bug#4445](#) [<http://bugs.mysql.com/4445>])
- Fixed a rare race condition which could lead to `FLUSH TABLES WITH READ LOCK` hanging. ([Bug#8682](#) [<http://bugs.mysql.com/8682>])
- Fixed a bug in replication that caused the master to stamp generated statements (such as `SET` commands) with an `error_code` intended only for another statement. This could happen, for example, when a statements generates a duplicate key error on the master but must be replicated. ([Bug#8412](#) [<http://bugs.mysql.com/8412>])
- If multiple semicolon-separated statements were received in a single packet, they were written to the binary log as a single event rather than as separate per-statement events. For a server serving as a replication master, this caused replication to fail when the event was sent to slave servers. ([Bug#8436](#) [<http://bugs.mysql.com/8436>])

## D.1.13. Changes in release 4.1.10 (12 February 2005)

**Note:** The security improvements related to creation of table files and to user-defined functions were made after MySQL 4.1.10 was released and are present in MySQL 4.1.10a. We would like to thank Stefano Di Paola <[stefano.dipaola@wisec.it](mailto:stefano.dipaola@wisec.it)> for making us aware of these.

Functionality added or changed:

- Added back faster subquery execution from 4.1.8. This adds also back a bug from 4.1.8 in comparing `NULL` to the value of a subquery. See [Section A.8.4, “Open Issues in MySQL”](#).
- Security improvement: The server creates `.frm`, `.MYD`, `.MYI`, `.MRG`, `.ISD`, and `.ISM` table files only if a file with the same name does not already exist. Thanks to Stefano Di Paola <[stefano.dipaola@wisec.it](mailto:stefano.dipaola@wisec.it)> for finding and informing us about this issue. (CVE-2005-0711 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0711>])
- Security improvement: User-defined functions should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` by default no longer loads UDFs unless they have at least one auxiliary symbol defined in addition to the main symbol. The `--allow-suspicious-udfs` option controls whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off. `mysqld` also checks UDF filenames when it reads them from the `mysql.func` table and rejects those that contain directory pathname separator characters. (It already checked names as given in [CREATE FUNCTION](#) statements.) See [Section 19.2.4.1, “UDF Calling Sequences for Simple Functions”](#), [Section 19.2.4.2, “UDF Calling Sequences for Aggregate Functions”](#), and [Section 19.2.4.6, “User-Defined Function Security Precautions”](#). Thanks to Stefano Di Paola <[stefano.dipaola@wisec.it](mailto:stefano.dipaola@wisec.it)> for finding and informing us about this issue. (CVE-2005-0709 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0709>], CVE-2005-0710 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0710>])
- Setting the connection collation to a value different from the server collation followed by a [CREATE TABLE](#) statement that included a quoted default value resulted in a server crash. (Bug#8235 [<http://bugs.mysql.com/8235>])
- Thread stack size was increased from 192KB to 256KB on Linux/IA-64 (too small stack size was causing server crashes on some queries). (Bug#8391 [<http://bugs.mysql.com/8391>])
- From the Windows distribution, predefined accounts without passwords for remote users (“root@%”, “@%”) were removed (other distributions never had them).
- Added `mysql_library_init()` and `mysql_library_end()` as synonyms for the `mysql_server_init()` and `mysql_server_end()` C API functions. `mysql_library_init()` and `mysql_library_end()` are `#define` symbols, but the names more clearly indicate that they should be called when beginning and ending use of a MySQL C API library no matter whether the application uses `libmysqlclient` or `libmysqld`. (Bug#6149 [<http://bugs.mysql.com/6149>])
- The server now issues a warning when `lower_case_table_names=2` and the data directory is on a case-sensitive filesystem, just as when `lower_case_table_names=0` on a case-insensitive filesystem. (Bug#7887 [<http://bugs.mysql.com/7887>])
- The server now issues a warning to the error log when it encounters older tables that contain character columns that might be interpreted by newer servers to have a different column length. (Bug#6913 [<http://bugs.mysql.com/6913>]) See [Section 2.11.1, “Upgrading from MySQL 4.0 to 4.1”](#), for a discussion of this problem and what to do about it.
- InnoDB: When MySQL/InnoDB is compiled on Mac OS X 10.2 or earlier, detect the operating system version at run time and use the `fcntl()` file flush method on Mac OS X versions 10.3 and later. In Mac OS X, `fsync()` does not flush the write cache in the disk drive, but the special `fcntl()` does; however, the flush request is ignored by some external devices. Failure to flush the buffers may cause severe database corruption at power outages.
- InnoDB: A shared record lock (`LOCK_REC_NOT_GAP`) is now taken for a matching record in the

foreign key check because inserts can be allowed into gaps.

- InnoDB: Relaxed locking in `INSERT...SELECT`, single table `UPDATE...SELECT` and single table `DELETE...SELECT` clauses when `innodb_locks_unsafe_for_binlog` is used and isolation level of the transaction is not serializable. InnoDB uses consistent read in these cases for a selected table.

Bugs fixed:

- `FOUND_ROWS()` returned an incorrect value after a `SELECT SQL_CALC_FOUND_ROWS DISTINCT` statement that selected constants and included `GROUP BY` and `LIMIT` clauses. (Bug#7945 [<http://bugs.mysql.com/7945>])
- Fixed a bug in cardinality estimations for `HASH` indexes of `TEMPORARY` tables created using `MEMORY` storage engine. As a result queries that were using this index (as shown by `EXPLAIN`) could have returned incorrect results. (Bug#8371 [<http://bugs.mysql.com/8371>])
- Corrected a problem with references to `DUAL` where statements such as `SELECT 1 AS a FROM DUAL` would succeed but statements such as `SELECT 1 AS a FROM DUAL LIMIT 1` would fail. (Bug#8023 [<http://bugs.mysql.com/8023>])
- Fixed a server crash caused by `DELETE FROM tbl_name ... WHERE ... ORDER BY tbl_name.col_name` when the `ORDER BY` column was qualified with the table name. (Bug#8392 [<http://bugs.mysql.com/8392>])
- `mysqld` had problems finding its language files if the `basedir` value was specified as a very long pathname. (Bug#8015 [<http://bugs.mysql.com/8015>])
- Updates were being written to the binary log when there were `binlog-do-db` or `binlog-ignore-db` options even when there was no current database, contrary to Section 5.11.4, “The Binary Log”. (Bug#6749 [<http://bugs.mysql.com/6749>])
- Fixed conversion of floating-point values to character fields when the absolute value of the float was less than 1, and also fixed calculation of length for negative values. (Bug#7774 [<http://bugs.mysql.com/7774>])
- Column headers in query results retrieved from the query cache could be corrupted when a non-4.1 client was served a result originally generated for a 4.1 client. The query cache was not keeping track of which client/server protocol was being used. (Bug#6511 [<http://bugs.mysql.com/6511>])
- Fixed `LOAD INDEX` statement to actually load index in memory. (Bug#8452 [<http://bugs.mysql.com/8452>])
- If multiple prepared statements were executed without retrieving their results, executing one of them again would cause the client program to crash. (Bug#8330 [<http://bugs.mysql.com/8330>])
- Non-numeric values inserted into a `YEAR` column were being stored as 2000 rather than as 0000. (Bug#6067 [<http://bugs.mysql.com/6067>])
- Fixed a failure of multiple-table updates to replicate properly on slave servers when `-replicate-*-table` options had been specified. (Bug#7011 [<http://bugs.mysql.com/7011>])
- `mysql_stmt_close()` C API function was not clearing an error indicator when a previous prepare call failed, causing subsequent invocations of error-retrieving calls to indicate spurious error values. (Bug#7990 [<http://bugs.mysql.com/7990>])
- Fixed failure of `CREATE TABLE ... LIKE` Windows when the source or destination table was

located in a symlinked database directory. ([Bug#6607](http://bugs.mysql.com/6607) [<http://bugs.mysql.com/6607>])

- With `lower_case_table_names` set to 1, `mysqldump` on Windows could write the same table name in different lettercase for different SQL statements. Fixed so that consistent lettercase is used. ([Bug#5185](http://bugs.mysql.com/5185) [<http://bugs.mysql.com/5185>]) `HAVING` that referred to `RAND()` or a user-defined function in the `SELECT` part through an alias could cause a crash or wrong value. ([Bug#8216](http://bugs.mysql.com/8216) [<http://bugs.mysql.com/8216>])
- If one used `CONVERT_TZ()` function in `SELECT`, which in its turn was used in `CREATE TABLE` statements, then system time zone tables were added to list of tables joined in `SELECT` and thus erroneous result was produced. ([Bug#7899](http://bugs.mysql.com/7899) [<http://bugs.mysql.com/7899>])
- Fixed a bug in `CONV()` function returning unsigned `BIGINT` number (third argument is positive, and return value does not fit in 32 bits). ([Bug#7751](http://bugs.mysql.com/7751) [<http://bugs.mysql.com/7751>])
- Fixed a failure of the `IN()` operator to return correct result if all values in the list were constants and some of them were using substring functions, for example, `LEFT()`, `RIGHT()`, or `MID()`.
- Fixed problem with `SHOW INDEX` reporting `Sub_part` values in bytes rather than characters for columns with a multi-byte character set. ([Bug#7943](http://bugs.mysql.com/7943) [<http://bugs.mysql.com/7943>])
- Fixed a crash in `CONVERT_TZ()` function when its second or third argument was from a `const` table (see [Section 7.2.1, “Optimizing Queries with EXPLAIN”](#)). ([Bug#7705](http://bugs.mysql.com/7705) [<http://bugs.mysql.com/7705>])
- Correct a problem with `mysql_config`, which was failing to produce proper `zlib` option for linking under some circumstances. ([Bug#6273](http://bugs.mysql.com/6273) [<http://bugs.mysql.com/6273>])
- Fixed a problem with calculation of number of columns in row comparison against a subquery. ([Bug#8020](http://bugs.mysql.com/8020) [<http://bugs.mysql.com/8020>])
- Fixed erroneous output resulting from `SELECT DISTINCT` combined with a subquery and `GROUP BY`. ([Bug#7946](http://bugs.mysql.com/7946) [<http://bugs.mysql.com/7946>])
- Fixed server crash in comparing a nested row expression (for example `row(1, (2, 3))`) with a subquery. ([Bug#8022](http://bugs.mysql.com/8022) [<http://bugs.mysql.com/8022>])
- Fixed server crash resulting from certain correlated subqueries with forward references (referring to an alias defined later in the outer query). ([Bug#8025](http://bugs.mysql.com/8025) [<http://bugs.mysql.com/8025>])
- Fixed server crash resulting from re-execution of prepared statements containing subqueries. ([Bug#8125](http://bugs.mysql.com/8125) [<http://bugs.mysql.com/8125>])
- Removed a dependence of boolean full-text search on `--default-character-set` option. ([Bug#8159](http://bugs.mysql.com/8159) [<http://bugs.mysql.com/8159>])
- Fixed a crash in a boolean full-text search in certain joins. ([Bug#8234](http://bugs.mysql.com/8234) [<http://bugs.mysql.com/8234>])
- Fixed erroneous comparison where strings that began with `CHAR(31)` were considered equal to the empty string. ([Bug#8134](http://bugs.mysql.com/8134) [<http://bugs.mysql.com/8134>])
- Add description of `debug` command to `mysqladmin` help output. ([Bug#8207](http://bugs.mysql.com/8207) [<http://bugs.mysql.com/8207>])
- `percona.exe` was always returning “Unknown error” on Windows. See [Section 8.17, “percona — Explain Error Codes”](#). ([Bug#7390](http://bugs.mysql.com/7390) [<http://bugs.mysql.com/7390>])
- Modify `SET` statements produced by `mysqldump` to write quoted strings using single quotes rather than double quotes. This avoids problems if the dump file is reloaded while the `ANSI_QUOTES`

SQL mode is in effect. (Bug#8148 [<http://bugs.mysql.com/8148>])

- Fixed a bug where `ALTER TABLE` improperly would accept an index on a `TIMESTAMP` column that `CREATE TABLE` would reject. (Bug#7884 [<http://bugs.mysql.com/7884>])
- Fixed a bug in multiple-table `UPDATE` statements that could cause spurious `Table '#sql_....' is full` errors if the number of rows to update is big enough. (Bug#7788 [<http://bugs.mysql.com/7788>])
- Fixed a problem where `SHOW INDEX` on a `MERGE` table could crash a debugging version of the server. (Bug#7377 [<http://bugs.mysql.com/7377>])
- Fixed a problem where adding an `ORDER BY` clause for an indexed column would cause a `SELECT` to return an empty result. (Bug#7331 [<http://bugs.mysql.com/7331>])
- Fixed a problem where `ALTER TABLE` on a `TEMPORARY` table with a mixed-lettercase name could cause the table to disappear when `lower_case_table_names` was set to 2. (Bug#7261 [<http://bugs.mysql.com/7261>])
- Fixed a problem with key cache statistics being reported incorrectly by the server after receipt of a `SIGHUP` signal. (Bug#4285 [<http://bugs.mysql.com/4285>])
- Fixed a problem that caused `mysql_stmt_prepare()` to be very slow when used in client programs on Windows. (Bug#5787 [<http://bugs.mysql.com/5787>])
- For indexes, `SHOW CREATE TABLE` now displays the index type even if it is the default, for storage engines that support multiple index types. (Bug#7235 [<http://bugs.mysql.com/7235>])
- Fixed a bug where the use of `GROUP_CONCAT()` with `HAVING` caused a server crash. (Bug#7769 [<http://bugs.mysql.com/7769>])
- Fixed a bug where comparing the result of a subquery to a non-existent column caused a server crash on Windows. (Bug#7885 [<http://bugs.mysql.com/7885>])
- Fixed a bug which caused `TIMEDIFF()` function to return wrong results if one of its arguments had non-zero microsecond part (Bug#7586 [<http://bugs.mysql.com/7586>]).
- Fixed a bug which caused `TIMESTAMP` columns with display width specified to be not identical to `DATETIME` columns when server was run in `MAXDB` mode (Bug#7418 [<http://bugs.mysql.com/7418>]).
- Fixed a bug in `UNION` statements that resulted in the wrong number of the examined rows reported in the slow query log.
- Fixed a bug in a combination of `-not` and `trunc*` operators of full-text search. Using more than one truncated negative search term, was causing empty result set.
- InnoDB: Fixed a bug introduced in 4.1.9 to the Windows version if you used `innodb_file_per_table`. `mysqld` would stop and complain about Windows error number 87 in a file operation. (See the Bugs database or the 4.1.9 change notes about a workaround for that bug in 4.1.9). (Bug#8021 [<http://bugs.mysql.com/8021>])
- InnoDB: Corrected the handling of trailing spaces in the `ucs2` character set. (Bug#7350 [<http://bugs.mysql.com/7350>])
- InnoDB: Use native `tmpfile()` function on Netware. All InnoDB temporary files are created under `sys:\tmp`. Previously, InnoDB temporary files were never deleted on Netware.
- InnoDB: Fix a race condition that could cause the assertion `space->n_pending_flushes ==`

0 to fail in `fil0fil.c`, in `fil_space_free()`, in `DROP TABLE` or in `ALTER TABLE`.

- InnoDB: `ALTER TABLE ... ADD CONSTRAINT PRIMARY KEY ...` complained about bad foreign key definition. (Bug#7831 [<http://bugs.mysql.com/7831>])
- InnoDB: Fix a theoretical hang over the adaptive hash latch in InnoDB if one runs `INSERT ... SELECT ...` (binlog not enabled), or a multiple-table `UPDATE` or `DELETE`, and only the read tables are InnoDB type, the rest are MyISAM. (Bug#7879 [<http://bugs.mysql.com/7879>])
- Fixed a bug in `max_heap_table_size` handling, that resulted in `Table is full` error when the table was still smaller than the limit. (Bug#7791 [<http://bugs.mysql.com/7791>]).
- Fixed a symlink vulnerability in the `mysqlaccess` script. Reported by Javier Fernandez-Sanguino Pena and [Debian Security Audit Team](http://www.debian.org/security/audit) [<http://www.debian.org/security/audit>]. (CVE-2005-0004 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0004>])
- `mysqlbinlog` forgot to add backquotes around the collation of user variables (causing later parsing problems as `BINARY` is a reserved word). (Bug#7793 [<http://bugs.mysql.com/7793>])
- Ensured that `mysqldump --single-transaction` sets its transaction isolation level to `REPEATABLE READ` before proceeding (otherwise if the MySQL server was configured to run with a default isolation level lower than `REPEATABLE READ` it could give an inconsistent dump). (Bug#7850 [<http://bugs.mysql.com/7850>])
- Changed `mysql` client so that including `\p` as part of a prompt command uses the name of the shared memory connection when the connection is using shared memory. (Bug#7922 [<http://bugs.mysql.com/7922>])
- Fixed a problem in the server where executing a multi-statement query more than once with the query cache active could yield incorrect result sets. (Bug#7966 [<http://bugs.mysql.com/7966>])
- Fixed that a 4.1.10 slave can connect to a master < 3.23.50 without hanging (the reason for the hang is a bug in these quite old masters -- `SELECT @@unknown_var` hangs them -- which was fixed in MySQL 3.23.50). (Bug#7965 [<http://bugs.mysql.com/7965>])
- Fixed a bug where MySQL was allowing concurrent updates (inserts, deletes) to a table if binary logging is enabled. Changed to ensure that all updates are executed in a serialized fashion, because they are executed serialized when binlog is replayed. (Bug#7879 [<http://bugs.mysql.com/7879>])

## D.1.14. Changes in release 4.1.9 (11 January 2005)

Functionality added or changed:

- `mysqld_safe` no longer tests for the presence of the data directory when using a relatively located server binary. It just assumes the directory is there, and fails to start up if it is not. This allows the data directory location to be specified on the command line, and avoids running a server binary that was not intended. (Bug#7249 [<http://bugs.mysql.com/7249>])
- The naming scheme of the Windows installation packages has changed slightly:
  - The platform suffix was changed from `-win` to `-win32`
  - The product descriptions `-noinstall` and `-essential` have been moved in front of the version number

Examples: `mysql-essential-4.1.9-win32.msi`, `mysql-noinstall-4.1.9-win32.zip` See [Section 2.3, "Installing MySQL on Windows"](#).

- The Mac OS X 10.3 installation disk images now include a MySQL Preference Pane for the Mac OS X Control Panel that enables the user to start and stop the MySQL server via the GUI and activate and deactivate the automatic MySQL server startup on bootup.
- The `MySQL-shared-compat` Linux RPM now includes the 3.23 as well as the 4.0 `libmysql-client.so` shared libraries. (Bug#6342 [http://bugs.mysql.com/6342])
- `Seconds_Behind_Master` is `NULL` (which means “unknown”) if the slave SQL thread is not running, or if the slave I/O thread is not running or not connected to master. It is zero if the SQL thread has caught up with the I/O thread. It no longer grows indefinitely if the master is idle.
- InnoDB: Do not acquire an internal InnoDB table lock in `LOCK TABLES` if `AUTOCOMMIT=1`. This helps in porting old MyISAM applications to InnoDB. InnoDB table locks in that case caused deadlocks very easily.
- InnoDB: Print a more descriptive error and refuse to start InnoDB if the size of `ibdata` files is smaller than what is stored in the tablespace header; `innodb_force_recovery` overrides this.
- The MySQL server aborts immediately instead of simply issuing a warning if it is started with the `--log-bin` option but cannot initialize the binary log at startup (that is, an error occurs when writing to the binary log file or binary log index file).
- The binary log file and binary log index file now behave like MyISAM when there is a "disk full" or "quota exceeded" error. See Section A.4.3, “How MySQL Handles a Full Disk”.

Bugs fixed:

- Fixed problem where running `mysql_fix_privilege_tables` could result in grant table columns with too-short lengths if the server character set had been set to a multi-byte character set first. (Bug#7539 [http://bugs.mysql.com/7539])
- InnoDB: Fixed the **critical bug** if you enabled `innodb_file_per_table` in `my.cnf`. If you shut down `mysqld`, records could disappear from the secondary indexes of a table. Unfortunately, on Windows a new Bug#8021 [http://bugs.mysql.com/8021] was introduced. Windows users of `innodb_file_per_table` should put a line `innodb_flush_method=unbuffered` to their `my.cnf` or `my.ini` to work around 8021. (Bug#7496 [http://bugs.mysql.com/7496])
- InnoDB: Fixed a bug: 32-bit `mysqld` binaries built on HP-UX-11 did not work with InnoDB files greater than 2 GB in size. (Bug#6189 [http://bugs.mysql.com/6189])
- InnoDB: Return a sensible error code from `DISCARD TABLESPACE` if it fails because the table is referenced by a `FOREIGN KEY`.
- InnoDB: Fixed a bug: InnoDB failed to drop a table in the background drop queue if the table was referenced by a `FOREIGN KEY` constraint.
- InnoDB: Fixed a bug: if we dropped a table where an `INSERT` was waiting for a lock to check a `FOREIGN KEY` constraint, then an assertion would fail in `lock_reset_all_on_table()`.
- InnoDB: Fix a little bug: we looked at the physical size of a stored SQL `NULL` value from a wrong field in the index; this has probably caused no bugs visible to the user. It caused only some extra space to be used in some rare cases.
- InnoDB: Use the `fcntl()` file flush method on Mac OS X versions 10.3 and up. Apple had disabled `fsync()` in Mac OS X for internal disk drives, which caused corruption at power outages.
- `mysqladmin password` now checks whether the server has `--old-passwords` turned on or

predates 4.1 and uses the old-format password if so. ([Bug#7451](http://bugs.mysql.com/7451) [<http://bugs.mysql.com/7451>])

- Added a `--default-character-set` option to `mysqladmin` to avoid problems when the default character set is not `latin1`. ([Bug#7524](http://bugs.mysql.com/7524) [<http://bugs.mysql.com/7524>])
- Fix a problem with truncation of `FLOAT` values. ([Bug#7361](http://bugs.mysql.com/7361) [<http://bugs.mysql.com/7361>])
- Fixed a bug in `PROCEDURE ANALYSE ( )`, which did not quote some `ENUM` values properly. ([Bug#2813](http://bugs.mysql.com/2813) [<http://bugs.mysql.com/2813>])
- Fixed a bug that caused incorrect results for complex datetime expressions containing casts of datetime values to `TIME` or `DATE` values. ([Bug#6914](http://bugs.mysql.com/6914) [<http://bugs.mysql.com/6914>])
- Include compression library flags in the output from `mysql_config --lib_r`. ([Bug#7021](http://bugs.mysql.com/7021) [<http://bugs.mysql.com/7021>])
- Corrected a problem with `mysql_config` not producing all relevant flags from `CFLAGS`. ([Bug#6964](http://bugs.mysql.com/6964) [<http://bugs.mysql.com/6964>])
- Corrected a problem with `mysqld_safe` not properly capturing output from `ps`. ([Bug#5878](http://bugs.mysql.com/5878) [<http://bugs.mysql.com/5878>])
- Fixed a bug that caused a linking failure when linking both the MySQL client library and IMAP library. ([Bug#7428](http://bugs.mysql.com/7428) [<http://bugs.mysql.com/7428>])
- Fixed table corruption bug when using `INSERT DELAYED` with prepared statements.
- Fixed a bug that caused microseconds to be gobbled from the string result of the `STR_TO_DATE` function, if there is some other specifier in the format string following `%f`. ([Bug#7458](http://bugs.mysql.com/7458) [<http://bugs.mysql.com/7458>])
- Made the MySQL server accept executing `SHOW CREATE DATABASE` even if the connection has an open transaction or locked tables. Refusing it made `mysqldump --single-transaction` sometimes fail to print a complete `CREATE DATABASE` statement for some dumped databases. ([Bug#7358](http://bugs.mysql.com/7358) [<http://bugs.mysql.com/7358>])
- Fixed that, when encountering a “disk full” or “quota exceeded” write error, `MyISAM` sometimes didn't sleep and retry the write, thus resulting in a corrupted table. ([Bug#7714](http://bugs.mysql.com/7714) [<http://bugs.mysql.com/7714>])
- Fixed that `--expire-log-days` was not honored if using only transactions. ([Bug#7236](http://bugs.mysql.com/7236) [<http://bugs.mysql.com/7236>])
- Fixed that a slave could crash after replicating many `ANALYZE TABLE`, `OPTIMIZE TABLE`, or `REPAIR TABLE` statements from the master. ([Bug#6461](http://bugs.mysql.com/6461) [<http://bugs.mysql.com/6461>], [Bug#7658](http://bugs.mysql.com/7658) [<http://bugs.mysql.com/7658>])

## D.1.15. Changes in release 4.1.8 (14 December 2004)

**Note:** Due to a `libtool`-related bug in the source distribution, the creation of shared `libmysqlclient` libraries was not possible (the resulting files were missing the `.so` file name extension). The file `ltmain.sh` was updated to fix this problem and the resulting source distribution was released as `mysql-4.1.8a.tar.gz`. This modification did not affect the binary packages. ([Bug#7401](http://bugs.mysql.com/7401) [<http://bugs.mysql.com/7401>])

Functionality added or changed:

- Automatic character set conversion formerly was done for operations that mix a column and a string such as assigning a string to a column, when this was possible without loss of information. Automatic conversion for operations that mix columns and strings has been expanded to cover many functions (such as `CONCAT()`) and assignment operators. This reduces the frequency of `Illegal mix of collations` errors.
- For `ALTER DATABASE`, the database name now can be omitted to apply the change to the default database.
- Added `WITH CONSISTENT SNAPSHOT` clause to `START TRANSACTION` to begin a transaction with a consistent read.
- Added `--order-by-primary` to `mysqldump`, to sort each table's data in a dump file. This may be useful when dumping a `MyISAM` table which will be loaded into an InnoDB table. Dumping a `MyISAM` table with this option is considerably slower than without.
- InnoDB: Do not periodically write `SHOW INNODB STATUS` information to a temporary file unless the configuration option `innodb_status_file=1` is set.
- InnoDB: Commit after every 10,000 copied rows when executing `ALTER TABLE`. This makes it much faster to recover from an aborted `ALTER TABLE` or `OPTIMIZE TABLE`.
- `FULLTEXT` index block size is changed to be 1024 instead of 2048.
- Added `--disable-log-bin` option to `mysqlbinlog`. Using this option you can disable binary logging for the statements produced by `mysqlbinlog`. That is, `mysqlbinlog --disable-log-bin <file_name> | mysql` won't write any statements to the MySQL server binary log.
- The `--master-data` option for `mysqldump` now takes an optional argument of 1 or 2 to produce a non-commented or commented `CHANGE MASTER TO` statement. The default is 1 for backward compatibility.
- `mysqldump --single-transaction --master-data` now is able to take an online (non-blocking) dump of InnoDB and report the corresponding binary log coordinates. This makes a backup suitable for point-in-time recovery, roll-forward or replication slave creation. See [Section 8.12, “mysqldump — A Database Backup Program”](#).
- Added `--lock-all-tables` to `mysqldump` to lock all tables by acquiring a global read lock.
- Added `--hex-lob` option to `mysqldump` for dumping binary string columns using hexadecimal notation.
- Added `mysql_hex_string()` C API function that hex-encodes a string.
- In the normal log MySQL now prints the log position for `Binlog Dump` requests.
- Added `[mysql_cluster]` section to `my.cnf` file for configuration settings specific to MySQL Cluster. `ndb-connectstring` variable moved here.
- A connection doing a rollback now displays "Rolling back" in the `State` column of `SHOW PROCESSLIST`.
- `mysqlbinlog` now prints an informative commented line (thread id, timestamp, server id, and so forth) before each `LOAD DATA INFILE`, like it does for other queries; unless `--short-form` is used.
- The statements `CREATE TABLE`, `TRUNCATE TABLE`, `DROP DATABASE`, and `CREATE DATABASE` cause an implicit commit.

Bugs fixed:

- A multiple-table `DELETE` could cause MySQL to crash when using `InnoDB` tables. ([Bug#5837](#) [<http://bugs.mysql.com/5837>], [Bug#6378](#) [<http://bugs.mysql.com/6378>])
- Some data definition statements (`CREATE TABLE` where the table was not a temporary table, `TRUNCATE TABLE`, `DROP DATABASE`, and `CREATE DATABASE`) were not being written to the binary log after a `ROLLBACK`. This also caused problems with replication. ([Bug#6883](#) [<http://bugs.mysql.com/6883>])
- Fixed incorrect referencing to column by name from subquery to outer query in case of using temporary table by outer query and placing subquery in the `WHERE` clause. ([Bug#7079](#) [<http://bugs.mysql.com/7079>])
- Fixed a bug in authentication code that allowed a malicious user to crash the server with specially crafted packets (using a modified client library). ([Bug#7187](#) [<http://bugs.mysql.com/7187>])
- Fixed a crashing bug in a string function `LEFT`, when this function is part of the expression which is used as `GROUP BY` field. ([Bug#7101](#) [<http://bugs.mysql.com/7101>])
- Fixed bug which caused MySQL to require privileges on system time zone description tables for implicit access to them (that is, if one set `time_zone` variable or used `CONVERT_TZ( )` function) in case when some table-level or column-level privileges existed. ([Bug#6765](#) [<http://bugs.mysql.com/6765>])
- `mysql_stmt_data_seek(stmt, 0)` now rewinds a counter and enables buffered rows to be re-fetched on the client side. ([Bug#6996](#) [<http://bugs.mysql.com/6996>])
- Fixed an insufficient privilege check in `SHOW CREATE TABLE` command. ([Bug#7043](#) [<http://bugs.mysql.com/7043>])
- Fixed a rare memory corruption (that resulted in a crash) in `MATCH ... AGAINST` on columns that use multi-byte character sets. ([Bug#6269](#) [<http://bugs.mysql.com/6269>])
- Fixed `NULL` processing in `ALL/SOME` subqueries. ([Bug#6247](#) [<http://bugs.mysql.com/6247>])
- Fixed execution of complex queries with subqueries. ([Bug#6406](#) [<http://bugs.mysql.com/6406>], [Bug#6841](#) [<http://bugs.mysql.com/6841>])
- Fixed initialization of some internal structures for first execution. ([Bug#6517](#) [<http://bugs.mysql.com/6517>])
- Backported a fix for the full-text interface from MySQL 5.0. ([Bug#6523](#) [<http://bugs.mysql.com/6523>])
- Fixed `NULL` value handling in case of empty results in subqueries. ([Bug#6806](#) [<http://bugs.mysql.com/6806>])
- Prevent adding `CREATE TABLE ... SELECT` query to the binary log when the insertion of new records partially failed. ([Bug#6682](#) [<http://bugs.mysql.com/6682>])
- `INSERT ... SELECT` no longer reports spurious "column truncated" warnings ([Bug#6284](#) [<http://bugs.mysql.com/6284>])
- Fixed a bug that could cause "Record has changed since last read in table" error message in some queries on `HEAP` tables that contain only one row. ([Bug#6748](#) [<http://bugs.mysql.com/6748>])
- `mysqld_safe` was in many cases ignoring any `--no-defaults`, `--defaults-file`, or `-`

`-defaults-extra-file` arguments. Those arguments are now honored, and this may change what options are passed to `mysqld` in some installations.

- The server was interpreting `CHAR BINARY` and `VARCHAR BINARY` columns from 4.0 tables as having the `BINARY` and `VARBINARY` data types. Now they are interpreted as `CHAR` and `VARCHAR` columns that have the binary collation of the column's character set. (This is the same way that `CHAR BINARY` and `VARCHAR BINARY` are handled for new tables created in 4.1.)
- Fixed spurious "duplicate key" error from `REPLACE` or `INSERT ... ON DUPLICATE KEY UPDATE` statements performing multiple-row insert in the table that had unique and full-text indexes. ([Bug#6784](http://bugs.mysql.com/6784) [<http://bugs.mysql.com/6784>])
- Fixed a bug in execution of subqueries in `SET` and `DO` statements which caused wrong results to be returned from subsequent queries. ([Bug#6462](http://bugs.mysql.com/6462) [<http://bugs.mysql.com/6462>])
- Fixed a bug that allowed server to accept datetime values with wrong year part. The server now also performs same checks for datetime values passed through `MYSQL_TIME` structures as for datetime values passed as strings. ([Bug#6266](http://bugs.mysql.com/6266) [<http://bugs.mysql.com/6266>])
- Fixed a bug with `INSERT` for a table with `FULLTEXT` indexes. Under rare circumstances, this could result in a corrupted table if words of different lengths may be considered equal. This is possible in some collations, for example, in `utf8_general_ci` or `latin1_german2_ci`. ([Bug#6265](http://bugs.mysql.com/6265) [<http://bugs.mysql.com/6265>])
- InnoDB: Do not intentionally crash `mysqld` if the buffer pool is exhausted by the lock table; return error 1206 instead. Do not intentionally crash `mysqld` if we cannot allocate the memory for the InnoDB buffer pool. ([Bug#6817](http://bugs.mysql.com/6817) [<http://bugs.mysql.com/6817>]) ([Bug#6827](http://bugs.mysql.com/6827) [<http://bugs.mysql.com/6827>])
- InnoDB: Let InnoDB's `FOREIGN KEY` parser to remove the `latin1` character `0xA0` from the end of an unquoted identifier. The EMS MySQL Manager in `ALTER TABLE` adds that character after a table name, which caused error 121 when we tried to add a new constraint.
- InnoDB: Refuse to open new-style tables created with MySQL 5.0.3 or later. ([Bug#7089](http://bugs.mysql.com/7089) [<http://bugs.mysql.com/7089>])
- InnoDB: Do not call `rewind()` when displaying `SHOW INNODB STATUS` information on `stderr`.
- InnoDB: Made the foreign key parser better aware of quotes. ([Bug#6340](http://bugs.mysql.com/6340) [<http://bugs.mysql.com/6340>])
- InnoDB: If one used `INSERT IGNORE` to insert several rows at a time, and the first inserts were ignored because of a duplicate key collision, then InnoDB in a replication slave assigned `AUTO_INCREMENT` values 1 bigger than in the master. This broke the MySQL replication. ([Bug#6287](http://bugs.mysql.com/6287) [<http://bugs.mysql.com/6287>])
- InnoDB: Fixed a bug: InnoDB ignored in `innodb_data_file_path` the `max` specification in `:autoextend:max:2000M`. This bug was introduced in 4.1.1.
- InnoDB: Fixed a bug: `innodb_locks_unsafe_for_binlog` still uses next-key locking ([Bug#6747](http://bugs.mysql.com/6747) [<http://bugs.mysql.com/6747>]). InnoDB used next-key locking when record matched completely to search tuple. This unnecessary next-key locking is now removed when `innodb_locks_unsafe_for_binlog` option is used.
- InnoDB: Fix two hangs: `FOREIGN KEY` constraints treated table and database names as case-insensitive. `RENAME TABLE t TO T` would hang in an endless loop if `t` had a foreign key constraint defined on it. Fix also a hang over the dictionary mutex that would occur if one tried in `ALTER TABLE` or `RENAME TABLE` to create a foreign key constraint name that collided with another

existing name. ([Bug#3478](http://bugs.mysql.com/3478) [<http://bugs.mysql.com/3478>])

- If `STMT_ATTR_UPDATE_MAX_LENGTH` is set for a prepared statement, `mysql_stmt_store_result()` updates `field->max_length` for numeric columns as well. ([Bug#6096](http://bugs.mysql.com/6096) [<http://bugs.mysql.com/6096>])
- Prepared statements now handle `ZEROFILL` when converting `integer` to `string`.
- Fixed crash when a call to `mysql_stmt_store_result()` occurred without a preceding call to `mysql_stmt_bind_result()`.
- Fixed crash in prepared statements when using `SELECT * FROM t1 NATURAL JOIN t2...`
- Fixed crash in prepared statements when using `SELECT ... PROCEDURE`.
- Fixed crash in prepared statements when using subqueries.
- `GROUP_CONCAT(...ORDER BY)` when used with prepared statements gave wrong sorting order.
- `CREATE TABLE created_table` didn't signal when table was created. This could cause a `DROP TABLE created_table` in another thread to wait "forever".
- Server warnings now are reset when you execute a prepared statement.
- Improved performance of identifier comparisons (if many tables or columns are specified).
- `OPTIMIZE TABLE`, `REPAIR TABLE`, and `ANALYZE TABLE` are now replicated without any error code in the binary log. ([Bug#5551](http://bugs.mysql.com/5551) [<http://bugs.mysql.com/5551>])
- `LOAD DATA INFILE` now works with option `replicate-rewrite-db`. ([Bug#6353](http://bugs.mysql.com/6353) [<http://bugs.mysql.com/6353>])
- Fixed a bug which caused a crash when only the slave I/O thread was stopped and started. ([Bug#6148](http://bugs.mysql.com/6148) [<http://bugs.mysql.com/6148>])
- Changed semantics of `CREATE/ALTER/DROP DATABASE` statements so that replication of `CREATE DATABASE` is possible when using `--binlog-do-db` and `--binlog-ignore-db`. ([Bug#6391](http://bugs.mysql.com/6391) [<http://bugs.mysql.com/6391>])
- If a connection had an open transaction but had done no updates to transactional tables (for example if had just done a `SELECT FOR UPDATE` then executed a non-transactional update, that update automatically committed the transaction (thus releasing InnoDB's row-level locks etc). ([Bug#5714](http://bugs.mysql.com/5714) [<http://bugs.mysql.com/5714>])
- If a connection was interrupted by a network error and did a rollback, the network error code got stored into the `BEGIN` and `ROLLBACK` binary log events; that caused superfluous slave stops. ([Bug#6522](http://bugs.mysql.com/6522) [<http://bugs.mysql.com/6522>])
- A sequence of `BEGIN` (or `SET AUTOCOMMIT=0`), `FLUSH TABLES WITH READ LOCK`, transactional update, `COMMIT`, `FLUSH TABLES WITH READ LOCK` could hang the connection forever and possibly the MySQL server itself. This happened for example when running the `innobackup` script several times. ([Bug#6732](http://bugs.mysql.com/6732) [<http://bugs.mysql.com/6732>])
- `mysqlbinlog` did not print `SET PSEUDO_THREAD_ID` statements in front of `LOAD DATA INFILE` statements inserting into temporary tables, thus causing potential problems when rolling forward these statements after restoring a backup. ([Bug#6671](http://bugs.mysql.com/6671) [<http://bugs.mysql.com/6671>])

## D.1.16. Changes in release 4.1.7 (23 October 2004: Produc-

## tion)

Functionality added or changed:

- `MOD( )` no longer rounds arguments with a fractional part to integers. Now it returns exact remainder after division. (Bug#6138 [<http://bugs.mysql.com/6138>])
- InnoDB: Added a startup option and settable system variable `innodb_table_locks` for making `LOCK TABLE` acquire also InnoDB locks. The default value is 1, which means that `LOCK TABLES` causes also InnoDB internally to take a table lock. In applications using `AUTOCOMMIT=1` and `LOCK TABLES`, InnoDB's internal table locks that were added in 4.0.20 and 4.1.2 can cause deadlocks. You can set `innodb_table_locks=0` in `my.cnf` to remove that problem. (Bug#3299 [<http://bugs.mysql.com/3299>], Bug#5998 [<http://bugs.mysql.com/5998>])
- See Section 14.2.17, “Restrictions on InnoDB Tables”. (Bug#3299 [<http://bugs.mysql.com/3299>], Bug#5998 [<http://bugs.mysql.com/5998>]) InnoDB: `SHOW TABLE STATUS` now shows the creation time of the table for InnoDB. Note that this timestamp might not be the correct time because, for example, `ALTER TABLE` changes this timestamp.
- InnoDB: If `innodb_thread_concurrency` would be exceeded, let a thread sleep 10 ms before entering the FIFO queue; previously, the value was 50 ms.

Bugs fixed:

- Fixed a bug with `FOUND_ROWS( )` used together with `LIMIT` clause in prepared statements. (Bug#6088 [<http://bugs.mysql.com/6088>])
- Fixed a bug with `NATURAL JOIN` in prepared statements. (Bug#6046 [<http://bugs.mysql.com/6046>]).
- Fixed a bug in join of tables from different databases having columns with identical names (prepared statements). (Bug#6050 [<http://bugs.mysql.com/6050>])
- Now implicit access to system time zone description tables (which happens when you set the `time_zone` variable or use `CONVERT_TZ( )` function) does not require any privileges. (Bug#6116 [<http://bugs.mysql.com/6116>])
- Fixed a bug which caused the server to crash when the deprecated `libmysqlclient` function `mysql_create_db( )` was called. (Bug#6081 [<http://bugs.mysql.com/6081>])
- Fixed `REVOKE ALL PRIVILEGES, GRANT OPTION FROM user` so that all privileges are revoked correctly. (Bug#5831 [<http://bugs.mysql.com/5831>]). This corrects a case that the fix in 4.1.6 could miss.
- Fixed crash when selecting from a `HEAP` table with `key_column IS NOT NULL`. This could also cause a crash if not all index parts were used. (Bug#6082 [<http://bugs.mysql.com/6082>])
- Fixed a bug that could cause `MyISAM` index corruption when key values start with character codes below `BLANK`. This was caused by the new key sort order in 4.1. (Bug#6151 [<http://bugs.mysql.com/6151>])
- InnoDB: Fixed a bug in `LOAD DATA INFILE...REPLACE` printing duplicate key error when executing the same load query several times. (Bug#5835 [<http://bugs.mysql.com/5835>])
- Fixed a bug in the prepared statements protocol when wrong metadata was sent for `SELECT` statements not returning a result set (such as `SELECT ... INTO OUTFILE`). (Bug#6059

[<http://bugs.mysql.com/6059>])

- Fixed bug which allowed one to circumvent missing UPDATE privilege if one had INSERT and SELECT privileges for table with primary key. (Bug#6173 [<http://bugs.mysql.com/6173>])
- Fixed a bug in `libmysqlclient` with wrong conversion of negative time values to strings. (Bug#6049 [<http://bugs.mysql.com/6049>]).
- Fixed a bug in `libmysqlclient` with wrong conversion of zero date values (0000-00-00) to strings. (Bug#6058 [<http://bugs.mysql.com/6058>])
- Fixed a bug that caused the server to crash on attempt to prepare a statement with `RAND(?)`. (Bug#5985 [<http://bugs.mysql.com/5985>])
- Fixed a bug with handling of `DATE`, `TIME`, and `DATETIME` columns in the binary protocol. The problem is compiler-specific and could have been observed on HP-UX, AIX, Solaris9, when compiling with native compiler. (Bug#6025 [<http://bugs.mysql.com/6025>])
- Fixed a bug with handling of `TINYINT` columns in the binary protocol. The problem is specific to platforms where the C compiler has the `char` data type unsigned by default. (Bug#6024 [<http://bugs.mysql.com/6024>])
- InnoDB: Fixed problem introduced in MySQL 4.0.21 where a connection starting a transaction, doing updates, then `FLUSH TABLES WITH READ LOCK`, then `COMMIT`, would cause replication slaves to stop (complaining about error 1223). Bug surfaced when using the InnoDB `innobackup` script. (Bug#5949 [<http://bugs.mysql.com/5949>])
- InnoDB: Release the dictionary latch during a long cascaded `FOREIGN KEY` operation, so that we do not starve other users doing `CREATE TABLE` or other DDL operation. This caused a notorious 'Long semaphore wait' message to be printed to the `.err` log. (Bug#5961 [<http://bugs.mysql.com/5961>])

## D.1.17. Changes in release 4.1.6 (10 October 2004)

Functionality added or changed:

- Added option `--sigint-ignore` to the `mysql` command line client to make it ignore `SIGINT` signals (typically the result of the user pressing Control-C).
- InnoDB: Added the startup option and settable global variable `innodb_max_purge_lag` for delaying `INSERT`, `UPDATE` and `DELETE` operations when the purge operations are lagging. The default value of this parameter is zero, meaning that there are no delays. See [Section 14.2.13](#), “Implementation of Multi-Versioning”.
- InnoDB: The `innodb_autoextend_increment` startup option that was introduced in release 4.1.5 was made a settable global variable. (Bug#5736 [<http://bugs.mysql.com/5736>])
- InnoDB: If `DROP TABLE` is invoked on an InnoDB table for which the `.ibd` file is missing, print to error log that the table was removed from the InnoDB data dictionary, and allow MySQL to delete the `.frm` file. Maybe `DROP TABLE` should issue a warning in this case.
- `TIMESTAMP` columns now can store `NULL` values. To create such a column, you must explicitly specify the `NULL` attribute in the column specification. (Unlike all other data types, `TIMESTAMP` columns are `NOT NULL` by default.)
- Now if `ALTER TABLE` converts one `AUTO_INCREMENT` column to another `AUTO_INCREMENT`

column it preserves zero values (this includes the case that we don't change such column at all).

- Now if `ALTER TABLE` converts some column to `TIMESTAMP NOT NULL` column it converts `NULL` values to current timestamp value (One can still get old behavior by setting system `TIMESTAMP` variable to zero).
- On Windows, the MySQL configuration files included in the package now use `.ini` instead of `.cnf` as the file name suffix.

Bugs fixed:

- Fixed a bug that caused the server to crash on attempt to execute a prepared statement with a sub-query inside a boolean expression. (Bug#5987 [http://bugs.mysql.com/5987])
- Fixed a bug that caused the server to sometimes choose non-optimal execution plan for a prepared statement executed with changed placeholder values. (Bug#6042 [http://bugs.mysql.com/6042])
- InnoDB: Make the check for excessive semaphore waits tolerate glitches in the system clock (do not crash the server if the system time is adjusted while InnoDB is under load.). (Bug#5898 [http://bugs.mysql.com/5898])
- InnoDB: Fixed a bug in the InnoDB `FOREIGN KEY` parser that prevented `ALTER TABLE` of tables containing '#' in their names. (Bug#5856 [http://bugs.mysql.com/5856])
- InnoDB: Fixed a bug that prevented `ALTER TABLE t DISCARD TABLESPACE` from working. (Bug#5851 [http://bugs.mysql.com/5851])
- InnoDB: `SHOW CREATE TABLE` now obeys the `SET SQL_MODE=ANSI` and `SET SQL_QUOTE_SHOW_CREATE=0` settings. (Bug#5292 [http://bugs.mysql.com/5292])
- InnoDB: Fixed a bug that caused `CREATE TEMPORARY TABLE ... ENGINE=InnoDB` to terminate `mysqld` when running in `innodb_file_per_table` mode. Per-table tablespaces for temporary tables from now on are created in the temporary directory of `mysqld`. (Bug#5137 [http://bugs.mysql.com/5137])
- InnoDB: Fixed some (not all) UTF-8 bugs in column prefix indexes. (Bug#5975 [http://bugs.mysql.com/5975])
- InnoDB: If one updated a column so that its size changed, or updated it to an externally stored (`TEXT` or `BLOB`) value, then ANOTHER externally stored column would show up as 512 bytes of good data + 20 bytes of garbage in a consistent read that fetched the old version of the row. (Bug#5960 [http://bugs.mysql.com/5960])
- InnoDB: Change error code to `HA_ERR_ROW_IS_REFERENCED` if we cannot `DROP` a parent table referenced by a `FOREIGN KEY` constraint; this error number is less misleading than the previous number `HA_ERR_CANNOT_ADD_FOREIGN`, but misleading still. (Bug#6202 [http://bugs.mysql.com/6202])
- Fixed `REVOKE ALL PRIVILEGES, GRANT OPTION FROM user` so that all privileges are revoked correctly. (Bug#5831 [http://bugs.mysql.com/5831])
- Fixed a bug that caused the server to crash when character set conversion was implicitly used in prepared mode; for example, as in `'abc' LIKE CONVERT('abc' as utf8)`. (Bug#5688 [http://bugs.mysql.com/5688])
- The `mysql_change_user()` C API function now frees all prepared statements associated with the connection. (Bug#5315 [http://bugs.mysql.com/5315])

- Fixed a bug when inserting `NULL` into an `AUTO_INCREMENT` column failed, when using prepared statements. (Bug#5510 [<http://bugs.mysql.com/5510>])
- Fixed slave SQL thread so that the `SET COLLATION_SERVER. . .` statements it replicates don't advance its position (so that if it gets interrupted before the actual update query, it later redoes the `SET`). (Bug#5705 [<http://bugs.mysql.com/5705>])
- Fixed that if the slave SQL thread found a syntax error in a query (which should be rare, as the master parsed it successfully), it stops. (Bug#5711 [<http://bugs.mysql.com/5711>])
- Fixed that if a write to a `MyISAM` table fails because of a full disk or an exceeded disk quota, it prints a message to the error log every 10 minutes, and waits until disk space becomes available. (Bug#3248 [<http://bugs.mysql.com/3248>])
- Now MySQL does not prefer columns, which are mentioned in select list but are renamed, over columns from other tables participating in `FROM` clause when it resolves `GROUP BY` clause (for example, `SELECT t1.a AS c FROM t1, t2 ORDER BY a` produces an error if both `t1` and `t2` tables contain `a` column). (Bug#4302 [<http://bugs.mysql.com/4302>])
- Behavior of `ALTER TABLE` converting column containing `NULL` values to `AUTO_INCREMENT` column is no longer affected by `NO_AUTO_VALUE_ON_ZERO` mode. (Bug#5915 [<http://bugs.mysql.com/5915>]).

## D.1.18. Changes in release 4.1.5 (16 September 2004)

Functionality added or changed:

- **InnoDB**: Added configuration option `innodb_autoextend_increment` for setting the size in megabytes by which **InnoDB** tablespaces are extended when they become full. The default value is 8, corresponding to the fixed increment of 8MB in previous versions of MySQL.
- **InnoDB**: The new Windows installation wizard of MySQL makes **InnoDB** as the MySQL default table type on Windows, unless explicitly specified otherwise. Note that it places the `my.ini` file in the installation directory of the MySQL server. See [Section 2.3.4.14](#), “The Location of the `my.ini` File”.

Bugs fixed:

- Fixed a bug which caused the server to crash on attempt to execute a prepared statement with `BETWEEN ? AND ?` and a datetime column. (Bug#5748 [<http://bugs.mysql.com/5748>])
- Fixed name resolving of external fields of subqueries if subquery placed in select list of query with grouping. (Bug#5326 [<http://bugs.mysql.com/5326>])
- Fixed detection of using same table for updating and selecting in multi-update queries. (Bug#5455 [<http://bugs.mysql.com/5455>])
- The values of the `max_sort_length`, `sql_mode`, and `group_concat_max_len` system variables now are stored in the query cache with other query information to avoid returning an incorrect result from the query cache. (Bug#5394 [<http://bugs.mysql.com/5394>]) (Bug#5515 [<http://bugs.mysql.com/5515>])
- Fixed syntax analyzer with `sql_mode=IGNORE_SPACE`. It happened to take phrases like `default .07` as `identifier.identifier`. (Bug#5318 [<http://bugs.mysql.com/5318>])

- Fixed illegal internal field length of user variables of integer type. This showed up when creating a table as `SELECT @var_name`. (Bug#4788 [<http://bugs.mysql.com/4788>])
- Fixed a buffer overflow in prepared statements API (libmysqlclient) when a statement containing thousands of placeholders was executed. (Bug#5194 [<http://bugs.mysql.com/5194>])
- Fixed a bug in the server when after reaching a certain limit of prepared statements per connection (97), statement ids began to overlap, so occasionally wrong statements were chosen for execution. (Bug#5399 [<http://bugs.mysql.com/5399>])
- Fixed a bug in prepared statements when `LIKE` used with arguments in different character sets crashed server on first execute. (Bug#4368 [<http://bugs.mysql.com/4368>])
- Fixed a bug in prepared statements when providing '0000-00-00' date to a parameter lead to server crash. (Bug#4231 [<http://bugs.mysql.com/4231>], Bug#4562 [<http://bugs.mysql.com/4562>])
- Fixed a bug in `OPTIMIZE TABLE` that could cause table corruption on `FULLTEXT` indexes. (Bug#5327 [<http://bugs.mysql.com/5327>])
- InnoDB: Fixed a bug that InnoDB only allowed a maximum of 1000 connections inside InnoDB at the same time. A higher number could cause an assertion failure in `sync0arr.c`, line 384. Now we allow 1000, 10000, or 50000, depending on the buffer pool size. (Bug#5414 [<http://bugs.mysql.com/5414>])

## D.1.19. Changes in release 4.1.4 (26 August 2004: Gamma)

**Note:** To fix a compile problem on systems that do not have `automake` 1.7 installed, an updated 4.1.4a source tarball has been published. In addition to resolving this `automake` dependency (Bug#5319 [<http://bugs.mysql.com/5319>]), it also fixes some reported `libedit` compile errors when using a non-`gcc` compiler (Bug#5353 [<http://bugs.mysql.com/5353>]).

Functionality added or changed:

- Added the `CSV` storage engine.
- Made internal representation of `TIMESTAMP` values in `InnoDB` in 4.1 to be the same as in 4.0. This difference resulted in incorrect datetime values in `TIMESTAMP` columns in `InnoDB` tables after an upgrade from 4.0 to 4.1. (Bug#4492 [<http://bugs.mysql.com/4492>]) **Warning: extra steps during upgrade required!** Unfortunately this means that if you are upgrading from 4.1.x, where  $x \leq 3$ , to 4.1.4 you should use `mysqldump` for saving and then restoring your `InnoDB` tables with `TIMESTAMP` columns.
- The `mysqld-opt` Windows server was renamed to `mysqld`. This completes the Windows server renaming begun in MySQL 4.1.2. See Section 2.3.8, “Selecting a MySQL Server type”.
- Added Latin language collations for the `ucs2` and `utf8` Unicode character sets. These are called `ucs2_roman_ci` and `utf8_roman_ci`.
- Corrected the name of the Mac OS X StartupItem script (it must match the name of the subdirectory, which was renamed to `MySQLCOM` in MySQL 4.1.2). Thanks to Bryan McCormack for reporting this.
- Added `--start-datetime`, `--stop-datetime`, `--start-position`, and `--stop-position` options to `mysqlbinlog`. These make point-in-time recovery easier.
- Killing a `CHECK TABLE` statement does not result in the table being marked as “corrupted” any

more; the table remains as if `CHECK TABLE` had not even started. See [Section 13.5.5.3](#), “`KILL Syntax`”.

- Made the MySQL server ignore `SIGHUP` and `SIGQUIT` on Mac OS X 10.3. This is needed because under this OS, the MySQL server receives lots of these signals (reported as [Bug#2030](#) [<http://bugs.mysql.com/2030>]).
- Support of usage of column aliases qualified by table name or alias in `ORDER BY` and `GROUP BY` was dropped. For example the following query `SELECT a AS b FROM t1 ORDER BY t1.b` is not allowed. One should use `SELECT a AS b FROM t1 ORDER BY t1.a` or `SELECT a AS b FROM t1 ORDER BY b` instead. This was non-standard (since aliases are defined on query level not on table level) and caused problems with some queries.

Bugs fixed:

- Fixed a bug that caused libmysql to crash when attempting to fetch a value of `MEDIUMINT` column. ([Bug#5126](#) [<http://bugs.mysql.com/5126>])
- Fixed a bug that caused the MySQL server to crash when attempting to execute a prepared statement with `SELECT ... INTO @var` for a second time. ([Bug#5034](#) [<http://bugs.mysql.com/5034>])
- Fixed execution of optimized `IN` subqueries that use compound indexes. ([Bug#4435](#) [<http://bugs.mysql.com/4435>])
- Prohibited resolving of table fields in inner queries if fields do not take part in grouping for queries with grouping (inside aggregate function arguments, all table fields are still allowed). ([Bug#4814](#) [<http://bugs.mysql.com/4814>])
- Fixed a crash after `SLAVE STOP` if the IO thread was in a special state. ([Bug#4629](#) [<http://bugs.mysql.com/4629>])
- Fixed an old bug in concurrent accesses to `MERGE` tables (even one `MERGE` table and `MyISAM` tables), that could have resulted in a crash or hang of the server. ([Bug#2408](#) [<http://bugs.mysql.com/2408>], [CVE-2004-0837](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0837>])
- Fixed a bug that caused server crash on attempt to execute for a second time a prepared statement with `NOT` in `WHERE` or `ON` clauses. ([Bug#4912](#) [<http://bugs.mysql.com/4912>])
- `MATCH ... AGAINST` now works in a subquery. ([Bug#4769](#) [<http://bugs.mysql.com/4769>])
- Fixed a bug that omitted the `.err` extension of the error log file (`--log-error`) when the host-name contained a domain name. The domain name is now replaced by the extension. ([Bug#4997](#) [<http://bugs.mysql.com/4997>])
- Fixed a crash in `myisamchk`. ([Bug#4901](#) [<http://bugs.mysql.com/4901>])
- Fixed a bug which caused server crash if one used the `CONVERT_TZ( )` function with time zone described in database as parameter and this time zone was not used before. ([Bug#4508](#) [<http://bugs.mysql.com/4508>])
- Support for `%T`, `%r`, `%V`, `%v` and `%X`, `%x` format specifiers was added to `STR_TO_DATE( )` function. ([Bug#4756](#) [<http://bugs.mysql.com/4756>])
- Fixed a bug (hang) in `NATURAL JOIN` where joined table had no common column. ([Bug#4807](#) [<http://bugs.mysql.com/4807>])

- Fixed a crash caused by `UNHEX(NULL)`. (Bug#4441 [<http://bugs.mysql.com/4441>])
- `mysql_fix_privilege_tables` didn't correctly handle the argument of its `--password=password_val` option. (Bug#4240 [<http://bugs.mysql.com/4240>], Bug#4543 [<http://bugs.mysql.com/4543>])
- Fixed that `mysqlbinlog --read-from-remote-server` sometimes couldn't accept 2 binary logs on command line. (Bug#4507 [<http://bugs.mysql.com/4507>])
- Fixed that `mysqlbinlog --position --read-from-remote-server` had wrong # at lines. (Bug#4506 [<http://bugs.mysql.com/4506>])
- If `CREATE TEMPORARY TABLE t SELECT` failed while loading the data, the temporary table was not dropped. (Bug#4551 [<http://bugs.mysql.com/4551>])
- Fixed that when a multiple-table `DROP TABLE` failed to drop a table on the master server, the error code was not written to the binary log. (Bug#4553 [<http://bugs.mysql.com/4553>])
- When the slave SQL thread was replicating a `LOAD DATA INFILE` statement, it didn't show the statement in the output of `SHOW PROCESSLIST`. (Bug#4326 [<http://bugs.mysql.com/4326>])
- Fixed an assertion failure when reading the grant tables (Bug#4407 [<http://bugs.mysql.com/4407>])
- Fixed that `CREATE TABLE ... TYPE=HEAP ... AS SELECT...` caused replication slave to stop. (Bug#4971 [<http://bugs.mysql.com/4971>])
- Fixed that `mysql_options(...,MYSQL_OPT_LOCAL_INFILE,...)` failed to disable `LOAD DATA LOCAL INFILE`. (Bug#5038 [<http://bugs.mysql.com/5038>])
- Fixed that `disable-local-infile` option had no effect if client read it from a configuration file using `mysql_options(...,MYSQL_READ_DEFAULT,...)`. (Bug#5073 [<http://bugs.mysql.com/5073>])
- Fixed that `SET GLOBAL SYNC_BINLOG` did not work on some platforms (Mac OS X). (Bug#5064 [<http://bugs.mysql.com/5064>])
- Fixed that `mysql-test-run` failed on the `rpl_trunc_binlog` test if running test from the installed (the target of 'make install') directory. (Bug#5050 [<http://bugs.mysql.com/5050>])
- Fixed that `mysql-test-run` failed on the `grant_cache` test when run as Unix user 'root'. (Bug#4678 [<http://bugs.mysql.com/4678>])
- Fixed an unlikely deadlock which could happen when using `KILL`. (Bug#4810 [<http://bugs.mysql.com/4810>])
- Fixed a crash when one connection got `KILLED` while it was doing `START SLAVE`. (Bug#4827 [<http://bugs.mysql.com/4827>])
- Made `FLUSH TABLES WITH READ LOCK` block `COMMIT` if server is running with binary logging; this ensures that the binary log position is trustable when doing a full backup of tables and the binary log. (Bug#4953 [<http://bugs.mysql.com/4953>])
- Fixed that the counter of an `auto_increment` column was not reset by `TRUNCATE TABLE` if the table was a temporary table. (Bug#5033 [<http://bugs.mysql.com/5033>])
- Fixed bug which caused error to be reported when column from `ORDER BY` clause was present in two tables participating in `SELECT` even if the second instance of column in select list was renamed. (Bug#4302 [<http://bugs.mysql.com/4302>])

## D.1.20. Changes in release 4.1.3 (28 June 2004: Beta)

**Note:** The initial release of MySQL 4.1.3 for Windows accidentally was not compiled with support for the Spatial Extensions (OpenGIS). This was fixed by rebuilding from the same 4.1 code snapshot with the missing option and releasing those packages as version 4.1.3a.

To enable compiling the newly released PHP 5 against MySQL 4.1.3 on Windows, the Windows packages had to be rebuilt once more to add a few missing symbols to the MySQL client library. These packages were released as MySQL 4.1.3b.

Functionality added or changed:

- **Warning: Incompatible change:** C API change: `mysql_shutdown()` now requires a second argument. This is a source-level incompatibility that affects how you compile client programs; it does not affect the ability of compiled clients to communicate with older servers. See [Section 17.2.3.63](#), “`mysql_shutdown()`”.
- **Warning: Incompatible change:** The `timezone` system variable has been removed and replaced by `system_time_zone`. See [Section 5.2.2](#), “System Variables”.
- Support for per-connection time zones was added. Now you can set the current time zone for a connection by setting the `@@time_zone` system variable to a value such as `'+10:00'` or `'Europe/Moscow'` (where `'Europe/Moscow'` is the name of one of the time zones described in the system tables). Functions like `CURRENT_TIMESTAMP`, `UNIX_TIMESTAMP`, and so forth honor this time zone. Values of `TIMESTAMP` type are also interpreted as values in this time zone. So now our `TIMESTAMP` type behaves similar to Oracle's `TIMESTAMP WITH LOCAL TIME ZONE`. That is, values stored in such a column are normalized toward UTC and converted back to the current connection time zone when they are retrieved from such a column. To set up the tables that store time zone information, see [Section 2.10](#), “Post-Installation Setup and Testing”.
- Basic time zone conversion function `CONVERT_TZ()` was added. It assumes that its first argument is a datetime value in the time zone specified by its second argument and returns the equivalent datetime value in the time zone specified by its third argument.
- Added the `ARCHIVE` storage engine.
- Added SQL syntax for prepared statements. See [Section 13.7](#), “SQL Syntax for Prepared Statements”.
- Language-specific collations were added for the `ucs2` and `utf8` Unicode character sets: Icelandic, Latvian, Romanian, Slovenian, Polish, Estonian, Swedish, Turkish, Czech, Danish, Lithuanian, Slovak, Spanish, Traditional Spanish.
- `CHECK TABLE` now can be killed. It then marks the table as corrupted. See [Section 13.5.5.3](#), “KILL Syntax”.
- `OPTIMIZE TABLE` for InnoDB tables is now mapped to `ALTER TABLE` instead of `ANALYZE TABLE`.
- `sync_frm` is now a settable global variable (not only a startup option).
- Added the `sync_binlog=N` global variable and startup option, which makes the MySQL server synchronize its binary log to disk (`flush_sync_binlog()`) after every *N*th write to the binary log.
- Changed the slave SQL thread to print fewer useless error messages (no more message duplication; no more messages when an error is skipped (because of `slave-skip-errors`)).
- `DROP DATABASE IF EXISTS`, `DROP TABLE IF EXISTS`, single-table `DELETE` and single-

table `UPDATE` are now written to the binary log even if they changed nothing on the master (for example, even if the `DELETE` matched no row). The old behavior sometimes caused bad surprises in replication setups.

- Replication and `mysqlbinlog` now have better support for the case that the session character set and collation variables are changed within a given session. See [Section 6.7, “Replication Features and Known Problems”](#).
- Added `--innodb-safe-binlog` server option, which adds consistency guarantees between the content of `InnoDB` tables and the binary log. See [Section 5.11.4, “The Binary Log”](#).
- `LIKE` now supports the use of a prepared statement parameter or delimited constant expression as the argument to `ESCAPE` ([Bug#4200](#) [<http://bugs.mysql.com/4200>]).

#### Bugs fixed:

- Fixed `CREATE DATABASE IF NOT EXISTS` for Win32 which caused an error if database existed. ([Bug#4378](#) [<http://bugs.mysql.com/4378>])
- Added missing `root` account to Windows version of `mysqld`. ([Bug#4242](#) [<http://bugs.mysql.com/4242>])
- Fixed bug in prepared `EXPLAIN` statement which led to server crash. ([Bug#4271](#) [<http://bugs.mysql.com/4271>])
- Fixed a bug of using parameters in some prepared statements via SQL syntax. ([Bug#4280](#) [<http://bugs.mysql.com/4280>])
- Fixed a bug in `MERGE` tables created with `INSERT_METHOD=LAST`, that were not able to report a key number that caused “Duplicate entry” error for `UNIQUE` key in `INSERT`. As a result, error message was not precise enough (error 1022 instead of error 1062) and `INSERT ... ON DUPLICATE KEY UPDATE` did not work. ([Bug#4008](#) [<http://bugs.mysql.com/4008>])
- Fixed a bug in `DELETE` from a table with `FULLTEXT` indexes which under rare circumstances could result in a corrupted table, if words of different lengths may be considered equal (which is possible in some collations, for example, in `utf8_general_ci` or `latin1_german2_ci`). ([Bug#3808](#) [<http://bugs.mysql.com/3808>])
- Fixed too-early unlocking of tables if we have subquery in `HAVING` clause. ([Bug#3984](#) [<http://bugs.mysql.com/3984>])
- Fixed a bug in `mysqldump` when it didn't return an error if the output device was filled ([Bug#1851](#) [<http://bugs.mysql.com/1851>])
- Fixed a bug in client-side conversion of string column to `MYSQL_TIME` application buffer (prepared statements API). ([Bug#4030](#) [<http://bugs.mysql.com/4030>])
- Fixed a bug with server crash on attempt to execute a non-prepared statement. ([Bug#4236](#) [<http://bugs.mysql.com/4236>])
- Fixed a bug with server crash on attempt to prepare a statement with character set introducer. ([Bug#4105](#) [<http://bugs.mysql.com/4105>])
- Fixed bug which caused different number of warnings to be generated when bad datetime as string or as number was inserted into `DATETIME` or `TIMESTAMP` column. ([Bug#2336](#) [<http://bugs.mysql.com/2336>])

- Fixed some byte order bugs with prepared statements on machines with high-byte-first. (Bug#4173 [http://bugs.mysql.com/4173])
- Fixed unlikely bug in the range optimizer when using many `IN( )` queries on different key parts. (Bug#4157 [http://bugs.mysql.com/4157])
- Fixed problem with `NULL` and derived tables. (Bug#4097 [http://bugs.mysql.com/4097])
- Fixed wrong `UNION` results if display length of fields for numeric types was set less than real length of values in them. (Bug#4067 [http://bugs.mysql.com/4067])
- Fixed a bug in `mysql_stmt_close( )`, which hung up when attempting to close statement after failed `mysql_stmt_fetch( )`. (Bug#4079 [http://bugs.mysql.com/4079])
- Fixed bug of re-execution optimized `COUNT( * )`, `MAX( )` and `MIN( )` functions in prepared statements. (Bug#2687 [http://bugs.mysql.com/2687])
- Fixed a bug with `COUNT(DISTINCT)` performance degradation in cases like `COUNT(DISTINCT a TEXT, b CHAR(1))` (no index used). (Bug#3904 [http://bugs.mysql.com/3904])
- Fixed a bug in `MATCH ... AGAINST(... IN BOOLEAN MODE)` that under rare circumstances could cause wrong results if in the data's collation one byte could match many (like in `utf8_general_ci` or `latin1_german2_ci`). (Bug#3964 [http://bugs.mysql.com/3964])
- Fixed a bug in prepared statements protocol, when microseconds part of `MYSQL_TYPE_TIME/MYSQL_TYPE_DATETIME` columns was not sent to the client. (Bug#4026 [http://bugs.mysql.com/4026])
- Fixed a bug that using `--with-charset` with `configure` didn't affect the MySQL client library. (Bug#3990 [http://bugs.mysql.com/3990])
- Fixed a bug in authentication code that allowed a malicious user to bypass password verification with specially crafted packets, using a modified client library. (CVE-2004-0627 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0627], CVE-2004-0628 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0628])
- Fixed bug with wrong result of `CONCAT(?, col_name)` in prepared statements. (Bug#3796 [http://bugs.mysql.com/3796])
- Fixed potential memory overrun in `mysql_real_connect( )` (which required a compromised DNS server and certain operating systems). (Bug#4017 [http://bugs.mysql.com/4017], CVE-2004-0836 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0836])
- During the installation process of the server RPM on Linux, `mysqld` was run as the `root` system user, and if you had `--log-bin=file_name`, where the file was located somewhere outside of the data directory, it created binary log files owned by `root` in this directory that remained owned by `root` after the installation. This is now fixed by starting `mysqld` as the `mysql` system user instead. (Bug#4038 [http://bugs.mysql.com/4038])
- Made `DROP DATABASE` honor the value of `lower_case_table_names`. (Bug#4066 [http://bugs.mysql.com/4066])
- The slave SQL thread refused to replicate `INSERT ... SELECT` if it examined more than 4 billion rows. (Bug#3871 [http://bugs.mysql.com/3871])
- `mysqlbinlog` didn't escape the string content of user variables, and did not deal well when these variables were in non-ASCII character sets; this is now fixed by always printing the string content of user variables in hexadecimal. The character set and collation of the string is now also printed. (Bug#3875 [http://bugs.mysql.com/3875])

- Fixed incorrect destruction of expression which led to crash of server on complex `AND/OR` expressions if query was ignored (either by a replication server because of `--replicate-*-table` rules, or by any MySQL server because of a syntax error). ([Bug#3969](http://bugs.mysql.com/3969) [http://bugs.mysql.com/3969], [Bug#4494](http://bugs.mysql.com/4494) [http://bugs.mysql.com/4494])

## D.1.21. Changes in release 4.1.2 (28 May 2004)

Functionality added or changed:

- `CHAR BYTE` is an alias for the `BINARY` data type. (Previously, it was an alias for `CHAR BINARY`.)
- **Warning: Incompatible change:** Handling of the `FLOAT` and `DOUBLE` floating-point data types is more strict to follow standard SQL. For example, a data type of `FLOAT(3,1)` stores a maximum value of 99.9. Previously, the server allowed larger numbers to be stored. That is, it stored a value such as 100.0 as 100.0. Now the server clips 100.0 to the maximum allowable value of 99.9. If you have tables that were created before MySQL 4.1.2 and that contain floating-point data not strictly legal for the column type, you should alter the data types of those columns. For example:

```
ALTER TABLE tbl_name MODIFY col_name FLOAT(4,1);
```

- **Warning: Incompatible change:** String comparison now works according to the SQL standard. Because we have that `'a' = 'a '` then from it must follow that `'a' > 'a\t'`. (The latter was not the case before MySQL 4.1.2.) To implement it, we had to change how storage engines compare strings internally. As a side effect, if you have a table where a `CHAR` or `VARCHAR` column in some row has a value with the last character less than `ASCII(32)`, you have to repair this table. `CHECK TABLES` tells you if this problem exists. ([Bug#3152](http://bugs.mysql.com/3152) [http://bugs.mysql.com/3152])
- Added support for `DEFAULT CURRENT_TIMESTAMP` and for `ON UPDATE CURRENT_TIMESTAMP` specifications for `TIMESTAMP` columns. Now you can explicitly say that a `TIMESTAMP` column should be set automatically to the current timestamp for `INSERT` and/or `UPDATE` statements, or even prevent the column from updating automatically. Only one column with such an auto-set feature per table is supported. `TIMESTAMP` columns created with earlier versions of MySQL behave as before. Behavior of `TIMESTAMP` columns that were created without explicit specification of default/on as earlier depends on its position in table: If it is the first `TIMESTAMP` column, it be treated as having been specified as `TIMESTAMP DEFAULT CURRENT_TIMESTAMP ON UPDATE CURRENT_TIMESTAMP`. In other cases, it would be treated as a `TIMESTAMP DEFAULT 0` column. `NOW` is supported as an alias for `CURRENT_TIMESTAMP`. **Warning: Incompatible change:** Unlike in previous versions, explicit specification of default values for `TIMESTAMP` column is never ignored and turns off the auto-set feature (unless you have `CURRENT_TIMESTAMP` as the default).
- **Warning: Incompatible change:** Renamed prepared statements C API functions:

Old Name	New Name
<code>mysql_bind_param()</code>	<code>mysql_stmt_bind_param()</code>
<code>mysql_bind_result()</code>	<code>mysql_stmt_bind_result()</code>
<code>mysql_prepare()</code>	<code>mysql_stmt_prepare()</code>
<code>mysql_execute()</code>	<code>mysql_stmt_execute()</code>
<code>mysql_fetch()</code>	<code>mysql_stmt_fetch()</code>
<code>mysql_fetch_column()</code>	<code>mysql_stmt_fetch_column()</code>
<code>mysql_param_count()</code>	<code>mysql_stmt_param_count()</code>
<code>mysql_param_result()</code>	<code>mysql_stmt_param_metadata()</code>

<code>mysql_get_metadata()</code>	<code>mysql_stmt_result_metadata()</code>
<code>mysql_send_long_data()</code>	<code>mysql_stmt_send_long_data()</code>

Now all functions that operate with a `MYSQL_STMT` structure begin with the prefix `mysql_stmt_`.

- **Warning: Incompatible change:** The signature of the `mysql_stmt_prepare()` function was changed to `int mysql_stmt_prepare(MYSQL_STMT *stmt, const char *query, unsigned long length)`. To create a `MYSQL_STMT` handle, you should use the `mysql_stmt_init()` function, not `mysql_stmt_prepare()`.
- **Warning: Incompatible change:** The `Type` output column for `SHOW TABLE STATUS` now is labeled `Engine`.
- Added the `EXAMPLE` storage engine.
- The `mysqld` Windows server was renamed to `mysqld-debug`. See [Section 2.3.8, “Selecting a MySQL Server type”](#).
- Added `Handler_discover` status variable.
- Added support for character set conversion and `MYSQL_TYPE_BLOB` type code in prepared statement protocol.
- Added explanation of hidden `SELECT` of `UNION` in output of `EXPLAIN SELECT` statement.
- `mysql` command-line client now supports multiple `-e` options. ([Bug#591](#) [<http://bugs.mysql.com/591>])
- New `myisam_data_pointer_size` system variable. See [Section 5.2.2, “System Variables”](#).
- The `--log-warnings` server option now is enabled by default. Disable with `--skip-log-warnings`.
- The `--defaults-file=file_name` option now requires that the filename must exist (safety fix). ([Bug#3413](#) [<http://bugs.mysql.com/3413>])
- `mysqld_multi` now creates the log in the directory named by `datadir` (from the `[mysqld]` section in `my.cnf` or compiled in), not in `/tmp`. Thanks to Christian Hammers from Debian Security Team for reporting this. ([CVE-2004-0388](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0388>])
- `SHOW GRANTS` with no `FOR` clause or with `FOR CURRENT_USER()` shows the privileges for the current session.
- The improved character set support introduced in MySQL 4.1.0 for the `MyISAM` and `HEAP` storage engines is now available for `InnoDB` as well.
- A name of “Primary” no longer can be specified as an index name. (That name is reserved for the `PRIMARY KEY` if the table has one.) ([Bug#856](#) [<http://bugs.mysql.com/856>])
- MySQL now issues a warning when a `SET` or `ENUM` column with duplicate values in the list is created. ([Bug#1427](#) [<http://bugs.mysql.com/1427>])
- Now `SQL_SELECT_LIMIT` variable has no influence on subqueries. ([Bug#2600](#))

[<http://bugs.mysql.com/2600>)]

- `UNHEX ( )` function implemented. See [Section 12.3, “String Functions”](#).
- The `mysql` command-line client no longer stores in the history file multiple copies of identical queries that are run consecutively.
- Multi-line statements in the `mysql` command-line client now are stored in the history file as a single line.
- `UUID ( )` function implemented. Note that it does not work with replication yet. See [Section 12.9.4, “Miscellaneous Functions”](#).
- Prepared statements with all types of subqueries fixed.
- MySQL now supports up to 64 indexes per table.
- `MyISAM` tables now support keys up to 1000 bytes long.
- `MyISAM` and `InnoDB` tables now support index prefix lengths up to 1000 bytes long.
- If you try to create a key with a key part that is too long, and it is safe to auto-truncate it to a smaller length, MySQL now does so. A warning is generated, rather than an error.
- The `ft_boolean_syntax` variable now can be changed while the server is running. See [Section 5.2.2, “System Variables”](#).
- `REVOKE ALL PRIVILEGES, GRANT FROM user_list` is changed to a more consistent `REVOKE ALL PRIVILEGES, GRANT OPTION FROM user_list`. ([Bug#2642](#) [<http://bugs.mysql.com/2642>])
- Internal string-to-number conversion now supports only SQL:2003 compatible syntax for numbers. In particular, `'0x10'+0` does not work anymore. (Actually, it worked only on some systems before, such as Linux. It did not work on others, such as FreeBSD or Solaris. Making these queries OS-independent was the goal of this change.) Use `CONV ( )` to convert hexadecimal numbers to decimal. Example: `CONV(MID( '0x10' , 3 ) , 16 , 10)+0`.
- `mysqlhotcopy` now works on NetWare.
- `ALTER TABLE DROP PRIMARY KEY` no longer drops the first `UNIQUE` index if there is no primary index. ([Bug#2361](#) [<http://bugs.mysql.com/2361>])
- Added `latin1_spanish_ci` (Modern Spanish) collation for the `latin1` character set.
- Added the `ENGINE` table option as a synonym for the `TYPE` option for `CREATE TABLE` and `ALTER TABLE`.
- Added the `--default-storage-engine` server option as a synonym for `--default-table-type`.
- Added the `storage_engine` system variable as a synonym for `table_type`.
- Added `init_connect` and `init_slave` system variables. The values should be SQL statements to be executed when each client connects or each time a slave's SQL thread starts, respectively.
- C API enhancement: `SERVER_QUERY_NO_INDEX_USED` and `SERV-ER_QUERY_NO_GOOD_INDEX_USED` flags are now set in the `server_status` field of the `MYSQL` structure. It is these flags that make the query to be logged as slow if `mysqld` was started

with `--log-slow-queries --log-queries-not-using-indexes`.

- For replication of `MEMORY` (`HEAP`) tables: Made the master automatically write a `DELETE FROM` statement to its binary log when a `MEMORY` table is opened for the first time since master's startup. This is for the case where the slave has replicated a non-empty `MEMORY` table, then the master is shut down and restarted: the table is now empty on master; the `DELETE FROM` empties it on slave too. Note that even with this fix, between the master's restart and the first use of the table on master, the slave still has out-of-date data in the table. But if you use the `init-file` option to populate the `MEMORY` table on the master at startup, it ensures that the failing time interval is zero. (Bug#2477 [<http://bugs.mysql.com/2477>])
- When a session having open temporary tables terminates, the statement automatically written to the binary log is now `DROP TEMPORARY TABLE IF EXISTS` instead of `DROP TEMPORARY TABLE`, for more robustness.
- The MySQL server now returns an error if `SET SQL_LOG_BIN` or `SET SQL_LOG_UPDATE` is issued by a user without the `SUPER` privilege (in previous versions it just silently ignored the statement in this case).
- Changed that when the MySQL server has binary logging disabled (that is, no `--log-bin` option was used), then no transaction binary log cache is allocated for connections. This should save `bin-log-cache-size` bytes of memory (32KB by default) for every connection.
- Added `Binlog_cache_use` and `Binlog_cache_disk_use` status variables that count the number of transactions that used transaction binary log and that had to flush this temporary binary log to disk instead of using only the in-memory buffer. They can be used for tuning the `bin-log-cache-size` system variable.
- Added option `--replicate-same-server-id`.
- The Mac OS X Startup Item has been moved from the directory `/Library/StartupItems/MySQL` to `/Library/StartupItems/MySQLCOM` to avoid a file name collision with the MySQL Startup Item installed with Mac OS X Server. See [Section 2.13.2](#), "Mac OS X Notes".
- Added option `--to-last-log` to `mysqlbinlog`, for use in conjunction with `--read-from-remote-server`.
- The `FLOAT` and `DECIMAL` types now obey (precision,scale) settings. (Bug#10897 [<http://bugs.mysql.com/10897>])
- Added the `mysql_set_local_infile_handler()` and `mysql_set_local_infile_default()` C API functions.

Bugs fixed:

- Fixed check of `EXPLAIN` of `UNION`. (Bug#3639 [<http://bugs.mysql.com/3639>])
- Fixed a bug in a query that used `DISTINCT` and `ORDER BY` by column's real name, while the column had an alias, specified in `SELECT` clause. (Bug#3681 [<http://bugs.mysql.com/3681>])
- `mysqld` could crash when a table was altered and used at the same time. This was a 4.1.2-specific bug. (Bug#3643 [<http://bugs.mysql.com/3643>]).
- Fixed bug when using impossible `WHERE` with `PROCEDURE ANALYSE()`. (Bug#2238 [<http://bugs.mysql.com/2238>]).

- Fixed security problem in new authentication where password was not checked for changed `GRANT` accounts until `FLUSH PRIVILEGES` was executed. (Bug#3404 [http://bugs.mysql.com/3404])
- Fixed crash of `GROUP_CONCAT()` on expression with `ORDER BY` and external `ORDER BY` in a query. (Bug#3752 [http://bugs.mysql.com/3752])
- Fixed a bug in `ALL/SOME` subqueries in case of optimization (key field present in subquery). (Bug#3646 [http://bugs.mysql.com/3646])
- Fixed a bug in `SHOW GRANTS` and `EXPLAIN SELECT` character set conversion. (Bug#3403 [http://bugs.mysql.com/3403])
- Prepare statements parameter do not cause error message as fields used in select list but not included in `ORDER BY` list.
- `UNION` statements did not consult `SQL_SELECT_LIMIT` value when set. This is now fixed properly, which means that this limit is applied to the top level query, unless `LIMIT` for entire `UNION` is used.
- Fixed a bug in multiple-table `UPDATE` statements that resulted in an error when one of the tables was not updated but was used in the nested query, contained therein.
- Fixed `mysql_stmt_send_long_data()` behavior on second execution of prepared statement and in case when long data had zero length. (Bug#1664 [http://bugs.mysql.com/1664])
- Fixed crash on second execution of prepared statement with `UNION`. (Bug#3577 [http://bugs.mysql.com/3577])
- Fixed incorrect results of aggregate functions in subquery with empty result set. (Bug#3505 [http://bugs.mysql.com/3505])
- You can now call `mysql_stmt_attr_set(..., STMT_ATTR_UPDATE_MAX_LENGTH)` to tell the client library to update `MYSQL_FIELD->max_length` when doing `mysql_stmt_store_result()`. (Bug#1647 [http://bugs.mysql.com/1647]).
- Added support for unsigned integer types to prepared statement API (Bug#3035 [http://bugs.mysql.com/3035]).
- Fixed crash in prepared statements when subquery in the `FROM` clause with parameter used. (Bug#3020 [http://bugs.mysql.com/3020])
- Fixed unknown error when negative value bind to unsigned. (Bug#3223 [http://bugs.mysql.com/3223])
- Fixed aggregate function in prepared statements. (Bug#3360 [http://bugs.mysql.com/3360])
- Incorrect error message when wrong table used in multiple-table `DELETE` statement in prepared statements. (Bug#3411 [http://bugs.mysql.com/3411])
- Requiring `UPDATE` privilege for tables which are not updated in multiple-table `UPDATE` statement in prepared statements.
- Fixed prepared statement support for `INSERT`, `REPLACE`, `CREATE`, `DELETE`, `SELECT`, `DO`, `SET` and `SHOW`. All other commands are prohibited via prepared statement interface. (Bug#3398 [http://bugs.mysql.com/3398], Bug#3406 [http://bugs.mysql.com/3406], Bug#2811 [http://bugs.mysql.com/2811])
- Fixed a lot of bugs in `GROUP_CONCAT()`. (Bug#2695 [http://bugs.mysql.com/2695], Bug#3381 [http://bugs.mysql.com/3381], Bug#3319 [http://bugs.mysql.com/3319])

- Added optimization that allows for prepared statements using a large number of tables or tables with a large number of columns to be re-executed significantly faster. (Bug#2050 [<http://bugs.mysql.com/2050>])
- Fixed bug that caused execution of prepared statements to fail then table that this statement were using left table cache. This bug showed up as if this prepared statement used random garbage as column names or as server crashes. (Bug#3307 [<http://bugs.mysql.com/3307>])
- Fixed a problem resulting from setting the `character_set_results` variable to `NULL`. (Bug#3296 [<http://bugs.mysql.com/3296>])
- Fixed query cache statistics.
- Fixed bug in `ANALYZE TABLE` on a `BDB` table inside a transaction that hangs server thread. (Bug#2342 [<http://bugs.mysql.com/2342>])
- Fixed a symlink vulnerability in the `mysqlbug` script. (Bug#3284 [<http://bugs.mysql.com/3284>], CVE-2004-0381 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0381>])
- Fixed a bug in parallel repair (`myisamchk -p, myisam_repair_threads`); sometimes the repair process failed to repair a table. (Bug#1334 [<http://bugs.mysql.com/1334>])
- A query that uses both `UNION [DISTINCT]` and `UNION ALL` now works correctly. (Bug#1428 [<http://bugs.mysql.com/1428>])
- Table default character set affects `LONGBLOB` columns. (Bug#2821 [<http://bugs.mysql.com/2821>])
- `CONCAT_WS ( )` makes the server die in case of illegal mix of collations. (Bug#3087 [<http://bugs.mysql.com/3087>])
- UTF8 charset breaks joins with mixed column/string constant. (Bug#2959 [<http://bugs.mysql.com/2959>])
- Fixed `DROP DATABASE` to report number of tables deleted.
- Fixed bug in privilege checking of `ALTER TABLE RENAME`. (Bug#3270 [<http://bugs.mysql.com/3270>], CVE-2004-0835 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0835>])
- Fixed memory leak in the client library when statement handle was freed on closed connection (call to `mysql_stmt_close` after `mysql_close`). (Bug#3073 [<http://bugs.mysql.com/3073>])
- Fixed server segmentation faults when processing malformed prepared statements. (Bug#2795 [<http://bugs.mysql.com/2795>], Bug#2274 [<http://bugs.mysql.com/2274>])
- Fixed using subqueries with `OR` and `AND` functions. (Bug#2838 [<http://bugs.mysql.com/2838>])
- Fixed comparison of tables/database names with `--lower_case_table_names` option. (Bug#2880 [<http://bugs.mysql.com/2880>])
- Removed try to check `NULL` if index built on column where `NULL` is impossible in `IN` subquery optimization. (Bug#2393 [<http://bugs.mysql.com/2393>])
- Fixed incorrect parsing of subqueries in the `FROM` clause. (Bug#2421 [<http://bugs.mysql.com/2421>])
- Fixed processing of `RAND ( )` in subqueries with static tables. (Bug#2645 [<http://bugs.mysql.com/2645>])
- Fixed bug with quoting of table names in `mysqldump` for various values of `sql_mode` of server.

[Bug#2591](http://bugs.mysql.com/2591) [http://bugs.mysql.com/2591])

- Fixed bug with storing values that are out of range for `DOUBLE` and `FLOAT` columns. ([Bug#2082](http://bugs.mysql.com/2082) [http://bugs.mysql.com/2082])
- Fixed bug with compiling `--with-pstack` with binutils 2.13.90. ([Bug#1661](http://bugs.mysql.com/1661) [http://bugs.mysql.com/1661])
- Fixed a bug in the `GRANT` system. When a password was assigned to an account at the global level and then privileges were granted at the database level (without specifying any password), the existing password was replaced temporarily in memory until the next `FLUSH PRIVILEGES` operation or the server was restarted. ([Bug#2953](http://bugs.mysql.com/2953) [http://bugs.mysql.com/2953])
- Fixed a bug in full-text search on multi-byte character set (such as UTF8) that appeared when a search word was shorter than a matching word from the index (for example, searching for “Uppsala” when table data contain “Uppsa\*la”). ([Bug#3011](http://bugs.mysql.com/3011) [http://bugs.mysql.com/3011])
- Fixed a bug that made `Max_used_connections` to be less than the actual maximum number of connections in use simultaneously.
- Fixed calculation of `Index_length` in `HEAP` table status for `BTREE` indexes. ([Bug#2719](http://bugs.mysql.com/2719) [http://bugs.mysql.com/2719])
- Fixed `mysql_stmt_affected_rows()` call to always return number of rows affected by given statement. ([Bug#2247](http://bugs.mysql.com/2247) [http://bugs.mysql.com/2247])
- Fixed crash in `MATCH ... AGAINST()` on a phrase search operator with a missing closing double quote. ([Bug#2708](http://bugs.mysql.com/2708) [http://bugs.mysql.com/2708])
- Fixed output of `mysqldump --tab`. ([Bug#2705](http://bugs.mysql.com/2705) [http://bugs.mysql.com/2705])
- Fix for a bug in `UNION` operations that prevented proper handling of `NULL` columns. This happened only if a column in the first `SELECT` node was `NOT NULL`. ([Bug#2508](http://bugs.mysql.com/2508) [http://bugs.mysql.com/2508])
- Fix for a bug in `UNION` operations with `InnoDB` storage engine, when some columns from one table were used in one `SELECT` statement and some were used in another `SELECT` statement. ([Bug#2552](http://bugs.mysql.com/2552) [http://bugs.mysql.com/2552])
- Fixed a few years old bug in the range optimizer that caused a segmentation fault on some very rare queries. ([Bug#2698](http://bugs.mysql.com/2698) [http://bugs.mysql.com/2698])
- Fixed bug with `SHOW CREATE TABLE ...` which didn't properly double quotes. ([Bug#2593](http://bugs.mysql.com/2593) [http://bugs.mysql.com/2593])
- Queries with subqueries in `FROM` clause locks all tables at once for now. This also fixed bugs in `EXPLAIN` of subqueries in `FROM` output. ([Bug#2120](http://bugs.mysql.com/2120) [http://bugs.mysql.com/2120])
- Fixed bug with `mysqldump` not quoting “tricky” names correctly. ([Bug#2592](http://bugs.mysql.com/2592) [http://bugs.mysql.com/2592])
- Fix for a bug that prevented table / column privileges from being loaded on startup. ([Bug#2546](http://bugs.mysql.com/2546) [http://bugs.mysql.com/2546])
- Fixed bug in replication with `CREATE TABLE ... LIKE ...` that resulted in a statement not being written to the binary log. ([Bug#2557](http://bugs.mysql.com/2557) [http://bugs.mysql.com/2557])
- Fixed memory leak in `INSERT ... ON DUPLICATE KEY UPDATE ...`. ([Bug#2438](http://bugs.mysql.com/2438) [http://bugs.mysql.com/2438])

- Fixed bug in the parser, making the syntax `CONVERT(expr, type)` legal again.
- Fixed parsing of short-form IP addresses in `INET_ATON()`. (Bug#2310 [<http://bugs.mysql.com/2310>])
- Fixed a bug in `CREATE ... SELECT` that sometimes caused a string column with a multi-byte character set (such as `utf8`) to have insufficient length to hold the data.
- Fixed a rare table corruption on adding data (`INSERT`, `REPLACE`, `UPDATE`, etc. but not `DELETE`) to a `FULLTEXT` index. (Bug#2417 [<http://bugs.mysql.com/2417>])
- Compile the `MySQL-client` RPM package against `libreadline` instead of `libedit`. (Bug#2289 [<http://bugs.mysql.com/2289>])
- Fix for a crashing bug that was caused by not setting `vio_timeout()` virtual function for all protocols. This bug occurred on Windows. (Bug#2025 [<http://bugs.mysql.com/2025>])
- Fix for a bug that caused `mysql` client program to erroneously cache the value of the current database. (Bug#2025 [<http://bugs.mysql.com/2025>])
- Fix for a bug that caused client/server communication to be broken when `mysql_set_server_option()` or `mysql_get_server_option()` were invoked. (Bug#2207 [<http://bugs.mysql.com/2207>])
- Fix for a bug that caused wrong results when `CAST()` was applied on `NULL` to signed or unsigned integer column. (Bug#2219 [<http://bugs.mysql.com/2219>])
- Fix for a crashing bug that occurred in the `mysql` client program when database name was longer than expected. (Bug#2221 [<http://bugs.mysql.com/2221>])
- Fixed a bug in `CHECK TABLE` that sometimes resulted in a spurious error `Found key at page ... that points to record outside datafile` for a table with a `FULLTEXT` index. (Bug#2190 [<http://bugs.mysql.com/2190>])
- Fixed bug in `GRANT` with table-level privilege handling. (Bug#2178 [<http://bugs.mysql.com/2178>])
- Fixed bug in `ORDER BY` on a small column. (Bug#2147 [<http://bugs.mysql.com/2147>])
- Fixed a bug with the `INTERVAL()` function when 8 or more comparison arguments are provided. (Bug#1561 [<http://bugs.mysql.com/1561>])
- Packaging: Fixed a bug in the Mac OS PKG `postinstall` script (`mysql_install_db` was called with an obsolete argument).
- Packaging: Added missing file `mysql_create_system_tables` to the server RPM package. This bug was fixed for the 4.1.1 RPMs by updating the MySQL-server RPM from `MySQL-server-4.1.1-0` to `MySQL-server-4.1.1-1`. The other RPMs were not affected by this change.
- Fixed a bug in `myisamchk` and `CHECK TABLE` that sometimes resulted in a spurious error `Found key at page ... that points to record outside datafile` for a table with a `FULLTEXT` index. (Bug#1977 [<http://bugs.mysql.com/1977>])
- Fixed a hang in full-text indexing of strings in multi-byte (all besides `utf8`) charsets. (Bug#2065 [<http://bugs.mysql.com/2065>])
- Fixed a crash in full-text indexing of UTF8 data. (Bug#2033 [<http://bugs.mysql.com/2033>])
- Replication: a rare race condition in the slave SQL thread that could lead to an incorrect complaint that the relay log is corrupted. (Bug#2011 [<http://bugs.mysql.com/2011>])

- Replication: If a client connects to a slave server and issues an administrative statement for a table (for example, `OPTIMIZE TABLE` or `REPAIR TABLE`), this could sometimes stop the slave SQL thread. This does not lead to any corruption, but you must use `START SLAVE` to get replication going again. (Bug#1858 [<http://bugs.mysql.com/1858>])
- Replication: in the slave SQL thread, a multiple-table `UPDATE` could produce an incorrect complaint that some record was not found in one table, if the `UPDATE` was preceded by a `INSERT . . . SELECT`. (Bug#1701 [<http://bugs.mysql.com/1701>])
- Replication: sometimes the master gets a non-fatal error during the execution of a statement but finally the statements succeeds (for example, a write to a `MyISAM` table first receives "no space left on device" but is able to finally complete, see Section A.4.3, "How MySQL Handles a Full Disk"); the bug was that the master forgot to reset the error code to 0 after success, so the error code got into its binary log, thus making the slave giving false alarms like "did not get the same error as on master". (Bug#2083 [<http://bugs.mysql.com/2083>])
- Removed a misleading "check permissions on master.info" from a replication error message, because the cause of the problem could be different from permissions. (Bug#2121 [<http://bugs.mysql.com/2121>])
- Fixed a crash when the replication slave was unable to create the first relay log. (Bug#2145 [<http://bugs.mysql.com/2145>])
- `ALTER DATABASE` caused the client to hang if the database did not exist. (Bug#2333 [<http://bugs.mysql.com/2333>])
- Multiple-table `DELETE` statements were never replicated by the slave if there were any `--replicate-*-table` options. (Bug#2527 [<http://bugs.mysql.com/2527>])
- Fixed bug in `ALTER TABLE RENAME`, when rename to the table with the same name in another database silently dropped destination table if it existed. (Bug#2628 [<http://bugs.mysql.com/2628>])
- The MySQL server did not report any error if a statement (submitted through `mysql_real_query()` or `mysql_stmt_prepare()`) was terminated by garbage characters. This can happen if you pass a wrong `length` parameter to these functions. The result was that the garbage characters were written into the binary log. (Bug#2703 [<http://bugs.mysql.com/2703>])
- Fixed bug in client library that caused `mysql_stmt_fetch` and `mysql_stmt_store_result()` to hang if they were called without prior call of `mysql_stmt_execute()`. Now they give an error instead. (Bug#2248 [<http://bugs.mysql.com/2248>])
- Made clearer the error message that one gets when an update is refused because of the `--read-only` option. (Bug#2757 [<http://bugs.mysql.com/2757>])
- Fixed that `--replicate-wild-*-table` rules apply to `ALTER DATABASE` when the table pattern is `%`, as is the case for `CREATE DATABASE` and `DROP DATABASE`. (Bug#3000 [<http://bugs.mysql.com/3000>])
- Fixed that when a `Rotate` event is found by the slave SQL thread in the middle of a transaction, the value of `Relay_Log_Pos` in `SHOW SLAVE STATUS` remains correct. (Bug#3017 [<http://bugs.mysql.com/3017>])
- Corrected the master's binary log position that `InnoDB` reports when it is doing a crash recovery on a slave server. (Bug#3015 [<http://bugs.mysql.com/3015>])
- Changed the column `Seconds_Behind_Master` in `SHOW SLAVE STATUS` to never show a value of -1. (Bug#2826 [<http://bugs.mysql.com/2826>])

- Changed that when a `DROP TEMPORARY TABLE` statement is automatically written to the binary log when a session ends, the statement is recorded with an error code of value zero (this ensures that killing a `SELECT` on the master does not result in a superfluous error on the slave). (Bug#3063 [<http://bugs.mysql.com/3063>])
- Changed that when a thread handling `INSERT DELAYED` (also known as a `delayed_insert` thread) is killed, its statements are recorded with an error code of value zero (killing such a thread does not endanger replication, so we thus avoid a superfluous error on the slave). (Bug#3081 [<http://bugs.mysql.com/3081>])
- Fixed deadlock when two `START SLAVE` commands were run at the same time. (Bug#2921 [<http://bugs.mysql.com/2921>])
- Fixed that a statement never triggers a superfluous error on the slave, if it must be excluded given the `--replicate-*` options. The bug was that if the statement had been killed on the master, the slave would stop. (Bug#2983 [<http://bugs.mysql.com/2983>])
- The `--local-load` option of `mysqlbinlog` now requires an argument.
- Fixed a segmentation fault when running `LOAD DATA FROM MASTER` after `RESET SLAVE`. (Bug#2922 [<http://bugs.mysql.com/2922>])
- `mysqlbinlog --read-from-remote-server` read all binary logs following the one that was requested. It now stops at the end of the requested file, the same as it does when reading a local binary log. There is an option `--to-last-log` to get the old behavior. (Bug#3204 [<http://bugs.mysql.com/3204>])
- Fixed `mysqlbinlog --read-from-remote-server` to print the exact positions of events in the "at #" lines. (Bug#3214 [<http://bugs.mysql.com/3214>])
- Fixed a rare error condition that caused the slave SQL thread spuriously to print the message `Bin-log has bad magic number` and stop when it was not necessary to do so. (Bug#3401 [<http://bugs.mysql.com/3401>])
- Fixed the `Exec_master_log_pos` column and its disk image in the `relay-log.info` file to be correct if the master had version 3.23. (The value was too big by six bytes.) This bug does not exist in MySQL 5.0. (Bug#3400 [<http://bugs.mysql.com/3400>])
- Fixed `mysqlbinlog` not to forget to print a `USE` statement under rare circumstances where the binary log contained a `LOAD DATA INFILE` statement. (Bug#3415 [<http://bugs.mysql.com/3415>])
- Fixed a memory corruption when replicating a `LOAD DATA INFILE` when the master had version 3.23. Some smaller problems remain in this setup, See [Section 6.7, "Replication Features and Known Problems"](#). (Bug#3422 [<http://bugs.mysql.com/3422>])
- Multiple-table `DELETE` statements were always replicated by the slave if there were some `--replicate-*--ignore-table` options and no `--replicate-*--do-table` options. (Bug#3461 [<http://bugs.mysql.com/3461>])
- Fixed a crash of the MySQL slave server when it was built with `--with-debug` and replicating itself. (Bug#3568 [<http://bugs.mysql.com/3568>])
- Fixed that in some replication error messages, a very long query caused the rest of the message to be invisible (truncated), by putting the query last in the message. (Bug#3357 [<http://bugs.mysql.com/3357>])
- Fixed a bug in `REPAIR TABLE` that resulted sometimes in a corrupted table, if the table contained `FULLTEXT` indexes and many words of different lengths that are considered equal (which is possible in certain collations, such as `latin1_german2_ci` or `utf8_general_ci`). (Bug#3835

[<http://bugs.mysql.com/3835>])

- Fixed a crash of `mysqld` that was started with binary logging disabled, but with a non-zero value for the `expire_logs_days` system variable. (Bug#3807 [<http://bugs.mysql.com/3807>])
- If `server-id` was not set using startup options but with `SET GLOBAL`, the replication slave still complained that it was not set. (Bug#3829 [<http://bugs.mysql.com/3829>])

## D.1.22. Changes in release 4.1.1 (01 December 2003)

This release includes all fixes in MySQL 4.0.16 and most of the fixes in MySQL 4.0.17.

Functionality added or changed:

- **Warning: Incompatible change:** Renamed the C API `mysql_prepare_result()` function to `mysql_get_metadata()` because the old name was confusing.
- **Warning: Incompatible change:** Client authentication now is based on 41-byte passwords in the `user` table, not 45-byte passwords as in 4.1.0. Any 45-byte passwords created for 4.1.0 must be re-set after running the `mysql_fix_privilege_tables` script.
- **Important note:** If you upgrade to `InnoDB-4.1.1` or higher, you cannot downgrade to a version lower than 4.1.1 any more! That is because earlier versions of `InnoDB` are not aware of multiple tablespaces.
- Added `secure_auth` global server system variable and `--secure-auth` server option that disallow authentication for accounts that have old (pre-4.1.1) passwords.
- Added `--secure-auth` option to `mysql` command-line client. If this option is set, the client refuses to send passwords in old (pre-4.1.1) format.
- `EXPLAIN` now supports an `EXTENDED` option. When given, `EXPLAIN` generates extra information that may be viewed with the `SHOW WARNINGS` statement.
- Table aliases are not case sensitive if `lower_case_table_names` is non-zero.
- The `--old-protocol` option for `mysqld` is no longer supported and has been removed.
- Renamed `bdb_version` system variable to `version_bdb`.
- `MyISAM` tables now use a better checksum algorithm (if checksum is enabled with `CREATE TABLE ... CHECKSUM=1`). Old tables will appear to have incorrect checksum, and should be repaired.
- New `CHECKSUM TABLE` statement for reporting table checksum values.
- Added `character_set_client`, `character_set_connection`, `character_set_database`, `character_set_results`, `character_set_server`, `character_set_system`, `collation_connection`, `collation_database`, and `collation_server` system variables to provide information about character sets and collations.
- It is now possible to create multiple key caches, assign table indexes to particular caches, and to preload indexes into caches. See [Section 13.5.5.1, “CACHE INDEX Syntax”](#). See [Section 13.5.5.4, “LOAD INDEX INTO CACHE Syntax”](#). Structured system variables are introduced as a means of grouping related key cache parameters. See [Section 5.2.3.1, “Structured System Variables”](#).
- Added `preload_buffer_size` system variable.

- New `COERCIBILITY()` function to return the collation coercibility of a string.
- The `--quote-names` option for `mysqldump` now is enabled by default.
- `mysqldump` now includes a statement in the dump output to set `FOREIGN_KEY_CHECKS` to 0 to avoid problems with tables having to be reloaded in a particular order when the dump is reloaded. The existing `FOREIGN_KEY_CHECKS` value is saved and restored.
- You can revoke all privileges from a user with `REVOKE ALL PRIVILEGES, GRANT FROM user_list`.
- Added `IGNORE` option for `DELETE` statement.
- MySQL source distributions now also include the MySQL Internals Manual `internals.texi`.
- Added `mysql_set_server_option()` C API client function to allow multiple statement handling in the server to be enabled or disabled.
- The `mysql_next_result()` C API function now returns `-1` if there are no more result sets.
- Renamed `CLIENT_MULTI_QUERIES` connect option flag to `CLIENT_MULTI_STATEMENTS`. To allow for a transition period, the old option continues to be recognized for a while.
- Require `DEFAULT` before table and database default character set. This enables us to use `ALTER TABLE tbl_name ... CHARACTER SET=...` to change the character set for all `CHAR`, `VARCHAR`, and `TEXT` columns in a table.
- Added `MATCH ... AGAINST( ... WITH QUERY EXPANSION)` and the `ft_query_expansion_limit` system variable.
- Removed unused `ft_max_word_len_for_sort` system variable.
- Removed unused `ft_max_word_len_for_sort` variable from `myisamchk`.
- Full-text search now supports multi-byte character sets and the Unicode `utf8` character set. (The Unicode `ucs2` character set is not yet supported.)
- Phrase search in `MATCH ... AGAINST ( ... IN BOOLEAN MODE)` no longer matches partial words.
- Added aggregate function `BIT_XOR()` for bitwise XOR operations.
- Replication over SSL now works.
- The `START SLAVE` statement now supports an `UNTIL` clause for specifying that the slave SQL thread should be started but run only until it reaches a given position in the master's binary logs or in the slave's relay logs.
- Produce warnings even for single-row `INSERT` statements, not just for multiple-row `INSERT` statements. Previously, it was necessary to set `SQL_WARNINGS=1` to generate warnings for single-row statements.
- Added `delimiter (\d)` command to the `mysql` command-line client for changing the statement delimiter (terminator). The default delimiter is semicolon.
- `CHAR`, `VARCHAR`, and `TEXT` columns now have lengths measured in characters rather than in bytes. The character size depends on the column's character set. This means, for example, that a `CHAR(n)` column for a multi-byte character set takes more storage than before. Similarly, index values on such columns are measured in characters, not bytes.

- `LIMIT` no longer accepts negative arguments (they used to be treated as very big positive numbers before).
- The `DATABASE()` function now returns `NULL` rather than the empty string if there is no database selected.
- Added `--sql-mode=NO_AUTO_VALUE_ON_ZERO` option to suppress the usual behavior of generating the next sequence number when zero is stored in an `AUTO_INCREMENT` column. With this mode enabled, zero is stored as zero; only storing `NULL` generates a sequence number.
- Added `DROP USER 'user_name'@'host_name'` statement to drop an account that has no privileges.
- The interface to aggregate user-defined functions has changed a bit. You must now declare a `xxx_clear()` function for each aggregate function `XXX()`. `xxx_clear()` is used instead of `xxx_reset()`.
- Added new `ADDTIME()`, `DATE()`, `DATEDIFF()`, `LAST_DAY()`, `MAKEDATE()`, `MAKETIME()`, `MICROSECOND()`, `SUBTIME()`, `TIME()`, `TIMEDIFF()`, `TIMESTAMP()`, `UTC_DATE()`, `UTC_TIME()`, `UTC_TIMESTAMP()`, and `WEEKOFYEAR()` functions.
- Added new syntax for `ADDDATE()` and `SUBDATE()`. The second argument now may be a number representing the number of days to be added to or subtracted from the first date argument.
- Added new `type` values `DAY_MICROSECOND`, `HOURL_MICROSECOND`, `MINUTE_MICROSECOND`, `SECOND_MICROSECOND`, and `MICROSECOND` for `DATE_ADD()`, `DATE_SUB()`, and `EXTRACT()`.
- Added new `%f` microseconds format specifier for `DATE_FORMAT()` and `TIME_FORMAT()`.
- All queries in which at least one `SELECT` does not use indexes properly now are written to the slow query log when long log format is used.
- It is now possible to create a `MERGE` table from `MyISAM` tables in different databases. Formerly, all the `MyISAM` tables had to be in the same database, and the `MERGE` table had to be created in that database as well.
- Added new `COMPRESS()`, `UNCOMPRESS()`, and `UNCOMPRESSED_LENGTH()` functions.
- When using `SET sql_mode='mode'` for a complex mode (such as `ANSI`), we now update the `sql_mode` variable to include all the individual options implied by the complex mode.
- Added the OLAP (On-Line Analytical Processing) function `ROLLUP`, which provides summary rows for each `GROUP BY` level.
- Added `SQLSTATE` codes for all server errors.
- Added `mysql_sqlstate()` and `mysql_stmt_sqlstate()` C API client functions that return the `SQLSTATE` error code for the last error.
- `TIME` columns with hour values greater than 24 were returned incorrectly to the client.
- `ANALYZE TABLE`, `OPTIMIZE TABLE`, `REPAIR TABLE`, and `FLUSH` statements are now stored in the binary log and thus replicated to slaves. This logging does not occur if the optional `NO_WRITE_TO_BINLOG` keyword (or its alias `LOCAL`) is given. Exceptions are that `FLUSH LOGS`, `FLUSH MASTER`, `FLUSH SLAVE`, and `FLUSH TABLES WITH READ LOCK` are not logged in any case. For a syntax example, see [Section 13.5.5.2, “FLUSH Syntax”](#).
- New global system variable `relay_log_purge` to enable or disable automatic relay log purging.

- `LOAD DATA` now produces warnings that can be fetched with `SHOW WARNINGS`.
- Added support for syntax `CREATE TABLE table2 (LIKE table1)` that creates an empty table `table2` with a definition that is exactly the same as `table1`, including any indexes.
- `CREATE TABLE tbl_name (...) TYPE=storage_engine` now generates a warning if the named storage engine is not available. The table is still created as a `MyISAM` table, as before.
- Most subqueries are now much faster than before.
- Added `PURGE BINARY LOGS` as an alias for `PURGE MASTER LOGS`.
- Disabled the `PURGE LOGS` statement that was added in version 4.1.0. The statement now should be issued as `PURGE MASTER LOGS` or `PURGE BINARY LOGS`.
- Added `SHOW BDB LOGS` as an alias for `SHOW LOGS`.
- Added `SHOW MASTER LOGS` as an alias for `SHOW BINARY LOGS`. (In 4.1.0, `SHOW MASTER LOGS` was renamed to `SHOW BINARY LOGS`. Now you can use either one.)
- Added `Slave_IO_State` and `Seconds_Behind_Master` columns to the output of `SHOW SLAVE STATUS`. `Slave_IO_State` indicates the state of the slave I/O thread, and `Seconds_Behind_Master` indicates the number of seconds by which the slave is late compared to the master.
- The `--lower-case-table-names=1` server option now also makes aliases case insensitive. ([Bug#534](http://bugs.mysql.com/534) [<http://bugs.mysql.com/534>])
- Changed that the relay log is flushed to disk by the slave I/O thread every time it reads a relay log event. This reduces the risk of losing some part of the relay log in case of brutal crash.

Bugs fixed:

- Fixed `mysql` parser not to erroneously interpret ‘;’ character within `/* ... */` comment as statement terminator.
- Fixed merging types and length of result set columns for `UNION` operations. The types and lengths now are determined taking into account values for all `SELECT` statements in the `UNION`, not just the first `SELECT`.
- Fixed a bug in privilege handling that caused connections from certain IP addresses to be assigned incorrect database-level privileges. A connection could be assigned the database privileges of the previous successful authentication from one of those IP addresses, even if the IP address username and database name were different. ([Bug#1636](http://bugs.mysql.com/1636) [<http://bugs.mysql.com/1636>])
- Error-handling functions were not called properly when an error resulted from `[CREATE | REPLACE | INSERT] ... SELECT` statements.
- `HASH`, `BTREE`, `RTREE`, `ERRORS`, and `WARNINGS` no longer are reserved words. ([Bug#724](http://bugs.mysql.com/724) [<http://bugs.mysql.com/724>])
- Fix for bug in `ROLLUP` when all tables were `const` tables. ([Bug#714](http://bugs.mysql.com/714) [<http://bugs.mysql.com/714>])
- Fixed a bug in `UNION` that prohibited `NULL` values from being inserted into result set columns where the first `SELECT` of the `UNION` retrieved `NOT NULL` columns. The type and `max_length` of the result column is now defined based on all `UNION` parts.

- Fixed name resolution of columns of reduced subqueries in unions. ([Bug#745](#) [<http://bugs.mysql.com/745>])
- Fixed memory overrun in subqueries in select list with `WHERE` clause bigger than outer query `WHERE` clause. ([Bug#726](#) [<http://bugs.mysql.com/726>])
- Fixed a bug that caused `MyISAM` tables with `FULLTEXT` indexes created in 4.0.x to be unreadable in 4.1.x.
- Fixed a data loss bug in `REPAIR TABLE . . . USE_FRM` when used with tables that contained `TIMESTAMP` columns and were created in 4.0.x.
- Fixed reduced subquery processing in `ORDER BY/GROUP BY` clauses. ([Bug#442](#) [<http://bugs.mysql.com/442>])
- Fixed name resolution of outer columns of subquery in `INSERT/REPLACE` statements. ([Bug#446](#) [<http://bugs.mysql.com/446>])
- Fixed bug in marking columns of reduced subqueries. ([Bug#679](#) [<http://bugs.mysql.com/679>])
- Fixed a bug that made `CREATE FULLTEXT INDEX` syntax illegal.
- Fixed a crash when a `SELECT` that required a temporary table (marked by `Using temporary` in `EXPLAIN` output) was used as a derived table in `EXPLAIN` command. ([Bug#251](#) [<http://bugs.mysql.com/251>])
- Fixed a rare table corruption bug in `DELETE` from a big table with a `new` (created by MySQL-4.1) full-text index.
- `LAST_INSERT_ID( )` now returns 0 if the last `INSERT` statement didn't insert any rows.
- Fixed missing last character in function output. ([Bug#447](#) [<http://bugs.mysql.com/447>])
- Fixed a rare replication bug when a transaction spanned two or more relay logs, and the slave was stopped while executing the part of the transaction that was in the second or later relay log. Then replication would resume at the beginning of the second or later relay log, which was incorrect. (It should resume at `BEGIN`, in the first relay log.) ([Bug#53](#) [<http://bugs.mysql.com/53>])
- `CONNECTION_ID( )` now is properly replicated. ([Bug#177](#) [<http://bugs.mysql.com/177>])
- The new `PASSWORD( )` function in 4.1 is now properly replicated. ([Bug#344](#) [<http://bugs.mysql.com/344>])
- Fixed a bug with double freed memory.
- Fixed a crashing bug in `UNION` operations that involved temporary tables.
- Fixed a bug that under certain circumstances could allow a privilege escalation via database wild-cards in `GRANT`. ([Bug#3924](#) [<http://bugs.mysql.com/3924>], [CVE-2004-0957](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0957>])
- Fixed a crashing bug in `DERIVED TABLES` when `EXPLAIN` is used on a `DERIVED TABLES` with a join.
- Fixed a crashing bug in `DELETE` with `ORDER BY` and `LIMIT` caused by an uninitialized array of reference pointers.
- Fixed a bug in the `USER( )` function caused by an error in the size of the allocated string.

- Fixed a crashing bug when attempting to create a table containing a spatial (GIS) column with a storage engine that does not support spatial types.
- Fixed a crashing bug in `UNION` caused by the empty select list and a non-existent column being used in some of the individual `SELECT` statements.
- Fixed a replication bug with a 3.23 master and a 4.0 slave: The slave lost the replicated temporary tables if `FLUSH LOGS` was issued on the master. (Bug#254 [http://bugs.mysql.com/254])
- Fixed a security bug: A server compiled without SSL support still allowed connections by users who had the `REQUIRE SSL` option specified for their accounts.
- When an undefined user variable was used in a updating query on the master (such as `INSERT INTO t VALUES (@a)`, where `@a` had never been set by this connection before), the slave could replicate the query incorrectly if a previous transaction on the master used a user variable of the same name. (Bug#1331 [http://bugs.mysql.com/1331])
- Fixed bug with prepared statements: Using the `?` prepared statement parameter as the argument to certain functions or statement clauses caused a server crash when `mysql_prepare()` was invoked. (Bug#1500 [http://bugs.mysql.com/1500])
- Fixed bug with prepared statements: after call to `mysql_prepare` placeholders became allowed in all consequent statements, even if they are not prepared (Bug#1946 [http://bugs.mysql.com/1946])
- `SLAVE START` (which is a deprecated syntax, `START SLAVE` should be used instead) could crash the slave. (Bug#2516 [http://bugs.mysql.com/2516])
- Fixed bug in `ALTER TABLE RENAME`, when rename to the table with the same name in another database silently dropped destination table if it existed. (Bug#2628 [http://bugs.mysql.com/2628])
- When not specify hostname in `SET PASSWORD FOR user` it's now defaulted to `%` instead of the current host.

## D.1.23. Changes in release 4.1.0 (03 April 2003: Alpha)

Functionality added or changed:

- **Warning: Incompatible change:** `TIMESTAMP` is now returned as a string of type `'YYYY-MM-DD HH:MM:SS'` and different timestamp lengths are not supported.  
  
This change was necessary for SQL standards compliance. In a future version, a further change will be made (backward compatible with this change), allowing the timestamp length to indicate the desired number of digits of fractions of a second.
- Renamed `SHOW MASTER LOGS` statement to `SHOW BINARY LOGS`.
- Allow `DEFAULT(col_name)` in expressions; it produces the column's default value.
- Added `--compatible` option to `mysqldump` for producing output that is compatible with other database systems or with older MySQL servers.
- The `--opt` option for `mysqldump` now is enabled by default, as are all the options implied by `-opt`.
- New `CHARSET()` and `COLLATION()` functions to return the character set and collation of a string.
- Allow index type to be specified explicitly for some storage engines via `USING type_name` syn-

tax in index definition.

- New function `IS_USED_LOCK()` for determining the connection identifier of the client that holds a given advisory lock.
- New more secure client authentication based on 45-byte passwords in the `user` table. (CVE-2000-0981 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2000-0981>])
- Added `old-password` command to `mysqladmin` for changing password but storing it using the old password-hashing format.
- New `CRC32()` function to compute cyclic redundancy check value.
- On Windows, we are now using shared memory to communicate between server and client when they are running on the same machine and you are connecting to `localhost`.
- `REPAIR TABLE` of `MyISAM` tables now uses less temporary disk space when sorting char columns.
- `DATE/DATETIME` checking is now a bit stricter to support the ability to automatically distinguish between date, datetime, and time with microseconds. For example, dates of type `YYYYMMDD HHMM` are no longer supported; you must either have separators between each `DATE/TIME` part or not at all.
- Server side help for all MySQL functions. One can now type `help week` in the `mysql` client and get help for the `week()` function.
- Added new `mysql_get_server_version()` C API client function.
- Fixed bug in `libmysqlclient` that fetched column defaults.
- Fixed bug in `mysql` command-line client in interpreting quotes within comments. (Bug#539 [<http://bugs.mysql.com/539>])
- Added `record_in_range()` method to `MERGE` tables to be able to choose the right index when there are many to choose from.
- Replication now works with `RAND()` and user variables `@var`.
- Allow one to change mode for `ANSI_QUOTES` on the fly.
- `EXPLAIN SELECT` now can be killed. See [Section 13.5.5.3, “KILL Syntax”](#).
- `REPAIR TABLE` and `OPTIMIZE TABLE` now can be killed. See [Section 13.5.5.3, “KILL Syntax”](#).
- Allow empty index lists to be specified for `USE INDEX`, `IGNORE INDEX`, and `FORCE INDEX`.
- `DROP TEMPORARY TABLE` now drops only temporary tables and doesn't end transactions.
- Added support for `UNION` in derived tables.
- New faster client/server protocol that supports prepared statements, bound parameters, and bound result columns, binary transfer of data, warnings.
- Added database and real table name (in case of alias) to the `MYSQL_FIELD` structure.
- Multi-line queries: You can now issue several queries at once and then read the results in one go.
- In `CREATE TABLE foo (a INT not null primary key)` the `PRIMARY` word is now optional.

- In `CREATE TABLE` the attribute `SERIAL` is now an alias for `BIGINT UNSIGNED NOT NULL AUTO_INCREMENT UNIQUE`.
- `SELECT ... FROM DUAL` is an alias for `SELECT ...` (To be compatible with some other database systems).
- If one creates a too long `CHAR/VARCHAR` it's now automatically changed to `TEXT` or `BLOB`; One get a warning in this case.
- One can specify the different `BLOB/TEXT` types with the syntax `BLOB(length)` and `TEXT(length)`. MySQL automatically changes it to one of the internal `BLOB/TEXT` types.
- `CHAR BYTE` is an alias for the `CHAR BINARY` data type.
- `VARCHARACTER` is an alias for `VARCHAR`.
- New operators `integer MOD integer` and `integer DIV integer`. `DIV` is now a reserved word.
- `SERIAL DEFAULT VALUE` added as an alias for `AUTO_INCREMENT`.
- `TRUE` and `FALSE` added as alias for 1 and 0, respectively.
- Aliases are now forced in derived tables, as per standard SQL.
- Fixed `SELECT .. LIMIT 0` to return proper row count for `SQL_CALC_FOUND_ROWS`.
- One can specify many temporary directories to be used in a round-robin fashion with: `--tmpdir=dirname1:dirname2:dirname3`.
- Subqueries: `SELECT * from t1 where t1.a=(SELECT t2.b FROM t2)`.
- Derived tables:

```
SELECT a.col1, b.col2
FROM (SELECT MAX(col1) AS col1 FROM root_table) a,
other_table b
WHERE a.col1=b.col1;
```

- Character sets to be defined per column, table and database.
- Unicode (UTF8) support.
- New `CONVERT(... USING ...)` syntax for converting string values between character sets.
- `BTREE` index on `MEMORY (HEAP)` tables.
- Faster embedded server (new internal communication protocol).
- One can add a comment per column in `CREATE TABLE`.
- `SHOW FULL COLUMNS FROM tbl_name` shows column comments.
- `ALTER DATABASE`.
- Support for GIS (Geometrical data). See [Chapter 16, Spatial Extensions](#).
- `SHOW [COUNT(*)] WARNINGS` shows warnings from the last command.
- One can specify a data type for a column in `CREATE TABLE ... SELECT` by defining the

column in the `CREATE` part.

```
CREATE TABLE foo (a TINYINT NOT NULL) SELECT b+1 AS a FROM bar;
```

- `expr SOUNDS LIKE expr` same as `SOUNDEX(expr)=SOUNDEX(expr)`.
- Added new `VARIANCE(expr)` function returns the variance of `expr`
- One can create a table from the existing table using `CREATE [TEMPORARY] TABLE [IF NOT EXISTS] table (LIKE table)`. The table can be either normal or temporary.
- New options `--reconnect` and `--skip-reconnect` for the `mysql` client, to reconnect automatically or not if the connection is lost.
- `START SLAVE (STOP SLAVE)` no longer returns an error if the slave is started (stopped); it returns a warning instead.
- `SLAVE START` and `SLAVE STOP` are no longer accepted by the query parser; use `START SLAVE` and `STOP SLAVE` instead.

## D.2. Changes in release 4.0.x (Recent; still supported)

Version 4.0 of the MySQL server includes many enhancements and new features:

- The `InnoDB` storage engine is now included in the standard binaries, adding transactions, row-level locking, and foreign keys. See [Section 14.2, “The InnoDB Storage Engine”](#).
- A query cache, offering vastly increased performance for many applications. By caching complete result sets, later identical queries can return instantly. See [Section 5.13, “The MySQL Query Cache”](#).
- Improved full-text indexing with boolean mode, truncation, and phrase searching. See [Section 12.7, “Full-Text Search Functions”](#).
- Enhanced `MERGE` tables, now supporting `INSERT` statements and `AUTO_INCREMENT`. See [Section 14.3, “The MERGE Storage Engine”](#).
- `UNION` syntax in `SELECT`. See [Section 13.2.7.2, “UNION Syntax”](#).
- Multiple-table `DELETE` statements. See [Section 13.2.1, “DELETE Syntax”](#).
- `libmysqld`, the embedded server library. See [Section 17.1, “libmysqld, the Embedded MySQL Server Library”](#).
- Additional `GRANT` privilege options for even tighter control and security. See [Section 13.5.1.2, “GRANT Syntax”](#).
- Management of user resources in the `GRANT` system, particularly useful for ISPs and other hosting providers. See [Section 5.8.4, “Limiting Account Resources”](#).
- Dynamic server variables, allowing configuration changes to be made without having to stop and restart the server. See [Section 13.5.3, “SET Syntax”](#).
- Improved replication code and features. See [Chapter 6, Replication](#).
- Numerous new functions and options.

- Changes to existing code for enhanced performance and reliability.

For a full list of changes, please refer to the changelog sections for each individual 4.0.x release.

## D.2.1. Changes in release 4.0.28 (Not yet released)

This is a bugfix release for the previous production release family.

This section documents all changes and bug fixes that have been applied since the last official MySQL release. If you would like to receive more fine-grained and personalized *update alerts* about fixes that are relevant to the version and features you use, please consider subscribing to *MySQL Network* (a commercial MySQL offering). For more details please see <http://www.mysql.com/network/advisors.html>.

Functionality added or changed:

- The `mysqldumpslow` script has been moved from client RPM packages to server RPM packages. This corrects a problem where `mysqldumpslow` could not be used with a client-only RPM install, because it depends on `my_print_defaults` which is in the server RPM. (Bug#20216 [<http://bugs.mysql.com/20216>])

Bugs fixed:

- `mysqlhotcopy` did not copy `RAID` directories with names that contained non-decimal hex digits. (It copied only directories containing the characters 0 through 9 and ignored those containing a through f.) (Bug#18777 [<http://bugs.mysql.com/18777>])
- Using `SELECT` and a table join while running a concurrent `INSERT` operation would join incorrect rows. (Bug#14400 [<http://bugs.mysql.com/14400>])
- A query with a `WHERE` clause containing `column = ELT(int_value_1, value_list)` OR `column = ELT(int_value_2, value_list)` could return unexpected results. (Bug#12728 [<http://bugs.mysql.com/12728>])

## D.2.2. Changes in release 4.0.27 (06 May 2006)

This is a security fix release and bugfix release for the MySQL 4.0 production release family.

This release includes the patches for recently reported security vulnerabilities in the MySQL client-server protocol. We would like to thank Stefano Di Paola <[stefano.dipaola@wisec.it](mailto:stefano.dipaola@wisec.it)> for finding and reporting these to us.

Functionality added or changed:

- The `MySQL-server` RPM now explicitly assigns the `mysql` system user to the `mysql` user group during the postinstallation process. This corrects an issue with upgrading the server on some Linux distributions whereby a previously existing `mysql` user was not changed to the `mysql` group, resulting in wrong groups for files created following the installation. (Bug#12823 [<http://bugs.mysql.com/12823>])
- Better detection of connection timeout for replication servers on Windows allows elimination of extraneous `Lost connection` errors in the error log. (Bug#5588 [<http://bugs.mysql.com/5588>])

Bugs fixed:

- **Security fix:** A malicious client, using specially crafted invalid login or `COM_TABLE_DUMP` packets was able to read uninitialized memory, which potentially, though unlikely in MySQL, could have led to an information disclosure. (CVE-2006-1516 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-1516>], CVE-2006-1517 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-1517>]) Thanks to Stefano Di Paola <[stefano.dipaola@wisec.it](mailto:stefano.dipaola@wisec.it)> for finding and reporting this bug.
- `MySQL-shared-compat-4.0.26-0.i386.rpm` incorrectly depend on `glibc` 2.3 and cannot not be installed on a `glibc` 2.2 system. For MySQL 4.0, we recommend using the older `MySQL-shared-compat-4.0.25-0.i386.rpm` package. (Bug#16539 [<http://bugs.mysql.com/16539>])
- Running `myisampack` followed by `myisamchk` with the `--unpack` option would corrupt the `auto_increment` key. (Bug#12633 [<http://bugs.mysql.com/12633>])
- When `myisamchk` needed to rebuild a table, `AUTO_INCREMENT` information was lost. (Bug#10405 [<http://bugs.mysql.com/10405>])
- Avoid trying to include `<asm/atomic.h>` when it doesn't work in C++ code. (Bug#13621 [<http://bugs.mysql.com/13621>])
- `BIT_COUNT()` could return an incorrect value for right table columns in a `LEFT JOIN`. (Bug#13044 [<http://bugs.mysql.com/13044>])
- MySQL would not compile on Linux distributions that use the tinfo library. (Bug#18912 [<http://bugs.mysql.com/18912>])
- An `UPDATE` statement which tried to update a column with a name beginning with an asterisk would cause the server to crash. This was because the server would wrongly expand the `*` character to the list of all table columns, causing the list of columns to become longer than the list of values. Now the server performs this expansion only if the `*` character is followed by a space. (Bug#15610 [<http://bugs.mysql.com/15610>])
- An `INSERT ... SELECT` statement between tables in a `MERGE` set can return errors when statement involves insert into child table from merge table or vice-versa. (Bug#5390 [<http://bugs.mysql.com/5390>])
- Fixed problems with static variables to allow building on Fedora Core 3. (Bug#6554 [<http://bugs.mysql.com/6554>])
- A `LIMIT`-related optimization failed to take into account that `MyISAM` table indexes can be disabled, causing Error 124 when it tried to use such an index. (Bug#14616 [<http://bugs.mysql.com/14616>])
- For a table that had been opened with `HANDLER OPEN`, issuing `OPTIMIZE TABLE`, `ALTER TABLE`, or `REPAIR TABLE` caused a server crash. (Bug#14397 [<http://bugs.mysql.com/14397>])
- Queries of the form `(SELECT ...) ORDER BY ...` were being treated as a `UNION`. This improperly resulted in only distinct values being returned (because `UNION` by default eliminates duplicate results). Also, references to column aliases in `ORDER BY` clauses following parenthesized `SELECT` statements were not resolved properly. (Bug#7672 [<http://bugs.mysql.com/7672>])
- `SELECT DISTINCT` with a `GROUP BY` clause caused a server crash. (Bug#13855 [<http://bugs.mysql.com/13855>])
- `SHOW CREATE TABLE` did not display any `FOREIGN KEY` clauses if a temporary file could not

be created. Now `SHOW CREATE TABLE` displays an error message in an SQL comment if this occurs. (Bug#13002 [<http://bugs.mysql.com/13002>])

- MySQL programs in binary distributions for Solaris 8/9/10 x86 systems would not run on Pentium III machines. (Bug#6772 [<http://bugs.mysql.com/6772>])
- Queries against a `MERGE` table that has a composite index could produce incorrect results. (Bug#9112 [<http://bugs.mysql.com/9112>])
- The counters for the `Key_read_requests`, `Key_reads`, `Key_write_requests`, and `Key_writes` status variables were changed from `unsigned long` to `unsigned longlong` to accommodate larger values before the variables roll over and restart from 0. (Bug#12920 [<http://bugs.mysql.com/12920>])
- A concurrency problem for `CREATE ... SELECT` could cause a server crash. (Bug#12845 [<http://bugs.mysql.com/12845>])
- On HP-UX 11.x (PA-RISC), the `-L` option caused `mysqlimport` to crash. (Bug#12958 [<http://bugs.mysql.com/12958>])
- The server crashed when one thread resized the query cache while another thread was using it. (Bug#12848 [<http://bugs.mysql.com/12848>])

### D.2.3. Changes in release 4.0.26 (08 September 2005)

Functionality added or changed:

- Added the `mysql_get_client_version` C API function to the embedded server library. (It was present in the regular client library but inadvertently omitted from the embedded library.) (Bug#10266 [<http://bugs.mysql.com/10266>])

Bugs fixed:

- An optimizer estimate of zero rows for a non-empty `InnoDB` table used in a left or right join could cause incomplete rollback for the table. (Bug#12779 [<http://bugs.mysql.com/12779>])
- Query cache is switched off if a thread (connection) has tables locked. This prevents invalid results where the locking thread inserts values between a second thread connecting and selecting from the table. (Bug#12385 [<http://bugs.mysql.com/12385>])
- For PKG installs on Mac OS X, the preinstallation and postinstallation scripts were being run only for new installations and not for upgrade installations, resulting in an incomplete installation process. (Bug#11380 [<http://bugs.mysql.com/11380>])
- On Windows, applications that used the embedded server made it not possible to remove certain files in the data directory, even after the embedded server had been shut down. This occurred because a file descriptor was being held open. (Bug#12177 [<http://bugs.mysql.com/12177>])
- Creation of the `mysql` group account failed during the RPM installation. (Bug#12348 [<http://bugs.mysql.com/12348>])
- Attempting to repair a table having a fulltext index on a column containing words whose length exceeded 21 characters and where `myisam_repair_threads` was greater than 1 would crash the server. (Bug#11684 [<http://bugs.mysql.com/11684>])

- When two threads compete for the same table, a deadlock could occur if one thread has also a lock on another table through `LOCK TABLES` and the thread is attempting to remove the table in some manner and the other thread want locks on both tables. ([Bug#10600](http://bugs.mysql.com/10600) [<http://bugs.mysql.com/10600>])

## D.2.4. Changes in release 4.0.25 (05 July 2005)

Functionality added or changed:

- Security improvement: Applied a patch to fix a UDF library-loading vulnerability that could result in a buffer overflow and code execution. (<http://www.appsecinc.com/resources/alerts/mysql/2005-002.html>)
- Added `--with-big-tables` compilation option to `configure`. (Previously it was necessary to pass `-DBIG_TABLES` to the compiler manually in order to enable large table support.) See [Section 2.9.2, “Typical configure Options”](#), for details.

Bugs fixed:

- On Mac OS X, `libmysqlclient_r.a` now is built with `--fno-common` to make it possible to link a shared two-level namespace library against `libmysqlclient_r.a`. ([Bug#10638](http://bugs.mysql.com/10638) [<http://bugs.mysql.com/10638>])
- An error in the implementation of the MyISAM compression algorithm caused `myisampack` to fail with very large sets of data (total size of all the records in a single column needed to be  $\geq 3$  GB in order to trigger this issue). ([Bug#8321](http://bugs.mysql.com/8321) [<http://bugs.mysql.com/8321>])
- A problem with the `my_global.h` file caused compilation of MySQL to fail on single-processor Linux systems running 2.6 kernels. ([Bug#10364](http://bugs.mysql.com/10364) [<http://bugs.mysql.com/10364>])
- Fixed a portability problem testing for `crypt()` support that caused compilation problems when using OpenSSL/yaSSL on HP-UX and Mac OS X. ([Bug#10675](http://bugs.mysql.com/10675) [<http://bugs.mysql.com/10675>], [Bug#11150](http://bugs.mysql.com/11150) [<http://bugs.mysql.com/11150>])
- MyISAM table corruption could occur with `ANALYZE TABLE` if a write lock was acquired with `LOCK TABLES` and then an `INSERT` or `DELETE` was done prior to analyzing the table. ([Bug#10901](http://bugs.mysql.com/10901) [<http://bugs.mysql.com/10901>])
- Fixed a server crash resulting from `CREATE TABLE ... SELECT` that selected from a table being altered by `ALTER TABLE`. ([Bug#10224](http://bugs.mysql.com/10224) [<http://bugs.mysql.com/10224>])
- InnoDB: In `DROP DATABASE`, check for all referencing tables from other databases before dropping any tables. ([Bug#10335](http://bugs.mysql.com/10335) [<http://bugs.mysql.com/10335>])
- Fixed a problem with incorrect constant propagation resulting in incorrect evaluation of `AND/OR` queries. ([Bug#10095](http://bugs.mysql.com/10095) [<http://bugs.mysql.com/10095>])
- Fixed wrong buffer usage for auto-increment key with blob part that caused `CHECK TABLE` to report that the table was wrong. ([Bug#10045](http://bugs.mysql.com/10045) [<http://bugs.mysql.com/10045>])
- No error was raised for `BOOLEAN` full-text searches for storage engines that do not support full-text. ([Bug#7709](http://bugs.mysql.com/7709) [<http://bugs.mysql.com/7709>])
- The test in `configure` to see whether `CXX` specified `gcc` failed if `gcc` was specified as a full pathname. ([Bug#9690](http://bugs.mysql.com/9690) [<http://bugs.mysql.com/9690>])

- In the `mysql_real_escape_string()` C API function, when a multi-byte character is encountered that is illegal in the current character set, escape only the first byte, not each byte. This avoids creating a valid character from an invalid one. (Bug#9864 [http://bugs.mysql.com/9864]; this is a backport of Bug#8378 [http://bugs.mysql.com/8378] from MySQL 4.1.11 to 4.0.25)
- Fixed a deadlock resulting from use of `FLUSH TABLES WITH READ LOCK` while an `INSERT DELAYED` statement is in progress. (Bug#7823 [http://bugs.mysql.com/7823])
- Fixed a segmentation fault in `mysqlcheck` that occurred when the last table checked in `--auto-repair` mode returned an error (such as the table being a `MERGE` table). (Bug#9492 [http://bugs.mysql.com/9492])
- Fixed faulty display of `TIMESTAMP` columns retrieved as `col_name+0` while the `new` system variable is set to 1. (Bug#8894 [http://bugs.mysql.com/8894])
- Queries containing `CURRENT_USER()` incorrectly were registered in the query cache. (Bug#9796 [http://bugs.mysql.com/9796])
- An `UPDATE` that updated only some of the columns in a multiple-column index could result in a loop. (Bug#8942 [http://bugs.mysql.com/8942])
- `REPAIR TABLE` did not invalidate query results in the query cache that were generated from the table. (Bug#8480 [http://bugs.mysql.com/8480])
- Fixed a bug that caused concurrent inserts to be allowed into the tables in the `SELECT ... UNION ...` part of `INSERT ... SELECT ... UNION ...`. This could result in the incorrect order of queries in the binary log. (Bug#9922 [http://bugs.mysql.com/9922])
- Fixed a bug that under certain circumstances could allow a privilege escalation via database wildcards in `GRANT`. (Bug#3924 [http://bugs.mysql.com/3924], CVE-2004-0957 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0957])
- `<=>` was not properly comparing `NULL` values in the `WHERE` clause of outer joins. (Bug#8711 [http://bugs.mysql.com/8711])
- InnoDB: Fixed a bug: MySQL-4.0.23 and 4.0.24 could complain that an InnoDB table created with MySQL-3.23.49 or earlier was in the new compact InnoDB table format of 5.0.3 or later, and InnoDB would refuse to use that table. (The same bug exists in 4.1.8 - 4.1.10.) There is nothing wrong with the table, it is `mysqld` that is in error. Workaround: wait that 4.0.25 or 4.1.11 is released before doing an upgrade, or dump the table and re-create it with any MySQL version  $\geq$  3.23.50 before upgrading to 4.0.23 or 4.0.24.

## D.2.5. Changes in release 4.0.24 (04 March 2005)

Functionality added or changed:

- Security improvement: The server creates `.frm`, `.MYD`, `.MYI`, `.MRG`, `.ISD`, and `.ISM` table files only if a file with the same name does not already exist. Thanks to Stefano Di Paola <stefano.dipaola@wisec.it> for finding and informing us about this issue. (CVE-2005-0711 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0711])
- Security improvement: User-defined functions should have at least one symbol defined in addition to the `xxx` symbol that corresponds to the main `xxx()` function. These auxiliary symbols correspond to the `xxx_init()`, `xxx_deinit()`, `xxx_reset()`, `xxx_clear()`, and `xxx_add()` functions. `mysqld` by default no longer loads UDFs unless they have at least one auxiliary symbol defined in addition to the main symbol. The `--allow-suspicious-udfs` option controls

whether UDFs that have only an `xxx` symbol can be loaded. By default, the option is off. `mysqld` also checks UDF filenames when it reads them from the `mysql.func` table and rejects those that contain directory pathname separator characters. (It already checked names as given in `CREATE FUNCTION` statements.) See [Section 19.2.4.1, “UDF Calling Sequences for Simple Functions”](#), [Section 19.2.4.2, “UDF Calling Sequences for Aggregate Functions”](#), and [Section 19.2.4.6, “User-Defined Function Security Precautions”](#). Thanks to Stefano Di Paola <[stefano.dipaola@wisec.it](mailto:stefano.dipaola@wisec.it)> for finding and informing us about this issue. ([CVE-2005-0709](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0709>], [CVE-2005-0710](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0710>])

- **InnoDB:** Added configuration option and settable global variable `innodb_autoextend_increment` for setting the size in megabytes by which InnoDB tablespaces are extended when they become full. The default value is 8, corresponding to the fixed increment of 8MB in previous versions of MySQL.
- **InnoDB:** Do not acquire an internal InnoDB table lock in `LOCK TABLES` if `AUTOCOMMIT=1`. This helps in porting old MyISAM applications to InnoDB. InnoDB table locks in that case caused deadlocks very easily.

Bugs fixed:

- `AES_DECRYPT(col_name,key)` could fail to return `NULL` for invalid values in `col_name`, if `col_name` was declared as `NOT NULL`. ([Bug#8669](#) [<http://bugs.mysql.com/8669>])
- `FOUND_ROWS()` returned an incorrect value after a `SELECT SQL_CALC_FOUND_ROWS DISTINCT` statement that selected constants and included `GROUP BY` and `LIMIT` clauses. ([Bug#7945](#) [<http://bugs.mysql.com/7945>])
- Index cardinality was not being updated properly for `TEMPORARY` tables under some circumstances, such as `CREATE TABLE ... SELECT` followed by `ANALYZE TABLE`. ([Bug#7519](#) [<http://bugs.mysql.com/7519>])
- Fixed a server crash caused by `DELETE FROM tbl_name ... WHERE ... ORDER BY tbl_name.col_name` when the `ORDER BY` column was qualified with the table name. ([Bug#8392](#) [<http://bugs.mysql.com/8392>])
- Fixed a bug in `MATCH ... AGAINST` in natural language mode that could cause a server crash if the `FULLTEXT` index was not used in a join (`EXPLAIN` did not show `fulltext` join mode) and the search query matched no rows in the table ([Bug#8522](#) [<http://bugs.mysql.com/8522>]).
- Platform and architecture information in version information produced for `--version` option on Windows was always `Win95/Win98 (i32)`. More accurately determine platform as `Win32` or `Win64` for 32-bit or 64-bit Windows, and architecture as `ia32` for x86, `ia64` for Itanium, and `axp` for Alpha. ([Bug#4445](#) [<http://bugs.mysql.com/4445>])
- Fixed an optimization problem that allowed a negative number to be stored in a `DOUBLE UNSIGNED` column when it was assigned a value from a signed `DOUBLE` column. ([Bug#7700](#) [<http://bugs.mysql.com/7700>])
- Fixed a failure of multiple-table updates to replicate properly on slave servers when `-replicate-*-table` options had been specified. ([Bug#7011](#) [<http://bugs.mysql.com/7011>])
- Renamed `set_bit()` and `clear_bit()` functions in source code to avoid a conflict with functions of the same names in Linux kernel header files. ([Bug#7971](#) [<http://bugs.mysql.com/7971>])
- Part of the information being used to cache access-permission lookups was not always reinitialized properly, particularly for connections from localhost on Windows. The result was connection fail-

- ures that appeared to occur randomly. ([Bug#5569](http://bugs.mysql.com/5569) [<http://bugs.mysql.com/5569>])
- Corrected a problem with the `QUOTE ( )` function returning bad results. ([Bug#8248](http://bugs.mysql.com/8248) [<http://bugs.mysql.com/8248>])
  - Fixed a problem where `INSERT INTO ...SELECT` failed when the source and target table were the same. ([Bug#6034](http://bugs.mysql.com/6034) [<http://bugs.mysql.com/6034>])
  - Fixed a problem where RPM installation on Linux as a non-privileged user would result in incomplete installation. ([Bug#7347](http://bugs.mysql.com/7347) [<http://bugs.mysql.com/7347>])
  - Change thread stack size used for building Linux RPM distributions to avoid warnings about stack size during server startup. ([Bug#6226](http://bugs.mysql.com/6226) [<http://bugs.mysql.com/6226>])
  - Fixed a symlink vulnerability in the `mysqlaccess` script. Reported by Javier Fernandez-Sanguino Pena and [Debian Security Audit Team](http://www.debian.org/security/audit) [<http://www.debian.org/security/audit>]. ([CVE-2005-0004](http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0004) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0004>])
  - Fixed support for C API function `mysql_list_fields( )`, which was accidentally broken in 4.0.22 ([Bug#6761](http://bugs.mysql.com/6761) [<http://bugs.mysql.com/6761>])
  - Make `query_cache_wlock_invalidate` system variable visible in `SHOW VARIABLES` output. ([Bug#7594](http://bugs.mysql.com/7594) [<http://bugs.mysql.com/7594>])
  - Fixed a bug which caused `FROM_UNIXTIME( )` function to return `NULL` for zero argument instead of the Epoch. ([Bug#7515](http://bugs.mysql.com/7515) [<http://bugs.mysql.com/7515>])
  - Now in datetime values two digit year is interpreted as year in 20th or 21st century even with zero month and day. ([Bug#7297](http://bugs.mysql.com/7297) [<http://bugs.mysql.com/7297>])
  - Fixed a bug in `QUOTE` function when used in conjunction with some other string functions. This lead to severe buffer overflow and server crashing. ([Bug#7495](http://bugs.mysql.com/7495) [<http://bugs.mysql.com/7495>])
  - InnoDB: Work around a problem in AIX 5.1 patched with ML7 security patch: InnoDB would refuse to open its `ibdata` files, complaining about an operating system error 0.
  - InnoDB: Fixed a memory corruption bug if one created a table with a primary key that contained at least two column prefixes. An example: `CREATE TABLE t(a char(100), b tinyblob, PRIMARY KEY(a(5), b(10)))`.
  - InnoDB: Use native `tmpfile( )` function on Netware. All InnoDB temporary files are created under `sys:\tmp`. Previously, InnoDB temporary files were never deleted on Netware.
  - InnoDB: Honor the `--tmpdir` startup option when creating temporary files. Previously, InnoDB temporary files were always created in the temporary directory of the operating system. On Netware, InnoDB will continue to ignore `--tmpdir`. ([Bug#5822](http://bugs.mysql.com/5822) [<http://bugs.mysql.com/5822>])
  - InnoDB: Fix a theoretical hang over the adaptive hash latch in InnoDB if one runs `INSERT ... SELECT ...` (binlog not enabled), or a multiple-table `UPDATE` or `DELETE`, and only the read tables are InnoDB type, the rest are MyISAM; this also fixes [Bug#7879](http://bugs.mysql.com/7879) [<http://bugs.mysql.com/7879>] for InnoDB type tables. ([Bug#7879](http://bugs.mysql.com/7879) [<http://bugs.mysql.com/7879>])
  - InnoDB: Fixed a bug: 32-bit `mysqld` binaries built on HP-UX-11 did not work with InnoDB files greater than 2 GB in size. ([Bug#6189](http://bugs.mysql.com/6189) [<http://bugs.mysql.com/6189>])
  - InnoDB: Fixed a bug: InnoDB failed to drop a table in the background drop queue if the table was referenced by a foreign key constraint.
  - InnoDB: Fixed a bug: if we dropped a table where an `INSERT` was waiting for a lock to check a

`FOREIGN KEY` constraint, then an assertion would fail in `lock_reset_all_on_table()`, since that operation assumes no waiting locks on the table or its records.

- Fixed that, when encountering a “disk full” or “quota exceeded” write error, `MyISAM` sometimes didn't sleep and retry the write, thus resulting in a corrupted table. ([Bug#7714](http://bugs.mysql.com/7714) [<http://bugs.mysql.com/7714>])
- Fixed that a slave could crash after replicating many `ANALYZE TABLE`, `OPTIMIZE TABLE`, or `REPAIR TABLE` statements from the master. ([Bug#6461](http://bugs.mysql.com/6461) [<http://bugs.mysql.com/6461>], [Bug#7658](http://bugs.mysql.com/7658) [<http://bugs.mysql.com/7658>])
- Fixed a bug where MySQL was allowing concurrent updates (inserts, deletes) to a table if binary logging is enabled. Changed to ensure that all updates are executed in a serialized fashion, because they are executed serialized when binlog is replayed. ([Bug#7879](http://bugs.mysql.com/7879) [<http://bugs.mysql.com/7879>])
- Fixed a bug in replication that caused the master to stamp generated statements (such as `SET` commands) with an `error_code` intended only for another statement. This could happen, for example, when a statements generates a duplicate key error on the master but must be replicated. ([Bug#8412](http://bugs.mysql.com/8412) [<http://bugs.mysql.com/8412>])
- Documented problem with using `mysqldump` in 4.0.x to dump `TIMESTAMP(2)` and `TIMESTAMP(4)` data types. ([Bug#6530](http://bugs.mysql.com/6530) [<http://bugs.mysql.com/6530>])

## D.2.6. Changes in release 4.0.23 (18 December 2004)

**Note:** Due to a `libtool`-related bug in the source distribution, the creation of shared `libmysqlclient` libraries was not possible (the resulting files were missing the `.so` file name extension). The file `ltmain.sh` was updated to fix this problem and the resulting source distribution was released as `mysql-4.0.23a.tar.gz`. This modification did not affect the binary packages. ([Bug#7401](http://bugs.mysql.com/7401) [<http://bugs.mysql.com/7401>])

Functionality added or changed:

- Added `--hex-blob` option to `mysqldump` for dumping binary string columns using hexadecimal notation.
- Added `mysql_hex_string()` C API function that hex-encodes a string.
- InnoDB: Do not periodically write `SHOW INNODB STATUS` information to a temporary file unless the configuration option `innodb_status_file=1` is set.
- InnoDB: Made the foreign key parser better aware of quotes. ([Bug#6340](http://bugs.mysql.com/6340) [<http://bugs.mysql.com/6340>])
- `mysqlbinlog` now prints an informative commented line (thread id, timestamp, server id, and so forth) before each `LOAD DATA INFILE`, like it does for other queries; unless `--short-form` is used.

Bugs fixed:

- A multiple-table `DELETE` could cause MySQL to crash when using InnoDB tables. ([Bug#5837](http://bugs.mysql.com/5837) [<http://bugs.mysql.com/5837>], [Bug#6378](http://bugs.mysql.com/6378) [<http://bugs.mysql.com/6378>])
- Corrected accounts in the `mysql.user` table in Windows distributions that had been created with a `Host` value of `build` rather than `%`. ([Bug#6000](http://bugs.mysql.com/6000) [<http://bugs.mysql.com/6000>])

- Prevent adding `CREATE TABLE ... SELECT` query to the binary log when the insertion of new records partially failed. (Bug#6682 [<http://bugs.mysql.com/6682>])
- Fixed bug which caused `FROM_UNIXTIME()` function to return wrong result if the argument was too big. (Bug#6439 [<http://bugs.mysql.com/6439>])
- Fixed bug which caused MySQL server to store wrong values in `TIMESTAMP` columns and give wrong results for `UNIX_TIMESTAMP()` function if it was run in time zone with leap seconds. (Bug#6387 [<http://bugs.mysql.com/6387>])
- InnoDB: Fixed a bug in `LOAD DATA INFILE...REPLACE` printing duplicate key error when executing the same load query several times. (Bug#5835 [<http://bugs.mysql.com/5835>])
- InnoDB: Refuse to open new-style tables created with MySQL 5.0.3 or later. (Bug#7089 [<http://bugs.mysql.com/7089>])
- InnoDB: Do not call `rewind()` when displaying `SHOW INNODB STATUS` information on `stderr`.
- InnoDB: If one used `INSERT IGNORE` to insert several rows at a time, and the first inserts were ignored because of a duplicate key collision, then InnoDB in a replication slave assigned `AUTO_INCREMENT` values 1 bigger than in the master. This broke the MySQL replication. (Bug#6287 [<http://bugs.mysql.com/6287>])
- InnoDB: Fix two hangs: `FOREIGN KEY` constraints treated table and database names as case-insensitive. `RENAME TABLE t TO T` would hang in an endless loop if `t` had a foreign key constraint defined on it. Fix also a hang over the dictionary mutex that would occur if one tried in `ALTER TABLE` or `RENAME TABLE` to create a foreign key constraint name that collided with another existing name. (Bug#3478 [<http://bugs.mysql.com/3478>])
- InnoDB: Treat character `0xA0` as space in InnoDB's `FOREIGN KEY` parser if MySQL treats it as space in the default charset. EMS MySQL Manager inserts character `0xA0` after the table name in an `ALTER`, which confused InnoDB's parser.
- Fixed a bug which caused a crash when only the slave I/O thread was stopped and restarted. (Bug#6148 [<http://bugs.mysql.com/6148>])
- If a connection had an open transaction but had done no updates to transactional tables (for example if had just done a `SELECT FOR UPDATE` then executed a non-transactional update, that update automatically committed the transaction (thus releasing InnoDB's row-level locks etc). (Bug#5714 [<http://bugs.mysql.com/5714>])
- If a connection was interrupted by a network error and did a rollback, the network error code got stored into the `BEGIN` and `ROLLBACK` binary log events; that caused superfluous slave stops. (Bug#6522 [<http://bugs.mysql.com/6522>])
- A sequence of `BEGIN` (or `SET AUTOCOMMIT=0`), `FLUSH TABLES WITH READ LOCK`, transactional update, `COMMIT`, `FLUSH TABLES WITH READ LOCK` could hang the connection forever and possibly the MySQL server itself. This happened for example when running the `innobackup` script several times. (Bug#6732 [<http://bugs.mysql.com/6732>])

## D.2.7. Changes in release 4.0.22 (27 October 2004)

Functionality added or changed:

- The `--with-openssl` option for `configure` now accepts a path prefix as an argument. -

`--with-openssl-includes` and `--with-openssl-libs` are still supported, but are needed only to override the default values. (Bug#5494 [http://bugs.mysql.com/5494])

- Added new `--without-man` option to `configure` to suppress building/installing the manual pages. (Bug#5379 [http://bugs.mysql.com/5379])
- InnoDB: New `mysqld` option `--innodb-table-locks` and session variable `innodb_table_locks` (on by default). In applications using `AUTOCOMMIT=1` and MySQL's `LOCK TABLES` command, InnoDB's internal table locks that were added in 4.0.20 can cause deadlocks. You can set `innodb_table_locks=0` in `my.cnf` to remove that problem. See Section 14.2.17, “Restrictions on InnoDB Tables”. (Bug#3299 [http://bugs.mysql.com/3299], Bug#5998 [http://bugs.mysql.com/5998])
- InnoDB: Added the startup option and settable global variable `innodb_max_purge_lag` for delaying `INSERT`, `UPDATE` and `DELETE` operations when the purge operations are lagging. The default value of this parameter is zero, meaning that there are no delays. See Section 14.2.13, “Implementation of Multi-Versioning”.
- InnoDB: Change error code to `HA_ERR_ROW_IS_REFERENCED` if we cannot `DROP` a parent table because it is referenced by a `FOREIGN KEY` constraint.

#### Bugs fixed:

- Fixed bug in server which caused connection stall when one of deprecated `libmysqlclient` functions `mysql_create_db()`, `mysql_rm_db()` were called and were going to return error. (Bug#6081 [http://bugs.mysql.com/6081])
- Fixed returning wrong query result from query cache if a temporary table was hiding a real table after putting results to query cache. (Bug#6084 [http://bugs.mysql.com/6084])
- Fixed `ENABLE KEYS`, which failed if `tmpdir` ran out of space. Now, a full repair is done in this case. (Bug#5625 [http://bugs.mysql.com/5625])
- Fixed an improper error message when trying to drop a table which is referenced by a `FOREIGN KEY` constraint. (Bug#5784 [http://bugs.mysql.com/5784])
- Fixed a bug that allowed `FLUSH TABLE(S)` to close `HANDLER` tables. `HANDLER` tables are now reopened after a `FLUSH TABLE(S)` the next time they are used. However, they lose their file position if this happens. (Bug#4286 [http://bugs.mysql.com/4286])
- Fixed a bug that allowed `HANDLER` tables with the same alias to be opened multiple times. `HANDLER` aliases must now be unique, even though it is syntactically correct in versions below 4.1 to qualify them with their base table's database name (for example, `test_db.handler_tbl` now conflicts with `another_db.handler_tbl`). (Bug#4335 [http://bugs.mysql.com/4335])
- Fixed crash when using MySQL 4.0 with privilege tables from MySQL 5.0.
- `mysqlimport` now reads input files locally from the client host only if the `--local` option is given. Previously, it assumed incorrectly in some cases that files were local even without `--local`. (Bug#5829 [http://bugs.mysql.com/5829])
- InnoDB: Make the check for excessive semaphore waits to tolerate glitches in the system clock (do not crash the server if the system time is adjusted while InnoDB is under load.). (Bug#5898 [http://bugs.mysql.com/5898])
- InnoDB: Fixed a bug in the InnoDB `FOREIGN KEY` parser that prevented `ALTER TABLE` of tables containing '#' in their names. (Bug#5856 [http://bugs.mysql.com/5856])

- InnoDB: Fixed problem introduced in 4.0.21 where a connection starting a transaction, doing updates, then `FLUSH TABLES WITH READ LOCK`, then `COMMIT`, would cause replication slaves to stop (complaining about error 1223). Bug surfaced when using the InnoDB `innobackup` script. (Bug#5949 [<http://bugs.mysql.com/5949>])
- InnoDB: If one updated a column so that its size changed, or updated it to an externally stored (`TEXT` or `BLOB`) value, then ANOTHER externally stored column would show up as 512 bytes of good data + 20 bytes of garbage in a consistent read that fetched the old version of the row. (Bug#5960 [<http://bugs.mysql.com/5960>])
- InnoDB: Release the dictionary latch during a long cascaded `FOREIGN KEY` operation, so that we do not starve other users doing `CREATE TABLE` or other DDL operations. This caused a notorious 'Long semaphore wait' message to be printed to the `.err` log. (Bug#5961 [<http://bugs.mysql.com/5961>])
- InnoDB: Let InnoDB remember row locking type (X or S) inside `LOCK TABLES`, also over plain consistent read `SELECTs`.
- InnoDB: Fixed a bug introduced in 4.0.21. An assertion failed if one used `mysqldump` with the option `-l` or `--opt`, or if one used `LOCK TABLES ... LOCAL`. (Workaround in 4.0.21: use `--quick` and `--single-transaction`. (Bug#5538 [<http://bugs.mysql.com/5538>])
- InnoDB: Having a column prefix index in the primary key, and the same column fully in a secondary key could cause an assertion failure in `row_build_row_ref()`. (Bug#5180 [<http://bugs.mysql.com/5180>])
- Fixed a bug which resulted in an erroneously calculated number of examined rows in `UNIONS`. This value is printed in the slow query log. (Bug#5879 [<http://bugs.mysql.com/5879>])
- Fixed bug with crash of server on some values of `read_rnd_buffer_size` (Bug#5492 [<http://bugs.mysql.com/5492>])
- Fixed bug which caused truncation of values read from or into `TIMESTAMP` fields if `--new` mode was enabled. (Bug#4131 [<http://bugs.mysql.com/4131>])
- `mysqladmin` now returns a status of 0 even when the server denies access; such an error means the server is running. (Bug#3120 [<http://bugs.mysql.com/3120>])
- Fixed that if the slave SQL thread found a syntax error in a query (which should be rare, as the master parsed it successfully), it stops. (Bug#5711 [<http://bugs.mysql.com/5711>])
- Fixed that if a write to a `MyISAM` table fails because of a full disk or an exceeded disk quota, it prints a message to the error log every 10 minutes, and waits until disk becomes free. (Bug#3248 [<http://bugs.mysql.com/3248>])
- Fixed problem with symlinked databases on Windows being shown with `SHOW DATABASES` even if the database name doesn't match the given wildcard (Bug#5539 [<http://bugs.mysql.com/5539>])

## D.2.8. Changes in release 4.0.21 (06 September 2004)

Functionality added or changed:

- Print `version_comment` (from `./configure --comment` during compilation) when starting the server. Example: `Version: '4.0.21-debug' socket: '/tmp/mysql.sock' port: 0 Official MySQL Binary`

- Made the MySQL server not react to signals `SIGHUP` and `SIGQUIT` on Mac OS X 10.3. This is needed because under this OS, the MySQL server receives lots of these signals (reported as [Bug#2030](http://bugs.mysql.com/2030) [<http://bugs.mysql.com/2030>]).
- On Windows, the `mysqld-nt` and `mysqld-max-nt` servers now write error messages to the Windows event log in addition to the MySQL error log.

Bugs fixed:

- Fixed an old bug in concurrent accesses to `MERGE` tables (even one `MERGE` table and `MyISAM` tables), that could've resulted in a crash or hang of the server. ([Bug#2408](http://bugs.mysql.com/2408) [<http://bugs.mysql.com/2408>], [CVE-2004-0837](http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0837) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0837>])
- Fixed a bug that caused incorrect results from `GROUP BY` queries with expression in `HAVING` clause that refers to a columns such as `BLOB`, `TEXT`, or `TINYBLOB`. ([Bug#4358](http://bugs.mysql.com/4358) [<http://bugs.mysql.com/4358>])
- Fixed a bug when memory was not released when `HEAP` table is dropped. It could only happen on Windows when a symlink file (`.sym`) is used and if that symlink file contained double backslashes (`\\`). ([Bug#4973](http://bugs.mysql.com/4973) [<http://bugs.mysql.com/4973>])
- Fixed a bug which prevented `TIMESTAMP(19)` fields from being created. ([Bug#4491](http://bugs.mysql.com/4491) [<http://bugs.mysql.com/4491>])
- Fixed a bug that caused wrong results in queries that were using index to search for `NULL` values in `BLOB` (`TINYBLOB`, `TEXT`, `TINYTEXT`, etc) columns of `MyISAM` tables. ([Bug#4816](http://bugs.mysql.com/4816) [<http://bugs.mysql.com/4816>])
- Fixed a bug in the function `ROUND()` reporting incorrect metadata (number of digits after the decimal point). It can be seen, for example, in `CREATE TABLE t1 SELECT ROUND(1, 34)`. ([Bug#4393](http://bugs.mysql.com/4393) [<http://bugs.mysql.com/4393>])
- Fixed precision loss bug in some mathematical functions such as `SQRT()` and `LOG()`. ([Bug#4356](http://bugs.mysql.com/4356) [<http://bugs.mysql.com/4356>])
- Fixed a long-standing problem with `LOAD DATA` with the `LOCAL` option. The problem occurs when an error happens during the `LOAD DATA` operation. Previously, the connection was broken. Now the error message is returned and connection stays open.
- Optimizer now treats `col IN (val)` the same way it does for `col = val`.
- Fixed a problem with `net_buffer_length` when building the `DBD:mysql` Perl module. ([Bug#4206](http://bugs.mysql.com/4206) [<http://bugs.mysql.com/4206>])
- `lower_case_table_names=2` (keep case for table names) was not honored with `ALTER TABLE` and `CREATE/DROP INDEX`. ([Bug#3109](http://bugs.mysql.com/3109) [<http://bugs.mysql.com/3109>])
- Fixed a crash on declaration of `DECIMAL(0, ...)` column. ([Bug#4046](http://bugs.mysql.com/4046) [<http://bugs.mysql.com/4046>])
- Fixed a bug in `IF()` function incorrectly determining the result type if aggregate functions were involved. ([Bug#3987](http://bugs.mysql.com/3987) [<http://bugs.mysql.com/3987>])
- Fixed bug in privilege checking where, under some conditions, one was able to grant privileges on the database, he has no privileges on. ([Bug#3933](http://bugs.mysql.com/3933) [<http://bugs.mysql.com/3933>])

- Fixed crash in `MATCH ... AGAINST()` on a phrase search operator with a missing closing double quote. (Bug#3870 [<http://bugs.mysql.com/3870>], CVE-2004-0956 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0956>])
- Fixed a bug with truncation of big values (> 4294967295) of 64-bit system variables. (Bug#3754 [<http://bugs.mysql.com/3754>])
- If `server-id` was not set using startup options but with `SET GLOBAL`, the replication slave still complained that it was not set. (Bug#3829 [<http://bugs.mysql.com/3829>])
- Fixed potential memory overrun in `mysql_real_connect()` (which required a compromised DNS server and certain operating systems). (Bug#4017 [<http://bugs.mysql.com/4017>], CVE-2004-0836 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0836>])
- During the installation process of the server RPM on Linux, `mysqld` was run as the `root` system user, and if you had `--log-bin=somewhere_out_of_var_lib_mysql` it created binary log files owned by `root` in this directory, which remained owned by `root` after the installation. This is now fixed by starting `mysqld` as the `mysql` system user instead. (Bug#4038 [<http://bugs.mysql.com/4038>])
- Made `DROP DATABASE` honor the value of `lower_case_table_names`. (Bug#4066 [<http://bugs.mysql.com/4066>])
- The slave SQL thread refused to replicate `INSERT ... SELECT` if it examined more than 4 billion rows. (Bug#3871 [<http://bugs.mysql.com/3871>])
- Fixed incorrect destruction of expression which led to crash of server on complex `AND/OR` expressions if query was ignored (either by a replication server because of `--replicate-*-table` rules, or by any MySQL server because of a syntax error). (Bug#3969 [<http://bugs.mysql.com/3969>], Bug#4494 [<http://bugs.mysql.com/4494>])
- Fixed that `mysqlbinlog --position --read-from-remote-server` had wrong # at lines. (Bug#4506 [<http://bugs.mysql.com/4506>])
- If `CREATE TEMPORARY TABLE t SELECT` failed while loading the data, the temporary table was not dropped. (Bug#4551 [<http://bugs.mysql.com/4551>])
- Fixed that when a multiple-table `DROP TABLE` failed to drop a table on the master server, the error code was not written to the binary log. (Bug#4553 [<http://bugs.mysql.com/4553>])
- When the slave SQL thread was replicating a `LOAD DATA INFILE` statement, it didn't show the statement in the output of `SHOW PROCESSLIST`. (Bug#4326 [<http://bugs.mysql.com/4326>])
- Fixed that `CREATE TABLE ... TYPE=HEAP ... AS SELECT...` caused replication slave to stop. (Bug#4971 [<http://bugs.mysql.com/4971>])
- Fixed that `disable-local-infile` option had no effect if client read it from a configuration file using `mysql_options(...,MYSQL_READ_DEFAULT,...)`. (Bug#5073 [<http://bugs.mysql.com/5073>])
- Fixed that `mysql-test-run` failed on the `rpl_trunc_binlog` test if running test from the installed (the target of 'make install') directory. (Bug#5050 [<http://bugs.mysql.com/5050>])
- Fixed an unlikely deadlock which could happen when using `KILL`. (Bug#4810 [<http://bugs.mysql.com/4810>])
- Fixed a crash when one connection got `KILLED` while it was doing `START SLAVE`. (Bug#4827 [<http://bugs.mysql.com/4827>])

- Made `FLUSH TABLES WITH READ LOCK` block `COMMIT` if server is running with binary logging; this ensures that the binary log position is trustable when doing a full backup of tables and the binary log. ([Bug#4953](http://bugs.mysql.com/4953) [<http://bugs.mysql.com/4953>])
- Fixed that the counter of an `auto_increment` column was not reset by `TRUNCATE TABLE` if the table was a temporary one. ([Bug#5033](http://bugs.mysql.com/5033) [<http://bugs.mysql.com/5033>])
- Made database names to compare case-insensitively in fully qualified column names (`database.table.column`) when `lower_case_table_names=1`. ([Bug#4792](http://bugs.mysql.com/4792) [<http://bugs.mysql.com/4792>])
- Fixed that `SET CHARACTER SET` was not replicated correctly. MySQL 4.1 does not have that bug. ([Bug#4500](http://bugs.mysql.com/4500) [<http://bugs.mysql.com/4500>])

## D.2.9. Changes in release 4.0.20 (17 May 2004)

**Note:** The windows packages had to be repackaged and re-released several times to resolve packaging issues (such as missing files). This did not affect the binaries included (they have not been recompiled), therefore the installation packages are of version 4.0.20d, while the binaries included still identify themselves as version 4.0.20b.

Functionality added or changed:

- From the Windows distribution, predefined accounts without passwords for remote users ("root@%", "@%") were removed (other distributions never had them).
- Phrase search in `MATCH ... AGAINST ( ... IN BOOLEAN MODE)` no longer matches partial words.

Bugs fixed:

- A crashing bug (race condition) was fixed in InnoDB diagnostic logging. It was introduced in 4.0.19. ([Bug#3596](http://bugs.mysql.com/3596) [<http://bugs.mysql.com/3596>])
- Fixed a bug in division `/` reporting incorrect metadata (number of digits after the decimal point). It can be seen, for example, in `CREATE TABLE t1 SELECT "0.01" / "3"`. ([Bug#3612](http://bugs.mysql.com/3612) [<http://bugs.mysql.com/3612>])
- Fixed a problem with non-working `DROP DATABASE` on some configurations (in particular, Linux 2.6.5 with ext3 are known to expose this bug). ([Bug#3594](http://bugs.mysql.com/3594) [<http://bugs.mysql.com/3594>])
- Fixed a symlink vulnerability in the `mysqlhotcopy` script. ([CVE-2004-0457](http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0457) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0457>])
- Fixed that in some replication error messages, a very long query caused the rest of the message to be invisible (truncated), by putting the query last in the message. ([Bug#3357](http://bugs.mysql.com/3357) [<http://bugs.mysql.com/3357>])

## D.2.10. Changes in release 4.0.19 (04 May 2004)

**Note:** The MySQL 4.0.19 binaries were uploaded to the download mirrors on May, 10th. However, a potential crashing bug was found just before the 4.0.19 release was publicly announced and published from the 4.0 download pages at <http://dev.mysql.com/>.

A fix for the bug was pushed into the MySQL source tree shortly after it could be reproduced and is included in MySQL 4.0.20. Users upgrading from MySQL 4.0.18 should upgrade directly to MySQL 4.0.20 or later.

See [Bug#3596](http://bugs.mysql.com/3596) [http://bugs.mysql.com/3596] for details (it was reported against MySQL-4.1, but was confirmed to affect 4.0.19 as well).

Functionality added or changed:

- If length of a timestamp field is defined as 19, the timestamp is displayed as "YYYY-MM-DD HH:MM:SS". This is done to make it easier to use tables created in MySQL 4.1 to be used in MySQL 4.0.
- If you use `RAID_CHUNKS` with a value > 255 it is set to 255. This was made to ensure that all raid directories are always 2 hex bytes. ([Bug#3182](http://bugs.mysql.com/3182) [http://bugs.mysql.com/3182])
- Changed that the optimizer now considers the index specified in `FORCE INDEX` clause as a candidate to resolve `ORDER BY` as well.
- The `--log-warnings` server option now is enabled by default. Disable with `--skip-log-warnings`.
- Until now, in `SELECT ... UNION SELECT ... ORDER BY ...`, it was possible to qualify a column name in the `ORDER BY` clause with a table name. This is no longer possible. Column names in `ORDER BY` should refer to names established in the first `SELECT` of the `UNION`. ([Bug#3064](http://bugs.mysql.com/3064) [http://bugs.mysql.com/3064])
- Added `max_insert_delayed_threads` system variable as a synonym for `max_delayed_threads`.
- Added `query_cache_wlock_invalidate` system variable. It allows emulation of `MyISAM` table write-locking behavior, even for queries in the query cache. ([Bug#2693](http://bugs.mysql.com/2693) [http://bugs.mysql.com/2693])
- The keyword `MASTER_SERVER_ID` is not reserved anymore.
- The following is relevant mainly for Mac OS X users who use a case-insensitive filesystem. This is not relevant for Windows users as `InnoDB` in this case always stores filenames in lower case:

You can now force `lower_case_table_names` to 0 from the command line or a configuration file. This is useful with case-insensitive filesystems when you have previously not used `lower_case_table_names=1` or `lower_case_table_names=2` and you have created `InnoDB` tables. With `lower_case_table_names=0`, `InnoDB` tables were stored in mixed case while setting `lower_case_table_names` to a non-zero value now forces it to lower case (to make the table names case insensitive).

Because it's possible to crash `MyISAM` tables by referring to them with different case on a case-insensitive filesystem, we recommend that you use `lower_case_table_names` or `lower_case_table_names=2` on such filesystems.

The easiest way to convert to use `lower_case_table_names=2` is to dump all your `InnoDB` tables with `mysqldump`, drop them and then restore them.

- Changed that the relay log is flushed to disk by the slave I/O thread every time it reads a relay log event. This reduces the risk of losing some part of the relay log in case of brutal crash.
- When a session having open temporary tables terminates, the statement automatically written to the binary log is now `DROP TEMPORARY TABLE IF EXISTS` instead of `DROP TEMPORARY TA-`

`BLE`, for more robustness.

- Added option `--replicate-same-server-id`.

Bugs fixed:

- Added missing full-text variable `ft_stopword_file` to `myisamchk`.
- Don't allow stray `' , '` at the end of field specifications. (Bug#3481 [http://bugs.mysql.com/3481])
- `INTERVAL` now can handle big values for seconds, minutes and hours. (Bug#3498 [http://bugs.mysql.com/3498])
- Blank hostname did not work as documented for table and column privileges. Now it works the same way as `' % '`. (Bug#3473 [http://bugs.mysql.com/3473])
- Fixed a harmless buffer overflow in `replace` utility. (Bug#3541 [http://bugs.mysql.com/3541])
- Fixed `SOUNDEX()` to ignore non-alphabetic characters also in the beginning of the string. (Bug#3556 [http://bugs.mysql.com/3556])
- Fixed a bug in `MATCH . . . AGAINST()` searches when another thread was doing concurrent inserts into the `MyISAM` table in question. The first `---` full-text search `---` query could return incorrect results in this case (for example, “phantom” rows or not all matching rows, even an empty result set). The easiest way to check whether you are affected is to start `mysqld` with `-skip-concurrent-insert` switch and see whether it helps.
- Fixed bug when doing `DROP DATABASE` on a directory containing non-MySQL files. Now a proper error message is returned.
- Fixed bug in `ANALYZE TABLE` on a `BDB` table inside a transaction that hangs server thread. (Bug#2342 [http://bugs.mysql.com/2342])
- Fixed a symlink vulnerability in the `mysqlbug` script. (Bug#3284 [http://bugs.mysql.com/3284], CVE-2004-0381 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0381])
- Fixed core dump bug in `SELECT DISTINCT` where all selected parts were constants and there were hidden columns in the created temporary table. (Bug#3203 [http://bugs.mysql.com/3203])
- Fixed core dump bug in `COUNT(DISTINCT)` when there was a lot of values and one had a big value for `max_heap_table_size`.
- Fixed problem with multiple-table-update and `BDB` tables. (Bug: #3098)
- Fixed memory leak when dropping database with `RAID` tables. (Bug#2882 [http://bugs.mysql.com/2882])
- Fixed core dump crash in replication during relay-log switch when the relay log went over `max_relay_log_size` and the slave thread did a `flush_io_cache()` at the same time.
- Fixed hangup bug when issuing multiple `SLAVE START` from different threads at the same time. (Bug#2921 [http://bugs.mysql.com/2921])
- Fixed bug when using `DROP DATABASE` with `lower_case_table_names=2`.
- Fixed wrong result in `UNION` when using `lower_case_table_names=2`. (Bug#2858 [http://bugs.mysql.com/2858])

- One can now kill threads that is 'stuck' in the join optimizer (can happen when there is MANY tables in the join in which case the optimizer can take really long time). ([Bug#2825](#) [<http://bugs.mysql.com/2825>])
- Rollback `DELETE` and `UPDATE` statements if thread is killed. ([Bug#2422](#) [<http://bugs.mysql.com/2422>])
- Ensure that all rows in an `INSERT DELAYED` statement is written at once if binary logging is enabled. ([Bug#2491](#) [<http://bugs.mysql.com/2491>]).
- Fixed bug in query cache statistic, more accurate formula linked statistic variables mentioned in the manual.
- Fixed a bug in parallel repair (`myisamchk -p, myisam_repair_threads`) - sometimes repair process failed to repair a table. ([Bug#1334](#) [<http://bugs.mysql.com/1334>])
- Fixed bugs with names of tables, databases, and columns that end to space ([Bug#2985](#) [<http://bugs.mysql.com/2985>])
- Fixed a bug in multiple-table `UPDATE` statements involving at least one constant table. Bug was exhibited in allowing non matching row to be updated. ([Bug#2996](#) [<http://bugs.mysql.com/2996>]).
- Fixed all bugs in scripts for creating/upgrading system database ([Bug#2874](#) [<http://bugs.mysql.com/2874>]) Added tests which guarantee against such bugs in the future.
- Fixed bug in `mysql` command-line client in interpreting quotes within comments. ([Bug#539](#) [<http://bugs.mysql.com/539>])
- `--set-character-set` and `--character-sets-dir` options in `myisamchk` now work.
- Fixed a bug in `mysqlbinlog` that caused one pointer to be free'd twice in some cases.
- Fixed a bug in boolean full-text search, that sometimes could lead to false matches in queries with several levels of subexpressions using `+` operator (for example, `MATCH ... AGAINST( '(+(word1 word2)) +word3*' IN BOOLEAN MODE)`).
- Fixed Windows-specific portability bugs in `myisam_ftdump`.
- Fixed a bug in multiple-table `DELETE` that was caused by foreign key constraints. If the order of the tables established by MySQL optimizer did not match parent-child order, no rows were deleted and no error message was provided. ([Bug#2799](#) [<http://bugs.mysql.com/2799>])
- Fixed a few years old bug in the range optimizer that caused a segmentation fault on some very rare queries. ([Bug#2698](#) [<http://bugs.mysql.com/2698>])
- Replication: If a client connects to a slave server and issues an administrative statement for a table (for example, `OPTIMIZE TABLE` or `REPAIR TABLE`), this could sometimes stop the slave SQL thread. This does not lead to any corruption, but you must use `START SLAVE` to get replication going again. ([Bug#1858](#) [<http://bugs.mysql.com/1858>]) The bug was accidentally not fixed in 4.0.17 as it was unfortunately earlier said.
- Fixed that when a `Rotate` event is found by the slave SQL thread in the middle of a transaction, the value of `Relay_Log_Pos` in `SHOW SLAVE STATUS` remains correct. ([Bug#3017](#) [<http://bugs.mysql.com/3017>])
- Corrected the master's binary log position that `InnoDB` reports when it is doing a crash recovery on a slave server. ([Bug#3015](#) [<http://bugs.mysql.com/3015>])
- Changed that when a `DROP TEMPORARY TABLE` statement is automatically written to the binary

log when a session ends, the statement is recorded with an error code of value zero (this ensures that killing a `SELECT` on the master does not result in a superfluous error on the slave). (Bug#3063 [http://bugs.mysql.com/3063])

- Changed that when a thread handling `INSERT DELAYED` (also known as a `delayed_insert` thread) is killed, its statements are recorded with an error code of value zero (killing such a thread does not endanger replication, so we thus avoid a superfluous error on the slave). (Bug#3081 [http://bugs.mysql.com/3081])
- Fixed deadlock when two `START SLAVE` commands were run at the same time. (Bug#2921 [http://bugs.mysql.com/2921])
- Fixed that a statement never triggers a superfluous error on the slave, if it must be excluded given the `--replicate-*` options. The bug was that if the statement had been killed on the master, the slave would stop. (Bug#2983 [http://bugs.mysql.com/2983])
- The `--local-load` option of `mysqlbinlog` now requires an argument.
- Fixed a segmentation fault when running `LOAD DATA FROM MASTER` after `RESET SLAVE`. (Bug#2922 [http://bugs.mysql.com/2922])
- Fixed a rare error condition that caused the slave SQL thread spuriously to print the message `Bin-log has bad magic number` and stop when it was not necessary to do so. (Bug#3401 [http://bugs.mysql.com/3401])
- Fixed bug in privilege checking of `ALTER TABLE RENAME`. (Bug#3270 [http://bugs.mysql.com/3270], CVE-2004-0835 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0835])
- Fixed the column `Exec_master_log_pos` (and its disk image in the `relay-log.info` file) to be correct if the master had version 3.23 (it was too big by 6 bytes). This bug does not exist in the 5.0 version. (Bug#3400 [http://bugs.mysql.com/3400])
- Fixed that `mysqlbinlog` does not forget to print a `USE` command under rare circumstances where the binary log contained a `LOAD DATA INFILE` command. (Bug#3415 [http://bugs.mysql.com/3415])
- Fixed a memory corruption when replicating a `LOAD DATA INFILE` when the master had version 3.23. Some smaller problems remain in this setup, See Section 6.7, “Replication Features and Known Problems”. (Bug#3422 [http://bugs.mysql.com/3422])
- Multiple-table `DELETE` statements were always replicated by the slave if there were some `--replicate-*-ignore-table` options and no `--replicate-*-do-table` options. (Bug#3461 [http://bugs.mysql.com/3461])
- Fixed a crash of the MySQL slave server when it was built with `--with-debug` and replicating itself. (Bug#3568 [http://bugs.mysql.com/3568])

## D.2.11. Changes in release 4.0.18 (12 February 2004)

Functionality added or changed:

- Fixed processing of `LOAD DATA` by `mysqlbinlog` in remote mode. (Bug#1378 [http://bugs.mysql.com/1378])
- The `ft_dump` utility program was renamed to `myisam_ftdump`, and is included in binary distri-

butions.

- `ENGINE` is now a synonym for the `TYPE` option for `CREATE TABLE` and `ALTER TABLE`.
- `lower_case_table_names` system variable now can take a value of 2, to store table names in mixed case on case-insensitive filesystems. It's forced to 2 if the database directory is located on a case-insensitive filesystem.
- For replication of `MEMORY (HEAP)` tables: Made the master automatically write a `DELETE FROM` statement to its binary log when a `MEMORY` table is opened for the first time since master's startup. This is for the case where the slave has replicated a non-empty `MEMORY` table, then the master is shut down and restarted: the table is now empty on master; the `DELETE FROM` empties it on slave too. Note that even with this fix, between the master's restart and the first use of the table on master, the slave still has out-of-date data in the table. But if you use the `init-file` option to populate the `MEMORY` table on the master at startup, it ensures that the failing time interval is zero. (Bug#2477 [http://bugs.mysql.com/2477])
- Optimizer is now better tuned for the case where the first used key part (of many) is a constant. (Bug#1679 [http://bugs.mysql.com/1679])
- Removed old non-working `--old-rpl-compat` server option, which was a holdover from the very first 4.0.x versions. (Bug#2428 [http://bugs.mysql.com/2428])
- Added option `--sync-frm`. It's on by default, to instruct MySQL to sync to disk each time `.frm` file is created. Use `--disable-sync-frm` to disable.

Bugs fixed:

- `mysqlhotcopy` now works on NetWare.
- `DROP DATABASE` could not drop databases with RAID tables that had more than nine `RAID_CHUNKS`. (Bug#2627 [http://bugs.mysql.com/2627])
- Fixed bug in range optimizer when using overlapping ranges. (Bug#2448 [http://bugs.mysql.com/2448])
- Limit `wait_timeout` to 2147483 on Windows (OS limit). (Bug#2400 [http://bugs.mysql.com/2400])
- Fixed bug when `--init-file` crashes MySQL if it contains a large `SELECT`. (Bug#2526 [http://bugs.mysql.com/2526])
- `SHOW KEYS` now shows `NULL` in the `Sub_part` column for `FULLTEXT` indexes.
- The signal thread's stack size was increased to enable `mysqld` to run on Debian/IA-64 with a TLS-enabled `glibc`. (Bug#2599 [http://bugs.mysql.com/2599])
- Now only the `SELECT` privilege is needed for tables that are only read in multiple-table `UPDATE` statements. (Bug#2377 [http://bugs.mysql.com/2377])
- Give proper error message if one uses `LOCK TABLES ... ; INSERT ... SELECT` and one used the same table in the `INSERT` and `SELECT` part. (Bug#2296 [http://bugs.mysql.com/2296])
- `SELECT INTO ... DUMPFILE` now deletes the generated file on error.
- Fixed foreign key reference handling to allow references to column names that contain spaces. (Bug#1725 [http://bugs.mysql.com/1725])

- Fixed problem with index reads on character columns with BDB tables. The symptom was that data could be returned in the wrong lettercase. ([Bug#2509](http://bugs.mysql.com/2509) [<http://bugs.mysql.com/2509>])
- Fixed a spurious table corruption problem that could sometimes appear on tables with indexed TEXT columns if these columns happened to contain values having trailing spaces. This bug was introduced in 4.0.17.
- Fixed a problem where some queries could hang if a condition like `indexed_TEXT_column = expr` was present and the column contained values having trailing spaces. This bug was introduced in 4.0.17.
- Fixed a bug that could cause incorrect results from a query that involved range conditions on indexed TEXT columns that happened to contain values having trailing spaces. This bug was introduced in 4.0.17. ([Bug#2295](http://bugs.mysql.com/2295) [<http://bugs.mysql.com/2295>])
- Fixed incorrect path names in some of the manual pages. ([Bug#2270](http://bugs.mysql.com/2270) [<http://bugs.mysql.com/2270>])
- Fixed spurious “table corrupted” errors in parallel repair operations. See [Section 5.2.2, “System Variables”](#).
- Fixed a crashing bug in parallel repair operations. See [Section 5.2.2, “System Variables”](#).
- Fixed bug in updating MyISAM tables for BLOB values longer than 16MB. ([Bug#2159](http://bugs.mysql.com/2159) [<http://bugs.mysql.com/2159>])
- Fixed bug in `mysqld_safe` when running multiple instances of MySQL. ([Bug#2114](http://bugs.mysql.com/2114) [<http://bugs.mysql.com/2114>])
- Fixed a bug in using `HANDLER` statement with tables not from a current database. ([Bug#2304](http://bugs.mysql.com/2304) [<http://bugs.mysql.com/2304>])
- Fixed a crashing bug that occurred due to the fact that multiple-table `UPDATE` statements did not check that there was only one table to be updated. ([Bug#2103](http://bugs.mysql.com/2103) [<http://bugs.mysql.com/2103>])
- Fixed a crashing bug that occurred due to BLOB data type index size being calculated incorrectly in `MIN( )` and `MAX( )` optimizations. ([Bug#2189](http://bugs.mysql.com/2189) [<http://bugs.mysql.com/2189>])
- Fixed a bug with incorrect syntax for `LOCK TABLES` in `mysqldump`. ([Bug#2242](http://bugs.mysql.com/2242) [<http://bugs.mysql.com/2242>])
- Fixed a bug in `mysqld_safe` that caused `mysqld` to generate a warning about duplicate `user=xxx` options if this option was specified in the `[mysqld]` or `[server]` sections of `my.cnf`. ([Bug#2163](http://bugs.mysql.com/2163) [<http://bugs.mysql.com/2163>])
- `INSERT DELAYED ... SELECT ...` could cause table corruption because tables were not locked properly. This is now fixed by ignoring `DELAYED` in this context. ([Bug#1983](http://bugs.mysql.com/1983) [<http://bugs.mysql.com/1983>])
- Replication: Sometimes the master gets a non-fatal error during the execution of a statement that does not immediately succeed. (For example, a write to a MyISAM table may first receive “no space left on device,” but later complete when disk space becomes available. See [Section A.4.3, “How MySQL Handles a Full Disk”](#).) The bug was that the master forgot to reset the error code to 0 after success, so the error code got into its binary log, thus causing the slave to issue false alarms such as “did not get the same error as on master.” ([Bug#2083](http://bugs.mysql.com/2083) [<http://bugs.mysql.com/2083>])
- Removed a misleading “check permissions on master.info” from a replication error message, because the cause of the problem could be something other than permissions. ([Bug#2121](http://bugs.mysql.com/2121) [<http://bugs.mysql.com/2121>])

- Fixed a crash when the replication slave was unable to create the first relay log. ([Bug#2145](#) [<http://bugs.mysql.com/2145>])
- Replication of `LOAD DATA INFILE` for an empty file from a 3.23 master to a 4.0 slave caused the slave to print an error. ([Bug#2452](#) [<http://bugs.mysql.com/2452>])
- When automatically forcing `lower_case_table_names` to 1 if the file system was case insensitive, `mysqld` could crash. This bug existed only in MySQL 4.0.17. ([Bug#2481](#) [<http://bugs.mysql.com/2481>])
- Restored ability to specify default values for `TIMESTAMP` columns that was erroneously disabled in previous release. ([Bug#2539](#) [<http://bugs.mysql.com/2539>]) Fixed `SHOW CREATE TABLE` to reflect these values. ([Bug#1885](#) [<http://bugs.mysql.com/1885>]) Note that because of the auto-update feature for the first `TIMESTAMP` column in a table, it makes no sense to specify a default value for the column. Any such default is silently ignored (unless another `TIMESTAMP` column is added before this one). Also fixed the meaning of the `DEFAULT` keyword when it is used to specify the value to be inserted into a `TIMESTAMP` column other than the first. ([Bug#2464](#) [<http://bugs.mysql.com/2464>])
- Fixed bug for out-of-range arguments on QNX platform that caused `UNIX_TIMESTAMP( )` to produce incorrect results or that caused non-zero values to be inserted into `TIMESTAMP` columns. ([Bug#2523](#) [<http://bugs.mysql.com/2523>]) Also, current time zone now is taken into account when checking if datetime values satisfy both range boundaries for `TIMESTAMP` columns. The range allowed for a `TIMESTAMP` column is time zone-dependent and equivalent to a range of `1970-01-01 00:00:01 UTC to 2037-12-31 23:59:59 UTC`.
- Multiple-table `DELETE` statements were never replicated by the slave if there were any `-replicate-*-table` options. ([Bug#2527](#) [<http://bugs.mysql.com/2527>])
- Changes to session counterparts of variables `query_prealloc_size`, `query_alloc_block_size`, `trans_prealloc_size`, `trans_alloc_block_size` now have an effect. ([Bug#1948](#) [<http://bugs.mysql.com/1948>])
- Fixed bug in `ALTER TABLE RENAME`, when rename to the table with the same name in another database silently dropped destination table if it existed. ([Bug#2628](#) [<http://bugs.mysql.com/2628>])

## D.2.12. Changes in release 4.0.17 (14 December 2003)

Functionality added or changed:

- `mysqldump` no longer dumps data for `MERGE` tables. ([Bug#1846](#) [<http://bugs.mysql.com/1846>])
- `lower_case_table_names` is now forced to 1 if the database directory is located on a case-insensitive filesystem. ([Bug#1812](#) [<http://bugs.mysql.com/1812>])
- Symlink creation is now disabled on systems where `realpath( )` doesn't work. (Before one could use `CREATE TABLE .. DATA DIRECTORY=..` even if `HAVE_BROKEN_REALPATH` was defined. This is now disabled to avoid problems when running `ALTER TABLE`).
- Inserting a negative `AUTO_INCREMENT` value in a `MyISAM` table no longer updates the `AUTO_INCREMENT` counter to a big unsigned value. ([Bug#1366](#) [<http://bugs.mysql.com/1366>])
- Added four new modes to `WEEK( ..., mode)` function. See `WEEK(date: (mode))`. ([Bug#1178](#) [<http://bugs.mysql.com/1178>])
- Allow `UNION DISTINCT` syntax.

- MySQL now syncs to disk each time `.frm` file is created.
- `mysql_server_init()` now returns 1 if it can't initialize the environment. (Previously `mysql_server_init()` called `exit(1)` if it could not create a key with `pthread_key_create()`. (Bug#2062 [<http://bugs.mysql.com/2062>]))
- Allow spaces in Windows service names.
- Changed the default Windows service name for `mysqld` from `MySql` to `MySQL`. This should not affect usage, because service names are not case sensitive.
- When you install `mysqld` as a service on Windows systems, `mysqld` reads startup options in option files from the option group with the same name as the service name. (Except when the service name is `MySQL`).

### Bugs fixed:

- Sending `SIGHUP` to `mysqld` crashed the server if it was running with `--log-bin`. (Bug#2045 [<http://bugs.mysql.com/2045>])
- One can now configure MySQL as a Windows service as a normal user. (Bug#1802 [<http://bugs.mysql.com/1802>]). Thanks to Richard Hansen for fixing this.
- Database names are now compared in lowercase in `ON` clauses when `lower_case_table_names` is set. (Bug#1736 [<http://bugs.mysql.com/1736>])
- `IGNORE ... LINES` option to `LOAD DATA INFILE` didn't work when used with fixed length rows. (Bug#1704 [<http://bugs.mysql.com/1704>])
- Fixed problem with `UNIX_TIMESTAMP()` for timestamps close to 0. (Bug#1998 [<http://bugs.mysql.com/1998>])
- Fixed problem with character values greater than 128 in the `QUOTE()` function. (Bug#1868 [<http://bugs.mysql.com/1868>])
- Fixed searching of `TEXT` with endspace. (Bug#1651 [<http://bugs.mysql.com/1651>])
- Fixed caching bug in multiple-table updates where same table was used twice. (Bug#1711 [<http://bugs.mysql.com/1711>])
- Fixed directory permissions for the MySQL-server RPM documentation directory. (Bug#1672 [<http://bugs.mysql.com/1672>])
- Fixed server crash when updating an `ENUM` column that is set to the empty string (for example, with `REPLACE()`). (Bug#2023 [<http://bugs.mysql.com/2023>])
- `mysql` client program now correctly prints connection identifier returned by `mysql_thread_id()` as unsigned integer rather than as signed integer. (Bug#1951 [<http://bugs.mysql.com/1951>])
- `FOUND_ROWS()` could return incorrect number of rows after a query with an impossible `WHERE` condition. (Bug#1468 [<http://bugs.mysql.com/1468>])
- `SHOW DATABASES` no longer shows `.sym` files (on Windows) that do not point to a valid directory. (Bug#1385 [<http://bugs.mysql.com/1385>])
- Fixed a possible memory leak on Mac OS X when using the shared `libmysql.so` library. (from

`pthread_key_create()`. (Bug#2061 [http://bugs.mysql.com/2061])

- Fixed bug in `UNION` statement with alias `*`. (Bug#1249 [http://bugs.mysql.com/1249])
- Fixed a bug in `DELETE ... ORDER BY ... LIMIT` where the rows were not deleted in the proper order. (Bug#1024 [http://bugs.mysql.com/1024], Bug#1697 [http://bugs.mysql.com/1697]).
- Fixed serious problem with multi-threaded programs on Windows that used the embedded MySQL libraries. (Locks of tables were not handled correctly between different threads).
- Code cleanup: Fixed a few code defects (potential memory leaks, null pointer dereferences, uninitialized variables). Thanks to Reasoning Inc. for informing us about these findings.
- Fixed a buffer overflow error that occurred with prepended '0' characters in some columns of type `DECIMAL`. (Bug#2128 [http://bugs.mysql.com/2128])
- Filesort was never shown in `EXPLAIN` if query contained an `ORDER BY NULL` clause. (Bug#1335 [http://bugs.mysql.com/1335])
- Fixed invalidation of whole query cache on `DROP DATABASE`. (Bug#1898 [http://bugs.mysql.com/1898])
- Fixed bug in range optimizer that caused wrong results for some unlikely `AND/OR` queries. (Bug#1828 [http://bugs.mysql.com/1828])
- Fixed a crash in `ORDER BY` when ordering by expression and identifier. (Bug#1945 [http://bugs.mysql.com/1945])
- Fixed a crash in an open `HANDLER` when an `ALTER TABLE` was executed in a different connection. (Bug#1826 [http://bugs.mysql.com/1826])
- Fixed a bug in `trunc*` operator of full-text search which sometimes caused MySQL not to find all matched rows.
- Fixed bug in prepending '0' characters to `DECIMAL` column values.
- Fixed optimizer bug, introduced in 4.0.16, when `REF` access plan was preferred to more efficient `RANGE` on another column.
- Fixed problem when installing a MySQL server as a Windows service using a command of the form `mysqld --install mysql --defaults-file=path-to-file`. (Bug#1643 [http://bugs.mysql.com/1643])
- Fixed an incorrect result from a query that uses only `const` tables (such as one-row tables) and non-constant expression (such as `RAND()`). (Bug#1271 [http://bugs.mysql.com/1271])
- Fixed bug when the optimizer did not take `SQL_CALC_FOUND_ROWS` into account if `LIMIT` clause was present. (Bug#1274 [http://bugs.mysql.com/1274])
- `mysqlbinlog` now asks for a password at the console when the `-p` or `--password` option is used with no argument. This is consistent with the way that other clients such `mysqladmin` and `mysqldump` behave. **Note:** A consequence of this change is that it is no longer possible to invoke `mysqlbinlog` as `mysqlbinlog -p pass_val` (with a space between the `-p` option and the following password value). (Bug#1595 [http://bugs.mysql.com/1595])
- Fixed bug accidentally introduced in 4.0.16 where the slave SQL thread deleted its replicated temporary tables when `STOP SLAVE` was issued.
- In a "chain" replication setup `A->B->C`, if 2 sessions on A updated temporary tables of the same

name at the same time, the binary log of **B** became incorrect, resulting in **C** becoming confused. ([Bug#1686](http://bugs.mysql.com/1686) [<http://bugs.mysql.com/1686>])

- In a “chain” replication setup **A**->**B**->**C**, if `STOP SLAVE` was issued on **B** while it was replicating a temporary table from **A**, then when `START SLAVE` was issued on **B**, the binary log of **B** became incorrect, resulting in **C** becoming confused. ([Bug#1240](http://bugs.mysql.com/1240) [<http://bugs.mysql.com/1240>])
- When `MASTER_LOG_FILE` and `MASTER_LOG_POS` were not specified, `CHANGE MASTER` used the coordinates of the slave I/O thread to set up replication, which broke replication if the slave SQL thread lagged behind the slave I/O thread. This caused the slave SQL thread to lose some events. The new behavior is to use the coordinates of the slave SQL thread instead. See [Section 13.6.2.1](#), “`CHANGE MASTER TO Syntax`”. ([Bug#1870](http://bugs.mysql.com/1870) [<http://bugs.mysql.com/1870>])
- Now if integer is stored or converted to `TIMESTAMP` or `DATETIME` value checks of year, month, day, hour, minute and second ranges are performed and numbers representing illegal timestamps are converted to 0 value. This behavior is consistent with manual and with behavior of string to `TIMESTAMP/DATETIME` conversion. ([Bug#1448](http://bugs.mysql.com/1448) [<http://bugs.mysql.com/1448>])
- Fixed bug when `BIT_AND( )` and `BIT_OR( )` group functions returned incorrect value if `SELECT` used a temporary table and no rows were found. ([Bug#1790](http://bugs.mysql.com/1790) [<http://bugs.mysql.com/1790>]).
- `BIT_AND( )` is now unsigned in all contexts. This means that it now returns 18446744073709551615 (= 0xffffffffffff) instead of -1 if there were no rows in the result.
- Fixed bug with `BIT_AND( )` still returning signed value for an empty set in some cases. ([Bug#1972](http://bugs.mysql.com/1972) [<http://bugs.mysql.com/1972>])
- Fixed bug with `^` (XOR) and `>>` (bit shift) still returning signed value in some cases. ([Bug#1993](http://bugs.mysql.com/1993) [<http://bugs.mysql.com/1993>])
- Replication: a rare race condition in the slave SQL thread, which could lead to a wrong complain that the relay log is corrupted. ([Bug#2011](http://bugs.mysql.com/2011) [<http://bugs.mysql.com/2011>])
- Replication: in the slave SQL thread, a multiple-table `UPDATE` could produce a wrong complain that some record was not found in one table, if the `UPDATE` was preceded by a `INSERT . . . SELECT`. ([Bug#1701](http://bugs.mysql.com/1701) [<http://bugs.mysql.com/1701>])
- Fixed deficiency in MySQL code which is responsible for scanning directories. This deficiency caused `SHOW TABLE STATUS` to be very slow when a database contained a large number of tables, even if a single particular table were specified. ([Bug#1952](http://bugs.mysql.com/1952) [<http://bugs.mysql.com/1952>])

## D.2.13. Changes in release 4.0.16 (17 October 2003)

Functionality added or changed:

- Option values in option files now may be quoted. This is useful for values that contain whitespace or comment characters.
- Write memory allocation information to error log when doing `mysqladmin debug`. This works only on systems that support the `mallinfo( )` call (like newer Linux systems).
- Added the following new system variables to allow more precise memory allocation: `range_alloc_block_size`, `query_alloc_block_size`, `query_prealloc_size`, `transaction_alloc_block_size`, and `transaction_prealloc_size`.
- `mysqlbinlog` now reads option files. To make this work, you must now specify -

`-read-from-remote-server` when reading binary logs from a MySQL server. (Note that using a remote server is deprecated and may disappear in future `mysqlbinlog` versions).

- Block `SIGPIPE` signals also for non-threaded programs. The blocking is moved from `mysql_init()` to `mysql_server_init()`, which is automatically called on the first call to `mysql_init()`.
- Added `--libs_r` and `--include` options to `mysql_config`.
- New ``>` prompt for `mysql`. This prompt is similar to the `'>` and `">` prompts, but indicates that an identifier quoted with backticks was begun on an earlier line and the closing backtick has not yet been seen.
- Updated `mysql_install_db` to be able to use the local machine's IP address instead of the host-name when building the initial grant tables if `skip-name-resolve` has been specified. This option can be helpful on FreeBSD to avoid thread-safety problems with the FreeBSD resolver libraries. (Thanks to Jeremy Zawodny for the patch.)
- A documentation change: Added a note that when backing up a slave, it is necessary also to back up the `master.info` and `relay-log.info` files, as well as any `SQL_LOAD-*` files located in the directory specified by the `--slave-load-tmpdir` option. All these files are needed when the slave resumes replication after you restore the slave's data.

Bugs fixed:

- Fixed a spurious error `ERROR 14: Can't change size of file (Errcode: 2)` on Windows in `DELETE FROM tbl_name` without a `WHERE` clause or `TRUNCATE TABLE tbl_name`, when `tbl_name` is a `MyISAM` table. (Bug#1397 [http://bugs.mysql.com/1397])
- Fixed a bug that resulted in `thr_alarm queue is full` warnings after increasing the `max_connections` variable with `SET GLOBAL`. (Bug#1435 [http://bugs.mysql.com/1435])
- Made `LOCK TABLES` to work when `Lock_tables_priv` is granted on the database level and `Select_priv` is granted on the table level.
- Fixed crash of `FLUSH QUERY CACHE` on queries that use same table several times (Bug#988 [http://bugs.mysql.com/988]).
- Fixed core dump bug when setting an enum system variable (such as `SQL_WARNINGS`) to `NULL`.
- Extended the default timeout value for Windows clients from 30 seconds to 1 year. (The timeout that was added in MySQL 4.0.15 was way too short). This fixes a bug that caused `ERROR 2013: Lost connection to MySQL server during query` for queries that lasted longer than 30 seconds, if the client didn't specify a limit with `mysql_options()`. Users of 4.0.15 on Windows should upgrade to avoid this problem.
- More “out of memory” checking in range optimizer.
- Fixed and documented a problem when setting and using a user variable within the same `SELECT` statement. (Bug#1194 [http://bugs.mysql.com/1194]).
- Fixed bug in overrun check for `BLOB` values with compressed tables. This was a bug introduced in 4.0.14. It caused MySQL to regard some correct tables containing `BLOB` values as corrupted. (Bug#770 [http://bugs.mysql.com/770], Bug#1304 [http://bugs.mysql.com/1304], and maybe Bug#1295 [http://bugs.mysql.com/1295])
- `SHOW GRANTS` showed `USAGE` instead of the real column-level privileges when no table-level

privileges were given.

- When copying a database from the master, `LOAD DATA FROM MASTER` dropped the corresponding database on the slave, thus erroneously dropping tables that had no counterpart on the master and tables that may have been excluded from replication using `--replicate-*-table` rules. Now `LOAD DATA FROM MASTER` no longer drops the database. Instead, it drops only the tables that have a counterpart on the master and that match the `--replicate-*-table` rules. `--replicate-*-db` rules can still be used to include or exclude a database as a whole from `LOAD DATA FROM MASTER`. A database also is included or excluded as a whole if there are some rules like `--replicate-wild-do-table=db1.%` or `--replicate-wild-ignore-table=db1.%`, as is the case for `CREATE DATABASE` and `DROP DATABASE` in replication. ([Bug#1248](http://bugs.mysql.com/1248) [<http://bugs.mysql.com/1248>])
- Fixed a bug where `mysqlbinlog` crashed with a segmentation fault when used with the `-h` or `-host` option. ([Bug#1258](http://bugs.mysql.com/1258) [<http://bugs.mysql.com/1258>])
- Fixed a bug where `mysqlbinlog` crashed with a segmentation fault when used on a binary log containing only final events for `LOAD DATA`. ([Bug#1340](http://bugs.mysql.com/1340) [<http://bugs.mysql.com/1340>])
- `mysqlbinlog` does not reuse temporary filenames from previous runs. Previously `mysqlbinlog` failed if was used several times on the same binary log file that contained a `LOAD DATA` command.
- Fixed compilation problem when compiling with OpenSSL 0.9.7 with disabled old DES support (If `OPENSSL_DISABLE_OLD_DES_SUPPORT` option was enabled).
- Fixed a bug when two (or more) MySQL servers were running on the same machine, and they were both slaves, and at least one of them was replicating some `LOAD DATA INFILE` command from its master. The bug was that one slave MySQL server sometimes deleted the `SQL_LOAD-*` files (used for replication of `LOAD DATA INFILE` and located in the `slave-load-tmpdir` directory, which defaults to `tmpdir`) belonging to the other slave MySQL server of this machine, if these slaves had the same `slave-load-tmpdir` directory. When that happened, the other slave could not replicate `LOAD DATA INFILE` and complained about not being able to open some `SQL_LOAD-*` file. ([Bug#1357](http://bugs.mysql.com/1357) [<http://bugs.mysql.com/1357>])
- If `LOAD DATA INFILE` failed for a small file, the master forgot to write a marker (a `Delete_file` event) in its binary log, so the slave could not delete 2 files (`SQL_LOAD-*.info` and `SQL_LOAD-*.data` from its `tmpdir`). ([Bug#1391](http://bugs.mysql.com/1391) [<http://bugs.mysql.com/1391>])
- On Windows, the slave forgot to delete a `SQL_LOAD-*.info` file from `tmpdir` after successfully replicating a `LOAD DATA INFILE` command. ([Bug#1392](http://bugs.mysql.com/1392) [<http://bugs.mysql.com/1392>])
- When a connection terminates, MySQL writes `DROP TEMPORARY TABLE` statements to the binary log for all temporary tables which the connection had not explicitly dropped. MySQL forgot to use backticks to quote the database and table names in the statement. ([Bug#1345](http://bugs.mysql.com/1345) [<http://bugs.mysql.com/1345>])
- On some 64-bit machines (some HP-UX and Solaris machines), a slave installed with the 64-bit MySQL binary could not connect to its master (it connected to itself instead). ([Bug#1256](http://bugs.mysql.com/1256) [<http://bugs.mysql.com/1256>], [Bug#1381](http://bugs.mysql.com/1381) [<http://bugs.mysql.com/1381>])
- Code was introduced in MySQL 4.0.15 for the slave to detect that the master had died while writing a transaction to its binary log. This code reported an error in a legal situation: When the slave I/O thread was stopped while copying a transaction to the relay log, the slave SQL thread would later pretend that it found an unfinished transaction. ([Bug#1475](http://bugs.mysql.com/1475) [<http://bugs.mysql.com/1475>])

## D.2.14. Changes in release 4.0.15 (03 September 2003)

---

**IMPORTANT:**

If you are using this release on Windows, you should upgrade at least your clients (any program that uses `libmysql.lib`) to 4.0.16 or above. This is because the 4.0.15 release had a bug in the Windows client library that causes Windows clients using the library to die with a `Lost connection to MySQL server during query` error for queries that take more than 30 seconds. This problem is specific to Windows; clients on other platforms are unaffected.

Functionality added or changed:

- `mysqldump` now correctly quotes all identifiers when communicating with the server. This assures that during the dump process, `mysqldump` never sends queries to the server that result in a syntax error. This problem is **not** related to the `mysqldump` program's output, which was not changed. (Bug#1148 [<http://bugs.mysql.com/1148>])
- Change result set metadata information so that `MIN()` and `MAX()` report that they can return `NULL` (this is true because an empty set returns `NULL`). (Bug#324 [<http://bugs.mysql.com/324>])
- Produce an error message on Windows if a second `mysqld` server is started on the same TCP/IP port as a running `mysqld` server.
- The `mysqld` system variables `wait_timeout`, `net_read_timeout`, and `net_write_timeout` now work on Windows. One can now also set timeouts for read and writes in Windows clients with `mysql_options()`.
- Added option `--sql-mode=NO_DIR_IN_CREATE` to make it possible for slaves to ignore `INDEX DIRECTORY` and `DATA DIRECTORY` options given to `CREATE TABLE`. When this is mode is on, `SHOW CREATE TABLE` does not show the given directories.
- `SHOW CREATE TABLE` now shows the `INDEX DIRECTORY` and `DATA DIRECTORY` options, if they were specified when the table was created.
- The `open_files_limit` system variable now shows the real open files limit.
- `MATCH ... AGAINST()` in natural language mode now treats words that are present in more than 2,000,000 rows as stopwords.
- The Mac OS X installation disk images now include an additional `MySQLStartupItem.pkg` package that enables the automatic startup of MySQL on system startup. See Section 2.5, "Installing MySQL on Mac OS X".
- Most of the documentation included in the binary tarball distributions (`.tar.gz`) has been moved into a subdirectory `docs`. See Section 2.1.5, "Installation Layouts".
- The manual is now included as an additional `info` file in the binary distributions. (Bug#1019 [<http://bugs.mysql.com/1019>])
- The binary distributions now include the embedded server library (`libmysqld.a`) by default. Due to a linking problem with non-gcc compilers, it was not included in all packages of the initial 4.0.15 release. The affected packages were rebuilt and released as 4.0.15a. See Section 1.6.1.2, "The Embedded MySQL Server".
- MySQL can now use range optimization for `BETWEEN` with non-constant limits. (Bug#991 [<http://bugs.mysql.com/991>])
- Replication error messages now include the default database, so that users can check which database the failing query was run for.

- A documentation change: Added a paragraph about how the `binlog-do-db` and `binlog-ignore-db` options are tested against the database on the master (see [Section 5.11.4](#), “The Binary Log”), and a paragraph about how `--replicate-do-db`, `--replicate-do-table` and analogous options are tested against the database and tables on the slave (see [Section 6.8](#), “Replication Startup Options”).
- Now the slave does not replicate `SET PASSWORD` if it is configured to exclude the `mysql` database from replication (using for example `--replicate-wild-ignore-table=mysql.%`). This was the case for `GRANT` and `REVOKE` since version 4.0.13 (although there was [Bug#980](#) [<http://bugs.mysql.com/980>] in 4.0.13 & 4.0.14, which has been fixed in 4.0.15).
- Rewrote the information shown in the `State` column of `SHOW PROCESSLIST` for replication threads and for `MASTER_POS_WAIT()` and added the most common states for these threads to the documentation, see [Section 6.3](#), “Replication Implementation Details”.
- Added a test in replication to detect the case where the master died in the middle of writing a transaction to the binary log; such unfinished transactions now trigger an error message on the slave.
- A `GRANT` command that creates an anonymous user (that is, an account with an empty username) no longer requires `FLUSH PRIVILEGES` for the account to be recognized by the server. ([Bug#473](#) [<http://bugs.mysql.com/473>])
- `CHANGE MASTER` now flushes `relay-log.info`. Previously this was deferred to the next run of `START SLAVE`, so if `mysqld` was shutdown on the slave after `CHANGE MASTER` without having run `START SLAVE`, the relay log’s name and position were lost. At restart they were reloaded from `relay-log.info`, thus reverting to their old (incorrect) values from before `CHANGE MASTER` and leading to error messages (as the old relay log did not exist any more) and the slave threads refusing to start. ([Bug#858](#) [<http://bugs.mysql.com/858>])

Bugs fixed:

- Fixed buffer overflow in password handling which could potentially be exploited by MySQL users with `ALTER` privilege on the `mysql.user` table to execute random code or to gain shell access with the UID of the `mysqld` process (thanks to Jedi/Sector One for spotting and reporting this bug).
- Fixed server crash on `FORCE INDEX` in a query that contained “Range checked for each record” in the `EXPLAIN` output. ([Bug#1172](#) [<http://bugs.mysql.com/1172>])
- Fixed table/column grant handling: The proper sort order (from most specific to less specific, see [Section 5.7.6](#), “Access Control, Stage 2: Request Verification”) was not honored. ([Bug#928](#) [<http://bugs.mysql.com/928>])
- Fixed rare bug in `MYISAM` introduced in 4.0.3 where the index file header was not updated directly after an `UPDATE` of split dynamic rows. The symptom was that the table had a corrupted delete-link if `mysqld` was shut down or the table was checked directly after the update.
- Fixed `Can't unlock file` error when running `myisamchk --sort-index` on Windows. ([Bug#1119](#) [<http://bugs.mysql.com/1119>])
- Fixed possible deadlock when changing `key_buffer_size` while the key cache was actively used. ([Bug#1088](#) [<http://bugs.mysql.com/1088>])
- Fixed overflow bug in `MyISAM` and `ISAM` when a row is updated in a table with a large number of columns and at least one `BLOB/TEXT` column.
- Fixed incorrect result when doing `UNION` and `LIMIT #, #` when braces were not used around the `SELECT` parts.

- Fixed incorrect result when doing `UNION` and `ORDER BY .. LIMIT #` when one didn't use braces around the `SELECT` parts.
- Fixed problem with `SELECT SQL_CALC_FOUND_ROWS ... UNION ALL ... LIMIT #` where `FOUND_ROWS()` returned incorrect number of rows.
- Fixed unlikely stack bug when having a BIG expression of type `1+1-1+1-1...` in certain combinations. (Bug#871 [<http://bugs.mysql.com/871>])
- Fixed the bug that sometimes prevented a table with a `FULLTEXT` index from being marked as "analyzed".
- Fixed MySQL so that the column length (in C API) for the second column in `SHOW CREATE TABLE` is always larger than the data length. The only known application that was affected by the old behavior was Borland dbExpress, which truncated the output from the command. (Bug#1064 [<http://bugs.mysql.com/1064>])
- Fixed crash in comparisons of strings using the `tis620` character set. (Bug#1116 [<http://bugs.mysql.com/1116>])
- Fixed `ISAM` bug in `MAX()` optimization.
- `myisamchk --sort-records=N` no longer marks table as crashed if sorting failed because of an inappropriate key. (Bug#892 [<http://bugs.mysql.com/892>])
- Fixed a minor bug in `MyISAM` compressed table handling that sometimes made it impossible to repair compressed table in "Repair by sort" mode. "Repair with keycache" (`myisamchk -safe-recover`) worked, though. (Bug#1015 [<http://bugs.mysql.com/1015>])
- Fixed bug in propagating the version number to the manual included in the distribution files. (Bug#1020 [<http://bugs.mysql.com/1020>])
- Fixed key sorting problem (a `PRIMARY` key declared for a column that is not explicitly marked `NOT NULL` was sorted after a `UNIQUE` key for a `NOT NULL` column).
- Fixed the result of `INTERVAL` when applied to a `DATE` value. (Bug#792 [<http://bugs.mysql.com/792>])
- Fixed compiling of the embedded server library in the RPM spec file. (Bug#959 [<http://bugs.mysql.com/959>])
- Added some missing files to the RPM spec file and fixed some RPM building errors that occurred on Red Hat Linux 9. (Bug#998 [<http://bugs.mysql.com/998>])
- Fixed incorrect `XOR` evaluation in `WHERE` clause. (Bug#992 [<http://bugs.mysql.com/992>])
- Fixed bug with processing in query cache merged tables constructed from more than 255 tables. (Bug#930 [<http://bugs.mysql.com/930>])
- Fixed incorrect results from outer join query (for example, `LEFT JOIN`) when `ON` condition is always false, and range search in used. (Bug#926 [<http://bugs.mysql.com/926>])
- Fixed a bug causing incorrect results from `MATCH ... AGAINST()` in some joins. (Bug#942 [<http://bugs.mysql.com/942>])
- `MERGE` tables do not ignore `Using index` (from `EXPLAIN` output) anymore.
- Fixed a bug that prevented an empty table from being marked as "analyzed". (Bug#937 [<http://bugs.mysql.com/937>])

- Fixed `myisamchk --sort-records` crash when used on compressed table.
- Fixed slow (as compared to 3.23) `ALTER TABLE` and related commands such as `CREATE INDEX`. (Bug#712 [<http://bugs.mysql.com/712>])
- Fixed segmentation fault resulting from `LOAD DATA FROM MASTER` when the master was running without the `--log-bin` option. (Bug#934 [<http://bugs.mysql.com/934>])
- Fixed a security bug: A server compiled without SSL support still allowed connections by users who had the `REQUIRE SSL` option specified for their accounts.
- Fixed a random bug: Sometimes the slave would replicate `GRANT` or `REVOKE` queries even if it was configured to exclude the `mysql` database from replication (for example, using `--replicate-wild-ignore-table=mysql.%`). (Bug#980 [<http://bugs.mysql.com/980>])
- The `Last_Errno` and `Last_Error` fields in the output of `SHOW SLAVE STATUS` are now cleared by `CHANGE MASTER` and when the slave SQL thread starts. (Bug#986 [<http://bugs.mysql.com/986>])
- A documentation mistake: It said that `RESET SLAVE` does not change connection information (master host, port, user, and password), whereas it does. The statement resets these to the startup options (`master-host` etc) if there were some. (Bug#985 [<http://bugs.mysql.com/985>])
- `SHOW SLAVE STATUS` now shows correct information (master host, port, user, and password) after `RESET SLAVE` (that is, it shows the new values, which are copied from the startup options if there were some). (Bug#985 [<http://bugs.mysql.com/985>])
- Disabled propagation of the original master's log position for events because this caused unexpected values for `Exec_Master_Log_Pos` and problems with `MASTER_POS_WAIT()` in A->B->C replication setup. (Bug#1086 [<http://bugs.mysql.com/1086>])
- Fixed a segmentation fault in `mysqlbinlog` when `--position=x` was used with `x` being between a `Create_file` event and its fellow `Append_block`, `Exec_load` or `Delete_file` events. (Bug#1091 [<http://bugs.mysql.com/1091>])
- `mysqlbinlog` printed superfluous warnings when using `--database`, which caused syntax errors when piped to `mysql`. (Bug#1092 [<http://bugs.mysql.com/1092>])
- Made `mysqlbinlog --database` filter `LOAD DATA INFILE` too (previously, it filtered all queries except `LOAD DATA INFILE`). (Bug#1093 [<http://bugs.mysql.com/1093>])
- `mysqlbinlog` in some cases forgot to put a leading '#' in front of the original `LOAD DATA INFILE` (this command is displayed only for information, not to be run; it is later reworked to `LOAD DATA LOCAL` with a different filename, for execution by `mysql`). (Bug#1096 [<http://bugs.mysql.com/1096>])
- `binlog-do-db` and `binlog-ignore-db` incorrectly filtered `LOAD DATA INFILE` (it was half-written to the binary log). This resulted in a corrupted binary log, which could cause the slave to stop with an error. (Bug#1100 [<http://bugs.mysql.com/1100>])
- When, in a transaction, a transactional table (such as an `InnoDB` table) was updated, and later in the same transaction a non-transactional table (such as a `MyISAM` table) was updated using the updated content of the transactional table (with `INSERT ... SELECT` for example), the queries were written to the binary log in an incorrect order. (Bug#873 [<http://bugs.mysql.com/873>])
- When, in a transaction, `INSERT ... SELECT` updated a non-transactional table, and `ROLLBACK` was issued, no error was returned to the client. Now the client is warned that some changes could not be rolled back, as this was the case for normal `INSERT`. (Bug#1113 [<http://bugs.mysql.com/1113>])

- Fixed a potential bug: When `STOP SLAVE` was run while the slave SQL thread was in the middle of a transaction, and then `CHANGE MASTER` was used to point the slave to some non-transactional statement, the slave SQL thread could get confused (because it would still think, from the past, that it was in a transaction).

## D.2.15. Changes in release 4.0.14 (18 July 2003)

Functionality added or changed:

- Added `default_week_format` system variable. The value is used as the default mode for the `WEEK()` function.
- `mysqld` now reads an additional option file group having a name corresponding to the server's release series: `[mysqld-4.0]` for 4.0.x servers, `[mysqld-4.1]` for 4.1.x servers, and so forth. This allows options to be specified on a series-specific basis.
- The `CONCAT_WS()` function no longer skips empty strings. (Bug#586 [<http://bugs.mysql.com/586>]).
- InnoDB now supports indexing a prefix of a column. This means, in particular, that `BLOB` and `TEXT` columns can be indexed in InnoDB tables, which was not possible before.
- A documentation change: Function `INTERVAL(NULL, ...)` returns `-1`.
- Enabled `INSERT` from `SELECT` when the table into which the records are inserted is also a table listed in the `SELECT`.
- Allow `CREATE TABLE` and `INSERT` from any `UNION`.
- The `SQL_CALC_FOUND_ROWS` option now always returns the total number of rows for any `UNION`.
- Removed `--table` option from `mysqlbinlog` to avoid repeating `mysqldump` functionality.
- Comment lines in option files can now start from the middle of a line, too (like `basedir=c:\mysql # installation directory`).
- Changed optimizer slightly to prefer index lookups over full table scans in some boundary cases.
- Added thread-specific `max_seeks_for_key` variable that can be used to force the optimizer to use keys instead of table scans even if the cardinality of the index is low.
- Added optimization that converts `LEFT JOIN` to normal join in some cases.
- A documentation change: added a paragraph about failover in replication (how to use a surviving slave as the new master, how to resume to the original setup). See Section 6.10, “Replication FAQ”.
- A documentation change: added warning notes about safe use of the `CHANGE MASTER` command. See Section 13.6.2.1, “CHANGE MASTER TO Syntax”.
- MySQL now issues a warning (not an error, as in 4.0.13) when it opens a table that was created with MySQL 4.1.
- Added `--nice` option to `mysqld_safe` to allow setting the niceness of the `mysqld` process. (Thanks to Christian Hammers for providing the initial patch.) (Bug#627 [<http://bugs.mysql.com/627>])

- Added `--read-only` option to cause `mysqld` to allow no updates except from slave threads or from users with the `SUPER` privilege. (Original patch from Markus Benning).
- `SHOW BINLOG EVENTS FROM x` where `x` is less than 4 now silently converts `x` to 4 instead of printing an error. The same change was done for `CHANGE MASTER TO MASTER_LOG_POS=x` and `CHANGE MASTER TO RELAY_LOG_POS=x`.
- `mysqld` now only adds an interrupt handler for the `SIGINT` signal if you start it with the new `-gdb` option. This is done because some MySQL users encountered strange problems when they accidentally sent `SIGINT` to `mysqld` threads.
- `RESET SLAVE` now clears the `Last_Errno` and `Last_Error` fields in the output of `SHOW SLAVE STATUS`.
- Added `max_relay_log_size` variable; the relay log is rotated automatically when its size exceeds `max_relay_log_size`. But if `max_relay_log_size` is 0 (the default), `max_binlog_size` is used (as in older versions). `max_binlog_size` still applies to binary logs in any case.
- `FLUSH LOGS` now rotates relay logs in addition to the other types of logs it rotates.

Bugs fixed:

- Comparison/sorting for `latin1_de` character set was rewritten. The old algorithm could not handle cases like `"sä" > "ßa"`. See Section 5.10.1.1, “Using the German Character Set”. In rare cases it resulted in table corruption.
- Fixed a problem with the password prompt on Windows. (Bug#683 [<http://bugs.mysql.com/683>])
- `ALTER TABLE ... UNION=(...)` for `MERGE` table is now allowed even if some underlying `MyISAM` tables are read-only. (Bug#702 [<http://bugs.mysql.com/702>])
- Fixed a problem with `CREATE TABLE t1 SELECT x'41'`. (Bug#801 [<http://bugs.mysql.com/801>])
- Removed some incorrect lock warnings from the error log.
- Fixed memory overrun when doing `REPAIR TABLE` on a table with a multiple-part auto\_increment key where one part was a packed `CHAR`.
- Fixed a probable race condition in the replication code that could potentially lead to `INSERT` statements not being replicated in the event of a `FLUSH LOGS` command or when the binary log exceeds `max_binlog_size`. (Bug#791 [<http://bugs.mysql.com/791>])
- Fixed a crashing bug in `INTERVAL` and `GROUP BY` or `DISTINCT`. (Bug#807 [<http://bugs.mysql.com/807>])
- Fixed bug in `mysqlhotcopy` so it actually aborts for unsuccessful table copying operations. Fixed another bug so that it succeeds when there are thousands of tables to copy. (Bug#812 [<http://bugs.mysql.com/812>])
- Fixed problem with `mysqlhotcopy` failing to read options from option files. (Bug#808 [<http://bugs.mysql.com/808>])
- Fixed bugs in optimizer that sometimes prevented MySQL from using `FULLTEXT` indexes even though it was possible (for example, in `SELECT * FROM t1 WHERE MATCH a,b AGAINST("index") > 0`).

- Fixed a bug with “table is full” in `UNION` operations.
- Fixed a security problem that enabled users with no privileges to obtain information on the list of existing databases by using `SHOW TABLES` and similar commands.
- Fixed a stack problem on UnixWare/OpenUnix.
- Fixed a configuration problem on UnixWare/OpenUNIX and OpenServer.
- Fixed a stack overflow problem in password verification. (CVE-2003-0780 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-0780>])
- Fixed a problem with `max_user_connections`.
- `HANDLER` without an index now works properly when a table has deleted rows. (Bug#787 [<http://bugs.mysql.com/787>])
- Fixed a bug with `LOAD DATA` in `mysqlbinlog`. (Bug#670 [<http://bugs.mysql.com/670>])
- Fixed that `SET CHARACTER SET DEFAULT` works. (Bug#462 [<http://bugs.mysql.com/462>])
- Fixed `MERGE` table behavior in `ORDER BY ... DESC` queries. (Bug#515 [<http://bugs.mysql.com/515>])
- Fixed server crash on `PURGE MASTER LOGS` or `SHOW MASTER LOGS` when the binary log is off. (Bug#733 [<http://bugs.mysql.com/733>])
- Fixed password-checking problem on Windows. (Bug#464 [<http://bugs.mysql.com/464>])
- Fixed the bug in comparison of a `DATETIME` column and an integer constant. (Bug#504 [<http://bugs.mysql.com/504>])
- Fixed remote mode of `mysqlbinlog`. (Bug#672 [<http://bugs.mysql.com/672>])
- Fixed `ERROR 1105: Unknown error` that occurred for some `SELECT` queries, where a column that was declared as `NOT NULL` was compared with an expression that took `NULL` value.
- Changed timeout in `mysql_real_connect()` to use `poll()` instead of `select()` to work around problem with many open files in the client.
- Fixed incorrect results from `MATCH ... AGAINST` used with a `LEFT JOIN` query.
- Fixed a bug that limited the maximum value for `mysqld` variables to 4294967295 when they are specified on the command line.
- Fixed a bug that sometimes caused spurious “Access denied” errors in `HANDLER ... READ` statements, when a table is referenced via an alias.
- Fixed portability problem with `safe_malloc`, which caused MySQL to give “Freeing wrong aligned pointer” errors on SCO 3.2.
- `ALTER TABLE ... ENABLE/DISABLE KEYS` could cause a core dump when done after an `INSERT DELAYED` statement on the same table.
- Fixed problem with conversion of localtime to GMT where some times resulted in different (but correct) timestamps. Now MySQL should use the smallest possible timestamp value in this case. (Bug#316 [<http://bugs.mysql.com/316>])
- Very small query cache sizes could crash `mysqld`. (Bug#549 [<http://bugs.mysql.com/549>])

- Fixed a bug (accidentally introduced by us but present only in version 4.0.13) that made `INSERT ... SELECT` into an `AUTO_INCREMENT` column not replicate well. This bug is in the master, not in the slave. (Bug#490 [<http://bugs.mysql.com/490>])
- Fixed a bug: When an `INSERT ... SELECT` statement inserted rows into a non-transactional table, but failed at some point (for example, due to a “Duplicate key” error), the query was not written to the binary log. Now it is written to the binary log, with its error code, as all other queries are. About the `slave-skip-errors` option for how to handle partially completed queries in the slave, see Section 6.8, “Replication Startup Options”. (Bug#491 [<http://bugs.mysql.com/491>])
- `SET FOREIGN_KEY_CHECKS=0` was not replicated properly. The fix probably will not be backported to 3.23.
- On a slave, `LOAD DATA INFILE` which had no `IGNORE` or `REPLACE` clause on the master, was replicated with `IGNORE`. Although this is not a problem if the master and slave data are identical (a `LOAD` that produces no duplicate conflicts on the master produces none on the slave anyway), which is true in normal operation, it is better for debugging not to silently add the `IGNORE`. That way, you can get an error message on the slave and discover that for some reason, the data on master and slave are different and investigate why. (Bug#571 [<http://bugs.mysql.com/571>])
- On a slave, `LOAD DATA INFILE` printed an incomplete “Duplicate entry '%-.64s' for key %d” message (the key name and value were not mentioned) in case of duplicate conflict (which does not happen in normal operation). (Bug#573 [<http://bugs.mysql.com/573>])
- When using a slave compiled with `--debug`, `CHANGE MASTER TO RELAY_LOG_POS` could cause a debug assertion failure. (Bug#576 [<http://bugs.mysql.com/576>])
- When doing a `LOCK TABLES WRITE` on an InnoDB table, commit could not happen, if the query was not written to the binary log (for example, if `--log-bin` was not used, or `binlog-ignore-db` was used). (Bug#578 [<http://bugs.mysql.com/578>])
- If a 3.23 master had open temporary tables that had been replicated to a 4.0 slave, and the binary log got rotated, these temporary tables were immediately dropped by the slave (which caused problems if the master used them subsequently). This bug had been fixed in 4.0.13, but in a manner which caused an unlikely inconvenience: If the 3.23 master died brutally (power failure), without having enough time to automatically write `DROP TABLE` statements to its binary log, then the 4.0.13 slave would not notice the temporary tables have to be dropped, until the slave `mysqld` server is restarted. This minor inconvenience is fixed in 3.23.57 and 4.0.14 (meaning the master must be upgraded to 3.23.57 and the slave to 4.0.14 to remove the inconvenience). (Bug#254 [<http://bugs.mysql.com/254>])
- If `MASTER_POS_WAIT()` was waiting, and the slave was idle, and the slave SQL thread terminated, `MASTER_POS_WAIT()` would wait forever. Now when the slave SQL thread terminates, `MASTER_POS_WAIT()` immediately returns `NULL` (“slave stopped”). (Bug#651 [<http://bugs.mysql.com/651>])
- After `RESET SLAVE; START SLAVE;`, the `Relay_Log_Space` value displayed by `SHOW SLAVE STATUS` was too big by four bytes. (Bug#763 [<http://bugs.mysql.com/763>])
- If a query was ignored on the slave (because of `--replicate-ignore-table` and other similar rules), the slave still checked if the query got the same error code (0, no error) as on the master. So if the master had an error on the query (for example, “Duplicate entry” in a multiple-row insert), then the slave stopped and warned that the error codes didn't match. (Bug#797 [<http://bugs.mysql.com/797>])

## D.2.16. Changes in release 4.0.13 (16 May 2003)

Functionality added or changed:

- `PRIMARY KEY` now implies `NOT NULL`. (Bug#390 [http://bugs.mysql.com/390])
- The Windows binary packages are now compiled with `--enable-local-infile` to match the Unix build configuration.
- Removed timing of tests from `mysql-test-run.time` does not accept all required parameters on many platforms (for example, QNX) and timing the tests is not really required (it's not a benchmark anyway).
- `SHOW MASTER STATUS` and `SHOW SLAVE STATUS` required the `SUPER` privilege; now they accept `REPLICATION CLIENT` as well. (Bug#343 [http://bugs.mysql.com/343])
- Added multi-threaded `MyISAM` repair optimization and `myisam_repair_threads` variable to enable it. See Section 5.2.2, "System Variables".
- Added `innodb_max_dirty_pages_pct` variable which controls amount of dirty pages allowed in `InnoDB` buffer pool.
- `CURRENT_USER()` and `Access denied` error messages now report the hostname exactly as it was specified in the `GRANT` command.
- Removed benchmark results from the source and binary distributions. They are still available in the BK source tree, though.
- `InnoDB` tables now support `ANALYZE TABLE`.
- MySQL now issues an error when it opens a table that was created with MySQL 4.1.
- Option `--new` now changes binary items (`0xFFDF`) to be treated as binary strings instead of numbers by default. This fixes some problems with character sets where it's convenient to input the string as a binary item. After this change you have to convert the binary string to `INTEGER` with a `CAST` if you want to compare two binary items with each other and know which one is bigger than the other. `SELECT CAST(0xfeff AS UNSIGNED) < CAST(0xff AS UNSIGNED)`. This is the default behavior in MySQL 4.1. (Bug#152 [http://bugs.mysql.com/152])
- Enabled `delayed_insert_timeout` on Linux (most modern `glibc` libraries have a fixed `pthread_cond_timedwait()`). (Bug#211 [http://bugs.mysql.com/211])
- Don't create more insert delayed threads than given by `max_delayed_threads`. (Bug#211 [http://bugs.mysql.com/211])
- Changed `UPDATE ... LIMIT` to apply the limit to rows that were matched, whether or not they actually were changed. Previously the limit was applied as a restriction on the number of rows changed.
- Tuned optimizer to favor clustered index over table scan.
- `BIT_AND()` and `BIT_OR()` now return an unsigned 64-bit value.
- Added warnings to error log of why a secure connection failed (when running with `-log-warnings`).
- Deprecated options `--skip-symlink` and `--use-symbolic-links` and replaced these with `--symbolic-links`.
- The default option for `innodb_flush_log_at_trx_commit` was changed from 0 to 1 to

make InnoDB tables ACID by default. See [Section 14.2.5, “InnoDB Startup Options and System Variables”](#).

- Added a feature to `SHOW KEYS` to display keys that are disabled by `ALTER TABLE DISABLE KEYS` command.
- When using a non-existing table type with `CREATE TABLE`, first try if the default table type exists before falling back to `MyISAM`.
- Added `MEMORY` as an alias for `HEAP`.
- Renamed function `rnd` to `my_rnd` as the name was too generic and is an exported symbol in `libmysqlclient` (thanks to Dennis Haney for the initial patch).
- Portability fix: renamed `include/dbug.h` to `include/my_dbug.h`.
- `mysqldump` no longer silently deletes the binary logs when invoked with the `--master-data` or `--first-slave` option; while this behavior was convenient for some users, others may suffer from it. Now you must explicitly ask for binary logs to be deleted by using the new `--delete-master-logs` option.
- If the slave is configured (using for example `--replicate-wild-ignore-table=mysql.%`) to exclude `mysql.user`, `mysql.host`, `mysql.db`, `mysql.tables_priv` and `mysql.columns_priv` from replication, then `GRANT` and `REVOKE` are not replicated.

Bugs fixed:

- Logged `Access denied` error message had incorrect `Using password` value. ([Bug#398](#) [<http://bugs.mysql.com/398>])
- Fixed bug with `NATURAL LEFT JOIN`, `NATURAL RIGHT JOIN` and `RIGHT JOIN` when using many joined tables. The problem was that the `JOIN` method was not always associated with the tables surrounding the `JOIN` method. If you have a query that uses many `RIGHT JOIN` or `NATURAL ... JOINS` you should verify that they work as you expected after upgrading MySQL to this version. ([Bug#291](#) [<http://bugs.mysql.com/291>])
- Fixed `mysql` parser not to erroneously interpret ‘`'`’ or ‘`"`’ characters within `/* ... */` comment as beginning a quoted string.
- `mysql` command-line client no longer looks for `\*` commands inside backtick-quoted strings.
- Fixed `Unknown error` when using `UPDATE ... LIMIT`. ([Bug#373](#) [<http://bugs.mysql.com/373>])
- Fixed problem with ANSI mode and `GROUP BY` with constants. ([Bug#387](#) [<http://bugs.mysql.com/387>])
- Fixed bug with `UNION` and `OUTER JOIN`. ([Bug#386](#) [<http://bugs.mysql.com/386>])
- Fixed bug if one used a multiple-table `UPDATE` and the query required a temporary table bigger than `tmp_table_size`. ([Bug#286](#) [<http://bugs.mysql.com/286>])
- Run `mysql_install_db` with the `-IN-RPM` option for the Mac OS X installation to not fail on systems with improperly configured hostname configurations.
- `LOAD DATA INFILE` now reads `000000` as a zero date instead of `"2000-00-00"`.

- Fixed bug that caused `DELETE FROM table WHERE const_expression` always to delete the whole table (even if expression result was false). (Bug#355 [<http://bugs.mysql.com/355>])
- Fixed core dump bug when using `FORMAT( 'nan' ,#)`. (Bug#284 [<http://bugs.mysql.com/284>])
- Fixed name resolution bug with `HAVING ... COUNT(DISTINCT ...)`.
- Fixed incorrect result from truncation operator (\*) in `MATCH ... AGAINST()` in some complex joins.
- Fixed a crash in `REPAIR ... USE_FRM` command, when used on read-only, non-existing table or a table with a crashed index file.
- Fixed a crashing bug in `mysql` monitor program. It occurred if program was started with `--no-defaults`, with a prompt that contained the hostname and a connection to a non-existent database was requested.
- Fixed problem when comparing a key for a multi-byte character set. (Bug#152 [<http://bugs.mysql.com/152>])
- Fixed bug in `LEFT`, `RIGHT` and `MID` when used with multi-byte character sets and some `GROUP BY` queries. (Bug#314 [<http://bugs.mysql.com/314>])
- Fix problem with `ORDER BY` being discarded for some `DISTINCT` queries. (Bug#275 [<http://bugs.mysql.com/275>])
- Fixed that `SET SQL_BIG_SELECTS=1` works as documented (This corrects a new bug introduced in 4.0)
- Fixed some serious bugs in `UPDATE ... ORDER BY`. (Bug#241 [<http://bugs.mysql.com/241>])
- Fixed unlikely problem in optimizing `WHERE` clause with constant expression like in `WHERE 1 AND (a=1 AND b=1)`.
- Fixed that `SET SQL_BIG_SELECTS=1` works again.
- Introduced proper backtick quoting for `db.table` in `SHOW GRANTS`.
- `FULLTEXT` index stopped working after `ALTER TABLE` that converts `TEXT` column to `CHAR`. (Bug#283 [<http://bugs.mysql.com/283>])
- Fixed a security problem with `SELECT` and wildcarded select list, when user only had partial column `SELECT` privileges on the table.
- Mark a `MyISAM` table as "analyzed" only when all the keys are indeed analyzed.
- Only ignore world-writable `my.cnf` files that are regular files (and not, for example, named pipes or character devices).
- Fixed few smaller issues with `SET PASSWORD`.
- Fixed error message which contained deprecated text.
- Fixed a bug with two `NATURAL JOINS` in the query.
- `SUM()` didn't return `NULL` when there was no rows in result or when all values was `NULL`.
- On Unix, symbolic link handling was not enabled by default and there was no way to turn this on.
- Added missing dashes to parameter `--open-files-limit` in `mysqld_safe`. (Bug#264

[<http://bugs.mysql.com/264>])

- Fixed incorrect hostname for TCP/IP connections displayed in `SHOW PROCESSLIST`.
- Fixed a bug with `NAN` in `FORMAT( . . . )` function ...
- Fixed a bug with improperly cached database privileges.
- Fixed a bug in `ALTER TABLE ENABLE / DISABLE KEYS` which failed to force a refresh of table data in the cache.
- Fixed bugs in replication of `LOAD DATA INFILE` for custom parameters (`ENCLOSED`, `TERMINATED` and so on) and temporary tables. (Bug#183 [<http://bugs.mysql.com/183>], Bug#222 [<http://bugs.mysql.com/222>])
- Fixed a replication bug when the master is 3.23 and the slave 4.0: the slave lost the replicated temporary tables if `FLUSH LOGS` was issued on the master. (Bug#254 [<http://bugs.mysql.com/254>])
- Fixed a bug when doing `LOAD DATA INFILE IGNORE`: When reading the binary log, `mysql-binlog` and the replication code read `REPLACE` instead of `IGNORE`. This could make the slave's table become different from the master's table. (Bug#218 [<http://bugs.mysql.com/218>])
- Fixed a deadlock when `relay_log_space_limit` was set to a too small value. (Bug#79 [<http://bugs.mysql.com/79>])
- Fixed a bug in `HAVING` clause when an alias is used from the **select list**.
- Fixed overflow bug in `MyISAM` when a row is inserted into a table with a large number of columns and at least one `BLOB/TEXT` column. Bug was caused by incorrect calculation of the needed buffer to pack data.
- Fixed a bug when `SELECT @non_existent_variable` caused an error in the client/server protocol due to `net_printf()` output being sent to the client twice.
- Fixed a bug in setting `SQL_BIG_SELECTS` option.
- Fixed a bug in `SHOW PROCESSLIST` which only displayed a localhost in the "Host" column. This was caused by a glitch that used only current thread information instead of information from the linked list of threads.
- Removed unnecessary Mac OS X helper files from server RPM. (Bug#144 [<http://bugs.mysql.com/144>])
- Allow optimization of multiple-table update for `InnoDB` tables as well.
- Fixed a bug in multiple-table updates that caused some rows to be updated several times.
- Fixed a bug in `mysqldump` when it was called with `--master-data`: the `CHANGE MASTER TO` commands appended to the SQL dump had incorrect coordinates. (Bug#159 [<http://bugs.mysql.com/159>])
- Fixed a bug when an updating query using `USER()` was replicated on the slave; this caused a segmentation fault on the slave. (Bug#178 [<http://bugs.mysql.com/178>]). `USER()` is still badly replicated on the slave (it is replicated to " ").

## D.2.17. Changes in release 4.0.12 (15 March 2003: Production)

Functionality added or changed:

- `mysqld` no longer reads options from world-writable config files. (CVE-2003-0150 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-0150])
- Integer values between 9223372036854775807 and 9999999999999999 are now regarded as unsigned longlongs, not as floats. This makes these values work similar to values between 1000000000000000000 and 18446744073709551615.
- `SHOW PROCESSLIST` now includes the client TCP port after the hostname to make it easier to know from which client the request originated.
- The `--new` option can be used to make a 4.0 server return `TIMESTAMP` as a string in `'YYYY-MM-DD HH:MM:SS'` format, the way that 4.1 servers do. This is also a `new` system variable that can be set for the same effect. See Section 11.3.1.1, “`TIMESTAMP` Properties Prior to MySQL 4.1”.

Bugs fixed:

- Fixed `mysqld` crash on extremely small values of `sort_buffer` variable.
- `INSERT INTO u SELECT ... FROM t` was written too late to the binary log if `t` was very frequently updated during the execution of this query. This could cause a problem with `mysqlbinlog` or replication. The master must be upgraded, not the slave. (Bug#136 [http://bugs.mysql.com/136])
- Fixed checking of random part of `WHERE` clause. (Bug#142 [http://bugs.mysql.com/142])
- Fixed a bug with multiple-table updates with `InnoDB` tables. This bug occurred as, in many cases, `InnoDB` tables cannot be updated “on the fly,” but offsets to the records have to be stored in a temporary table.
- Added missing file `mysql_secure_installation` to the `server` RPM subpackage. (Bug#141 [http://bugs.mysql.com/141])
- Fixed MySQL (and `myisamchk`) crash on artificially corrupted `.MYI` files.
- Don't allow `BACKUP TABLE` to overwrite existing files.
- Fixed a bug with multiple-table `UPDATE` statements when user had all privileges on the database where tables are located and there were any entries in `tables_priv` table, that is, `grant_option` was true.
- Fixed a bug that allowed a user with table or column grants on some table, `TRUNCATE` any table in the same database.
- Fixed deadlock when doing `LOCK TABLE` followed by `DROP TABLE` in the same thread. In this case one could still kill the thread with `KILL`.
- `LOAD DATA LOCAL INFILE` was not properly written to the binary log (hence not properly replicated). (Bug#82 [http://bugs.mysql.com/82])
- `RAND()` entries were not read correctly by `mysqlbinlog` from the binary log which caused problems when restoring a table that was inserted with `RAND(). INSERT INTO t1 VALUES (RAND())`. In replication this worked okay.
- `SET SQL_LOG_BIN=0` was ignored for `INSERT DELAYED` queries. (Bug#104

[<http://bugs.mysql.com/104>])

- `SHOW SLAVE STATUS` reported too old positions (columns `Relay_Master_Log_File` and `Exec_Master_Log_Pos`) for the last executed statement from the master, if this statement was the `COMMIT` of a transaction. The master must be upgraded for that, not the slave. ([Bug#52](http://bugs.mysql.com/52) [<http://bugs.mysql.com/52>])
- `LOAD DATA INFILE` was not replicated by the slave if `replicate_*_table` was set on the slave. ([Bug#86](http://bugs.mysql.com/86) [<http://bugs.mysql.com/86>])
- After `RESET SLAVE`, the coordinates displayed by `SHOW SLAVE STATUS` looked un-reset (although they were, but only internally). ([Bug#70](http://bugs.mysql.com/70) [<http://bugs.mysql.com/70>])
- Fixed query cache invalidation on `LOAD DATA`.
- Fixed memory leak on `ANALYZE` procedure with error.
- Fixed a bug in handling `CHAR(0)` columns that could cause incorrect results from the query.
- Fixed rare bug with incorrect initialization of `AUTO_INCREMENT` column, as a secondary column in a multi-column key (see [Section 3.6.9, “Using AUTO\\_INCREMENT”](#)), when data was inserted with `INSERT ... SELECT` or `LOAD DATA` into an empty table.
- On Windows, `STOP SLAVE` didn't stop the slave until the slave got one new command from the master (this bug has been fixed for MySQL 4.0.11 by releasing updated 4.0.11a Windows packages, which include this individual fix on top of the 4.0.11 sources). ([Bug#69](http://bugs.mysql.com/69) [<http://bugs.mysql.com/69>])
- Fixed a crash when no database was selected and `LOAD DATA` command was issued with full table name specified, including database prefix.
- Fixed a crash when shutting down replication on some platforms (for example, Mac OS X).
- Fixed a portability bug with `pthread_attr_getstacksize` on HP-UX 10.20 (Patch was also included in 4.0.11a sources).
- Fixed the `bigint` test to not fail on some platforms (for example, HP-UX and Tru64) due to different return values of the `atof()` function.
- Fixed the `rpl_rotate_logs` test to not fail on certain platforms (such as Mac OS X) due to a too-long file name (changed `slave-master-info.opt` to `.slave-mi`).

## D.2.18. Changes in release 4.0.11 (20 February 2003)

Functionality added or changed:

- `NULL` is now sorted **LAST** if you use `ORDER BY ... DESC` (as it was before MySQL 4.0.2). This change was required to comply with the SQL standard. (The original change was made because we thought that standard SQL required `NULL` to be always sorted at the same position, but this was incorrect).
- Added `START TRANSACTION` (standard SQL syntax) as alias for `BEGIN`. This is recommended to use instead of `BEGIN` to start a transaction.
- Added `OLD_PASSWORD()` as a synonym for `PASSWORD()`.
- Allow keyword `ALL` in group functions.

- Added support for some new `INNER JOIN` and `JOIN` syntaxes. For example, `SELECT * FROM t1 INNER JOIN t2` didn't work before.
- Novell NetWare 6.0 porting effort completed, Novell patches merged into the main source tree.

Bugs fixed:

- Fixed problem with multiple-table delete and `InnoDB` tables.
- Fixed a problem with `BLOB NOT NULL` columns used with `IS NULL`.
- Re-added missing pre- and post(un)install scripts to the Linux RPM packages (they were missing after the renaming of the server subpackage).
- Fixed that table locks are not released with multiple-table updates and deletes with `InnoDB` storage engine.
- Fixed bug in updating `BLOB` columns with long strings.
- Fixed integer-wraparound when giving big integer ( $\geq 10$  digits) to function that requires an unsigned argument, like `CREATE TABLE (...) AUTO_INCREMENT=N`.
- `MIN(key_column)` could in some cases return `NULL` on a column with `NULL` and other values.
- `MIN(key_column)` and `MAX(key_column)` could in some cases return incorrect values when used in `OUTER JOIN`.
- `MIN(key_column)` and `MAX(key_column)` could return incorrect values if one of the tables was empty.
- Fixed rare crash in compressed `MyISAM` tables with blobs.
- Fixed bug in using aggregate functions as argument for `INTERVAL`, `CASE`, `FIELD`, `CONCAT_WS`, `ELT` and `MAKE_SET` functions.
- When running with `--lower-case-table-names` (default on Windows) and you had tables or databases with mixed case on disk, then executing `SHOW TABLE STATUS` followed with `DROP DATABASE` or `DROP TABLE` could fail with `Errcode 13`.

## D.2.19. Changes in release 4.0.10 (29 January 2003)

Functionality added or changed:

- Added option `--log-error[=file_name]` to `mysqld_safe` and `mysqld`. This option forces all error messages to be put in a log file if the option `--console` is not given. On Windows `--log-error` is enabled as default, with a default name of `host_name.err` if the name is not specified.
- Changed some things from `Warning:` to `Note:` in the log files.
- The `mysqld` server should now compile on NetWare.
- Added optimization that if one does `GROUP BY ... ORDER BY NULL` then result is not sorted.
- New `--ft-stopword-file` command-line option for `mysqld` to replace/disable the built-in

stopword list that is used in full-text searches. See [Section 5.2.2, “System Variables”](#).

- Changed default stack size from 64KB to 192KB; This fixes a core dump problem on Red Hat 8.0 and other systems with a `glibc` that requires a stack size larger than 128K for `gethostbyaddr()` to resolve a hostname. You can fix this for earlier MySQL versions by starting `mysqld` with `--thread-stack=192K`.
- Added `mysql_waitpid` to the binary distribution and the `MySQL-client` RPM subpackage (required for `mysql-test-run`).
- Renamed the main `MySQL` RPM package to `MySQL-server`. When updating from an older version, `MySQL-server.rpm` simply replaces `MySQL.rpm`.
- If a slave is configured with `replicate_wild_do_table=db.%` or `replicate_wild_ignore_table=db.%`, these rules are applied to `CREATE/DROP DATABASE`, too.
- Added timeout value for `MASTER_POS_WAIT()`.

Bugs fixed:

- Fixed initialization of the random seed for newly created threads to give a better `rand()` distribution from the first call.
- Fixed a bug that caused `mysqld` to hang when a table was opened with the `HANDLER` command and then dropped without being closed.
- Fixed bug in logging to binary log (which affects replication) a query that inserts a `NULL` in an `AUTO_INCREMENT` column and also uses `LAST_INSERT_ID()`.
- Fixed an unlikely bug that could cause a memory overrun when using `ORDER BY constant_expression`.
- Fixed a table corruption in `myisamchk` parallel repair mode.
- Fixed bug in query cache invalidation on simple table renaming.
- Fixed bug in `mysqladmin --relative`.
- On some 64-bit systems, `show status` reported a strange number for `Open_files` and `Open_streams`.
- Fixed incorrect number of columns in `EXPLAIN` on empty table.
- Fixed bug in `LEFT JOIN` that caused zero rows to be returned in the case the `WHERE` condition was evaluated as `FALSE` after reading `const` tables. (Unlikely condition).
- `FLUSH PRIVILEGES` didn't correctly flush table/column privileges when `mysql.tables_priv` is empty.
- Fixed bug in replication when using `LOAD DATA INFILE` one a file that updated an `AUTO_INCREMENT` column with `NULL` or `0`. This bug only affected MySQL 4.0 masters (not slaves or MySQL 3.23 masters). **Note:** If you have a slave that has replicated a file with generated `AUTO_INCREMENT` columns then the slave data is corrupted and you should reinitialize the affected tables from the master.
- Fixed possible memory overrun when sending a `BLOB` value larger than 16M to the client.

- Fixed incorrect error message when setting a `NOT NULL` column to an expression that returned `NULL`.
- Fixed core dump bug in `str LIKE "%other_str%"` where `str` or `other_str` contained characters  $\geq 128$ .
- Fixed bug: When executing on master `LOAD DATA` and `InnoDB` failed with `table full` error the binary log was corrupted.

## D.2.20. Changes in release 4.0.9 (09 January 2003)

Functionality added or changed:

- `OPTIMIZE TABLE` for `MyISAM` tables treats all `NULL` values as different when calculating cardinality. This helps in optimizing joins between tables where one of the tables has a lot of `NULL` values in a indexed column:

```
SELECT * from t1, t2 where t1.a=t2.key_with_a_lot_of_null;
```

- Added join operator `FORCE INDEX (key_list)`. This acts like `USE INDEX (key_list)` but with the addition that a table scan is assumed to be `VERY` expensive. One bad thing with this is that it makes `FORCE` a reserved word.
- Reset internal row buffer in `MyISAM` after each query. This reduces memory in case you have a lot of big blobs in a table.

Bugs fixed:

- A security patch in 4.0.8 causes the `mysqld` server to die if the remote hostname can't be resolved. This is now fixed.
- Fixed crash when replication big `LOAD DATA INFILE` statement that caused log rotation.

## D.2.21. Changes in release 4.0.8 (07 January 2003)

Functionality added or changed:

- Default `max_packet_length` for `libmysqld.c` is now `1024*1024*1024`.
- You can now specify `max_allowed_packet` in a file read by `mysql_options(MYSQL_READ_DEFAULT_FILE)` for clients.
- When sending a too big packet to the server with the not compressed protocol, the client now gets an error message instead of a lost connection.
- We now send big queries/result rows in bigger hunks, which should give a small speed improvement.
- Fixed some bugs with the compressed protocol for rows  $> 16\text{MB}$ .
- `InnoDB` tables now also support `ON UPDATE CASCADE` in `FOREIGN KEY` constraints. See the `InnoDB` section in the manual for the `InnoDB` changelog.

Bugs fixed:

- Fixed bug in `ALTER TABLE` with `BDB` tables.
- Fixed core dump bug in `QUOTE ( )` function.
- Fixed a bug in handling communication packets bigger than 16MB. Unfortunately this required a protocol change; If you upgrade the server to 4.0.8 and above and have clients that use packets  $\geq 255*255*255$  bytes (=16581375) you must also upgrade your clients to at least 4.0.8. If you don't upgrade, the clients hang when sending a big packet.
- Fixed bug when sending blobs longer than 16MB to client.
- Fixed bug in `GROUP BY` when used on `BLOB` column with `NULL` values.
- Fixed a bug in handling `NULL` values in `CASE ... WHEN ...`

## D.2.22. Changes in release 4.0.7 (20 December 2002)

Functionality added or changed:

- `mysqlbug` now also reports the compiler version used for building the binaries (if the compiler supports the option `--version`).

Bugs fixed:

- Fixed compilation problems on OpenUnix and HP-UX 10.20.
- Fixed some optimization problems when compiling MySQL with `-DBIG_TABLES` on a 32-bit system.
- `mysql_drop_db ( )` didn't check permissions properly so anyone could drop another users database. `DROP DATABASE` is checked properly.

## D.2.23. Changes in release 4.0.6 (14 December 2002: Gamma)

Functionality added or changed:

- Added syntax support for `CHARACTER SET xxx` and `CHARSET=xxx` table options (to be able to read table dumps from 4.1).
- Fixed replication bug that caused the slave to lose its position in some cases when the replication log was rotated.
- Fixed that a slave restarts from the start of a transaction if it's killed in the middle of one.
- Moved the manual pages from `man` to `man/man1` in the binary distributions.
- The default type returned by `IFNULL (A, B)` is now set to be the more 'general' of the types of `A` and `B`. (The order is `STRING`, `REAL` or `INTEGER`).
- Moved the `mysql.server` startup script in the RPM packages from /

`etc/rc.d/init.d/mysql` to `/etc/init.d/mysql` (which almost all current Linux distributions support for LSB compliance).

- Added `Qcache_lowmem_prunes` status variable (number of queries that were deleted from the cache because of low memory).
- Fixed `mysqlcheck` so it can deal with table names containing dashes.
- Bulk insert optimization (see [Section 5.2.2, “System Variables”](#)) is no longer used when inserting small (less than 100) number of rows.
- Optimization added for queries like `SELECT ... FROM merge_table WHERE indexed_column=constant_expr`.
- Added functions `LOCALTIME` and `LOCALTIMESTAMP` as synonyms for `NOW()`.
- `CEIL` is now an alias for `CEILING`.
- The `CURRENT_USER()` function can be used to get a `user@host` value as it was matched in the `GRANT` system. See [Section 12.9.3, “Information Functions”](#).
- Fixed `CHECK` constraints to be compatible with standard SQL. This made `CHECK` a reserved word. (Checking of `CHECK` constraints is still not implemented).
- Added `CAST(... as CHAR)`.
- Added PostgreSQL compatible `LIMIT` syntax: `SELECT ... LIMIT row_count OFFSET offset`
- `mysql_change_user()` now resets the connection to the state of a fresh connect (Ie, `ROLLBACK` any active transaction, close all temporary tables, reset all user variables etc..)
- `CHANGE MASTER` and `RESET SLAVE` now require that slave threads both be stopped; these commands return an error if at least one of these two threads is running.

Bugs fixed:

- Fixed number of found rows returned in `multi table updates`
- Make `--lower-case-table-names` default on Mac OS X as the default filesystem (HFS+) is case insensitive. See [Section 9.2.2, “Identifier Case Sensitivity”](#).
- Transactions in `AUTOCOMMIT=0` mode didn't rotate binary log.
- A fix for the bug in a `SELECT` with joined tables with `ORDER BY` and `LIMIT` clause when `file-sort` had to be used. In that case `LIMIT` was applied to `filesort` of one of the tables, although it could not be. This fix also solved problems with `LEFT JOIN`.
- `mysql_server_init()` now makes a copy of all arguments. This fixes a problem when using the embedded server in C# program.
- Fixed buffer overrun in `libmysqlclient` library that allowed a malicious MySQL server to crash the client application. ([CVE-2002-1376](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1376>])
- Fixed security-related bug in `mysql_change_user()` handling. All users are strongly recommended to upgrade to version 4.0.6. ([CVE-2002-1374](#))

[<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1374>], [CVE-2002-1375](#)  
[<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1375>])

- Fixed bug that prevented `--chroot` command-line option of `mysqld` from working.
- Fixed bug in phrase operator `"..."` in boolean full-text search.
- Fixed bug that caused `OPTIMIZE TABLE` to corrupt the table under some rare circumstances.
- Part rewrite of multiple-table-update to optimize it, make it safer and more bug-free.
- `LOCK TABLES` now works together with multiple-table-update and multiple-table-delete.
- `--replicate-do=xxx` didn't work for `UPDATE` commands. (Bug introduced in 4.0.0)
- Fixed shutdown problem on Mac OS X.
- Major InnoDB bugs in `REPLACE`, `AUTO_INCREMENT`, `INSERT INTO ... SELECT ...` were fixed. See the InnoDB changelog in the InnoDB section of the manual.
- `RESET SLAVE` caused a crash if the slave threads were running.

## D.2.24. Changes in release 4.0.5 (13 November 2002)

Functionality added or changed:

- Port number was added to hostname (if it is known) in `SHOW PROCESSLIST` command
- Changed handling of last argument in `WEEK()` so that you can get week number according to the ISO 8601 specification. (Old code should still work).
- Fixed that `INSERT DELAYED` threads don't hang on `Waiting for INSERT` when one sends a `SIGHUP` to `mysqld`.
- Change that `AND` works according to standard SQL when it comes to `NULL` handling. In practice, this affects only queries where you do something like `WHERE ... NOT (NULL AND 0)`.
- `mysqld` now resolves `basedir` to its full path (with `realpath()`). This enables one to use relative symlinks to the MySQL installation directory. This however causes `show variables` to report different directories on systems where there is a symbolic link in the path.
- Fixed that MySQL does not use index scan on index disabled with `IGNORE INDEX` or `USE INDEX`. to be ignored.
- Added `--use-frm` option to `mysqlcheck`. When used with `REPAIR TABLE`, it gets the table structure from the `.frm` file, so the table can be repaired even if the `.MYI` header is corrupted.
- Fixed bug in `MAX()` optimization when used with `JOIN` and `ON` expressions.
- Added support for reading of MySQL 4.1 table definition files.
- `BETWEEN` behavior changed (see [Section 12.1.3, "Comparison Functions and Operators"](#)). Now `datetime_col BETWEEN timestamp AND timestamp` should work as expected.
- One can create `TEMPORARY MERGE` tables now.
- `DELETE FROM myisam_table` now shrinks not only the `.MYD` file but also the `.MYI` file.

- When one uses the `--open-files-limit=val` option to `mysqld_safe` it's now passed on to `mysqld`.
- Changed output from `EXPLAIN` from `'where used'` to `'Using where'` to make it more in line with other output.
- Removed variable `safe_show_database` as it was no longer used.
- Updated source tree to be built using `automake 1.5` and `libtool 1.4`.
- Fixed an inadvertently changed option (`--ignore-space`) back to the original `--ignore-spaces` in `mysqlclient`. (Both syntaxes work).
- Don't require `UPDATE` privilege when using `REPLACE`.
- Added support for `DROP TEMPORARY TABLE ...`, to be used to make replication safer.
- When transactions are enabled, all commands that update temporary tables inside a `BEGIN/COMMIT` are now stored in the binary log on `COMMIT` and not stored if one does `ROLLBACK`. This fixes some problems with non-transactional temporary tables used inside transactions.
- Allow braces in joins in all positions. Formerly, things like `SELECT * FROM (t2 LEFT JOIN t3 USING (a)), t1` worked, but not `SELECT * FROM t1, (t2 LEFT JOIN t3 USING (a))`. Note that braces are simply removed, they do not change the way the join is executed.
- `InnoDB` now supports also isolation levels `READ UNCOMMITTED` and `READ COMMITTED`. For a detailed `InnoDB` changelog, see [Section D.4, "Changes in InnoDB"](#).

Bugs fixed:

- Fixed bug in `MAX()` optimization when used with `JOIN` and `ON` expressions.
- Fixed that `INSERT DELAY` threads don't hang on `Waiting for INSERT` when one sends a `SIGHUP` to `mysqld`.
- Fixed that MySQL does not use an index scan on an index that has been disabled with `IGNORE INDEX` or `USE INDEX`.
- Corrected test for `root` user in `mysqld_safe`.
- Fixed error message issued when storage engine cannot do `CHECK TABLE` or `REPAIR TABLE`.
- Fixed rare core dump problem in complicated `GROUP BY` queries that didn't return any result.
- Fixed `mysqlshow` to work properly with wildcarded database names and with database names that contain underscores.
- Portability fixes to get MySQL to compile cleanly with Sun Forte 5.0.
- Fixed `MyISAM` crash when using dynamic-row tables with huge numbers of packed columns.
- Fixed query cache behavior with `BDB` transactions.
- Fixed possible floating point exception in `MATCH` relevance calculations.
- Fixed bug in full-text search `IN BOOLEAN MODE` that made `MATCH` to return incorrect relevance value in some complex joins.

- Fixed a bug that limited `MyISAM` key length to a value slightly less than 500. It is exactly 500 now.
- Fixed that `GROUP BY` on columns that may have a `NULL` value doesn't always use disk based temporary tables.
- The filename argument for the `--des-key-file` argument to `mysqld` is interpreted relative to the data directory if given as a relative pathname.
- Removed a condition that temp table with index on column that can be `NULL` has to be `MyISAM`. This was okay for 3.23, but not needed in 4.\*. This resulted in slowdown in many queries since 4.0.2.
- Small code improvement in multiple-table updates.
- Fixed a newly introduced bug that caused `ORDER BY ... LIMIT row_count` to not return all rows.
- Fixed a bug in multiple-table deletes when outer join is used on an empty table, which gets first to be deleted.
- Fixed a bug in multiple-table updates when a single table is updated.
- Fixed bug that caused `REPAIR TABLE` and `myisamchk` to corrupt `FULLTEXT` indexes.
- Fixed bug with caching the `mysql` grant table database. Now queries in this database are not cached in the query cache.
- Small fix in `mysqld_safe` for some shells.
- Give error if a `MyISAM MERGE` table has more than  $2^{32}$  rows and MySQL was not compiled with `-DBIG_TABLES`.
- Fixed some `ORDER BY ... DESC` problems with `InnoDB` tables.

## D.2.25. Changes in release 4.0.4 (29 September 2002)

- Fixed bug where `GRANT/REVOKE` failed if hostname was given in non-matching case.
- Don't give warning in `LOAD DATA INFILE` when setting a `timestamp` to a string value of `'0'`.
- Fixed bug in `myisamchk -R` mode.
- Fixed bug that caused `mysqld` to crash on `REVOKE`.
- Fixed bug in `ORDER BY` when there is a constant in the `SELECT` statement.
- One didn't get an error message if `mysqld` couldn't open the privilege tables.
- `SET PASSWORD FOR ...` closed the connection in case of errors (bug from 4.0.3).
- Increased maximum possible `max_allowed_packet` in `mysqld` to 1GB.
- Fixed bug when doing a multiple-row `INSERT` on a table with an `AUTO_INCREMENT` key which was not in the first part of the key.
- Changed `LOAD DATA INFILE` to not re-create index if the table had rows from before.

- Fixed overrun bug when calling `AES_DECRYPT()` with incorrect arguments.
- `--skip-ssl` can now be used to disable SSL in the MySQL clients, even if one is using other SSL options in an option file or previously on the command line.
- Fixed bug in `MATCH ... AGAINST( ... IN BOOLEAN MODE)` used with `ORDER BY`.
- Added `LOCK TABLES` and `CREATE TEMPORARY TABLES` privilege on the database level. You must run the `mysql_fix_privilege_tables` script on old installations to activate these.
- In `SHOW TABLE ... STATUS`, compressed tables sometimes showed up as `dynamic`.
- `SELECT @@[global|session].var_name` didn't report `global | session` in the result column name.
- Fixed problem in replication that `FLUSH LOGS` in a circular replication setup created an infinite number of binary log files. Now a `rotate-binary-log` command in the binary log does not cause slaves to rotate logs.
- Removed `STOP EVENT` from binary log when doing `FLUSH LOGS`.
- Disable the use of `SHOW NEW MASTER FOR SLAVE` as this needs to be completely reworked in a future release.
- Fixed a bug with constant expression (for example, column of a one-row table, or column from a table, referenced by a `UNIQUE` key) appeared in `ORDER BY` part of `SELECT DISTINCT`.
- `--log-binary=a.b.c` now properly strips off `.b.c`.
- `FLUSH LOGS` removed numerical extension for all future update logs.
- `GRANT ... REQUIRE` didn't store the SSL information in the `mysql.user` table if SSL was not enabled in the server.
- `GRANT ... REQUIRE NONE` can now be used to remove SSL information.
- `AND` is now optional between `REQUIRE` options.
- `REQUIRE` option was not properly saved, which could cause strange output in `SHOW GRANTS`.
- Fixed that `mysqld --help` reports correct values for `--datadir` and `--bind-address`.
- Fixed that one can drop UDFs that didn't exist when `mysqld` was started.
- Fixed core dump problem with `SHOW VARIABLES` on some 64-bit systems (like Solaris SPARC).
- Fixed a bug in `my_getopt()`; `--set-variable` syntax didn't work for those options that didn't have a valid variable in the `my_option` struct. This affected at least the `default-table-type` option.
- Fixed a bug from 4.0.2 that caused `REPAIR TABLE` and `myisamchk --recover` to fail on tables with duplicates in a unique key.
- Fixed a bug from 4.0.3 in calculating the default data type for some functions. This affected queries of type `CREATE TABLE tbl_name SELECT expression(),...`
- Fixed bug in queries of type `SELECT * FROM table-list GROUP BY ...` and `SELECT DISTINCT * FROM ....`
- Fixed bug with the `--slow-log` when logging an administrator command (like `FLUSH`

).

- Fixed a bug that `OPTIMIZE TABLE` of locked and modified table, reported table corruption.
- Fixed a bug in `my_getopt()` in handling of special prefixes (`--skip-`, `--enable-`). `--skip-external-locking` didn't work and the bug may have affected other similar options.
- Fixed bug in checking for output file name of the `tee` option.
- Added some more optimization to use index for `SELECT ... FROM many_tables .. ORDER BY key limit #`
- Fixed problem in `SHOW OPEN TABLES` when a user didn't have access permissions to one of the opened tables.

## D.2.26. Changes in release 4.0.3 (26 August 2002: Beta)

- Fixed problem with types of user variables. (Bug#551 [<http://bugs.mysql.com/551>])
- Fixed problem with `configure ... --localstatedir=...`
- Cleaned up `mysql.server` script.
- Fixed a bug in `mysqladmin shutdown` when pid file was modified while `mysqladmin` was still waiting for the previous one to disappear. This could happen during a very quick restart and caused `mysqladmin` to hang until `shutdown_timeout` seconds had passed.
- Don't increment warnings when setting `AUTO_INCREMENT` columns to `NULL` in `LOAD DATA INFILE`.
- Fixed all boolean type variables/options to work with the old syntax, for example, all of these work: `--lower-case-table-names`, `--lower-case-table-names=1`, `-O lower-case-table-names=1`, `--set-variable=lower-case-table-names=1`
- Fixed shutdown problem (SIGTERM signal handling) on Solaris. (Bug from 4.0.2).
- `SHOW MASTER STATUS` now returns an empty set if binary log is not enabled.
- `SHOW SLAVE STATUS` now returns an empty set if slave is not initialized.
- Don't update `MyISAM` index file on update if not strictly necessary.
- Fixed bug in `SELECT DISTINCT ... FROM many_tables ORDER BY not-used-column`.
- Fixed a bug with `BIGINT` values and quoted strings.
- Added `QUOTE()` function that performs SQL quoting to produce values that can be used as data values in queries.
- Changed variable `DELAY_KEY_WRITE` to an enumeration to allow it to be set for all tables without taking down the server.
- Changed behavior of `IF(condition, column, NULL)` so that it returns the value in the column's data type.
- Made `safe mysqld` a symlink to `mysqld_safe` in binary distribution.

- Fixed security bug when having an empty database name in the `user.db` table.
- Fixed some problems with `CREATE TABLE ... SELECT function()`.
- `mysqld` now has the option `--temp-pool` enabled by default as this gives better performance with some operating systems.
- Fixed problem with too many allocated alarms on slave when connecting to master many times (normally not a very critical error).
- Fixed hang in `CHANGE MASTER TO` if the slave thread died very quickly.
- Big cleanup in replication code (less logging, better error messages, etc..)
- If the `--code-file` option is specified, the server calls `setrlimit()` to set the maximum allowed core file size to unlimited, so core files can be generated.
- Fixed bug in query cache after temporary table creation.
- Added `--count=N (-c)` option to `mysqladmin`, to make the program do only *N* iterations. To be used with `--sleep (-i)`. Useful in scripts.
- Fixed bug in multiple-table `UPDATE`: when updating a table, `do_select()` became confused about reading records from a cache.
- Fixed bug in multiple-table `UPDATE` when several columns were referenced from a single table
- Fixed bug in truncating non-existing table.
- Fixed bug in `REVOKE` that caused user resources to be randomly set.
- Fixed bug in `GRANT` for the new `CREATE TEMPORARY TABLE` privilege.
- Fixed bug in multiple-table `DELETE` when tables are re-ordered in the table initialization method and `ref_lengths` are of different sizes.
- Fixed two bugs in `SELECT DISTINCT` with large tables.
- Fixed bug in query cache initialization with very small query cache size.
- Allow `DEFAULT` with `INSERT` statement.
- The startup parameters `myisam_max_sort_file_size` and `myisam_max_extra_sort_file_size` are now given in bytes, not megabytes.
- External system locking of `MyISAM/ISAM` files is now turned off by default. One can turn this on with `--external-locking`. (For most users this is never needed).
- Fixed core dump bug with `INSERT ... SET db_name.tbl_name.col_name= ''`.
- Fixed client hangup bug when using some SQL commands with incorrect syntax.
- Fixed a timing bug in `DROP DATABASE`
- New `SET [GLOBAL | SESSION]` syntax to change thread-specific and global system variables at runtime.
- Added variable `slave_compressed_protocol`.
- Renamed variable `query_cache_startup_type` to `query_cache_type`, `myis-`

`am_bulk_insert_tree_size` to `bulk_insert_buffer_size`, `record_buffer` to `read_buffer_size` and `record_rnd_buffer` to `read_rnd_buffer_size`.

- Renamed some SQL variables, but old names still work until 5.0. See [Section 2.11.2, “Upgrading from MySQL 3.23 to 4.0”](#).
- Renamed `--skip-locking` to `--skip-external-locking`.
- Removed unused variable `query_buffer_size`.
- Fixed a bug that made the pager option in the `mysql` client non-functional.
- Added full `AUTO_INCREMENT` support to `MERGE` tables.
- Extended `LOG()` function to accept an optional arbitrary base parameter. See [Section 12.4.2, “Mathematical Functions”](#).
- Added `LOG2()` function (useful for finding out how many bits a number would require for storage).
- Added `LN()` natural logarithm function for compatibility with other databases. It is synonymous with `LOG(X)`.

## D.2.27. Changes in release 4.0.2 (01 July 2002)

- Cleaned up `NULL` handling for default values in `DESCRIBE tbl_name`.
- Fixed `TRUNCATE()` to round up negative values to the nearest integer.
- Fixed buffer overflow problem if someone specified a too-long `datadir` parameter to `mysqld`. ([CVE-2002-0969](http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-0969) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-0969>])
- Changed `--chroot=path` option to execute `chroot()` immediately after all options have been parsed.
- Don't allow database names that contain `'\'`.
- `lower_case_table_names` now also applies to database names.
- Added `XOR` operator (logical and bitwise `XOR`) with `^` as a synonym for bitwise `XOR`.
- Added function `IS_FREE_LOCK("lock_name")`. Based on code contributed by Hartmut Holzgraefe <[hartmut@six.de](mailto:hartmut@six.de)>.
- Removed `mysql_ssl_clear()` from C API, as it was not needed.
- `DECIMAL` and `NUMERIC` types can now read exponential numbers.
- Added `SHA1()` function to calculate 160 bit hash value as described in RFC 3174 (Secure Hash Algorithm). This function can be considered a cryptographically more secure equivalent of `MD5()`. See [Section 12.9.2, “Encryption and Compression Functions”](#).
- Added `AES_ENCRYPT()` and `AES_DECRYPT()` functions to perform encryption according to AES standard (Rijndael). See [Section 12.9.2, “Encryption and Compression Functions”](#).
- Added `--single-transaction` option to `mysqldump`, allowing a consistent dump of `InnoDB` tables. See [Section 8.12, “mysqldump — A Database Backup Program”](#).

- Fixed bug in `innodb_log_group_home_dir` in `SHOW VARIABLES`.
- Fixed a bug in optimizer with merge tables when non-unique values are used in summing up (causing crashes).
- Fixed a bug in optimizer when a range specified makes index grouping impossible (causing crashes).
- Fixed a rare bug when `FULLTEXT` index is present and no tables are used.
- Added privileges `CREATE TEMPORARY TABLES`, `EXECUTE`, `LOCK TABLES`, `REPLICATION CLIENT`, `REPLICATION SLAVE`, `SHOW DATABASES` and `SUPER`. To use these, you must have run the `mysql_fix_privilege_tables` script after upgrading.
- Fixed query cache align data bug.
- Fixed mutex bug in replication when reading from master fails.
- Added missing mutex in `TRUNCATE TABLE`. This fixes some core dump/hangup problems when using `TRUNCATE TABLE`.
- Fixed bug in multiple-table `DELETE` when optimizer uses only indexes.
- Fixed that `ALTER TABLE tbl_name RENAME new_tbl_name` is as fast as `RENAME TABLE`.
- Fixed bug in `GROUP BY` with two or more columns, where at least one column can contain `NULL` values.
- Use Turbo Boyer-Moore algorithm to speed up `LIKE "%keyword%"` searches.
- Fixed bug in `DROP DATABASE` with symlink.
- Fixed crash in `REPAIR ... USE_FRM`.
- Fixed bug in `EXPLAIN` with `LIMIT offset != 0`.
- Fixed bug in phrase operator `"..."` in boolean full-text search.
- Fixed bug that caused duplicated rows when using truncation operator `*` in boolean full-text search.
- Fixed bug in truncation operator of boolean full-text search (incorrect results when there are only `+word*s` in the query).
- Fixed bug in boolean full-text search that caused a crash when an identical `MATCH` expression that did not use an index appeared twice.
- Query cache is now automatically disabled in `mysqldump`.
- Fixed problem on Windows 98 that made sending of results very slow.
- Boolean full-text search weighting scheme changed to something more reasonable.
- Fixed bug in boolean full-text search that caused MySQL to ignore queries of `ft_min_word_len` characters.
- Boolean full-text search now supports “phrase searches.”
- New configure option `--without-query-cache`.
- Memory allocation strategy for “root memory” changed. Block size now grows with number of al-

located blocks.

- `INET_NTOA()` now returns `NULL` if you give it an argument that is too large (greater than the value corresponding to `255.255.255.255`).
- Fix `SQL_CALC_FOUND_ROWS` to work with `UNION`. It works only if the first `SELECT` has this option and if there is global `LIMIT` for the entire statement. For the moment, this requires using parentheses for individual `SELECT` queries within the statement.
- Fixed bug in `SQL_CALC_FOUND_ROWS` and `LIMIT`.
- Don't give an error for `CREATE TABLE ... (... VARCHAR(0))`.
- Fixed `SIGINT` and `SIGQUIT` problems in `mysql.cc` on Linux with some `glibc` versions.
- Fixed bug in `convert.cc`, which is caused by having an incorrect `net_store_length()` linked in the `CONVERT::store()` method.
- `DOUBLE` and `FLOAT` columns now honor the `UNSIGNED` flag on storage.
- `InnoDB` now retains foreign key constraints through `ALTER TABLE` and `CREATE/DROP INDEX`.
- `InnoDB` now allows foreign key constraints to be added through the `ALTER TABLE` syntax.
- `InnoDB` tables can now be set to automatically grow in size (auto-extend).
- Added `--ignore-lines=n` option to `mysqlimport`. This has the same effect as the `IGNORE n LINES` clause for `LOAD DATA`.
- Fixed bug in `UNION` with last offset being transposed to total result set.
- `REPAIR ... USE_FRM` added.
- Fixed that `DEFAULT_SELECT_LIMIT` is always imposed on `UNION` result set.
- Fixed that some `SELECT` options can appear only in the first `SELECT`.
- Fixed bug with `LIMIT` with `UNION`, where last select is in the braces.
- Fixed that full-text works fine with `UNION` operations.
- Fixed bug with indexless boolean full-text search.
- Fixed bug that sometimes appeared when full-text search was used with `const` tables.
- Fixed incorrect error value when doing a `SELECT` with an empty `HEAP` table.
- Use `ORDER BY column DESC` now sorts `NULL` values first. (In other words, `NULL` values sort first in all cases, whether or not `DESC` is specified.) This is changed back in 4.0.10.
- Fixed bug in `WHERE key_name='constant' ORDER BY key_name DESC`.
- Fixed bug in `SELECT DISTINCT ... ORDER BY DESC` optimization.
- Fixed bug in `... HAVING 'GROUP_FUNCTION'(xxx) IS [NOT] NULL`.
- Fixed bug in truncation operator for boolean full-text search.
- Allow value of `--user` option for `mysqld` to be specified as a numeric user ID

`user_id`).

- Fixed a bug where `SQL_CALC_ROWS` returned an incorrect value when used with one table and `ORDER BY` and with `InnoDB` tables.
- Fixed that `SELECT 0 LIMIT 0` doesn't hang thread.
- Fixed some problems with `USE/IGNORE INDEX` when using many keys with the same start column.
- Don't use table scan with `BerkeleyDB` and `InnoDB` tables when we can use an index that covers the whole row.
- Optimized `InnoDB` sort-buffer handling to take less memory.
- Fixed bug in multiple-table `DELETE` and `InnoDB` tables.
- Fixed problem with `TRUNCATE` and `InnoDB` tables that produced the error `Can't execute the given command because you have active locked tables or an active transaction`.
- Added `NO_UNSIGNED_SUBTRACTION` to the set of flags that may be specified with the `-sql-mode` option for `mysqld`. It disables unsigned arithmetic rules when it comes to subtraction. (This makes MySQL 4.0 behave more like 3.23 with `UNSIGNED` columns).
- The result returned for all bit functions (`|`, `<<`, ...) is now of type `unsigned integer`.
- Added detection of `nan` values in `MyISAM` to make it possible to repair tables with `nan` in float or double columns.
- Fixed new bug in `myisamchk` where it didn't correctly update number of “parts” in the `MyISAM` index file.
- Changed to use `autoconf 2.52` (from `autoconf 2.13`).
- Fixed optimization problem where the MySQL Server was in “preparing” state for a long time when selecting from an empty table which had contained a lot of rows.
- Fixed bug in complicated join with `const` tables. This fix also improves performance a bit when referring to another table from a `const` table.
- First pre-version of multiple-table `UPDATE` statement.
- Fixed bug in multiple-table `DELETE`.
- Fixed bug in `SELECT CONCAT(argument_list) ... GROUP BY 1`.
- `INSERT ... SELECT` did a full rollback in case of an error. Fixed so that we only roll back the last statement in the current transaction.
- Fixed bug with empty expression for boolean full-text search.
- Fixed core dump bug in updating full-text key from/to `NULL`.
- ODBC compatibility: Added `BIT_LENGTH()` function.
- Fixed core dump bug in `GROUP BY BINARY column`.
- Added support for `NULL` keys in `HEAP` tables.

- Use index for `ORDER BY` in queries of type: `SELECT * FROM t WHERE key_part1=1 ORDER BY key_part1 DESC, key_part2 DESC`
- Fixed bug in `FLUSH QUERY CACHE`.
- Added `CAST()` and `CONVERT()` functions. The `CAST` and `CONVERT` functions are nearly identical and mainly useful when you want to create a column with a specific type in a `CREATE ... SELECT` statement. For more information, read [Section 12.8, “Cast Functions and Operators”](#).
- `CREATE ... SELECT` on `DATE` and `TIME` functions now create columns of the expected type.
- Changed order in which keys are created in tables.
- Added new columns `Null` and `Index_type` to `SHOW INDEX` output.
- Added `--no-beep` and `--prompt` options to `mysql` command-line client.
- New feature: management of user resources.

```
GRANT ... WITH MAX_QUERIES_PER_HOUR N1
             MAX_UPDATES_PER_HOUR N2
             MAX_CONNECTIONS_PER_HOUR N3;
```

See [Section 5.8.4, “Limiting Account Resources”](#).

- Added `mysql_secure_installation` to the `scripts/` directory.

## D.2.28. Changes in release 4.0.1 (23 December 2001)

- Added `system` command to `mysql`.
- Fixed bug when `HANDLER` was used with some unsupported table type.
- `mysqldump` now puts `ALTER TABLE tbl_name DISABLE KEYS` and `ALTER TABLE tbl_name ENABLE KEYS` in the sql dump.
- Added `mysql_fix_extensions` script.
- Fixed stack overrun problem with `LOAD DATA FROM MASTER` on OSF/1.
- Fixed shutdown problem on HP-UX.
- Added `DES_ENCRYPT()` and `DES_DECRYPT()` functions.
- Added `FLUSH DES_KEY_FILE` statement.
- Added `--des-key-file` option to `mysqld`.
- `HEX(str)` now returns the characters in `str` converted to hexadecimal.
- Fixed problem with `GRANT` when using `lower_case_table_names=1`.
- Changed `SELECT ... IN SHARE MODE` to `SELECT ... LOCK IN SHARE MODE` (as in MySQL 3.23).
- A new query cache to cache results from identical `SELECT` queries.

- Fixed core dump bug on 64-bit machines when it got an incorrect communication packet.
- `MATCH ... AGAINST(... IN BOOLEAN MODE)` can now work without `FULLTEXT` index.
- Fixed slave to replicate from 3.23 master.
- Miscellaneous replication fixes/cleanup.
- Got shutdown to work on Mac OS X.
- Added `myisam/ft_dump` utility for low-level inspection of `FULLTEXT` indexes.
- Fixed bug in `DELETE ... WHERE ... MATCH ...`.
- Added support for `MATCH ... AGAINST(... IN BOOLEAN MODE)`. **Note:** You must rebuild your tables with `ALTER TABLE tbl_name TYPE=MyISAM` to be able to use boolean full-text search.
- `LOCATE()` and `INSTR()` are now case sensitive if either argument is a binary string.
- Changed `RAND()` initialization so that `RAND(N)` and `RAND(N+1)` are more distinct.
- Fixed core dump bug in `UPDATE ... ORDER BY`.
- In 3.23, `INSERT INTO ... SELECT` always had `IGNORE` enabled. Now MySQL stops (and possibly rolls back) by default in case of an error unless you specify `IGNORE`.
- Ignore `DATA DIRECTORY` and `INDEX DIRECTORY` directives on Windows.
- Added boolean full-text search code. It should be considered early alpha.
- Extended `MODIFY` and `CHANGE` in `ALTER TABLE` to accept the `FIRST` and `AFTER` keywords.
- Indexes are now used with `ORDER BY` on a whole InnoDB table.

## D.2.29. Changes in release 4.0.0 (October 2001: Alpha)

- Added `--xml` option to `mysql` for producing XML output.
- Added full-text variables `ft_min_word_len`, `ft_max_word_len`, and `ft_max_word_len_for_sort` system variables.
- Added full-text variables `ft_min_word_len`, `ft_max_word_len`, and `ft_max_word_len_for_sort` variables to `myisamchk`.
- Added documentation for `libmysqld`, the embedded MySQL server library. Also added example programs (a `mysql` client and `mysqltest` test program) which use `libmysqld`.
- Removed all Gemini hooks from MySQL server.
- Removed `my_thread_init()` and `my_thread_end()` from `mysql_com.h`, and added `mysql_thread_init()` and `mysql_thread_end()` to `mysql.h`.
- Support for communication packets > 16MB. In 4.0.1 we extended `MyISAM` to be able to handle these.
- Secure connections (with SSL).

- Unsigned `BIGINT` constants now work. `MIN()` and `MAX()` now handle signed and unsigned `BIGINT` numbers correctly.
- New character set `latin1_de` which provides correct German sorting.
- `STRCMP()` now uses the current character set when doing comparisons, which means that the default comparison behavior now is case insensitive.
- `TRUNCATE TABLE` and `DELETE FROM tbl_name` are now separate functions. One bonus is that `DELETE FROM tbl_name` now returns the number of deleted rows, rather than zero.
- `DROP DATABASE` now executes a `DROP TABLE` on all tables in the database, which fixes a problem with `InnoDB` tables.
- Added support for `UNION`.
- Added support for multiple-table `DELETE` operations.
- A new `HANDLER` interface to `MyISAM` tables.
- Added support for `INSERT` on `MERGE` tables. Patch from Benjamin Pflugmann.
- Changed `WEEK(date, 0)` to match the calendar in the USA.
- `COUNT(DISTINCT)` is about 30% faster.
- Speed up all internal list handling.
- Speed up `IS NULL`, `ISNULL()` and some other internal primitives.
- Full-text index creation now is much faster.
- Tree-like cache to speed up bulk inserts and `myisam_bulk_insert_tree_size` variable.
- Searching on packed (`CHAR/VARCHAR`) keys is now much faster.
- Optimized queries of type: `SELECT DISTINCT * FROM tbl_name ORDER by key_part1 LIMIT row_count`.
- `SHOW CREATE TABLE` now shows all table attributes.
- `ORDER BY ... DESC` can now use keys.
- `LOAD DATA FROM MASTER` “automatically” sets up a slave.
- Renamed `safe_mysqld` to `mysqld_safe` to make this name more in line with other MySQL scripts/commands.
- Added support for symbolic links to `MyISAM` tables. Symlink handling is now enabled by default for Windows.
- Added `SQL_CALC_FOUND_ROWS` and `FOUND_ROWS()`. This makes it possible to know how many rows a query would have returned without a `LIMIT` clause.
- Changed output format of `SHOW OPEN TABLES`.
- Allow `SELECT expression LIMIT ....`
- Added the `IDENTITY` variable as a synonym for the `LAST_INSERT_ID` variable (like Sybase).

- Added `ORDER BY` syntax to `UPDATE` and `DELETE`.
- `SHOW INDEXES` is now a synonym for `SHOW INDEX`.
- Added `ALTER TABLE tbl_name DISABLE KEYS` and `ALTER TABLE tbl_name ENABLE KEYS` commands.
- Allow use of `IN` as a synonym for `FROM` in `SHOW` commands.
- Implemented “repair by sort” for `FULLTEXT` indexes. `REPAIR TABLE`, `ALTER TABLE`, and `OPTIMIZE TABLE` for tables with `FULLTEXT` indexes are now up to 100 times faster.
- Allow standard SQL syntax `X'hexadecimal-number'`.
- Cleaned up global lock handling for `FLUSH TABLES WITH READ LOCK`.
- Fixed problem with `DATETIME = constant` in `WHERE` optimization.
- Added `--master-data` and `--no-autocommit` options to `mysqldump`. (Thanks to Brian Aker for this.)
- Added script `mysql_explain_log.sh` to distribution. (Thanks to mobile.de).

## D.3. Changes in release 3.23.x (Recent; still supported)

Please note that since release 4.0 is now production level, only critical fixes are done in the 3.23 release series. You are recommended to upgrade when possible, to take advantage of all speed and feature improvements in 4.0. See [Section 2.11.2, “Upgrading from MySQL 3.23 to 4.0”](#).

The 3.23 release has several major features that are not present in previous versions. We have added three new table types:

- [MyISAM](#)  
A new [ISAM](#) library which is tuned for SQL and supports large files.
- [InnoDB](#)  
A transaction-safe storage engine that supports row level locking, and many Oracle-like features.
- [BerkeleyDB](#) or [BDB](#)  
Uses the Berkeley DB library from Sleepycat Software to implement transaction-safe tables.

Note that only [MyISAM](#) is available in the standard binary distribution.

The 3.23 release also includes support for database replication between a master and many slaves, full-text indexing, and much more.

All new features are being developed in the 4.1.x and 5.0.x versions. Only serious bugfixes are added to 3.23.

### D.3.1. Changes in release 3.23.59 (Not yet released)

- Fixed an old bug in concurrent accesses to `MERGE` tables (even one `MERGE` table and `MyISAM` tables), that could've resulted in a crash or hang of the server. (Bug#2408 [http://bugs.mysql.com/2408], CVE-2004-0837 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0837])
- Fixed incorrect destruction of expression which led to crash of server on complex `AND/OR` expressions if query was ignored (either by a replication server because of `--replicate-*-table` rules, or by any MySQL server because of a syntax error). (Bug#3969 [http://bugs.mysql.com/3969], Bug#4494 [http://bugs.mysql.com/4494])
- Fixed problem with parsing complex queries on 64-bit architectures. (Bug#4204 [http://bugs.mysql.com/4204])
- Fixed a symlink vulnerability in the `mysqlbug` script. (Bug#3284 [http://bugs.mysql.com/3284], CVE-2004-0381 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0381])
- Fixed bug in privilege checking of `ALTER TABLE RENAME`. (Bug#3270 [http://bugs.mysql.com/3270], CVE-2004-0835 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0835])
- Fixed bugs in `ACOS()`, `ASIN()` (Bug#2338 [http://bugs.mysql.com/2338]) and in `FLOOR()` (Bug#3051 [http://bugs.mysql.com/3051]). The cause of the problem is an overly strong optimization done by `gcc` in this case.
- Fixed bug in `INSERT ... SELECT` statements where, if a `NOT NULL` column is assigned a value of `NULL`, the following columns in the row might be assigned a value of zero. (Bug#2012 [http://bugs.mysql.com/2012])
- If a query was ignored on the slave (because of `--replicate-ignore-table` and other similar rules), the slave still checked if the query got the same error code (0, no error) as on the master. So if the master had an error on the query (for example, "Duplicate entry" in a multiple-row insert), then the slave stopped and warned that the error codes didn't match. This is a backport of the fix for MySQL 4.0. (Bug#797 [http://bugs.mysql.com/797])
- `mysqlbinlog` now asks for a password at console when the `-p/--password` option is used with no argument. This is how the other clients (`mysqladmin`, `mysqldump`..) behave. Note that one now has to use `mysqlbinlog -p<my_password>`; `mysqlbinlog -p <my_password>` does not work anymore (in other words, put no space after `-p`). (Bug#1595 [http://bugs.mysql.com/1595])
- On some 64-bit machines (some HP-UX and Solaris machines), a slave installed with the 64-bit MySQL binary could not connect to its master (it connected to itself instead). (Bug#1256 [http://bugs.mysql.com/1256], Bug#1381 [http://bugs.mysql.com/1381])
- Fixed a Windows-specific bug present since MySQL 3.23.57 and 3.23.58 that caused Windows slaves to crash when they started replication if a `master.info` file existed. (Bug#1720 [http://bugs.mysql.com/1720])
- Fixed bug in `ALTER TABLE RENAME`, when rename to the table with the same name in another database silently dropped destination table if it existed. (Bug#2628 [http://bugs.mysql.com/2628])
- Fixed potential memory overrun in `mysql_real_connect()` (which required a compromised DNS server and certain operating systems). (Bug#4017 [http://bugs.mysql.com/4017], CVE-2004-0836 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0836])

## D.3.2. Changes in release 3.23.58 (11 September 2003)

- Fixed buffer overflow in password handling which could potentially be exploited by MySQL users with `ALTER` privilege on the `mysql.user` table to execute random code or to gain shell access with the UID of the `mysqld` process (thanks to Jedi/Sector One for spotting and reporting this bug).
- `mysqldump` now correctly quotes all identifiers when communicating with the server. This assures that during the dump process, `mysqldump` never sends queries to the server that result in a syntax error. This problem is **not** related to the `mysqldump` program's output, which was not changed. (Bug#1148 [<http://bugs.mysql.com/1148>])
- Fixed table/column grant handling: The proper sort order (from most specific to less specific, see [Section 5.7.6, “Access Control, Stage 2: Request Verification”](#)) was not honored. (Bug#928 [<http://bugs.mysql.com/928>])
- Fixed overflow bug in `MyISAM` and `ISAM` when a row is updated in a table with a large number of columns and at least one `BLOB/TEXT` column.
- Fixed MySQL so that field length (in C API) for the second column in `SHOW CREATE TABLE` is always larger than the data length. The only known application that was affected by the old behavior was Borland dbExpress, which truncated the output from the command. (Bug#1064 [<http://bugs.mysql.com/1064>])
- Fixed `ISAM` bug in `MAX( )` optimization.
- Fixed `Unknown error` when doing `ORDER BY` on reference table which was used with `NULL` value on `NOT NULL` column. (Bug#479 [<http://bugs.mysql.com/479>])

### D.3.3. Changes in release 3.23.57 (06 June 2003)

- Fixed problem in alarm handling that could cause problems when getting a packet that is too large.
- Fixed problem when installing MySQL as a service on Windows when two arguments were specified to `mysqld` (option file group name and service name).
- Fixed `kill pid-of-mysqld` to work on Mac OS X.
- `SHOW TABLE STATUS` displayed incorrect `Row_format` value for tables that have been compressed with `myisampack`. (Bug#427 [<http://bugs.mysql.com/427>])
- `SHOW VARIABLES LIKE 'innodb_data_file_path'` displayed only the name of the first data file. (Bug#468 [<http://bugs.mysql.com/468>])
- Fixed security problem where `mysqld` didn't allow one to `UPDATE` rows in a table even if one had a global `UPDATE` privilege and a database `SELECT` privilege.
- Fixed a security problem with `SELECT` and wildcard select list, when user only had partial column `SELECT` privileges on the table.
- Fixed unlikely problem in optimizing `WHERE` clause with a constant expression such as in `WHERE 1 AND (a=1 AND b=1)`.
- Fixed problem on IA-64 with timestamps that caused `mysqlbinlog` to fail.
- The default option for `innodb_flush_log_at_trx_commit` was changed from 0 to 1 to make `InnoDB` tables ACID by default. See [Section 14.2.5, “InnoDB Startup Options and System Variables”](#).
- Fixed problem with too many allocated alarms on slave when connecting to master many times

(normally not a very critical error).

- Fixed a bug in replication of temporary tables. ([Bug#183](http://bugs.mysql.com/183) [<http://bugs.mysql.com/183>])
- Fixed 64-bit bug that affected at least AMD hammer systems.
- Fixed a bug when doing `LOAD DATA INFILE IGNORE`: When reading the binary log, `mysql-binlog` and the replication code read `REPLACE` instead of `IGNORE`. This could make the slave's table become different from the master's table. ([Bug#218](http://bugs.mysql.com/218) [<http://bugs.mysql.com/218>])
- Fixed overflow bug in `MyISAM` when a row is inserted into a table with a large number of columns and at least one `BLOB/TEXT` column. Bug was caused by incorrect calculation of the needed buffer to pack data.
- The binary log was not locked during `TRUNCATE tbl_name` or `DELETE FROM tbl_name` statements, which could cause an `INSERT` to `tbl_name` to be written to the log before the `TRUNCATE` or `DELETE` statements.
- Fixed rare bug in `UPDATE` of `InnoDB` tables where one row could be updated multiple times.
- Produce an error for empty table and column names.
- Changed `PROCEDURE ANALYSE ( )` to report `DATE` instead of `NEWDATE`.
- Changed `PROCEDURE ANALYSE (#)` to restrict the number of values in an `ENUM` column to `#` also for string values.
- `mysqldump` no longer silently deletes the binary logs when invoked with the `--master-data` or `--first-slave` option; while this behavior was convenient for some users, others may suffer from it. Now you must explicitly ask for binary logs to be deleted by using the new `--delete-master-logs` option.
- Fixed a bug in `mysqldump` when it was invoked with the `--master-data` option: The `CHANGE MASTER TO` statements that were appended to the SQL dump had incorrect coordinates. ([Bug#159](http://bugs.mysql.com/159) [<http://bugs.mysql.com/159>])

### D.3.4. Changes in release 3.23.56 (13 March 2003)

- Fixed `mysqld` crash on extremely small values of `sort_buffer` variable.
- Fixed a bug in privilege system for `GRANT UPDATE` on the column level.
- Fixed a rare bug when using a date in `HAVING` with `GROUP BY`.
- Fixed checking of random part of `WHERE` clause. ([Bug#142](http://bugs.mysql.com/142) [<http://bugs.mysql.com/142>])
- Fixed MySQL (and `myisamchk`) crash on artificially corrupted `.MYI` files.
- Security enhancement: `mysqld` no longer reads options from world-writable config files. ([CVE-2003-0150](http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-0150) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-0150>])
- Security enhancement: `mysqld` and `safe_mysqld` now use only the first `--user` option specified on the command line. Normally this comes from `/etc/my.cnf`. ([CVE-2003-0150](http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-0150) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-0150>])
- Security enhancement: Don't allow `BACKUP TABLE` to overwrite existing files.

- Fixed unlikely deadlock bug when one thread did a `LOCK TABLE` and another thread did a `DROP TABLE`. In this case one could do a `KILL` on one of the threads to resolve the deadlock.
- `LOAD DATA INFILE` was not replicated by slave if `replicate_*_table` was set on the slave.
- Fixed a bug in handling `CHAR(0)` columns that could cause incorrect results from the query.
- Fixed a bug in `SHOW VARIABLES` on 64-bit platforms. The bug was caused by incorrect declaration of variable `server_id`.
- The `Comment` column in `SHOW TABLE STATUS` now reports that it can contain `NULL` values (which is the case for a crashed `.frm` file).
- Fixed the `rpl_rotate_logs` test to not fail on certain platforms (such as Mac OS X) due to a too-long file name (changed `slave-master-info.opt` to `.slave-mi`).
- Fixed a problem with `BLOB NOT NULL` columns used with `IS NULL`.
- Fixed bug in `MAX()` optimization in `MERGE` tables.
- Better `RAND()` initialization for new connections.
- Fixed bug with connect timeout. This bug was manifested on OS's with `poll()` system call, which resulted in timeout the value specified as it was executed in both `select()` and `poll()`.
- Fixed bug in `SELECT * FROM table WHERE datetime1 IS NULL OR datetime2 IS NULL`.
- Fixed bug in using aggregate functions as argument for `INTERVAL`, `CASE`, `FIELD`, `CONCAT_WS`, `ELT` and `MAKE_SET` functions.
- When running with `--lower-case-table-names=1` (default on Windows) and you had tables or databases with mixed case on disk, then executing `SHOW TABLE STATUS` followed with `DROP DATABASE` or `DROP TABLE` could fail with `Errcode 13`.
- Fixed bug in logging to binary log (which affects replication) a query that inserts a `NULL` in an `auto_increment` field and also uses `LAST_INSERT_ID()`.
- Fixed bug in `mysqladmin --relative`.
- On some 64-bit systems, `show status` reported a strange number for `Open_files` and `Open_streams`.

### D.3.5. Changes in release 3.23.55 (23 January 2003)

- Fixed double `free`'d pointer bug in `mysql_change_user()` handling, that enabled a specially hacked version of MySQL client to crash `mysqld`. **Note** that you must log in to the server by using a valid user account to be able to exploit this bug. (CVE-2003-0073 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-0073])
- Fixed bug with the `--slow-log` when logging an administrator command (like `FLUSH TABLES`).
- Fixed bug in `GROUP BY` when used on `BLOB` column with `NULL` values.
- Fixed a bug in handling `NULL` values in `CASE ... WHEN ...`.

- Bugfix for `--chroot` (see [Section D.3.6, “Changes in release 3.23.54 \(05 December 2002\)”](#)) is reverted. Unfortunately, there is no way to make it to work, without introducing backward-incompatible changes in `my.cnf`. Those who need `--chroot` functionality, should upgrade to MySQL 4.0. (The fix in the 4.0 branch did not break backward-compatibility).
- Make `--lower-case-table-names` default on Mac OS X as the default filesystem (HFS+) is case insensitive.
- Fixed a bug in `scripts/mysql_safe.sh` in `NOHUP_NICENESS` testing.
- Transactions in `AUTOCOMMIT=0` mode didn't rotate binary log.
- Fixed a bug in `scripts/make_binary_distribution` that resulted in a remaining `@HOSTNAME@` variable instead of replacing it with the correct path to the `hostname` binary.
- Fixed a very unlikely bug that could cause `SHOW PROCESSLIST` to core dump in `pthread_mutex_unlock()` if a new thread was connecting.
- Forbid `SLAVE STOP` if the thread executing the query has locked tables. This removes a possible deadlock situation.

### D.3.6. Changes in release 3.23.54 (05 December 2002)

- Fixed a bug, that allowed to crash `mysqld` with a specially crafted packet. ([CVE-2002-1373](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1373>])
- Fixed a rare crash (double `free`'d pointer) when altering a temporary table.
- Fixed buffer overrun in `libmysqlclient` library that allowed malicious MySQL server to crash the client application. ([CVE-2002-1376](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1376>])
- Fixed security-related bug in `mysql_change_user()` handling. All users are strongly recommended to upgrade to the version 3.23.54. ([CVE-2002-1374](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1374>], [CVE-2002-1375](#) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1375>])
- Fixed bug that prevented `--chroot` command-line option of `mysqld` from working.
- Fixed bug that made `OPTIMIZE TABLE` to corrupt the table under some rare circumstances.
- Fixed `mysqlcheck` so it can deal with table names containing dashes.
- Fixed shutdown problem on Mac OS X.
- Fixed bug with comparing an indexed `NULL` field with `<=> NULL`.
- Fixed bug that caused `IGNORE INDEX` and `USE INDEX` sometimes to be ignored.
- Fixed rare core dump problem in complicated `GROUP BY` queries that didn't return any result.
- Fixed a bug where `MATCH ... AGAINST ( ) >=0` was treated as if it was `>`.
- Fixed core dump in `SHOW PROCESSLIST` when running with an active slave (unlikely timing bug).
- Make it possible to use multiple MySQL servers on Windows (code backported from 4.0.2).

- One can create `TEMPORARY MERGE` tables now.
- Fixed that `--core-file` works on Linux (at least on kernel 2.4.18).
- Fixed a problem with `BDB` and `ALTER TABLE`.
- Fixed reference to freed memory when doing complicated `GROUP BY ... ORDER BY` queries. Symptom was that `mysqld` died in function `send_fields`.
- Allocate heap rows in smaller blocks to get better memory usage.
- Fixed memory allocation bug when storing `BLOB` values in internal temporary tables used for some (unlikely) `GROUP BY` queries.
- Fixed a bug in key optimizing handling where the expression `WHERE col_name = key_col_name` was calculated as true for `NULL` values.
- Fixed core dump bug when doing `LEFT JOIN ... WHERE key_column=NULL`.
- Fixed `MyISAM` crash when using dynamic-row tables with huge numbers of packed fields.
- Updated source tree to be built using `automake` 1.5 and `libtool` 1.4.

### D.3.7. Changes in release 3.23.53 (09 October 2002)

- Fixed crash when `SHOW INNODB STATUS` was used and `skip-innodb` was defined.
- Fixed possible memory corruption bug in binary log file handling when slave rotated the logs (only affected 3.23, not 4.0).
- Fixed problem in `LOCK TABLES` on Windows when one connects to a database that contains uppercase letters.
- Fixed that `--skip-show-database` doesn't reset the `--port` option.
- Small fix in `safe_mysqld` for some shells.
- Fixed that `FLUSH STATUS` doesn't reset `delayed_insert_threads`.
- Fixed core dump bug when using the `BINARY` cast on a `NULL` value.
- Fixed race condition when someone did a `GRANT` at the same time a new user logged in or did a `USE database`.
- Fixed bug in `ALTER TABLE` and `RENAME TABLE` when running with `-O lower_case_table_names=1` (typically on Windows) when giving the table name in uppercase.
- Fixed that `-O lower_case_table_names=1` also converts database names to lowercase.
- Fixed unlikely core dump with `SELECT ... ORDER BY ... LIMIT`.
- Changed `AND/OR` to report that they can return `NULL`. This fixes a bug in `GROUP BY` on `AND/OR` expressions that return `NULL`.
- Fixed a bug that `OPTIMIZE TABLE` of locked and modified `MyISAM` table, reported table corruption.

- Fixed a BDB-related `ALTER TABLE` bug with dropping a column and shutting down immediately thereafter.
- Fixed problem with `configure ... --localstatedir=...`
- Fixed problem with `UNSIGNED BIGINT` on AIX (again).
- Fixed bug in `pthread_mutex_trylock()` on HP-UX 11.0.
- Multi-threaded stress tests for `InnoDB`.

### D.3.8. Changes in release 3.23.52 (14 August 2002)

- Wrap `BEGIN/COMMIT` around transaction in the binary log. This makes replication honor transactions.
- Fixed security bug when having an empty database name in the `user.db` table.
- Changed initialization of `RAND()` to make it less predictable.
- Fixed problem with `GROUP BY` on result with expression that created a `BLOB` field.
- Fixed problem with `GROUP BY` on columns that have `NULL` values. To solve this we now create an `MyISAM` temporary table when doing a `GROUP BY` on a possible `NULL` item. From MySQL 4.0.5 we can use in memory `HEAP` tables for this case.
- Fixed problem with privilege tables when downgrading from 4.0.2 to 3.23.
- Fixed thread bug in `SLAVE START`, `SLAVE STOP` and automatic repair of `MyISAM` tables that could cause table cache to be corrupted.
- Fixed possible thread related key-cache-corruption problem with `OPTIMIZE TABLE` and `REPAIR TABLE`.
- Added name of 'administrator command' logs.
- Fixed bug with creating an auto-increment value on second part of a `UNIQUE()` key where first part could contain `NULL` values.
- Don't write slave-timeout reconnects to the error log.
- Fixed bug with slave net read timeouting
- Fixed a core-dump bug with `MERGE` tables and `MAX()` function.
- Fixed bug in `ALTER TABLE` with `BDB` tables.
- Fixed bug when logging `LOAD DATA INFILE` to binary log with no active database.
- Fixed a bug in range optimizer (causing crashes).
- Fixed possible problem in replication when doing `DROP DATABASE` on a database with `InnoDB` tables.
- Fixed `mysql_info()` to return 0 for `Duplicates` value when using `INSERT DELAYED IGNORE`.

- Added `-DHAVE_BROKEN_REALPATH` to the Mac OS X (darwin) compile options in `configure.in` to fix a failure under high load.

### D.3.9. Changes in release 3.23.51 (31 May 2002)

- Fix bug with closing tags missing slash for `mysqldump` XML output.
- Remove endspace from `ENUM` values. (This fixed a problem with `SHOW CREATE TABLE`.)
- Fixed bug in `CONCAT_WS()` that cut the result.
- Changed name of server variables `Com_show_master_stat` to `Com_show_master_status` and `Com_show_slave_stat` to `Com_show_slave_status`.
- Changed handling of `gethostbyname()` to make the client library thread-safe even if `gethostbyname_r` doesn't exist.
- Fixed core-dump problem when giving a wrong password string to `GRANT`.
- Fixed bug in `DROP DATABASE` with symlinked directory.
- Fixed optimization problem with `DATETIME` and value outside `DATETIME` range.
- Removed Sleepycat's `BDB` doc files from the source tree, as they're not needed (MySQL covers `BDB` in its own documentation).
- Fixed MIT-pthreads to compile with `glibc 2.2` (needed for `make dist`).
- Fixed the `FLOAT(X+1, X)` is not converted to `FLOAT(X+2, X)`. (This also affected `DECIMAL`, `DOUBLE` and `REAL` types)
- Fixed the result from `IF()` is case in-sensitive if the second and third arguments are case sensitive.
- Fixed core dump problem on OSF/1 in `gethostbyname_r`.
- Fixed that underflowed decimal fields are not zero filled.
- If we get an overflow when inserting `'+11111'` for `DECIMAL(5,0) UNSIGNED` columns, we just drop the sign.
- Fixed optimization bug with `ISNULL(expression_which_cannot_be_null)` and `ISNULL(constant_expression)`.
- Fixed host lookup bug in the `glibc` library that we used with the 3.23.50 Linux-x86 binaries.

### D.3.10. Changes in release 3.23.50 (21 April 2002)

- Fixed buffer overflow problem if someone specified a too-long `datadir` parameter to `mysqld`. (CVE-2002-0969 [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-0969>])
- Add missing `<row>` tags for `mysqldump` XML output.
- Fixed problem with `crash-me` and `gcc 3.0.4`.
- Fixed that `@@unknown_variable` doesn't hang server.

- Added `@@VERSION` as a synonym for `VERSION()`.
- `SHOW VARIABLES LIKE 'xxx'` is now case-insensitive.
- Fixed timeout for `GET_LOCK()` on HP-UX with DCE threads.
- Fixed memory allocation bug in the glibc library used to build Linux binaries, which caused `mysqld` to die in `free()`.
- Fixed `SIGINT` and `SIGQUIT` problems in `mysql`.
- Fixed bug in character table converts when used with big (larger than 64KB) strings.
- `InnoDB` now retains foreign key constraints through `ALTER TABLE` and `CREATE/DROP INDEX`.
- `InnoDB` now allows foreign key constraints to be added through the `ALTER TABLE` syntax.
- `InnoDB` tables can now be set to automatically grow in size (auto-extend).
- Our Linux RPMS and binaries are now compiled with `gcc 3.0.4`, which should make them a bit faster.
- Fixed some buffer overflow problems when reading startup parameters.
- Because of problems on shutdown we have now disabled named pipes on Windows by default. One can enable named pipes by starting `mysqld` with `--enable-named-pipe`.
- Fixed bug when using `WHERE key_column = 'J' or key_column='j'`.
- Fixed core-dump bug when using `--log-bin` with `LOAD DATA INFILE` without an active database.
- Fixed bug in `RENAME TABLE` when used with `lower_case_table_names=1` (default on Windows).
- Fixed unlikely core-dump bug when using `DROP TABLE` on a table that was in use by a thread that also used queries on only temporary tables.
- Fixed problem with `SHOW CREATE TABLE` and `PRIMARY KEY` when using 32 indexes.
- Fixed that one can use `SET PASSWORD` for the anonymous user.
- Fixed core dump bug when reading client groups from option files using `mysql_options()`.
- Memory leak (16 bytes per every **corrupted** table) closed.
- Fixed binary builds to use `--enable-local-infile`.
- Update source to work with new version of `bison`.
- Updated shell scripts to now agree with new POSIX standard.
- Fixed bug where `DATE_FORMAT()` returned empty string when used with `GROUP BY`.

### D.3.11. Changes in release 3.23.49 (14 February 2002)

- For a `MERGE` table, `DELETE FROM merge_table` used without a `WHERE` clause no longer clears the mapping for the table by emptying the `.MRG` file. Instead, it deletes records from the mapped tables.
- Don't give warning for a statement that is only a comment; this is needed for `mysqldump --disable-keys` to work.
- Fixed unlikely caching bug when doing a join without keys. In this case, the last used field for a table always returned `NULL`.
- Added options to make `LOAD DATA LOCAL INFILE` more secure.
- MySQL binary release 3.23.48 for Linux contained a new `glibc` library, which has serious problems under high load and Red Hat 7.2. The 3.23.49 binary release doesn't have this problem.
- Fixed shutdown problem on NT.

### D.3.12. Changes in release 3.23.48 (07 February 2002)

- Added `--xml` option to `mysqldump` for producing XML output.
- Changed to use `autoconf 2.52` (from `autoconf 2.13`)
- Fixed bug in complicated join with `const` tables.
- Added internal safety checks for `InnoDB`.
- Some `InnoDB` variables were always shown in `SHOW VARIABLES` as `OFF` on high-byte-first systems (like SPARC).
- Fixed problem with one thread using an `InnoDB` table and another thread doing an `ALTER TABLE` on the same table. Before that, `mysqld` could crash with an assertion failure in `row0row.c`, line 474.
- Tuned the `InnoDB` SQL optimizer to favor index searches more often over table scans.
- Fixed a performance problem with `InnoDB` tables when several large `SELECT` queries are run concurrently on a multiprocessor Linux computer. Large CPU-bound `SELECT` queries now also generally run faster on all platforms.
- If MySQL binary logging is used, `InnoDB` now prints after crash recovery the latest MySQL binary log name and the offset `InnoDB` was able to recover to. This is useful, for example, when resynchronizing a master and a slave database in replication.
- Added better error messages to help in installation problems of `InnoDB` tables.
- It is now possible to recover MySQL temporary tables that have become orphaned inside the `InnoDB` tablespace.
- `InnoDB` now prevents a `FOREIGN KEY` declaration where the signedness is not the same in the referencing and referenced integer columns.
- Calling `SHOW CREATE TABLE` or `SHOW TABLE STATUS` could cause memory corruption and make `mysqld` crash. Especially at risk was `mysqldump`, because it frequently calls `SHOW CREATE TABLE`.
- If inserts to several tables containing an `AUTO_INCREMENT` column were wrapped inside one

`LOCK TABLES`, InnoDB asserted in `lock0lock.c`.

- In 3.23.47 we allowed several `NULL` values in a `UNIQUE` secondary index for an InnoDB table. But `CHECK TABLE` was not relaxed: it reports the table as corrupt. `CHECK TABLE` no longer complains in this situation.
- `SHOW GRANTS` now shows `REFERENCES` instead of `REFERENCE`.

### D.3.13. Changes in release 3.23.47 (27 December 2001)

- Fixed bug when using the following construct: `SELECT ... WHERE key=@var_name OR key=@var_name2`
- Restrict InnoDB keys to 500 bytes.
- InnoDB now supports `NULL` in keys.
- Fixed shutdown problem on HP-UX. (Introduced in 3.23.46)
- Fixed core dump bug in replication when using `SELECT RELEASE_LOCK()`.
- Added new statement: `DO expr[,expr]...`
- Added `slave-skip-errors` option.
- Added statistics variables for all MySQL commands. (`SHOW STATUS` is now much longer.)
- Fixed default values for InnoDB tables.
- Fixed that `GROUP BY expr DESC` works.
- Fixed bug when using `t1 LEFT JOIN t2 ON t2.key=constant`.
- `mysql_config` now also works with binary (relocated) distributions.

### D.3.14. Changes in release 3.23.46 (29 November 2001)

- Fixed problem with aliased temporary table replication.
- InnoDB and BDB tables now use index when doing an `ORDER BY` on the whole table.
- Fixed bug where one got an empty set instead of a DEADLOCK error when using BDB tables.
- One can now kill `ANALYZE TABLE`, `REPAIR TABLE`, and `OPTIMIZE TABLE` when the thread is waiting to get a lock on the table.
- Fixed race condition in `ANALYZE TABLE`.
- Fixed bug when joining with caching (unlikely to happen).
- Fixed race condition when using the binary log and `INSERT DELAYED` which could cause the binary log to have rows that were not yet written to MyISAM tables.
- Changed caching of binary log to make replication slightly faster.

- Fixed bug in replication on Mac OS X.

### D.3.15. Changes in release 3.23.45 (22 November 2001)

- `(UPDATE | DELETE) ... WHERE MATCH` bugfix.
- shutdown should now work on Darwin (Mac OS X).
- Fixed core dump when repairing corrupted packed `MyISAM` files.
- `--core-file` now works on Solaris.
- Fix a bug which could cause `InnoDB` to complain if it cannot find free blocks from the buffer cache during recovery.
- Fixed bug in `InnoDB` insert buffer B-tree handling that could cause crashes.
- Fixed bug in `InnoDB` lock timeout handling.
- Fixed core dump bug in `ALTER TABLE` on a `TEMPORARY InnoDB` table.
- Fixed bug in `OPTIMIZE TABLE` that reset index cardinality if it was up to date.
- Fixed problem with `t1 LEFT JOIN t2 ... WHERE t2.date_column IS NULL` when `date_column` was declared as `NOT NULL`.
- Fixed bug with `BDB` tables and keys on `BLOB` columns.
- Fixed bug in `MERGE` tables on OS with 32-bit file pointers.
- Fixed bug in `TIME_TO_SEC()` when using negative values.

### D.3.16. Changes in release 3.23.44 (31 October 2001)

- Fixed `Rows_examined` count in slow query log.
- Fixed bug when using a reference to an `AVG()` column in `HAVING`.
- Fixed that date functions that require correct dates, like `DAYOFYEAR(column)`, return `NULL` for `0000-00-00` dates.
- Fixed bug in const-propagation when comparing columns of different types. (`SELECT * FROM date_col="2001-01-01" and date_col=time_col`)
- Fixed bug that caused error message `Can't write, because of unique constraint` with some `GROUP BY` queries.
- Fixed problem with `sjis` character strings used within quoted table names.
- Fixed core dump when using `CREATE ... FULLTEXT` keys with other storage engines than `MyISAM`.
- Don't use `signal()` on Windows because this appears to not be 100% reliable.
- Fixed bug when doing `WHERE col_name=NULL` on an indexed column that had `NULL` values.

- Fixed bug when doing `LEFT JOIN ... ON (col_name = constant) WHERE col_name = constant`.
- When using replications, aborted queries that contained `%` could cause a core dump.
- `TCP_NODELAY` was not used on some systems. (Speed problem.)
- Applied portability fixes for OS/2. (Patch by Yuri Dario.)

The following changes are for `InnoDB` tables:

- Add missing `InnoDB` variables to `SHOW VARIABLES`.
- Foreign key checking is now done for `InnoDB` tables.
- `DROP DATABASE` now works also for `InnoDB` tables.
- `InnoDB` now supports data files and raw disk partitions bigger than 4GB on those operating systems that have big files.
- `InnoDB` calculates better table cardinality estimates for the MySQL optimizer.
- Accent characters in the default character set `latin1` are ordered according to the MySQL ordering.

Note: If you are using `latin1` and have inserted characters whose code is greater than 127 into an indexed `CHAR` column, you should run `CHECK TABLE` on your table when you upgrade to 3.23.44, and drop and reimport the table if `CHECK TABLE` reports an error!

- A new `my.cnf` parameter, `innodb_thread_concurrency`, helps in performance tuning in heavily concurrent environments.
- A new `my.cnf` parameter, `innodb_fast_shutdown`, speeds up server shutdown.
- A new `my.cnf` parameter, `innodb_force_recovery`, helps to save your data in case the disk image of the database becomes corrupt.
- `innodb_monitor` has been improved and a new `innodb_table_monitor` added.
- Increased maximum key length from 500 to 7000 bytes.
- Fixed a bug in replication of `AUTO_INCREMENT` columns with multiple-line inserts.
- Fixed a bug when the case of letters changes in an update of an indexed secondary column.
- Fixed a hang when there are more than 24 data files.
- Fixed a crash when `MAX(col)` is selected from an empty table, and `col` is not the first column in a multi-column index.
- Fixed a bug in purge which could cause crashes.

### D.3.17. Changes in release 3.23.43 (04 October 2001)

- Fixed a bug in `INSERT DELAYED` and `FLUSH TABLES` introduced in 3.23.42.

- Fixed unlikely bug, which returned non-matching rows, in `SELECT` with many tables and multi-column indexes and 'range' type.
- Fixed an unlikely core dump bug when doing `EXPLAIN SELECT` when using many tables and `ORDER BY`.
- Fixed bug in `LOAD DATA FROM MASTER` when using table with `CHECKSUM=1`.
- Added unique error message when a DEADLOCK occurs during a transaction with `BDB` tables.
- Fixed problem with `BDB` tables and `UNIQUE` columns defined as `NULL`.
- Fixed problem with `myisampack` when using pre-space filled `CHAR` columns.
- Applied patch from Yuri Dario for OS/2.
- Fixed bug in `--safe-user-create`.

### D.3.18. Changes in release 3.23.42 (08 September 2001)

- Fixed problem when using `LOCK TABLES` and `BDB` tables.
- Fixed problem with `REPAIR TABLE` on `MyISAM` tables with row lengths in the range from 65517 to 65520 bytes.
- Fixed rare hang when doing `mysqladmin shutdown` when there was a lot of activity in other threads.
- Fixed problem with `INSERT DELAYED` where delayed thread could be hanging on `upgrading locks` for no apparent reason.
- Fixed problem with `myisampack` and `BLOB`.
- Fixed problem when one edited `.MRG` tables by hand. (Patch from Benjamin Pflugmann).
- Enforce that all tables in a `MERGE` table come from the same database.
- Fixed bug with `LOAD DATA INFILE` and transactional tables.
- Fix bug when using `INSERT DELAYED` with wrong column definition.
- Fixed core dump during `REPAIR TABLE` of some particularly broken tables.
- Fixed bug in `InnoDB` and `AUTO_INCREMENT` columns.
- Fixed bug in `InnoDB` and `RENAME TABLE` columns.
- Fixed critical bug in `InnoDB` and `BLOB` columns. If you have used `BLOB` columns larger than 8000 bytes in an `InnoDB` table, it is necessary to dump the table with `mysqldump`, drop it and restore it from the dump.
- Applied large patch for OS/2 from Yuri Dario.
- Fixed problem with `InnoDB` when one could get the error `Can't execute the given command...` even when no transaction was active.
- Applied some minor fixes that concern Gemini.

- Use real arithmetic operations even in integer context if not all arguments are integers. (Fixes uncommon bug in some integer contexts).
- Don't force everything to lowercase on Windows. (To fix problem with Windows and `ALTER TABLE`.) Now `--lower_case_table_names` also works on Unix.
- Fixed that automatic rollback is done when thread end doesn't lock other threads.

### D.3.19. Changes in release 3.23.41 (11 August 2001)

- Added `--sql-mode=value[ ,value[ ,value ]]` option to `mysqld`. See [Section 5.2.1, “Command Options”](#).
- Fixed possible problem with `shutdown` on Solaris where the `.pid` file wasn't deleted.
- `InnoDB` now supports < 4GB rows. The former limit was 8000 bytes.
- The `doublewrite` file flush method is used in `InnoDB`. It reduces the need for Unix `fsync()` calls to a fraction and improves performance on most Unix flavors.
- You can now use the `InnoDB` Monitor to print a lot of `InnoDB` state information, including locks, to the standard output. This is useful in performance tuning.
- Several bugs which could cause hangs in `InnoDB` have been fixed.
- Split `record_buffer` to `record_buffer` and `record_rnd_buffer`. To make things compatible to previous MySQL versions, if `record_rnd_buffer` is not set, then it takes the value of `record_buffer`.
- Fixed optimizing bug in `ORDER BY` where some `ORDER BY` parts were wrongly removed.
- Fixed overflow bug with `ALTER TABLE` and `MERGE` tables.
- Added prototypes for `my_thread_init()` and `my_thread_end()` to `mysql_com.h`
- Added `--safe-user-create` option to `mysqld`.
- Fixed bug in `SELECT DISTINCT ... HAVING` that caused error message `Can't find record in #...`

### D.3.20. Changes in release 3.23.40 (18 July 2001)

- Fixed problem with `--low-priority-updates` and `INSERT` statements.
- Fixed bug in slave thread when under some rare circumstances it could get 22 bytes ahead on the offset in the master.
- Added `slave_net_timeout` for replication.
- Fixed problem with `UPDATE` and `BDB` tables.
- Fixed hard bug in `BDB` tables when using key parts.
- Fixed problem when using `GRANT FILE ON database.* ...`; previously we added the `DROP` privilege for the database.

- Fixed `DELETE FROM tbl_name ... LIMIT 0` and `UPDATE FROM tbl_name ... LIMIT 0`, which acted as though the `LIMIT` clause was not present (they deleted or updated all selected rows).
- `CHECK TABLE` now checks whether an `AUTO_INCREMENT` column contains the value 0.
- Sending a `SIGHUP` to `mysqld` now only flushes the logs, but does not reset the replication.
- Fixed parser to allow floats of type `1.0e1` (no sign after `e`).
- Option `--force` to `myisamchk` now also updates states.
- Added option `--warnings` to `mysqld`. Now `mysqld` prints the error `Aborted connection` only if this option is used.
- Fixed problem with `SHOW CREATE TABLE` when you didn't have a `PRIMARY KEY`.
- Properly fixed the rename of `innodb_unix_file_flush_method` variable to `innodb_flush_method`.
- Fixed bug when converting `BIGINT UNSIGNED` to `DOUBLE`. This caused a problem when doing comparisons with `BIGINT` values outside of the signed range.
- Fixed bug in `BDB` tables when querying empty tables.
- Fixed a bug when using `COUNT(DISTINCT)` with `LEFT JOIN` and there weren't any matching rows.
- Removed all documentation referring to the `GEMINI` table type. `GEMINI` is not released under an Open Source license.

### D.3.21. Changes in release 3.23.39 (12 June 2001)

- The `AUTO_INCREMENT` sequence wasn't reset when dropping and adding an `AUTO_INCREMENT` column.
- `CREATE ... SELECT` now creates non-unique indexes delayed.
- Fixed problem where `LOCK TABLES tbl_name READ` followed by `FLUSH TABLES` put an exclusive lock on the table.
- `REAL @variable` values were represented with only 2 digits when converted to strings.
- Fixed problem that client “hung” when `LOAD TABLE FROM MASTER` failed.
- `myisamchk --fast --force` no longer repairs tables that only had the open count wrong.
- Added functions to handle symbolic links to make life easier in 4.0.
- We are now using the `-lcma` thread library on HP-UX 10.20 so that MySQL is more stable on HP-UX.
- Fixed problem with `IF()` and number of decimals in the result.
- Fixed date-part extraction functions to work with dates where day and/or month is 0.
- Extended argument length in option files from 256 to 512 chars.

- Fixed problem with shutdown when `INSERT DELAYED` was waiting for a `LOCK TABLE`.
- Fixed core dump bug in `InnoDB` when tablespace was full.
- Fixed problem with `MERGE` tables and big tables (larger than 4GB) when using `ORDER BY`.

### D.3.22. Changes in release 3.23.38 (09 May 2001)

- Fixed a bug when `SELECT` from `MERGE` table sometimes results in incorrectly ordered rows.
- Fixed a bug in `REPLACE()` when using the `ujis` character set.
- Applied Sleepycat `BDB` patches 3.2.9.1 and 3.2.9.2.
- Added `--skip-stack-trace` option to `mysqld`.
- `CREATE TEMPORARY` now works with `InnoDB` tables.
- `InnoDB` now promotes sub keys to whole keys.
- Added option `CONCURRENT` to `LOAD DATA`.
- Better error message when slave `max_allowed_packet` is too low to read a very long log event from the master.
- Fixed bug when too many rows were removed when using `SELECT DISTINCT ... HAVING`.
- `SHOW CREATE TABLE` now returns `TEMPORARY` for temporary tables.
- Added `Rows_examined` to slow query log.
- Fixed problems with function returning empty string when used together with a group function and a `WHERE` that didn't match any rows.
- New program `mysqlcheck`.
- Added database name to output for administrative commands like `CHECK TABLE`, `REPAIR TABLE`, `OPTIMIZE TABLE`.
- Lots of portability fixes for `InnoDB`.
- Changed optimizer so that queries like `SELECT * FROM tbl_name, tbl_name2 ... ORDER BY key_part1 LIMIT row_count` use an index on `key_part1` instead of `file-sort`.
- Fixed bug when doing `LOCK TABLE to_table WRITE, ...; INSERT INTO to_table... SELECT ...` when `to_table` was empty.
- Fixed bug with `LOCK TABLE` and `BDB` tables.

### D.3.23. Changes in release 3.23.37 (17 April 2001)

- Fixed a bug when using `MATCH()` in `HAVING` clause.
- Fixed a bug when using `HEAP` tables with `LIKE`.

- Added `--mysql-version` option to `safe_mysqld`
- Changed `INNOBASE` to `InnoDB` (because the `INNOBASE` name was in use). All `configure` options and `mysqld` start options now use `innodb` instead of `innobase`. This means that before upgrading to this version, you have to change any configuration files where you have used `innobase` options!
- Fixed bug when using indexes on `CHAR(255) NULL` columns.
- Slave threads now start even if `master-host` is not set, as long as `server-id` is set and valid `master.info` is present.
- Partial updates (terminated with kill) are now logged with a special error code to the binary log. Slave refuses to execute them if the error code indicates the update was terminated abnormally, and has to be recovered with `SET SQL_SLAVE_SKIP_COUNTER=1; SLAVE START` after a manual sanity check/correction of data integrity.
- Fixed bug that erroneously logged a drop of internal temporary table on thread termination to the binary log --- this bug affected replication.
- Fixed a bug in `REGEXP` on 64-bit machines.
- `UPDATE` and `DELETE` with `WHERE unique_key_part IS NULL` didn't update/delete all rows.
- Disabled `INSERT DELAYED` for tables that support transactions.
- Fixed bug when using date functions on `TEXT/BLOB` column with wrong date format.
- UDFs now also work on Windows. (Patch by Ralph Mason.)
- Fixed bug in `ALTER TABLE` and `LOAD DATA INFILE` that disabled key-sorting. These commands should now be faster in most cases.
- Fixed performance bug where reopened tables (tables that had been waiting for `FLUSH` or `REPAIR TABLE`) would not use indexes for the next query.
- Fixed problem with `ALTER TABLE` to `InnoDB` tables on FreeBSD.
- Added `mysqld` variables `myisam_max_sort_file_size` and `myisam_max_extra_sort_file_size`.
- Initialize signals early to avoid problem with signals in `InnoDB`.
- Applied patch for the `tis620` character set to make comparisons case-independent and to fix a bug in `LIKE` for this character set. **Note:** All tables that use the `tis620` character set must be fixed with `myisamchk -r` or `REPAIR TABLE`!
- Added `--skip-safemalloc` option to `mysqld`.

### D.3.24. Changes in release 3.23.36 (27 March 2001)

- Fixed a bug that allowed use of database names containing a `'.` character. This fixes a serious security issue when `mysqld` is run as root. (CVE-2001-0407 [http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-0407])
- Fixed bug when thread creation failed (could happen when doing a **lot** of connections in a short

time).

- Fixed some problems with `FLUSH TABLES` and `TEMPORARY` tables. (Problem with freeing the key cache and error `Can't reopen table...`)
- Fixed a problem in `InnoDB` with other character sets than `latin1` and another problem when using many columns.
- Fixed bug that caused a core dump when using a very complex query involving `DISTINCT` and summary functions.
- Added `SET TRANSACTION ISOLATION LEVEL ...`
- Added `SELECT ... FOR UPDATE`.
- Fixed bug where the number of affected rows was not returned when MySQL was compiled without transaction support.
- Fixed a bug in `UPDATE` where keys weren't always used to find the rows to be updated.
- Fixed a bug in `CONCAT_WS( )` where it returned incorrect results.
- Changed `CREATE ... SELECT` and `INSERT ... SELECT` to not allow concurrent inserts as this could make the binary log hard to repeat. (Concurrent inserts are enabled if you are not using the binary or update log.)
- Changed some macros to be able to use fast mutex with `glibc 2.2`.

### D.3.25. Changes in release 3.23.35 (15 March 2001)

- Fixed newly introduced bug in `ORDER BY`.
- Fixed wrong define `CLIENT_TRANSACTIONS`.
- Fixed bug in `SHOW VARIABLES` when using `INNOBASE` tables.
- Setting and using user variables in `SELECT DISTINCT` didn't work.
- Tuned `SHOW ANALYZE` for small tables.
- Fixed handling of arguments in the benchmark script `run-all-tests`.

### D.3.26. Changes in release 3.23.34a (11 March 2001)

- Added extra files to the distribution to allow `INNOBASE` support to be compiled.

### D.3.27. Changes in release 3.23.34 (10 March 2001)

- Added the `INNOBASE` storage engine and the `BDB` storage engine to the MySQL source distribution.
- Updated the documentation about `GEMINI` tables.

- Fixed a bug in `INSERT DELAYED` that caused threads to hang when inserting `NULL` into an `AUTO_INCREMENT` column.
- Fixed a bug in `CHECK TABLE / REPAIR TABLE` that could cause a thread to hang.
- Fixed problem that `REPLACE` would not replace a row that conflicts with an `AUTO_INCREMENT` generated key.
- `mysqld` now only sets `CLIENT_TRANSACTIONS` in `mysql->server_capabilities` if the server supports a transaction-safe storage engine.
- Fixed `LOAD DATA INFILE` to allow numeric values to be read into `ENUM` and `SET` columns.
- Improved error diagnostic for slave thread exit.
- Fixed bug in `ALTER TABLE ... ORDER BY`.
- Added `max_user_connections` variable to `mysqld`.
- Limit query length for replication by `max_allowed_packet`, not the arbitrary limit of 4MB.
- Allow space around `=` in argument to `--set-variable`.
- Fixed problem in automatic repair that could leave some threads in state `Waiting for table`.
- `SHOW CREATE TABLE` now displays the `UNION=()` for `MERGE` tables.
- `ALTER TABLE` now remembers the old `UNION=()` definition.
- Fixed bug when replicating timestamps.
- Fixed bug in bidirectional replication.
- Fixed bug in the `BDB` storage engine that occurred when using an index on multiple-part key where a key part may be `NULL`.
- Fixed `MAX()` optimization on sub-key for `BDB` tables.
- Fixed problem where garbage results were returned when using `BDB` tables and `BLOB` or `TEXT` fields when joining many tables.
- Fixed a problem with `BDB` tables and `TEXT` columns.
- Fixed bug when using a `BLOB` key where a const row wasn't found.
- Fixed that `mysqlbinlog` writes the timestamp value for each query. This ensures that one gets same values for date functions like `NOW()` when using `mysqlbinlog` to pipe the queries to another server.
- Allow `--skip-gemini`, `--skip-bdb`, and `--skip-innodb` options to be specified when invoking `mysqld`, even if these storage engines are not compiled in to `mysqld`.
- You can now use `ASC` and `DESC` with `GROUP BY` columns to specify a sort order.
- Fixed a deadlock in the `SET` code, when one ran `SET @foo=bar`, where `bar` is a column reference, an error was not properly generated.

### D.3.28. Changes in release 3.23.33 (09 February 2001)

- Fixed DNS lookups not to use the same mutex as the hostname cache. This enables known hosts to be quickly resolved even if a DNS lookup takes a long time.
- Added `--character-sets-dir` option to `myisampack`.
- Removed warnings when running `REPAIR TABLE ... EXTENDED`.
- Fixed a bug that caused a core dump when using `GROUP BY` on an alias, where the alias was the same as an existing column name.
- Added `SEQUENCE()` as an example user-defined function.
- Changed `mysql_install_db` to use `BINARY` for `CHAR` columns in the privilege tables.
- Changed `TRUNCATE tbl_name` to `TRUNCATE TABLE tbl_name` to use the same syntax as Oracle. Until 4.0 we also allow `TRUNCATE tbl_name` to not crash old code.
- Fixed “no found rows” bug in `MyISAM` tables when a `BLOB` was first part of a multiple-part key.
- Fixed bug where `CASE` didn't work with `GROUP BY`.
- Added `--sort-recover` option to `myisamchk`.
- `myisamchk -S` and `OPTIMIZE TABLE` now work on Windows.
- Fixed bug when using `DISTINCT` on results from functions that referred to a group function, like:

```
SELECT a, DISTINCT SEC_TO_TIME(SUM(a))  
FROM tbl_name GROUP BY a, b;
```

- Fixed buffer overrun in `libmysqlclient` library. Fixed bug in handling `STOP` event after `ROTATE` event in replication.
- Fixed another buffer overrun in `DROP DATABASE`.
- Added `Table_locks_immediate` and `Table_locks_waited` status variables.
- Fixed bug in replication that broke slave server start with existing `master.info`. This fixes a bug introduced in 3.23.32.
- Added `SET SQL_SLAVE_SKIP_COUNTER=n` command to recover from replication glitches without a full database copy.
- Added `max_binlog_size` variable; the binary log is rotated automatically when the size crosses the limit.
- Added `Last_Error`, `Last_Errno`, and `Slave_skip_counter` variables to `SHOW SLAVE STATUS`.
- Fixed bug in `MASTER_POS_WAIT()` function.
- Execute core dump handler on `SIGILL`, and `SIGBUS` in addition to `SIGSEGV`.
- On x86 Linux, print the current query and thread (connection) id, if available, in the core dump handler.
- Fixed several timing bugs in the test suite.
- Extended `mysqltest` to take care of the timing issues in the test suite.

- `ALTER TABLE` can now be used to change the definition for a `MERGE` table.
- Fixed creation of `MERGE` tables on Windows.
- Portability fixes for OpenBSD and OS/2.
- Added `--temp-pool` option to `mysqld`. Using this option causes most temporary files created to use a small set of names, rather than a unique name for each new file. This is to work around a problem in the Linux kernel dealing with creating a bunch of new files with different names. With the old behavior, Linux seems to "leak" memory, as it's being allocated to the directory entry cache instead of the disk cache.

### D.3.29. Changes in release 3.23.32 (22 January 2001)

- Changed code to get around compiler bug in Compaq C++ on OSF/1, that broke `BACKUP TABLE`, `RESTORE TABLE`, `CHECK TABLE`, `REPAIR TABLE`, and `ANALYZE TABLE`.
- Added option `FULL` to `SHOW COLUMNS`. Now we show the privilege list for the columns only if this option is given.
- Fixed bug in `SHOW LOGS` when there weren't any `BDB` logs.
- Fixed a timing problem in replication that could delay sending an update to the client until a new update was done.
- Don't convert field names when using `mysql_list_fields()`. This is to keep this code compatible with `SHOW FIELDS`.
- `MERGE` tables didn't work on Windows.
- Fixed problem with `SET PASSWORD=...` on Windows.
- Added missing `my_config.h` to RPM distribution.
- `TRIM("foo" from "foo")` didn't return an empty string.
- Added `--with-version-suffix` option to `configure`.
- Fixed core dump when client aborted connection without `mysql_close()`.
- Fixed a bug in `RESTORE TABLE` when trying to restore from a non-existent directory.
- Fixed a bug which caused a core dump on the slave when replicating `SET PASSWORD`.
- Added `MASTER_POS_WAIT()` function.

### D.3.30. Changes in release 3.23.31 (17 January 2001: Production)

- The test suite now tests all reachable `BDB` interface code. During testing we found and fixed many errors in the interface code.
- Using `HAVING` on an empty table could produce one result row when it shouldn't.

- Fixed the MySQL RPM so it no longer depends on Perl5.
- Fixed some problems with `HEAP` tables on Windows.
- `SHOW TABLE STATUS` didn't show correct average row length for tables larger than 4GB.
- `CHECK TABLE ... EXTENDED` didn't check row links for fixed size tables.
- Added option `MEDIUM` to `CHECK TABLE`.
- Fixed problem when using `DECIMAL()` keys on negative numbers.
- `hour()` (and some other `TIME` functions) on a `CHAR` column always returned `NULL`.
- Fixed security bug in `SHOW GRANT` (please upgrade if you are using an earlier MySQL 3.23 version). ([CVE-2001-1275](http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1275) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1275>])
- Fixed buffer overflow bug when writing a certain error message. ([CVE-2001-1274](http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1274) [<http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1274>])
- Added usage of `setrlimit()` on Linux to get `-O --open_files_limit=val` to work on Linux.
- Added `bdb_version` variable to `mysqld`.
- Fixed bug when using expression of type:

```
SELECT ... FROM t1 LEFT JOIN t2 ON (t1.a=t2.a) WHERE t1.a=t2.a
```

In this case the test in the `WHERE` clause was wrongly optimized away.

- Fixed bug in `MyISAM` when deleting keys with possible `NULL` values, but the first key-column was not a prefix-compressed text column.
- Fixed `mysql.server` to read the `[mysql.server]` option file group rather than the `[mysql_server]` group.
- Fixed `safe_mysqld` and `mysql.server` to also read the `server` option section.
- Added `Threads_created` status variable to `mysqld`.

### D.3.31. Changes in release 3.23.30 (04 January 2001)

- Added `SHOW OPEN TABLES` command.
- Fixed that `myisamdump` works against old `mysqld` servers.
- Fixed `myisamchk -kN` so that it works again.
- Fixed a problem with replication when the binary log file went over 2G on 32-bit systems.
- `LOCK TABLES` now automatically starts a new transaction.
- Changed `BDB` tables to not use internal subtransactions and reuse open files to get more speed.
- Added `--mysqld=path` option to `safe_mysqld`.

- Allow hex constants in the `--fields-*--by` and `--lines-terminated-by` options to `mysqldump` and `mysqlimport`. By Paul DuBois.
- Added `--safe-show-database` option to `mysqld`.
- Added `have_bdb`, `have_gemini`, `have_innobase`, `have_raid` and `have_openssl` to `SHOW VARIABLES` to make it easy to test for supported extensions.
- Added `--open-files-limit` option to `mysqld`.
- Changed `--open-files` option to `--open-files-limit` in `safe_mysqld`.
- Fixed a bug where some rows were not found with `HEAP` tables that had many keys.
- Fixed that `--bdb-no-sync` works.
- Changed `--bdb-recover` to `--bdb-no-recover` as recover should be on by default.
- Changed the default number of `BDB` locks to 10000.
- Fixed a bug from 3.23.29 when allocating the shared structure needed for `BDB` tables.
- Changed `mysqld_multi.sh` to use configure variables. Patch by Christopher McCrory.
- Added fixing of include files for Solaris 2.8.
- Fixed bug with `--skip-networking` on Debian Linux.
- Fixed problem that some temporary files were reported as having the name `UNOPENED` in error messages.
- Fixed bug when running two simultaneous `SHOW LOGS` queries.

### D.3.32. Changes in release 3.23.29 (16 December 2000)

- Configure updates for Tru64, large file support, and better TCP wrapper support. By Albert Chin-A-Young.
- Fixed bug in `<=>` operator.
- Fixed bug in `REPLACE` with `BDB` tables.
- `LPAD( )` and `RPAD( )` shortens the result string if it's longer than the length argument.
- Added `SHOW LOGS` command.
- Remove unused `BDB` logs on shutdown.
- When creating a table, put `PRIMARY` keys first, followed by `UNIQUE` keys.
- Fixed a bug in `UPDATE` involving multiple-part keys where you specified all key parts both in the update and the `WHERE` part. In this case MySQL could try to update a record that didn't match the whole `WHERE` part.
- Changed drop table to first drop the tables and then the `.frm` file.
- Fixed a bug in the hostname cache which caused `mysqld` to report the hostname as `' '` in some er-

ror messages.

- Fixed a bug with `HEAP` type tables; the variable `max_heap_table_size` wasn't used. Now either `MAX_ROWS` or `max_heap_table_size` can be used to limit the size of a `HEAP` type table.
- Changed the default `server-id` value to 1 for masters and 2 for slaves to make it easier to use the binary log.
- Renamed `bdb_lock_max` variable to `bdb_max_lock`.
- Added support for `AUTO_INCREMENT` on sub-fields for `BDB` tables.
- Added `ANALYZE TABLE` of `BDB` tables.
- In `BDB` tables, we now store the number of rows; this helps to optimize queries when we need an approximation of the number of rows.
- If we get an error in a multiple-row statement, we now only roll back the last statement, not the entire transaction.
- If you do a `ROLLBACK` when you have updated a non-transactional table you get an error as a warning.
- Added `--bdb-shared-data` option to `mysqld`.
- Added `Slave_open_temp_tables` status variable to `mysqld`
- Added `binlog_cache_size` and `max_binlog_cache_size` variables to `mysqld`.
- `DROP TABLE`, `RENAME TABLE`, `CREATE INDEX` and `DROP INDEX` are now transaction endpoints.
- If you do a `DROP DATABASE` on a symbolically linked database, both the link and the original database are deleted.
- Fixed `DROP DATABASE` to work on OS/2.
- Fixed bug when doing a `SELECT DISTINCT ... table1 LEFT JOIN table2 ...` when `table2` was empty.
- Added `--abort-slave-event-count` and `--disconnect-slave-event-count` options to `mysqld` for debugging and testing of replication.
- Fixed replication of temporary tables. Handles everything except slave server restart.
- `SHOW KEYS` now shows whether key is `FULLTEXT`.
- New script `mysqld_multi`. See [Section 5.4.3, “mysqld\\_multi — Manage Multiple MySQL Servers”](#).
- Added new script, `mysql-multi.server.sh`. Thanks to Tim Bunce <Tim.Bunce@ig.co.uk> for modifying `mysql.server` to easily handle hosts running many `mysqld` processes.
- `safe_mysqld`, `mysql.server`, and `mysql_install_db` have been modified to use `mysql_print_defaults` instead of various hacks to read the `my.cnf` files. In addition, the handling of various paths has been made more consistent with how `mysqld` handles them by default.

- Automatically remove Berkeley DB transaction logs that no longer are in use.
- Fixed bug with several `FULLTEXT` indexes in one table.
- Added a warning if number of rows changes on `REPAIR TABLE/OPTIMIZE TABLE`.
- Applied patches for OS/2 by [Yuri Dario](#).
- `FLUSH TABLES tbl_name` didn't always flush the index tree to disk properly.
- `--bootstrap` is now run in a separate thread. This fixes a problem that caused `mysql_install_db` to core dump on some Linux machines.
- Changed `mi_create()` to use less stack space.
- Fixed bug with optimizer trying to over-optimize `MATCH()` when used with `UNIQUE` key.
- Changed `crash-me` and the MySQL benchmarks to also work with FrontBase.
- Allow `RESTRICT` and `CASCADE` after `DROP TABLE` to make porting easier.
- Reset status variable which could cause problem if one used `--slow-log`.
- Added `connect_timeout` variable to `mysql` and `mysqladmin`.
- Added `connect-timeout` as an alias for `timeout` for option files read by `mysql_options()`.

### D.3.33. Changes in release 3.23.28 (22 November 2000: Gamma)

- Added new options `--pager[=...]`, `--no-pager`, `--tee=...` and `--no-tee` to the `mysql` client. The new corresponding interactive commands are `pager`, `nopager`, `tee` and `notee`. See [Section 8.6, “mysql — The MySQL Command-Line Tool”](#), `mysql --help` and the interactive help for more information.
- Fixed crash when automatic repair of `MyISAM` table failed.
- Fixed a major performance bug in the table locking code when a lot of `SELECT`, `UPDATE` and `INSERT` statements constantly were running. The symptom was that the `UPDATE` and `INSERT` queries were locked for a long time while new `SELECT` statements were executed before the updates.
- When reading `options_files` with `mysql_options()` the `return-found-rows` option was ignored.
- You can now specify `interactive-timeout` in the option file that is read by `mysql_options()`. This makes it possible to force programs that run for a long time (like `mysqlhotcopy`) to use the `interactive_timeout` time instead of the `wait_timeout` time.
- Added to the slow query log the time and the username for each logged query. If you are using `--log-long-format` then also queries that do not use an index are logged, even if the query takes less than `long_query_time` seconds.
- Fixed a problem in `LEFT JOIN` which caused all columns in a reference table to be `NULL`.

- Fixed a problem when using `NATURAL JOIN` without keys.
- Fixed a bug when using a multiple-part keys where the first part was of type `TEXT` or `BLOB`.
- `DROP` of temporary tables wasn't stored in the update/binary log.
- Fixed a bug where `SELECT DISTINCT * ... LIMIT row_count` only returned one row.
- Fixed a bug in the assembler code in `strstr()` for SPARC and cleaned up the `global.h` header file to avoid a problem with bad aliasing with the compiler submitted with Red Hat 7.0. (Reported by Trond Eivind Glomsrød)
- The `--skip-networking` option now works properly on NT.
- Fixed a long outstanding bug in the `ISAM` tables when a row with a length of more than 65KB was shortened by a single byte.
- Fixed a bug in `MyISAM` when running multiple updating processes on the same table.
- Allow one to use `FLUSH TABLE tbl_name`.
- Added `--replicate-ignore-table`, `--replicate-do-table`, `--replicate-wild-ignore-table`, and `--replicate-wild-do-table` options to `mysqld`.
- Changed all log files to use our own `IO_CACHE` mechanism instead of `FILE` to avoid OS problems when there are many files open.
- Added `--open-files` and `--timezone` options to `safe_mysqld`.
- Fixed a fatal bug in `CREATE TEMPORARY TABLE ... SELECT ...`
- Fixed a problem with `CREATE TABLE ... SELECT NULL`.
- Added variables `large_file_support`, `net_read_timeout`, `net_write_timeout` and `query_buffer_size` to `SHOW VARIABLES`.
- Added status variables `Created_tmp_files` and `Sort_merge_passes` to `SHOW STATUS`.
- Fixed a bug where we didn't allow an index name after the `FOREIGN KEY` definition.
- Added `TRUNCATE tbl_name` as a synonym for `DELETE FROM tbl_name`.
- Fixed a bug in a `BDB` key compare function when comparing part keys.
- Added `bdb_lock_max` variable to `mysqld`.
- Added more tests to the benchmark suite.
- Fixed an overflow bug in the client code when using overly long database names.
- `mysql_connect()` now aborts on Linux if the server doesn't answer in `timeout` seconds.
- `SLAVE START` did not work if you started with `--skip-slave-start` and had not explicitly run `CHANGE MASTER TO`.
- Fixed the output of `SHOW MASTER STATUS` to be consistent with `SHOW SLAVE STATUS`. (It now has no directory in the log name.)
- Added `PURGE MASTER LOGS TO`.

- Added `SHOW MASTER LOGS` statement to display a list of binary log files.
- Added `--safemalloc-mem-limit` option to `mysqld` to simulate memory shortage when compiled with the `--with-debug=full` option.
- Fixed several core dumps in out-of-memory conditions.
- `SHOW SLAVE STATUS` was using an uninitialized mutex if the slave had not been started yet.
- Fixed bug in `ELT()` and `MAKE_SET()` when the query used a temporary table.
- `CHANGE MASTER TO` without specifying `MASTER_LOG_POS` would set it to 0 instead of 4 and hit the magic number in the master binary log.
- `ALTER TABLE ... ORDER BY ...` syntax added. This creates the new table with the rows in a specific order.

### D.3.34. Changes in release 3.23.27 (24 October 2000)

- Fixed a bug where the automatic repair of `MyISAM` tables sometimes failed when the data file was corrupt.
- Fixed a bug in `SHOW CREATE` when using `AUTO_INCREMENT` columns.
- Changed `BDB` tables to use new compare function in Berkeley DB 3.2.3.
- You can now use Unix socket files with MIT-pthreads.
- Added the `latin5` (turkish) character set.
- Small portability fixes.

### D.3.35. Changes in release 3.23.26 (18 October 2000)

- Renamed `FLUSH MASTER` and `FLUSH SLAVE` to `RESET MASTER` and `RESET SLAVE`.
- Fixed `<>` to work properly with `NULL`.
- Fixed a problem with `SUBSTRING_INDEX()` and `REPLACE()`. (Patch by Alexander Igonitchev)
- Fix `CREATE TEMPORARY TABLE IF NOT EXISTS` not to produce an error if the table exists.
- If you don't create a `PRIMARY KEY` in a `BDB` table, a hidden `PRIMARY KEY` is created.
- Added read-only-key optimization to `BDB` tables.
- `LEFT JOIN` in some cases preferred a full table scan when there was no `WHERE` clause.
- When using `--log-slow-queries`, don't count the time waiting for a lock.
- Fixed bug in lock code on Windows which could cause the key cache to report that the key file was crashed even if it was okay.
- Automatic repair of `MyISAM` tables if you start `mysqld` with `--myisam-recover`.

- Removed the `TYPE=` keyword from `CHECK TABLE` and `REPAIR TABLE`. Allow `CHECK TABLE` options to be combined. (You can still use `TYPE=`, but this usage is deprecated.)
- Fixed mutex bug in the binary replication log --- long update queries could be read only in part by the slave if it did it at the wrong time, which was not fatal, but resulted in a performance-degrading reconnect and a scary message in the error log.
- Changed the format of the binary log --- added magic number, server version, binary log version. Added the server ID and query error code for each query event.
- Replication thread from the slave now kills all the stale threads from the same server.
- Long replication usernames were not being handled properly.
- Added `--replicate-rewrite-db` option to `mysqld`.
- Added `--skip-slave-start` option to `mysqld`.
- Updates that generated an error code (such as `INSERT INTO foo(some_key) values (1), (1)`) erroneously terminated the slave thread.
- Added optimization of queries where `DISTINCT` is used only on columns from some of the tables.
- Allow floating-point numbers where there is no sign after the exponent (like `1e1`).
- `SHOW GRANTS` didn't always show all column grants.
- Added `--default-extra-file=file_name` option to all MySQL clients.
- Columns referenced in `INSERT` statements now are initialized properly.
- `UPDATE` didn't always work when used with a range on a timestamp that was part of the key that was used to find rows.
- Fixed a bug in `FULLTEXT` index when inserting a `NULL` column.
- Changed to use `mkstemp()` instead of `tempnam()`. Based on a patch from John Jones.

### D.3.36. Changes in release 3.23.25 (29 September 2000)

- Fixed that `dbname` works as second argument to `mysqlhotcopy`.
- The values for the `UMASK` and `UMASK_DIR` environment variables now can be specified in octal by beginning the value with a zero.
- Added `RIGHT JOIN`. This makes `RIGHT` a reserved word.
- Added `@@IDENTITY` as a synonym for `LAST_INSERT_ID()`. (This is for MSSQL compatibility.)
- Fixed a bug in `myisamchk` and `REPAIR TABLE` when using `FULLTEXT` index.
- `LOAD DATA INFILE` now works with FIFOs. (Patch by Toni L. Harbaugh-Blackford.)
- `FLUSH LOGS` broke replication if you specified a log name with an explicit extension as the value of the `log-bin` option.

- Fixed a bug in `MyISAM` with packed multiple-part keys.
- Fixed crash when using `CHECK TABLE` on Windows.
- Fixed a bug where `FULLTEXT` index always used the `koi8_ukr` character set.
- Fixed privilege checking for `CHECK TABLE`.
- The `MyISAM` repair/reindex code didn't use the `--tmpdir` option for its temporary files.
- Added `BACKUP TABLE` and `RESTORE TABLE`.
- Fixed core dump on `CHANGE MASTER TO` when the slave did not have the master to start with.
- Fixed incorrect `Time` in the processlist for `Connect` of the slave thread.
- The slave now logs when it connects to the master.
- Fixed a core dump bug when doing `FLUSH MASTER` if you didn't specify a filename argument to `-log-bin`.
- Added missing `ha_berkeley.x` files to the MySQL Windows distribution.
- Fixed some mutex bugs in the log code that could cause thread blocks if new log files couldn't be created.
- Added lock time and number of selected processed rows to slow query log.
- Added `--memlock` option to `mysqld` to lock `mysqld` in memory on systems with the `mlock-all()` call (as in Solaris).
- `HEAP` tables didn't use keys properly. (Bug from 3.23.23.)
- Added better support for `MERGE` tables (keys, mapping, creation, documentation...). See [Section 14.3, “The MERGE Storage Engine”](#).
- Fixed bug in `mysqldump` from 3.23 which caused some `CHAR` columns not to be quoted.
- Merged `analyze`, `check`, `optimize` and repair code.
- `OPTIMIZE TABLE` is now mapped to `REPAIR TABLE` with statistics and sorting of the index tree. This means that for the moment it only works on `MyISAM` tables.
- Added a pre-allocated block to `root_malloc` to get fewer mallocs.
- Added a lot of new statistics variables.
- Fixed `ORDER BY` bug with `BDB` tables.
- Removed warning that `mysqld` couldn't remove the `.pid` file under Windows.
- Changed `--log-isam` to log `MyISAM` tables instead of `isam` tables.
- Fixed `CHECK TABLE` to work on Windows.
- Added file mutexes to make `pwrite()` safe on Windows.

### D.3.37. Changes in release 3.23.24 (08 September 2000)

- Added `Created_tmp_disk_tables` variable to `mysqld`.
- To make it possible to reliably dump and restore tables with `TIMESTAMP(X)` columns, MySQL now reports columns with `X` other than 14 or 8 to be strings.
- Changed sort order for `latin1` as it was before MySQL 3.23.23. Any table that was created or modified with 3.23.22 must be repaired if it has `CHAR` columns that may contain characters with ASCII values greater than 128!
- Fixed small memory leak introduced from 3.23.22 when creating a temporary table.
- Fixed problem with `BDB` tables and reading on a unique (not primary) key.
- Restored the `win1251` character set (it's now only marked deprecated).

### D.3.38. Changes in release 3.23.23 (01 September 2000)

- Changed sort order for 'German'; all tables created with 'German' sortorder must be repaired with `REPAIR TABLE` or `myisamchk` before use!
- Added `--core-file` option to `mysqld` to get a core file on Linux if `mysqld` dies on the `SIGSEGV` signal.
- MySQL client `mysql` now starts with option `--no-named-commands (-g)` by default. This option can be disabled with `--enable-named-commands (-G)`. This may cause incompatibility problems in some cases, for example, in SQL scripts that use named commands without a semi-colon! Long format commands still work from the first line.
- Fixed a problem when using many pending `DROP TABLE` statements at the same time.
- Optimizer didn't use keys properly when using `LEFT JOIN` on an empty table.
- Added shorter help text when invoking `mysqld` with incorrect options.
- Fixed non-fatal `free()` bug in `mysqlimport`.
- Fixed bug in MyISAM index handling of `DECIMAL/NUMERIC` keys.
- Fixed a bug in concurrent insert in MyISAM tables. In some contexts, usage of `MIN(key_part)` or `MAX(key_part)` returned an empty set.
- Updated `mysqlhotcopy` to use the new `FLUSH TABLES table_list` syntax. Only tables which are being backed up are flushed now.
- Changed behavior of `--enable-thread-safe-client` so that both non-threaded (`-lmysqlclient`) and threaded (`-lmysqlclient_r`) libraries are built. Users who linked against a threaded `-lmysqlclient` need to link against `-lmysqlclient_r` now.
- Added atomic `RENAME TABLE` command.
- Don't count `NULL` values in `COUNT(DISTINCT ...)`.
- Changed `ALTER TABLE`, `LOAD DATA INFILE` on empty tables and `INSERT ... SELECT ...` on empty tables to create non-unique indexes in a separate batch with sorting. This makes these statements much faster when you have many indexes.
- `ALTER TABLE` now logs the first used `insert_id` correctly.

- Fixed crash when adding a default value to a `BLOB` column.
- Fixed a bug with `DATE_ADD/DATE_SUB` where it returned a datetime instead of a date.
- Fixed a problem with the thread cache which made some threads show up as `***DEAD***` in `SHOW PROCESSLIST`.
- Fixed a lock in our `thr_rwlock` code, which could make selects that run at the same time as concurrent inserts crash. This affects only systems that don't have the `pthread_rwlock_rdlock` code.
- When deleting rows with a non-unique key in a `HEAP` table, all rows weren't always deleted.
- Fixed bug in range optimizer for `HEAP` tables for searches on a part index.
- Fixed `SELECT` on part keys to work with `BDB` tables.
- Fixed `INSERT INTO bdb_table ... SELECT` to work with `BDB` tables.
- `CHECK TABLE` now updates key statistics for the table.
- `ANALYZE TABLE` now only updates tables that have been changed since the last `ANALYZE TABLE`. Note that this is a new feature and tables are not marked to be analyzed until they are updated in any way with 3.23.23 or newer. For older tables, you have to do `CHECK TABLE` to update the key distribution.
- Fixed some minor privilege problems with `CHECK TABLE`, `ANALYZE TABLE`, `REPAIR TABLE` and `SHOW CREATE` commands.
- Added `CHANGE MASTER TO` statement.
- Added `FAST`, `QUICK` `EXTENDED` check types to `CHECK TABLES`.
- Changed `myisamchk` so that `--fast` and `--check-only-changed` are also honored with `--sort-index` and `--analyze`.
- Fixed fatal bug in `LOAD TABLE FROM MASTER` that did not lock the table during index re-build.
- `LOAD DATA INFILE` broke replication if the database was excluded from replication.
- More variables in `SHOW SLAVE STATUS` and `SHOW MASTER STATUS`.
- `SLAVE STOP` now does not return until the slave thread actually exits.
- Full-text search via the `MATCH()` function and `FULLTEXT` index type (for `MyISAM` files). This makes `FULLTEXT` a reserved word.

### D.3.39. Changes in release 3.23.22 (31 July 2000)

- Fixed that `lex_hash.h` is created properly for each MySQL distribution.
- Fixed that `MASTER` and `COLLECTION` are not reserved words.
- The log generated by `--slow-query-log` didn't contain the whole queries.
- Fixed that open transactions in `BDB` tables are rolled back if the connection is closed unexpectedly.
- Added workaround for a bug in `gcc 2.96` (intel) and `gcc 2.9` (IA-64) in `gen_lex_hash.c`.

- Fixed memory leak in the client library when using `host=` in the `my.cnf` file.
- Optimized functions that manipulate the hours/minutes/seconds.
- Fixed bug when comparing the result of `DATE_ADD()`/`DATE_SUB()` against a number.
- Changed the meaning of `-F`, `--fast` for `myisamchk`. Added `-C`, `--check-only-changed` option to `myisamchk`.
- Added `ANALYZE tbl_name` to update key statistics for tables.
- Changed binary items `0x...` to be regarded as integers by default.
- Fix for SCO and `SHOW PROCESSLIST`.
- Added `auto-rehash` on reconnect for the `mysql` client.
- Fixed a newly introduced bug in `MyISAM`, where the index file couldn't get bigger than 64MB.
- Added `SHOW MASTER STATUS` and `SHOW SLAVE STATUS`.

### D.3.40. Changes in release 3.23.21 (04 July 2000)

- Added `mysql_character_set_name()` function to the MySQL C API.
- Made the update log ASCII 0 safe.
- Added the `mysql_config` script.
- Fixed problem when using `<` or `>` with a char column that was only partly indexed.
- One would get a core dump if the log file was not readable by the MySQL user.
- Changed `mysqladmin` to use `CREATE DATABASE` and `DROP DATABASE` statements instead of the old deprecated API calls.
- Fixed `chown` warning in `safe_mysqld`.
- Fixed a bug in `ORDER BY` that was introduced in 3.23.19.
- Only optimize the `DELETE FROM tbl_name` to do a drop+create of the table if we are in `AUTO-COMMIT` mode (needed for `BDB` tables).
- Added extra checks to avoid index corruption when the `ISAM/MyISAM` index files get full during an `INSERT/UPDATE`.
- `myisamchk` didn't correctly update row checksum when used with `-ro` (this only gave a warning in subsequent runs).
- Fixed bug in `REPAIR TABLE` so that it works with tables without indexes.
- Fixed buffer overrun in `DROP DATABASE`.
- `LOAD TABLE FROM MASTER` is sufficiently bug-free to announce it as a feature.
- `MATCH` and `AGAINST` are now reserved words.

### D.3.41. Changes in release 3.23.20 (28 June 2000: Beta)

- Fixed bug in 3.23.19; `DELETE FROM tbl_name` removed the `.frm` file.
- Added `SHOW CREATE TABLE`.

### D.3.42. Changes in release 3.23.19

- Changed copyright for all files to GPL for the server code and utilities and to LGPL for the client libraries. See <http://www.fsf.org/licenses/>.
- Fixed bug where all rows matching weren't updated on a `MyISAM` table when doing update based on key on a table with many keys and some key changed values.
- The Linux MySQL RPMs and binaries are now statically linked with a `linuxthread` version that has faster mutex handling when used with MySQL.
- `ORDER BY` can now use `REF` keys to find subsets of the rows that need to be sorted.
- Changed name of `print_defaults` program to `my_print_defaults` to avoid name confusion.
- Fixed `NULLIF()` to work as required by standard SQL.
- Added `net_read_timeout` and `net_write_timeout` as startup parameters to `mysqld`.
- Fixed bug that destroyed index when doing `myisamchk --sort-records` on a table with prefix compressed index.
- Added `pack_isam` and `myisampack` to the standard MySQL distribution.
- Added the syntax `BEGIN WORK` (the same as `BEGIN`).
- Fixed core dump bug when using `ORDER BY` on a `CONV()` expression.
- Added `LOAD TABLE FROM MASTER`.
- Added `FLUSH MASTER` and `FLUSH SLAVE`.
- Fixed big/little endian problem in the replication.

### D.3.43. Changes in release 3.23.18 (11 June 2000)

- Fixed a problem from 3.23.17 when choosing character set on the client side.
- Added `FLUSH TABLES WITH READ LOCK` to make a global lock suitable for making a copy of MySQL data files.
- `CREATE TABLE ... SELECT ... PROCEDURE` now works.
- Internal temporary tables now use compressed index when using `GROUP BY` on `VARCHAR/CHAR` columns.
- Fixed a problem when locking the same table with both a `READ` and a `WRITE` lock.

- Fixed problem with `myisamchk` and `RAID` tables.

### D.3.44. Changes in release 3.23.17 (07 June 2000)

- Fixed a bug in `FIND_IN_SET()` when the first argument was `NULL`.
- Added table locks to Berkeley DB.
- Fixed a bug with `LEFT JOIN` and `ORDER BY` where the first table had only one matching row.
- Added 4 sample `my.cnf` example files in the `support-files` directory.
- Fixed `duplicated key` problem when doing big `GROUP BY` operations. (This bug was probably introduced in 3.23.15.)
- Changed syntax for `INNER JOIN` to match standard SQL.
- Added `NATURAL JOIN` syntax.
- A lot of fixes in the `BDB` interface.
- Added handling of `--no-defaults` and `--defaults-file` to `safe_mysqld.sh` and `mysql_install_db.sh`.
- Fixed bug in reading compressed tables with many threads.
- Fixed that `USE INDEX` works with `PRIMARY` keys.
- Added `BEGIN` statement to start a transaction in `AUTOCOMMIT` mode.
- Added support for symbolic links for Windows.
- Changed protocol to let client know if the server is in `AUTOCOMMIT` mode and if there is a pending transaction. If there is a pending transaction, the client library gives an error before reconnecting to the server to let the client know that the server did a rollback. The protocol is still backward-compatible with old clients.
- `KILL` now works on a thread that is locked on a 'write' to a dead client.
- Fixed memory leak in the replication slave thread.
- Added new `log-slave-updates` option to `mysqld`, to allow daisy-chaining the slaves.
- Fixed compile error on FreeBSD and other systems where `pthread_t` is not the same as `int`.
- Fixed master shutdown aborting the slave thread.
- Fixed a race condition in `INSERT DELAYED` code when doing `ALTER TABLE`.
- Added deadlock detection sanity checks to `INSERT DELAYED`.

### D.3.45. Changes in release 3.23.16 (16 May 2000)

- Added `SLAVE START` and `SLAVE STOP` statements.

- Added `TYPE=QUICK` option to `CHECK TABLE` and to `REPAIR TABLE`.
- Fixed bug in `REPAIR TABLE` when the table was in use by other threads.
- Added a thread cache to make it possible to debug MySQL with `gdb` when one does a lot of reconnects. This also improves systems where you can't use persistent connections.
- Lots of fixes in the Berkeley DB interface.
- `UPDATE IGNORE` does not abort if an update results in a `DUPLICATE_KEY` error.
- Put `CREATE TEMPORARY TABLE` commands in the update log.
- Fixed bug in handling of masked IP numbers in the privilege tables.
- Fixed bug with `delay_key_write` tables and `CHECK TABLE`.
- Added `--replicate-do-db` and `--replicate-ignore-db` options to `mysqld`, to restrict which databases get replicated.
- Added `SQL_LOG_BIN` option.

### D.3.46. Changes in release 3.23.15 (08 May 2000)

- To start `mysqld` as `root`, you must now use the `--user=root` option.
- Added interface to Berkeley DB. (This is not yet functional; play with it at your own risk!)
- Replication between master and slaves.
- Fixed bug that other threads could steal a lock when a thread had a lock on a table and did a `FLUSH TABLES` command.
- Added the `slow_launch_time` variable and the `Slow_launch_threads` status variable to `mysqld`. These can be examined with `mysqladmin variables` and `mysqladmin extended-status`.
- Added functions `INET_NTOA()` and `INET_ATON()`.
- The default type of `IF()` now depends on the second and third arguments and not only on the second argument.
- Fixed case when `myisamchk` could go into a loop when trying to repair a crashed table.
- Don't write `INSERT DELAYED` to update log if `SQL_LOG_UPDATE=0`.
- Fixed problem with `REPLACE` on `HEAP` tables.
- Added possible character sets and time zone to `SHOW VARIABLES` output.
- Fixed bug in locking code that could result in locking problems with concurrent inserts under high load.
- Fixed a problem with `DELETE` of many rows on a table with compressed keys where MySQL scanned the index to find the rows.
- Fixed problem with `CHECK TABLE` on table with deleted keyblocks.

- Fixed a bug in reconnect (at the client side) where it didn't free memory properly in some contexts.
- Fixed problems in update log when using `LAST_INSERT_ID()` to update a table with an `AUTO_INCREMENT` key.
- Added `NULLIF()` function.
- Fixed bug when using `LOAD DATA INFILE` on a table with `BLOB/TEXT` columns.
- Optimized `MyISAM` to be faster when inserting keys in sorted order.
- `EXPLAIN SELECT . . .` now also prints out whether MySQL needs to create a temporary table or use file sorting when resolving the `SELECT`.
- Added optimization to skip `ORDER BY` parts where the part is a constant expression in the `WHERE` part. Indexes can now be used even if the `ORDER BY` doesn't match the index exactly, as long as all the unused index parts and all the extra `ORDER BY` columns are constants in the `WHERE` clause. See [Section 7.4.5, "How MySQL Uses Indexes"](#).
- `UPDATE` and `DELETE` on a whole unique key in the `WHERE` part are now faster than before.
- Changed `RAID_CHUNKSIZE` to be in 1024-byte increments.
- Fixed core dump in `LOAD_FILE(NULL)`.

### D.3.47. Changes in release 3.23.14 (09 April 2000)

- Added `mysqlbinlog` program for displaying binary log files in text format.
- Added `mysql_real_escape_string()` function to the MySQL C API.
- Fixed a bug in `CONCAT()` where one of the arguments was a function that returned a modified argument.
- Fixed a critical bug in `myisamchk`, where it updated the header in the index file when one only checked the table. This confused the `mysqld` daemon if it updated the same table at the same time. Now the status in the index file is only updated if one uses `--update-state`. With older `myisamchk` versions you should use `--read-only` when only checking tables, if there is the slightest chance that the `mysqld` server is working on the table at the same time!
- Fixed that `DROP TABLE` is logged in the update log.
- Fixed problem when searching on `DECIMAL()` key field where the column data contained leading zeros.
- Fix bug in `myisamchk` when the `AUTO_INCREMENT` column isn't the first key.
- Allow `DATETIME` in ISO8601 format: 2000-03-12T12:00:00
- Dynamic character sets. A `mysqld` binary can now handle many different character sets (you can choose which when starting `mysqld`).
- Added `REPAIR TABLE` statement.
- Added `mysql_thread_safe()` function to the MySQL C API.
- Added the `UMASK_DIR` environment variable.

- Added `CONNECTION_ID()` function to return the client connection thread ID.
- When using `=` on `BLOB` or `VARCHAR BINARY` keys, where only a part of the column was indexed, the whole column of the result row wasn't compared.
- Fix for `sjis` character set and `ORDER BY`.
- When running in ANSI mode, don't allow columns to be used that aren't in the `GROUP BY` part.

### D.3.48. Changes in release 3.23.13 (14 March 2000)

- Fixed problem when doing locks on the same table more than 2 times in the same `LOCK TABLE` command; this fixed the problem one got when running the test-ATIS test with `--fast` or `-check-only-changed`.
- Added `SQL_BUFFER_RESULT` option to `SELECT`.
- Removed endspace from double/float numbers in results from temporary tables.
- Added `CHECK TABLE` command.
- Added changes for `MyISAM` in 3.23.12 that didn't get into the source distribution because of CVS problems.
- Fixed bug so that `mysqladmin shutdown` waits for the local server to close down.
- Fixed a possible endless loop when calculating timestamp.
- Added `print_defaults` program to the `.rpm` files. Removed `mysqlbug` from the client `.rpm` file.

### D.3.49. Changes in release 3.23.12 (07 March 2000)

- Fixed bug in `MyISAM` involving `REPLACE ... SELECT ...` which could give a corrupted table.
- Fixed bug in `myisamchk` where it incorrectly reset the `AUTO_INCREMENT` value.
- LOTS of patches for Linux Alpha. MySQL now appears to be relatively stable on Alpha.
- Changed `DISTINCT` on `HEAP` temporary tables to use hashed keys to quickly find duplicated rows. This mostly concerns queries of type `SELECT DISTINCT ... GROUP BY ...`. This fixes a problem where not all duplicates were removed in queries of the above type. In addition, the new code is MUCH faster.
- Added patches to make MySQL compile on Mac OS X.
- Added `IF NOT EXISTS` clause to `CREATE DATABASE`.
- Added `--all-databases` and `--databases` options to `mysqldump` to allow dumping of many databases at the same time.
- Fixed bug in compressed `DECIMAL()` index in `MyISAM` tables.
- Fixed bug when storing 0 into a timestamp.

- When doing `mysqladmin shutdown` on a local connection, `mysqladmin` now waits until the PID file is gone before terminating.
- Fixed core dump with some `COUNT(DISTINCT ...)` queries.
- Fixed that `myisamchk` works properly with RAID tables.
- Fixed problem with `LEFT JOIN` and `key_col IS NULL`.
- Fixed bug in `net_clear()` which could give the error `Aborted connection` in the MySQL clients.
- Added options `USE INDEX (key_list)` and `IGNORE INDEX (key_list)` as parameters in `SELECT`.
- `DELETE` and `RENAME` should now work on RAID tables.

### D.3.50. Changes in release 3.23.11 (16 February 2000)

- Added `HIGH_PRIORITY` option to `INSERT`. This overrides the effect of the `-low-priority-updates` server option and does not perform concurrent inserts.
- Allow the `ALTER TABLE tbl_name ADD (field_list)` syntax.
- Fixed problem with optimizer that could sometimes use incorrect keys.
- Fixed that `GRANT/REVOKE ALL PRIVILEGES` doesn't affect `GRANT OPTION`.
- Removed extra `'` from the output of `SHOW GRANTS`.
- Fixed problem when storing numbers in timestamps.
- Fix problem with time zones that have half hour offsets.
- Allow the syntax `UNIQUE INDEX` in `CREATE` statements.
- `mysqlhotcopy` - fast online hot-backup utility for local MySQL databases. By Tim Bunce.
- New more secure `mysqlaccess`. Thanks to Steve Harvey for this.
- Added `--i-am-a-dummy` and `--safe-updates` options to `mysql`.
- Added `select_limit` and `max_join_size` variables to `mysql`.
- Added `SQL_MAX_JOIN_SIZE` and `SQL_SAFE_UPDATES` options.
- Added `READ LOCAL` lock that doesn't lock the table for concurrent inserts. (This is used by `mysqldump`.)
- Changed that `LOCK TABLES ... READ` no longer allows concurrent inserts.
- Added `--skip-delay-key-write` option to `mysqld`.
- Fixed security problem in the protocol regarding password checking.
- `_rowid` can now be used as an alias for an integer type unique indexed column.

- Added back blocking of `SIGPIPE` when compiling with `--thread-safe-clients` to make things safe for old clients.

### D.3.51. Changes in release 3.23.10 (30 January 2000)

- Fixed bug in 3.23.9 where memory wasn't properly freed when using `LOCK TABLES`.

### D.3.52. Changes in release 3.23.9 (29 January 2000)

- Fixed problem that affected queries that did arithmetic on group functions.
- Fixed problem with timestamps and `INSERT DELAYED`.
- Fixed that `date_col BETWEEN const_date AND const_date` works.
- Fixed problem when only changing a 0 to `NULL` in a table with `BLOB/TEXT` columns.
- Fixed bug in range optimizer when using many key parts and or on the middle key parts: `WHERE K1=1 and K3=2 and (K2=2 and K4=4 or K2=3 and K4=5)`
- Added `source` command to `mysql` to allow reading of batch files inside the `mysql` client. Original patch by Matthew Vanecek.
- Fixed critical problem with the `WITH GRANT OPTION` option.
- Don't give an unnecessary `GRANT` error when using tables from many databases in the same query.
- Added VIO wrapper (needed for SSL support; by Andrei Errapart and Tõnu Samuel).
- Fixed optimizer problem on `SELECT` when using many overlapping indexes. MySQL should now be able to choose keys even better when there are many keys to choose from.
- Changed optimizer to prefer a range key instead of a ref key when the range key can use more columns than the ref key (which only can use columns with `=`). For example, the following type of queries should now be faster: `SELECT * from key_part_1=const and key_part_2 > const2`
- Fixed bug that a change of all `VARCHAR` columns to `CHAR` columns didn't change row type from dynamic to fixed.
- Disabled floating-point exceptions for FreeBSD to fix core dump when doing `SELECT FLOOR(POW(2,63))`.
- Renamed `mysqld` startup option from `--delay-key-write` to `--delay-key-write-for-all-tables`.
- Added `read-next-on-key` to `HEAP` tables. This should fix all problems with `HEAP` tables when using non-`UNIQUE` keys.
- Added option to print default arguments to all clients.
- Added `--log-slow-queries` option to `mysqld` to log all queries that take a long time to a separate log file with a time indicating how long the query took.

- Fixed core dump when doing `WHERE key_col=RAND(...)`.
- Fixed optimization bug in `SELECT ... LEFT JOIN ... key_col IS NULL`, when `key_col` could contain `NULL` values.
- Fixed problem with 8-bit characters as separators in `LOAD DATA INFILE`.

### D.3.53. Changes in release 3.23.8 (02 January 2000)

- Fixed problem when handling indexfiles larger than 8GB.
- Added latest patches to MIT-pthreads for NetBSD.
- Fixed problem with time zones that are < GMT - 11.
- Fixed a bug when deleting packed keys in `NISAM`.
- Fixed problem with `ISAM` when doing some `ORDER BY ... DESC` queries.
- Fixed bug when doing a join on a text key which didn't cover the whole key.
- Option `--delay-key-write` didn't enable delayed key writing.
- Fixed update of `TEXT` column which involved only case changes.
- Fixed that `INSERT DELAYED` doesn't update timestamps that are given.
- Added function `YEARWEEK()` and options `x`, `X`, `v` and `V` to `DATE_FORMAT()`.
- Fixed problem with `MAX(indexed_column)` and `HEAP` tables.
- Fixed problem with `BLOB NULL` keys and `LIKE "prefix%"`.
- Fixed problem with `MyISAM` and fixed-length rows < 5 bytes.
- Fixed problem that could cause MySQL to touch freed memory when doing very complicated `GROUP BY` queries.
- Fixed core dump if you got a crashed table where an `ENUM` field value was too big.

### D.3.54. Changes in release 3.23.7 (10 December 1999)

- Fixed workaround under Linux to avoid problems with `pthread_mutex_timedwait()`, which is used with `INSERT DELAYED`. See [Section 2.13.1, "Linux Notes"](#).
- Fixed that one get a 'disk full' error message if one gets disk full when doing sorting (instead of waiting until we got more disk space).
- Fixed a bug in `MyISAM` with keys > 250 characters.
- In `MyISAM` one can now do an `INSERT` at the same time as other threads are reading from the table.
- Added `max_write_lock_count` variable to `mysqld` to force a `READ` lock after a certain number of `WRITE` locks.

- Inverted flag `delay_key_write` on `show variables`.
- Renamed `concurrency` variable to `thread_concurrency`.
- The following functions are now multi-byte-safe: `LOCATE(substr, str)`, `POSITION(substr IN str)`, `LOCATE(substr, str, pos)`, `INSTR(str, substr)`, `LEFT(str, len)`, `RIGHT(str, len)`, `SUBSTRING(str, pos, len)`, `SUBSTRING(str FROM pos FOR len)`, `MID(str, pos, len)`, `SUBSTRING(str, pos)`, `SUBSTRING(str FROM pos)`, `SUBSTRING_INDEX(str, delim, count)`, `RTRIM(str)`, `TRIM([[BOTH | TRAILING] [remstr] FROM] str)`, `REPLACE(str, from_str, to_str)`, `REVERSE(str)`, `INSERT(str, pos, len, newstr)`, `LCASE(str)`, `LOWER(str)`, `UCASE(str)` and `UPPER(str)`; patch by Wei He.
- Fix core dump when releasing a lock from a non-existent table.
- Remove locks on tables before starting to remove duplicates.
- Added option `FULL` to `SHOW PROCESSLIST`.
- Added option `--verbose` to `mysqladmin`.
- Fixed problem when automatically converting `HEAP` to `MyISAM`.
- Fixed bug in `HEAP` tables when doing insert + delete + insert + scan the table.
- Fixed bugs on Alpha with `REPLACE()` and `LOAD DATA INFILE`.
- Added `interactive_timeout` variable to `mysqld`.
- Changed the argument to `mysql_data_seek()` from `ulong` to `ulonglong`.

### D.3.55. Changes in release 3.23.6 (15 December 1999)

- Added `-O lower_case_table_names={0|1}` option to `mysqld` to allow users to force table names to lowercase.
- Added `SELECT ... INTO DUMPFILE`.
- Added `--ansi` option to `mysqld` to make some functions standard SQL compatible.
- Temporary table names now start with `#sql`.
- Added quoting of identifiers with ``` (" in `--ansi` mode).
- Changed to use `snprintf()` when printing floats to avoid some buffer overflows on FreeBSD.
- Made `FLOOR()` overflow safe on FreeBSD.
- Added `--quote-names` option to `mysqldump`.
- Fixed bug that one could make a part of a `PRIMARY KEY NOT NULL`.
- Fixed `encrypt()` to be thread-safe and not reuse buffer.
- Added `mysql_odbc_escape_string()` function to support big5 characters in MyODBC.
- Rewrote the storage engine to use classes. This introduces a lot of new code, but make table hand-

ling faster and better.

- Added patch by Sasha for user-defined variables.
- Changed that `FLOAT` and `DOUBLE` (without any length modifiers) no longer are fixed decimal point numbers.
- Changed the meaning of `FLOAT(X)`: Now this is the same as `FLOAT` if  $X \leq 24$  and a `DOUBLE` if  $24 < X \leq 53$ .
- `DECIMAL(X)` is now an alias for `DECIMAL(X, 0)` and `DECIMAL` is now an alias for `DECIMAL(10, 0)`. The same goes for `NUMERIC`.
- Added option `ROW_FORMAT={DEFAULT | DYNAMIC | FIXED | COMPRESSED}` to `CREATE TABLE`.
- `DELETE FROM tbl_name` didn't work on temporary tables.
- Changed function `CHAR_LENGTH()` to be multi-byte character safe.
- Added function `ORD(string)`.

### D.3.56. Changes in release 3.23.5 (20 October 1999)

- Fixed some Y2K problems in the new date handling in 3.23.
- Fixed problem with `SELECT DISTINCT ... ORDER BY RAND()`.
- Added patches by Sergei A. Golubchik for text searching on the `MyISAM` level.
- Fixed cache overflow problem when using full joins without keys.
- Fixed some configure issues.
- Some small changes to make parsing faster.
- Adding a column after the last field with `ALTER TABLE` didn't work.
- Fixed problem when using an `AUTO_INCREMENT` column in two keys
- With `MyISAM`, you now can have an `AUTO_INCREMENT` column as a key sub part: `CREATE TABLE foo (a INT NOT NULL AUTO_INCREMENT, b CHAR(5), PRIMARY KEY (b,a))`
- Fixed bug in `MyISAM` with packed char keys that could be `NULL`.
- `AS` on field name with `CREATE TABLE tbl_name SELECT ...` didn't work.
- Allow use of `NATIONAL` and `NCHAR` when defining character columns. This is the same as not using `BINARY`.
- Don't allow `NULL` columns in a `PRIMARY KEY` (only in `UNIQUE` keys).
- Clear `LAST_INSERT_ID()` if one uses this in ODBC: `WHERE auto_increment_column IS NULL`. This seems to fix some problems with Access.
- `SET SQL_AUTO_IS_NULL=0 | 1` now turns on/off the handling of searching for the last inserted

row with `WHERE auto_increment_column IS NULL`.

- Added new variable `concurrency` to `mysqld` for Solaris.
- Added `--relative` option to `mysqladmin` to make `extended-status` more useful to monitor changes.
- Fixed bug when using `COUNT(DISTINCT ...)` on an empty table.
- Added support for the Chinese character set GBK.
- Fixed problem with `LOAD DATA INFILE` and `BLOB` columns.
- Added bit operator `~` (negation).
- Fixed problem with user-defined functions.

### D.3.57. Changes in release 3.23.4 (28 September 1999)

- Inserting a `DATETIME` into a `TIME` column no longer try to store 'days' in it.
- Fixed problem with storage of float/double on little endian machines. (This affected `SUM( )`.)
- Added connect timeout on TCP/IP connections.
- Fixed problem with `LIKE "%"` on an index that may have `NULL` values.
- `REVOKE ALL PRIVILEGES` didn't revoke all privileges.
- Allow creation of temporary tables with same name as the original table.
- When granting an account a `GRANT` option for a database, the account couldn't grant privileges to other users.
- New statement: `SHOW GRANTS FOR user` (by Sinisa).
- New `date_add` syntax: `date/datetime + INTERVAL # interval_type`. By Joshua Chamas.
- Fixed privilege check for `LOAD DATA REPLACE`.
- Automatic fixing of broken include files on Solaris 2.7
- Some configure issues to fix problems with big filesystem detection.
- `REGEXP` is now case-insensitive if you use non-binary strings.

### D.3.58. Changes in release 3.23.3 (13 September 1999)

- Added patches for MIT-pthreads on NetBSD.
- Fixed range bug in `MyISAM`.
- `ASC` is now the default again for `ORDER BY`.

- Added `LIMIT` to `UPDATE`.
- Added `mysql_change_user()` function to the MySQL C API.
- Added character set to `SHOW VARIABLES`.
- Added support of `--[whitespace]` comments.
- Allow `INSERT INTO tbl_name VALUES ()`, that is, you may now specify an empty value list to insert a row in which each column is set to its default value.
- Changed `SUBSTRING(text FROM pos)` to conform to standard SQL. (Before this construct returned the rightmost `pos` characters.)
- `SUM()` with `GROUP BY` returned 0 on some systems.
- Changed output for `SHOW TABLE STATUS`.
- Added `DELAY_KEY_WRITE` option to `CREATE TABLE`.
- Allow `AUTO_INCREMENT` on any key part.
- Fixed problem with `YEAR(NOW())` and `YEAR(CURDATE())`.
- Added `CASE` construct.
- New `COALESCE()` function.

### D.3.59. Changes in release 3.23.2 (09 August 1999)

- Fixed range optimizer bug: `SELECT * FROM tbl_name WHERE key_part1 >= const AND (key_part2 = const OR key_part2 = const)`. The bug was that some rows could be duplicated in the result.
- Running `myisamchk` without `-a` updated the index distribution incorrectly.
- `SET SQL_LOW_PRIORITY_UPDATES=1` was causing a parse error.
- You can now update index columns that are used in the `WHERE` clause. `UPDATE tbl_name SET KEY=KEY+1 WHERE KEY > 100`
- Date handling should now be a bit faster.
- Added handling of fuzzy dates (dates where day or month is 0), such as `'1999-01-00'`.
- Fixed optimization of `SELECT ... WHERE key_part1=const1 AND key_part_2=const2 AND key_part1=const4 AND key_part2=const4`; indextype should be `range` instead of `ref`.
- Fixed `egcs` 1.1.2 optimizer bug (when using `BLOB` values) on Linux Alpha.
- Fixed problem with `LOCK TABLES` combined with `DELETE FROM table`.
- `MyISAM` tables now allow keys on `NULL` and `BLOB/TEXT` columns.
- The following join is now much faster: `SELECT ... FROM t1 LEFT JOIN t2 ON ... WHERE t2.not_null_column IS NULL`.

- `ORDER BY` and `GROUP BY` can be done on functions.
- Changed handling of 'const\_item' to allow handling of `ORDER BY RAND()`.
- Indexes are now used for `WHERE key_column = function`.
- Indexes are now used for `WHERE key_column = col_name` even if the columns are not identically packed.
- Indexes are now used for `WHERE col_name IS NULL`.
- Changed heap tables to be stored in `low_byte_first` order (to make it easy to convert to `MyISAM` tables)
- Automatic change of `HEAP` temporary tables to `MyISAM` tables in case of “table is full” errors.
- Added `--init-file=file_name` option to `mysqld`.
- Added `COUNT(DISTINCT value, [value, ...])`.
- `CREATE TEMPORARY TABLE` now creates a temporary table, in its own namespace, that is automatically deleted if connection is dropped.
- New reserved words (required for `CASE`): `CASE`, `THEN`, `WHEN`, `ELSE` and `END`.
- New functions `EXPORT_SET()` and `MD5()`.
- Support for the GB2312 Chinese character set.

### D.3.60. Changes in release 3.23.1 (08 July 1999)

- Fixed some compilation problems.

### D.3.61. Changes in release 3.23.0 (05 July 1999: Alpha)

- A new storage engine library (`MyISAM`) with a lot of new features. See [Section 14.1, “The MyISAM Storage Engine”](#).
- You can create in-memory `HEAP` tables which are extremely fast for lookups.
- Support for big files (63-bit) on OSs that support big files.
- New function `LOAD_FILE(filename)` to get the contents of a file as a string value.
- New `<=>` operator that acts as `=` but returns `TRUE` if both arguments are `NULL`. This is useful for comparing changes between tables.
- Added the ODBC 3.0 `EXTRACT(interval FROM datetime)` function.
- Columns defined as `FLOAT(X)` are not rounded on storage and may be in scientific notation (1.0E+10) when retrieved.
- `REPLACE` is now faster than before.
- Changed `LIKE` character comparison to behave as `=`; This means that `'e' LIKE 'é'` is now true.

(If the line doesn't display correctly, the latter 'e' is a French 'e' with an acute accent above.)

- `SHOW TABLE STATUS` returns a lot of information about the tables.
- Added `LIKE` to the `SHOW STATUS` command.
- Added `Privileges` column to `SHOW COLUMNS`.
- Added `Packed` and `Comment` columns to `SHOW INDEX`.
- Added comments to tables (with `CREATE TABLE ... COMMENT 'xxx'`).
- Added `UNIQUE`, as in `CREATE TABLE tbl_name (col INT NOT NULL UNIQUE)`
- New create syntax: `CREATE TABLE tbl_name SELECT ...`
- New create syntax: `CREATE TABLE IF NOT EXISTS ...`
- Allow creation of `CHAR(0)` columns.
- `DATE_FORMAT()` now requires `'%'` before any format character.
- `DELAYED` is now a reserved word (sorry about that :()).
- An example procedure is added: `analyse`, file: `sql_analyse.c`. This describes the data in your query. Try the following:

```
SELECT ... FROM ...
WHERE ... PROCEDURE ANALYSE([max_elements],[max_memory])
```

This procedure is extremely useful when you want to check the data in your table!

- `BINARY` cast to force a string to be compared in case-sensitive fashion.
- Added `--skip-show-database` option to `mysqld`.
- Check whether a row has changed in an `UPDATE` now also works with `BLOB/TEXT` columns.
- Added the `INNER` join syntax. **Note:** This made `INNER` a reserved word!
- Added support for netmasks to the hostname in the MySQL grant tables. You can specify a netmask using the `IP/NETMASK` syntax.
- If you compare a `NOT NULL DATE/DATETIME` column with `IS NULL`, this is changed to a compare against `0` to satisfy some ODBC applications. (By <shreeve@uci.edu>.)
- `NULL IN (...)` now returns `NULL` instead of `0`. This ensures that `null_column NOT IN (...)` doesn't match `NULL` values.
- Fix storage of floating-point values in `TIME` columns.
- Changed parsing of `TIME` strings to be more strict. Now the fractional second part is detected (and currently skipped). The following formats are supported:
  - `[[DAYS] [H]H:]MM:]SS[.fraction]`
  - `[[[[[H]H]H]H]MM]SS[.fraction]`
- Detect (and ignore) fractional second part from `DATETIME`.

- Added the `LOW_PRIORITY` attribute to `LOAD DATA INFILE`.
- The default index name now uses the same case as the column name on which the index name is based.
- Changed default number of connections to 100.
- Use bigger buffers when using `LOAD DATA INFILE`.
- `DECIMAL(x,y)` now works according to standard SQL.
- Added aggregate user-defined functions. Thanks to Andreas F. Bobak ([<bobak@relog.ch>](mailto:bobak@relog.ch)) for this!
- `LAST_INSERT_ID()` is now updated for `INSERT INTO ... SELECT`.
- Some small changes to the join table optimizer to make some joins faster.
- `SELECT DISTINCT` is much faster; it uses the new `UNIQUE` functionality in `MyISAM`. One difference compared to MySQL 3.22 is that the output of `DISTINCT` is no longer sorted.
- All C client API macros are now functions to make shared libraries more reliable. Because of this, you can no longer call `mysql_num_fields()` on a `MYSQL` object, you must use `mysql_field_count()` instead.
- Added use of `LIBWRAP`; patch by Henning P. Schmiedehausen.
- Don't allow `AUTO_INCREMENT` for other than numerical columns.
- Using `AUTO_INCREMENT` now automatically makes the column `NOT NULL`.
- Show `NULL` as the default value for `AUTO_INCREMENT` columns.
- Added `SQL_BIG_RESULT`; `SQL_SMALL_RESULT` is now default.
- Added a shared library RPM. This enhancement was contributed by David Fox ([<dsfox@cogsci.ucsd.edu>](mailto:dsfox@cogsci.ucsd.edu)).
- Added `--enable-large-files` and `--disable-large-files` options to `configure`. See `configure.in` for some systems where this is automatically turned off because of broken implementations.
- Upgraded `readline` to 4.0.
- New `CREATE TABLE` options: `PACK_KEYS` and `CHECKSUM`.
- Added `--default-table-type` option to `mysqld`.

## D.4. Changes in InnoDB

Starting from 4.0.22 and 4.1.5, all InnoDB changes are included in the MySQL Change History, and this manual section is no longer separately maintained.

### D.4.1. Changes in MySQL/InnoDB-4.0.21, September 10, 2004

Functionality added or changed:

- Renamed the `innodb.status.<pid>` files (created in the data directory) to `innodb_status.<pid>`. This avoids problems on filesystems that do not allow multiple periods in filenames.
- Added `innodb_status_file` system variable to `mysqld` to control whether output from `SHOW INNODB STATUS` is written to a `innodb_status.<pid>` file in the data directory. By default, the file is not created. To create it, start `mysqld` with the `--innodb_status_file=1` option.
- Changes for NetWare to exit InnoDB gracefully on NetWare even in a case of an assertion failure, instead of intentionally crashing the `'mysqld'` server process.

Bugs fixed:

- Fixed a bug in `ON DELETE CASCADE` and `ON UPDATE CASCADE` foreign key constraints: long chains of cascaded operations would cause a stack overflow and crash the server. Cascaded operations are now limited to 15 levels. ([Bug#4446](http://bugs.mysql.com/4446) [<http://bugs.mysql.com/4446>])
- Fixed a possible bug in `LOCK TABLES` introduced in MySQL/InnoDB-4.0.19: The count of tables explicitly locked by a transaction was incremented only after the locks were granted, but decremented when the lock structures were destroyed.
- Fixed a bug in `UNLOCK TABLES` in `AUTOCOMMIT=0` mode, introduced in MySQL/InnoDB-4.0.19: The memory allocated for some locks acquired by the transaction could be deallocated before those locks were released. The bug can lead to crashes and memory corruption of the buffer pool when the transaction acquires a large number of locks (table locks or row-level locks).
- Increment the InnoDB watchdog timeout during `CHECK TABLE`. A long-running `CHECK TABLE` would cause InnoDB to complain about a 'long semaphore wait', and crash the server, if a query had to wait more than 600 seconds behind that `CHECK TABLE` operation. ([Bug#2694](http://bugs.mysql.com/2694) [<http://bugs.mysql.com/2694>])
- If you configure `innodb_additional_mem_pool_size` so small that InnoDB memory allocation spills over from it, then every 4 billionth spill may cause memory corruption. A symptom is a printout like the one following in the `.err` log. The workaround is to make `innodb_additional_mem_pool_size` big enough to hold all memory allocation. Use `SHOW INNODB STATUS` to determine that there is plenty of free space available in the additional mem pool, and the total allocated memory stays rather constant.

```
InnoDB: Error: Mem area size is 0. Possibly a memory overrun of the
InnoDB: previous allocated area!
InnoDB: Apparent memory corruption: mem dump len 500; hex
```

- The special meaning of the table names `innodb_monitor`, `innodb_lock_monitor`, `innodb_tablespace_monitor`, `innodb_table_monitor`, and `innodb_validate` in `CREATE TABLE` and `DROP TABLE` statements was accidentally removed in MySQL/InnoDB-4.0.19. The diagnostic functions attached to these special table names (see [Section 14.2.12.1, “SHOW ENGINE INNODB STATUS and the InnoDB Monitors”](#)) are accessible again in MySQL/InnoDB-4.0.21.
- When the private SQL parser of InnoDB was modified in MySQL/InnoDB-4.0.19 in order to allow the use of the apostrophe (‘ ’) in table and column names, the fix relied on a previously unused function `mem_realloc()`, whose implementation was incorrect. As a result, InnoDB can incorrectly parse column and table names as the empty string. The InnoDB `realloc()` implementation has been corrected in MySQL/InnoDB-4.0.21.
- Fixed a glitch introduced in 4.0.18 and 4.1.2: in `SHOW TABLE STATUS` InnoDB systematically overestimated the row count by 1 if the table fit on a single 16 kB data page.

- InnoDB created temporary files with the C library function `tmpfile()`. On Windows, the files would be created in the root directory of the current file system. To correct this behavior, the invocations of `tmpfile()` were replaced with code that uses the function `create_temp_file()` in the MySQL portability layer. (Bug#3998 [http://bugs.mysql.com/3998])
- If `ALTER TABLE ... DROP FOREIGN KEY ...` fails because of a wrong constraint name, return a table handler error number 150 instead of 152.
- If there was little file I/O in InnoDB, but the insert buffer was used, it could happen that 'Pending normal aio reads' was bigger than 0, but the I/O handler thread did not get waken up in 600 seconds. This resulted in a hang, and crashing of InnoDB.
- If we `RENAME`d a table, InnoDB forgot to load the `FOREIGN KEY` constraints that reference the new table name, and forgot to check that they are compatible with the table.

## D.4.2. Changes in MySQL/InnoDB-4.1.4, August 31, 2004

Functionality added or changed:

- **Important:** Made internal representation of `TIMESTAMP` values in InnoDB in 4.1 to be the same as in 4.0. This difference resulted in incorrect datetime values in `TIMESTAMP` columns in InnoDB tables after an upgrade from 4.0 to 4.1. (Bug#4492 [http://bugs.mysql.com/4492]) **Warning: extra steps during upgrade required!** This means that if you are upgrading from 4.1.x, where  $x \leq 3$ , to 4.1.4 you should use `mysqldump` for saving and then restoring your InnoDB tables with `TIMESTAMP` columns. No conversion is needed if you upgrade from 3.23 or 4.0 to 4.1.4 or later.
- Added a new startup option `innodb_locks_unsafe_for_binlog`. This option forces InnoDB not to use next-key locking in searches and index scans.
- Added `innodb_status_file` system variable to `mysqld` to control whether output from `SHOW INNODB STATUS` is written to a `innodb_status.<pid>` file in the data directory. By default, the file is not created. To create it, start `mysqld` with the `--innodb_status_file=1` option.
- Changes for NetWare to exit InnoDB gracefully on NetWare even in a case of an assertion failure, instead of intentionally crashing the `mysqld` server process.
- “Gap” type row locks without the `LOCK_INSERT_INTENTION` flag do not need to wait for anything. This is because different users can have conflicting lock types on gaps. This change reduces unnecessary deadlocks.

Bugs fixed:

- Fixed a bug in `ON DELETE CASCADE` and `ON UPDATE CASCADE` foreign key constraints: long chains of cascaded operations would cause a stack overflow and crash the server. Cascaded operations are now limited to 15 levels. (Bug#4446 [http://bugs.mysql.com/4446])
- Increment the InnoDB watchdog timeout during `CHECK TABLE`. (Bug#2694 [http://bugs.mysql.com/2694])
- If you configure `innodb_additional_mem_pool_size` so small that InnoDB memory allocation spills over from it, then every 4 billionth spill may cause memory corruption. A symptom is a printout like the one following in the `.err` log.

```
InnoDB: Error: Mem area size is 0. Possibly a memory overrun of the
InnoDB: previous allocated area!
```

```
InnoDB: Apparent memory corruption: mem dump len 500; hex
```

- Fixed a glitch introduced in 4.0.18 and 4.1.2: in `SHOW TABLE STATUS` InnoDB systematically overestimated the row count by 1 if the table fit on a single 16 kB data page.
- InnoDB created temporary files with the C library function `tmpfile()`. On Windows, the files would be created in the root directory of the current file system. To correct this behavior, the invocations of `tmpfile()` were replaced with code that uses the function `create_temp_file()` in the MySQL portability layer. (Bug#3998 [http://bugs.mysql.com/3998])
- If we `RENAME`d a table, InnoDB forgot to load the foreign key constraints that reference the new table name, and forgot to check that they are compatible with the table.
- If there was little file I/O in InnoDB, but the insert buffer was used, it could happen that 'Pending normal aio reads' was bigger than 0, but the I/O handler thread did not get waken up in 600 seconds. This resulted in a hang, and an intentional crashing of `mysqld`.

### D.4.3. Changes in MySQL/InnoDB-4.1.3, June 28, 2004

Functionality added or changed:

- **Important:** Starting from MySQL 4.1.3, InnoDB uses the same character set comparison functions as MySQL for non-`latin1_swedish_ci` character strings that are not `BINARY`. This changes the sorting order of space and characters < ASCII(32) in those character sets. For `latin1_swedish_ci` character strings and `BINARY` strings, InnoDB uses its own pad-spaces-at-end comparison method, which stays unchanged. If you have an InnoDB table created with MySQL 4.1.2 or earlier, with an index on a non-`latin1` character set (in the case of 4.1.0 and 4.1.1 with any character set) `CHAR/VARCHAR`/or `TEXT` column that is not `BINARY` but may contain characters < ASCII(32), then you should do `ALTER TABLE` or `OPTIMIZE TABLE` on it to **regenerate the index, after upgrading to MySQL 4.1.3 or later**.
- `OPTIMIZE TABLE` for InnoDB tables is now mapped to `ALTER TABLE` rather than to `ANALYZE TABLE`.
- Added an interface for storing the binlog offset in the InnoDB log and flushing the log.

Bugs fixed:

- The **critical bug in 4.1.2** (crash recovery skipping all `.ibd` files if you specify `innodb_file_per_table` on Unix) has been fixed. The bug was a combination of two bugs. Crash recovery ignored the files, because the attempt to lock them in the wrong mode failed. From now on, locks are only obtained for regular files opened in read/write mode, and crash recovery stops if an `.ibd` file for a table exists in a database directory but is inaccessible.
- Do not remember the original `select_lock_type` inside `LOCK TABLES`. (Bug#4047 [http://bugs.mysql.com/4047])
- The special meaning of the table names `innodb_monitor`, `innodb_lock_monitor`, `innodb_tablespace_monitor`, `innodb_table_monitor`, and `innodb_validate` in `CREATE TABLE` and `DROP TABLE` statements was accidentally removed in MySQL/InnoDB-4.1.2. The diagnostic functions attached to these special table names (see Section 14.2.12.1, “`SHOW ENGINE INNODB STATUS` and the InnoDB Monitors”) are accessible again in MySQL/InnoDB-4.1.3.

- When the private SQL parser of InnoDB was modified in MySQL/InnoDB-4.0.19 in order to allow the use of the apostrophe ( ' ') in table and column names, the fix relied on a previously unused function `mem_realloc()`, whose implementation was incorrect. As a result, InnoDB can incorrectly parse column and table names as the empty string. The InnoDB `realloc()` implementation has been corrected in MySQL/InnoDB-4.1.3.
- In a clean-up of MySQL/InnoDB-4.1.2, the code for invalidating the query cache was broken. Now the query cache should be correctly invalidated for tables affected by `ON UPDATE CASCADE` or `ON DELETE CASCADE` constraints.
- Fixed a bug: in `LIKE 'abc%'`, the `'%'` did not match the empty string if the character set was not `latin1_swedish_ci`. This bug was fixed by changing the sorting order in these character sets. See the above note about data conversion in 4.1.3.

## D.4.4. Changes in MySQL/InnoDB-4.1.2, May 30, 2004

**NOTE:** CRITICAL BUG in 4.1.2 if you specify `innodb_file_per_table` in `my.cnf` on Unix. In crash recovery InnoDB skips the crash recovery for all `.ibd` files and those tables become CORRUPT! The symptom is a message `Unable to lock ...ibd with lock 1, error: 9: fcntl: Bad file descriptor` in the `.err` log in crash recovery.

Functionality added or changed:

- Support multiple character sets. Note that tables created in other collations than `latin1_swedish_ci` cannot be accessed in MySQL/InnoDB 4.0.
- Automatically create a suitable index on a `FOREIGN KEY`, if the user does not create one. Removes most of the cases of `Error 1005 (errno 150)` in table creation.
- Do not assert in `log0log.c`, line 856 if `ib_logfiles` are too small for `innodb_thread_concurrency`. Instead, print instructions how to adjust `my.cnf` and call `exit(1)`.
- If MySQL tries to `SELECT` from an InnoDB table without setting any table locks, print a descriptive error message and assert; some subquery bugs were of this type.
- Allow a key part length in InnoDB to be up to 3,500 bytes; this is needed so that you can create an index on a column with 255 UTF-8 characters.
- All new features from InnoDB-4.0.17, InnoDB-4.0.18, InnoDB-4.0.19 and InnoDB-4.0.20.

Bugs fixed:

- If you configure `innodb_additional_mem_pool_size` so small that InnoDB memory allocation spills over from it, then every 4 billionth spill may cause memory corruption. A symptom is a printout like the one following in the `.err` log.

```
InnoDB: Error: Mem area size is 0. Possibly a memory overrun of the
InnoDB: previous allocated area!
InnoDB: Apparent memory corruption: mem dump len 500; hex
```

- Improved portability to 64-bit platforms, especially Win64.
- Fixed an assertion failure when a purge of a table was not possible because of missing `.ibd` file.

- Fixed a bug: do not retrieve all columns in a table if we only need the 'ref' of the row (usually, the `PRIMARY KEY`) to calculate an `ORDER BY`. ([Bug#1942](http://bugs.mysql.com/1942) [<http://bugs.mysql.com/1942>])
- On Unix-like systems, obtain an exclusive advisory lock on InnoDB files, to prevent corruption when multiple instances of MySQL are running on the same set of data files. The Windows version of InnoDB currently takes a mandatory lock on the files. ([Bug#3608](http://bugs.mysql.com/3608) [<http://bugs.mysql.com/3608>])
- Added a missing space to the output format of `SHOW INNODB STATUS`; reported by Jocelyn Fournier.
- All bugfixes from InnoDB-4.0.17, InnoDB-4.0.18, InnoDB-4.0.19 and InnoDB-4.0.20.

## D.4.5. Changes in MySQL/InnoDB-4.0.20, May 18, 2004

Bugs fixed:

- Apostrophe characters now are recognized by the internal InnoDB parser and can be used within quoted table and column identifiers in `FOREIGN KEY` clauses.
- Make `LOCK TABLE` aware of InnoDB row-level locks and InnoDB aware of locks set with `LOCK TABLE`. ([Bug#3299](http://bugs.mysql.com/3299) [<http://bugs.mysql.com/3299>])
- Fixed race conditions in `SHOW INNODB STATUS`. ([Bug#3596](http://bugs.mysql.com/3596) [<http://bugs.mysql.com/3596>])

## D.4.6. Changes in MySQL/InnoDB-4.0.19, May 4, 2004

Functionality added or changed:

- Better error message when the server has to crash because the buffer pool is exhausted by the lock table or the adaptive hash index.
- Print always the count of pending `pread()` and `pwrite()` calls if there is a long semaphore wait.
- Improve space utilization when rows of 1,500 to 8,000 bytes are inserted in the order of the primary key.
- Remove potential buffer overflow errors by sending diagnostic output to `stderr` or files instead of `stdout` or fixed-size memory buffers. As a side effect, the output of `SHOW INNODB STATUS` is written to a file `<datadir>/innodb.status.<pid>` every 15 seconds.

Bugs fixed:

- Fixed a bug: `DROP DATABASE` did not work if `FOREIGN KEY` references were defined within the database. ([Bug#3058](http://bugs.mysql.com/3058) [<http://bugs.mysql.com/3058>])
- Remove unnecessary files, functions and variables. Many of these were needed in the standalone version of InnoDB. Remove debug functions and variables from non-debug build.
- Add diagnostic code to analyze an assertion failure in `ha_innodb.cc` on line 2020 reported by a user. ([Bug#2903](http://bugs.mysql.com/2903) [<http://bugs.mysql.com/2903>])
- Fixed a bug: in a `FOREIGN KEY, ON UPDATE CASCADE` was not triggered if the update changed

a string to another value identical in alphabetical ordering, for example, 'abc' -> 'aBc'.

- Protect the reading of the latest foreign key error explanation buffer with a mutex; in theory, a race condition could cause `SHOW INNODB STATUS` print garbage characters after the error info.
- Fixed a bug: The row count and key cardinality estimate was grossly too small if each clustered index page only contained one record.
- Parse `CONSTRAINT FOREIGN KEY` correctly. ([Bug#3332](http://bugs.mysql.com/3332) [<http://bugs.mysql.com/3332>])
- Fixed a memory corruption bug on Windows. The bug is present in all InnoDB versions in Windows, but it depends on how the linker places a static array in `srv0srv.c`, whether the bug shows itself. 4 bytes were overwritten with a pointer to a statically allocated string 'get windows aio return value'.
- Fix a glitch reported by Philippe Lewicki on the general mailing list: do not print a warning to the `.err` log if `read_key` fails with a lock wait timeout error 146.
- Allow quotes to be embedded in strings in the private SQL parser of InnoDB, so that ' ' can be used in InnoDB table and column names. Display quotes within identifiers properly.
- Debugging: Allow `UNIV_SYNC_DEBUG` to be disabled while `UNIV_DEBUG` is enabled.
- Debugging: Handle magic numbers in a more consistent way.

## D.4.7. Changes in MySQL/InnoDB-4.0.18, February 13, 2004

- Do not allow dropping a table referenced by a `FOREIGN KEY` constraint, unless the user does `SET FOREIGN_KEY_CHECKS=0`. The error message here is somewhat misleading "Cannot delete or update a parent row...", and must be changed in a future version 4.1.x.
- Make InnoDB to remember the `CONSTRAINT` name given by a user for a `FOREIGN KEY`.
- Change the print format of `FOREIGN KEY` constraints spanning multiple databases to ``db_name`.`tbl_name``. But when parsing them, we must also accept ``db_name.tbl_name``, because that was the output format in < 4.0.18.
- An optimization in locking: If `AUTOCOMMIT=1`, then we do not need to make a plain `SELECT` set shared locks even on the `SERIALIZABLE` isolation level, because we know that the transaction is read-only. A read-only transaction can always be performed on the `REPEATABLE READ` level, and that does not endanger the serializability.
- Implement an automatic downgrade from >= 4.1.1 -> 4.0.18 if the user has not created tables in `.ibd` files or used other 4.1.x features. **Consult** the manual section on **multiple tablespaces** carefully if you want to downgrade!
- Fixed a bug: MySQL should not allow `REPLACE` to internally perform an `UPDATE` if the table is referenced by a `FOREIGN KEY`. The MySQL manual states that `REPLACE` must resolve a duplicate-key error semantically with `DELETE + INSERT`, and not by an `UPDATE`. In versions < 4.0.18 and < 4.1.2, MySQL could resolve a duplicate key conflict in `REPLACE` by doing an `UPDATE` on the existing row, and `FOREIGN KEY` checks could behave in a semantically wrong way. ([Bug#2418](http://bugs.mysql.com/2418) [<http://bugs.mysql.com/2418>])
- Fixed a bug: generate `FOREIGN KEY` constraint identifiers locally for each table, in the form `db_name/tbl_name_ibfk_number`. If the user gives the constraint name explicitly, then remember it. These changes should ensure that foreign key id's in a slave are the same as in the master,

and `DROP FOREIGN KEY` does not break replication. ([Bug#2167](http://bugs.mysql.com/2167) [<http://bugs.mysql.com/2167>])

- Fixed a bug: allow quoting of identifiers in InnoDB's `FOREIGN KEY` definitions with a backtick ( ` ) and a double quote ( " ). You can now use also spaces in table and column names, if you quote the identifiers. ([Bug#1725](http://bugs.mysql.com/1725) [<http://bugs.mysql.com/1725>], [Bug#2424](http://bugs.mysql.com/2424) [<http://bugs.mysql.com/2424>])
- Fixed a bug: `FOREIGN KEY ... ON UPDATE/DELETE NO ACTION` must check the foreign key constraint, not ignore it. Since we do not have deferred constraints in InnoDB, this bugfix makes InnoDB to check `NO ACTION` constraints immediately, like it checks `RESTRICT` constraints.
- Fixed a bug: InnoDB crashed in `RENAME TABLE` if `db_name.tbl_name` is shorter than 5 characters. ([Bug#2689](http://bugs.mysql.com/2689) [<http://bugs.mysql.com/2689>])
- Fixed a bug: in `SHOW TABLE STATUS`, InnoDB row count and index cardinality estimates wrapped around at 512 million in 32-bit computers. Note that unless MySQL is compiled with the `BIG_TABLES` option, they still wrap around at 4 billion.
- Fixed a bug: If there was a `UNIQUE` secondary index, and `NULL` values in that unique index, then with the `IS NULL` predicate, InnoDB returned only the first matching row, though there can be many. This bug was introduced in 4.0.16. ([Bug#2483](http://bugs.mysql.com/2483) [<http://bugs.mysql.com/2483>])

## D.4.8. Changes in MySQL/InnoDB-5.0.0, December 24, 2003

- **Important note:** If you upgrade to MySQL 4.1.1 or higher, it is difficult to downgrade back to 4.0 or 4.1.0! That is because, for earlier versions, InnoDB is not aware of multiple tablespaces.
- InnoDB in 5.0.0 is essentially the same as InnoDB-4.1.1 with the bugfixes of InnoDB-4.0.17 included.

## D.4.9. Changes in MySQL/InnoDB-4.0.17, December 17, 2003

- Fixed a bug: If you created a column prefix secondary index and updated it so that the last characters in the column prefix were spaces, InnoDB would assert in `row0upd.c`, line 713. The same assertion failed if you updated a column in an ordinary secondary index so that the new value was alphabetically equivalent, but had a different length. This could happen, for example, in the UTF8 character set if you updated a letter to its accented or umlaut form.
- Fixed a bug: InnoDB could think that a secondary index record was not locked though it had been updated to an alphabetically equivalent value, for example, 'abc' -> 'aBc'.
- Fixed a bug: If you updated a secondary index column to an alphabetically equivalent value, and rolled back your update, InnoDB failed to restore the field in the secondary index to its original value.
- There are still several outstanding non-critical bugs reported in the MySQL bugs database. Their fixing has been delayed, because resources were allocated to the 4.1.1 release.

## D.4.10. Changes in MySQL/InnoDB-4.1.1, December 4, 2003

- **Important note:** If you upgrade to MySQL 4.1.1 or higher, you cannot downgrade to a version

lower than 4.1.1 any more! That is because, for earlier versions, `InnoDB` is not aware of multiple tablespaces.

- Multiple tablespaces now available for `InnoDB`. You can store each `InnoDB` type table and its indexes into a separate `.ibd` file into a MySQL database directory, into the same directory where the `.frm` file is stored.
- The MySQL query cache now works for `InnoDB` tables also if `AUTOCOMMIT=0`, or the statements are enclosed inside `BEGIN ... COMMIT`.
- Reduced `InnoDB` memory consumption by a few megabytes if one sets the buffer pool size  $< 8\text{MB}$ .
- You can use raw disk partitions also in Windows.

### D.4.11. Changes in MySQL/InnoDB-4.0.16, October 22, 2003

- Fixed a bug: in contrary to what was said in the manual, in a locking read `InnoDB` set two record locks if a unique exact match search condition was used on a multi-column unique key. For a single column unique key it worked right.
- Fixed a bug: If you used the rename trick `#sql... -> rsql...` to recover a temporary table, `InnoDB` asserted in `row_mysql_lock_data_dictionary()`.
- There are several outstanding non-critical bugs reported in the MySQL bugs database. Their fixing has been delayed, because resources are allocated to the upcoming 4.1.1 release.

### D.4.12. Changes in MySQL/InnoDB-3.23.58, September 15, 2003

- Fixed a bug: `InnoDB` could make the index page directory corrupt in the first B-tree page splits after `mysqld` startup. A symptom would be an assertion failure in `page0page.c`, in function `page_dir_find_slot()`.
- Fixed a bug: `InnoDB` could in rare cases return an extraneous row if a rollback, purge, and a `SELECT` coincided.
- Fixed a possible hang over the `btr0sea.c` latch if `SELECT` was used inside `LOCK TABLES`.
- Fixed a bug: If a single `DELETE` statement first managed to delete some rows and then failed in a `FOREIGN KEY` error or a `Table is full` error, MySQL did not roll back the whole SQL statement as it should.

### D.4.13. Changes in MySQL/InnoDB-4.0.15, September 10, 2003

- Fixed a bug: If you updated a row so that the 8000 byte maximum length (without `BLOB` and `TEXT`) was exceeded, `InnoDB` simply removed the record from the clustered index. In a similar insert, `InnoDB` would leak reserved file space extents, which would only be freed at the next `mysqld` startup.

- Fixed a bug: If you used big `BLOB` values, and your log files were relatively small, `InnoDB` could in a big `BLOB` operation temporarily write over the log produced after the latest checkpoint. If `InnoDB` would crash at that moment, then the crash recovery would fail, because `InnoDB` would not be able to scan the log even up to the latest checkpoint. Starting from this version, `InnoDB` tries to ensure the latest checkpoint is young enough. If that is not possible, `InnoDB` prints a warning to the `.err` log of MySQL and advises you to make the log files bigger.
- Fixed a bug: setting `innodb_fast_shutdown=0` had no effect.
- Fixed a bug introduced in 4.0.13: If a `CREATE TABLE` ended in a comment, that could cause a memory overrun.
- Fixed a bug: If `InnoDB` printed `Operating system error number .. in a file operation` to the `.err` log in Windows, the error number explanation was wrong. Workaround: look at section 13.2 of <http://www.innodb.com/ibman.php> about Windows error numbers.
- Fixed a bug: If you created a column prefix `PRIMARY KEY` like in `t(a CHAR(200), PRIMARY KEY (a(10)))` on a fixed-length `CHAR` column, `InnoDB` would crash even in a simple `SELECT`. A `CHECK TABLE` would report the table as corrupt, also in the case where the created key was not `PRIMARY`.

## D.4.14. Changes in MySQL/InnoDB-4.0.14, July 22, 2003

- `InnoDB` now supports the `SAVEPOINT` and `ROLLBACK TO SAVEPOINT` SQL statements. See <http://www.innodb.com/ibman.php#Savepoints> for the syntax.
- You can now create column prefix keys like in `CREATE TABLE t (a BLOB, INDEX (a(10)))`.
- You can also use `O_DIRECT` as the `innodb_flush_method` on the latest versions of Linux and FreeBSD. Beware of possible bugs in those operating systems, though.
- Fixed the checksum calculation of data pages. Previously most OS file system corruption went unnoticed. Note that if you downgrade from version 4.0.14 or up to a version earlier than 4.0.14, `InnoDB` prints warnings in the first startup:

```
InnoDB: Warning: An inconsistent page in the doublewrite buffer
InnoDB: space id 2552202359 page number 8245, 127'th page in dblwr buf.
```

but that is not dangerous and can be ignored.

- Modified the buffer pool replacement algorithm so that it tries to flush modified pages if there are no replaceable pages in the last 10 % of the LRU list. This can reduce disk I/O if the workload is a mixture of reads and writes.
- The buffer pool checkpoint flush algorithm now tries to flush also close neighbors of the page at the end of the flush list. This can speed up database shutdown, and can also speed up disk writes if `InnoDB` log files are very small compared to the buffer pool size.
- In 4.0.13 we made `SHOW INNODB STATUS` to print detailed info on the latest `UNIQUE KEY` error, but storing that information could slow down `REPLACE` significantly. We no longer store or print the info.
- Fixed a bug: `SET FOREIGN_KEY_CHECKS=0` was not replicated properly in the MySQL replication. The fix will not be backported to 3.23.

- Fixed a bug: the parameter `innodb_max_dirty_pages_pct` forgot to take into account the free pages in the buffer pool. This could lead to excessive flushing even though there were lots of free pages in the buffer pool. Workaround: `SET GLOBAL innodb_max_dirty_pages_pct = 100`.
- Fixed a bug: If there were big index scans then a file read request could starve and InnoDB could assert because of a very long semaphore wait.
- Fixed a bug: If `AUTOCOMMIT=1` then inside `LOCK TABLES` MySQL failed to do the commit after an updating SQL statement if binary logging was not on, and for `SELECT` statements did not commit regardless of binary logging state.
- Fixed a bug: InnoDB could make the index page directory corrupt in the first B-tree page splits after a `mysqld` startup. A symptom would be an assertion in `page0page.c`, in function `page_dir_find_slot()`.
- Fixed a bug: If in a `FOREIGN KEY` with an `UPDATE CASCADE` clause the parent column was of a different internal storage length than the child column, then a cascaded update would make the column length wrong in the child table and corrupt the child table. Because of MySQL's 'silent column specification changes' a fixed-length `CHAR` column can change internally to a `VARCHAR` and cause this error.
- Fixed a bug: If a non-`latin1` character set was used and if in a `FOREIGN KEY` the parent column was of a different internal storage length than the child column, then all inserts to the child table would fail in a foreign key error.
- Fixed a bug: InnoDB could complain that it cannot find the clustered index record, or in rare cases return an extraneous row if a rollback, purge, and a `SELECT` coincided.
- Fixed a possible hang over the `btr0sea.c` latch if `SELECT` was used inside `LOCK TABLES`.
- Fixed a bug: contrary to what the release note of 4.0.13 said, the group commit still did not work if the MySQL binary logging was on.
- Fixed a bug: `os_event_wait()` did not work properly in Unix, which might have caused starvation in various log operations.
- Fixed a bug: If a single `DELETE` statement first managed to delete some rows and then failed in a `FOREIGN KEY` error or a `Table is full` error, MySQL did not roll back the whole SQL statement as it should, and also wrote the failed statement to the binary log, reporting there a non-zero `error_code`.
- Fixed a bug: the maximum allowed number of columns in a table is 1000, but InnoDB did not check that limit in `CREATE TABLE`, and a subsequent `INSERT` or `SELECT` from that table could cause an assertion.

## D.4.15. Changes in MySQL/InnoDB-3.23.57, June 20, 2003

- Changed the default value of `innodb_flush_log_at_trx_commit` from 0 to 1. If you have not specified it explicitly in your `my.cnf`, and your application runs much slower with this new release, it is because the value 1 causes a log flush to disk at each transaction commit.
- Fixed a bug: InnoDB forgot to call `pthread_mutex_destroy()` when a table was dropped. That could cause memory leakage on FreeBSD and other non-Linux Unixes.
- Fixed a bug: MySQL could erroneously return 'Empty set' if InnoDB estimated an index range size

to 0 records though the range was not empty; MySQL also failed to do the next-key locking in the case of an empty index range.

- Fixed a bug: `GROUP BY` and `DISTINCT` could treat `NULL` values unequal.

## D.4.16. Changes in MySQL/InnoDB-4.0.13, May 20, 2003

- `InnoDB` now supports `ALTER TABLE DROP FOREIGN KEY`. You have to use `SHOW CREATE TABLE` to find the internally generated foreign key ID when you want to drop a foreign key.
- `SHOW INNODB STATUS` now prints detailed information of the latest detected `FOREIGN KEY` and `UNIQUE KEY` errors. If you do not understand why `InnoDB` gives the error 150 from a `CREATE TABLE`, you can use this statement to study the reason.
- `ANALYZE TABLE` now works also for `InnoDB` type tables. It makes eight random dives to each of the index trees and updates index cardinality estimates accordingly. Note that because these are only estimates, repeated runs of `ANALYZE TABLE` may produce different numbers. MySQL uses index cardinality estimates only in join optimization. If some join is not optimized in the right way, you may try using `ANALYZE TABLE`.
- `InnoDB` group commit capability now works also when MySQL binary logging is switched on. There have to be > 2 client threads for the group commit to become active.
- Changed the default value of `innodb_flush_log_at_trx_commit` from 0 to 1. If you have not specified it explicitly in your `my.cnf`, and your application runs much slower with this new release, it is because the value 1 causes a log flush to disk at each transaction commit.
- Added a new global settable MySQL system variable `innodb_max_dirty_pages_pct`. It is an integer in the range 0 - 100. The default is 90. The main thread in `InnoDB` tries to flush pages from the buffer pool so that at most this many percents are not yet flushed at any time.
- If `innodb_force_recovery=6`, do not let `InnoDB` do repair of corrupt pages based on the doublewrite buffer.
- `InnoDB` startup now happens faster because it does not set the memory in the buffer pool to zero.
- Fixed a bug: The `InnoDB` parser for `FOREIGN KEY` definitions was confused by the keywords 'foreign key' inside MySQL comments.
- Fixed a bug: If you dropped a table to which there was a `FOREIGN KEY` reference, and later created the same table with non-matching data types, `InnoDB` could assert in `dict0load.c`, in function `dict_load_table()`.
- Fixed a bug: `GROUP BY` and `DISTINCT` could treat `NULL` values as not equal. MySQL also failed to do the next-key locking in the case of an empty index range.
- Fixed a bug: Do not commit the current transaction when a `MyISAM` table is updated; this also makes `CREATE TABLE` not to commit an `InnoDB` transaction, even when binary logging is enabled.
- Fixed a bug: We did not allow `ON DELETE SET NULL` to modify the same table where the delete was made; we can allow it because that cannot produce infinite loops in cascaded operations.
- Fixed a bug: Allow `HANDLER PREV` and `NEXT` also after positioning the cursor with a unique search on the primary key.
- Fixed a bug: If `MIN()` or `MAX()` resulted in a deadlock or a lock wait timeout, MySQL did not re-

turn an error, but returned `NULL` as the function value.

- Fixed a bug: `InnoDB` forgot to call `pthread_mutex_destroy()` when a table was dropped. That could cause memory leakage on FreeBSD and other non-Linux Unix systems.

### D.4.17. Changes in MySQL/InnoDB-4.1.0, April 3, 2003

- `InnoDB` now supports up to 64GB of buffer pool memory in a Windows 32-bit Intel computer. This is possible because `InnoDB` can use the AWE extension of Windows to address memory over the 4GB limit of a 32-bit process. A new startup variable `innodb_buffer_pool_awe_mem_mb` enables AWE and sets the size of the buffer pool in megabytes.
- Reduced the size of buffer headers and the lock table. `InnoDB` uses 2 % less memory.

### D.4.18. Changes in MySQL/InnoDB-3.23.56, March 17, 2003

- Fixed a major bug in `InnoDB` query optimization: queries of type `SELECT ... WHERE index-column < x` and `SELECT ... WHERE indexcolumn > x` could cause a table scan even if the selectivity would have been very good.
- Fixed a potential bug if MySQL calls `store_lock` with `TL_IGNORE` in the middle of a query.

### D.4.19. Changes in MySQL/InnoDB-4.0.12, March 18, 2003

- In crash recovery `InnoDB` now prints the progress in percents of a transaction rollback.
- Fixed a bug/feature: If your application program used `mysql_use_result()`, and used  $\geq 2$  connections to send SQL queries, it could deadlock on the adaptive hash S-latch in `btr0sea.c`. Now `mysqld` releases the S-latch whenever it passes data from a `SELECT` to the client.
- Fixed a bug: MySQL could erroneously return 'Empty set' if `InnoDB` estimated an index range size to 0 records though the range was not empty; MySQL also failed to do the next-key locking in the case of an empty index range.

### D.4.20. Changes in MySQL/InnoDB-4.0.11, February 25, 2003

- Fixed a bug introduced in 4.0.10: `SELECT ... FROM ... ORDER BY ... DESC` could hang in an infinite loop.
- An outstanding bug: `SET FOREIGN_KEY_CHECKS=0` is not replicated properly in the MySQL replication.

### D.4.21. Changes in MySQL/InnoDB-4.0.10, February 4, 2003

- In `INSERT INTO t1 SELECT ... FROM t2 WHERE ...` MySQL previously set a table level read lock on `t2`. This lock is now removed.

- Increased SHOW INNODB STATUS maximum printed length to 200KB.
- Fixed a major bug in InnoDB query optimization: queries of type SELECT ... WHERE index-column < x and SELECT ... WHERE indexcolumn > x could cause a table scan even if the selectivity would have been very good.
- Fixed a bug: purge could cause a hang in a BLOB table where the primary key index tree was of height 1. Symptom: semaphore waits caused by an X-latch set in btr\_free\_externally\_stored\_field().
- Fixed a bug: using InnoDB HANDLER commands on a fresh handle crashed mysqld in ha\_innobase::change\_active\_index().
- Fixed a bug: If MySQL estimated a query in the middle of a SELECT statement, InnoDB could hang on the adaptive hash index latch in btr0sea.c.
- Fixed a bug: InnoDB could report table corruption and assert in page\_dir\_find\_owner\_slot() if an adaptive hash index search coincided with purge or an insert.
- Fixed a bug: some filesystem snapshot tool in Windows 2000 could cause an InnoDB file write to fail with error 33 ERROR\_LOCK\_VIOLATION. In synchronous writes InnoDB now retries the write 100 times at 1 second intervals.
- Fixed a bug: REPLACE INTO t1 SELECT ... did not work if t1 has an auto-inc column.
- An outstanding bug: SET FOREIGN\_KEY\_CHECKS=0 is not replicated properly in the MySQL replication.

## D.4.22. Changes in MySQL/InnoDB-3.23.55, January 24, 2003

- In INSERT INTO t1 SELECT ... FROM t2 WHERE ... MySQL previously set a table level read lock on t2. This lock is now removed.
- Fixed a bug: If the combined size of InnoDB log files was >= 2GB in a 32-bit computer, InnoDB would write log in a wrong position. That could make crash recovery and InnoDB Hot Backup to fail in log scan.
- Fixed a bug: index cursor restoration could theoretically fail.
- Fixed a bug: an assertion in btr0sea.c, in function btr\_search\_info\_update\_slow could theoretically fail in a race of 3 threads.
- Fixed a bug: purge could cause a hang in a BLOB table where the primary key index tree was of height 1. Symptom: semaphore waits caused by an X-latch set in btr\_free\_externally\_stored\_field().
- Fixed a bug: If MySQL estimated a query in the middle of a SELECT statement, InnoDB could hang on the adaptive hash index latch in btr0sea.c.
- Fixed a bug: InnoDB could report table corruption and assert in page\_dir\_find\_owner\_slot() if an adaptive hash index search coincided with purge or an insert.
- Fixed a bug: some filesystem snapshot tool in Windows 2000 could cause an InnoDB file write to fail with error 33 ERROR\_LOCK\_VIOLATION. In synchronous writes InnoDB now retries the write 100 times at 1 second intervals.
- An outstanding bug: SET FOREIGN\_KEY\_CHECKS=0 is not replicated properly in the MySQL replication. The fix appears in 4.0.11 and probably will not be backported to 3.23.

- Fixed bug in `InnoDB page0cur.c` file in function `page_cur_search_with_match` which caused `InnoDB` to remain on the same page forever. This bug is evident only in tables with more than one page.

### D.4.23. Changes in MySQL/InnoDB-4.0.9, January 14, 2003

- Removed the warning message: 'InnoDB: Out of memory in additional memory pool.'
- Fixed a bug: If the combined size of `InnoDB` log files was  $\geq 2$ GB in a 32-bit computer, `InnoDB` would write log in a wrong position. That could make crash recovery and `InnoDB Hot Backup` to fail.
- Fixed a bug: index cursor restoration could theoretically fail.

### D.4.24. Changes in MySQL/InnoDB-4.0.8, January 7, 2003

- `InnoDB` now supports also `FOREIGN KEY (...) REFERENCES ...(...)` [`ON UPDATE CASCADE` | `ON UPDATE SET NULL` | `ON UPDATE RESTRICT` | `ON UPDATE NO ACTION`].
- Tables and indexes now reserve 4 % less space in the tablespace. Also existing tables reserve less space. By upgrading to 4.0.8 you should see more free space in "InnoDB free" in `SHOW TABLE STATUS`.
- Fixed bugs: updating the `PRIMARY KEY` of a row would generate a foreign key error on all `FOREIGN KEY`s which referenced secondary keys of the row to be updated. Also, if a referencing `FOREIGN KEY` constraint only referenced the first columns in an index, and there were more columns in that index, updating the additional columns generated a foreign key error.
- Fixed a bug: If an index contains some column twice, and that column is updated, the table becomes corrupt. From now on `InnoDB` prevents creation of such indexes.
- Fixed a bug: removed superfluous error 149 and 150 printouts from the `.err` log when a locking `SELECT` caused a deadlock or a lock wait timeout.
- Fixed a bug: an assertion in `btr0sea.c`, in function `btr_search_info_update_slow` could theoretically fail in a race of 3 threads.
- Fixed a bug: one could not switch a session transaction isolation level back to `REPEATABLE READ` after setting it to something else.

### D.4.25. Changes in MySQL/InnoDB-4.0.7, December 26, 2002

- `InnoDB` in 4.0.7 is essentially the same as in 4.0.6.

### D.4.26. Changes in MySQL/InnoDB-4.0.6, December 19, 2002

- Since `innodb_log_arch_dir` has no relevance under MySQL, there is no need to specify it any more in `my.cnf`.

- `LOAD DATA INFILE` in `AUTOCOMMIT=1` mode no longer does implicit commits for each 1MB of written binary log.
- Fixed a bug introduced in 4.0.4: `LOCK TABLES ... READ LOCAL` should not set row locks on the rows read. This caused deadlocks and lock wait timeouts in `mysqldump`.
- Fixed two bugs introduced in 4.0.4: in `AUTO_INCREMENT`, `REPLACE` could cause the counter to be left 1 too low. A deadlock or a lock wait timeout could cause the same problem.
- Fixed a bug: `TRUNCATE` on a `TEMPORARY` table crashed `InnoDB`.
- Fixed a bug introduced in 4.0.5: If binary logging was not switched on, `INSERT INTO ... SELECT ...` or `CREATE TABLE ... SELECT ...` could cause `InnoDB` to hang on a semaphore created in `btr0sea.c`, line 128. Workaround: switch binary logging on.
- Fixed a bug: in replication issuing `SLAVE STOP` in the middle of a multiple-statement transaction could cause that `SLAVE START` would only perform a part of the transaction. A similar error could occur if the slave crashed and was restarted.

## D.4.27. Changes in MySQL/InnoDB-3.23.54, December 12, 2002

- Fixed a bug: the `InnoDB` range estimator greatly exaggerated the size of a short index range if the paths to the endpoints of the range in the index tree happened to branch in the root. This could cause unnecessary table scans in SQL queries.
- Fixed a bug: `ORDER BY` could fail if you had not created a primary key to a table, but had defined several indexes of which at least one was a `UNIQUE` index with all its columns declared as `NOT NULL`.
- Fixed a bug: a lock wait timeout in connection with `ON DELETE CASCADE` could cause corruption in indexes.
- Fixed a bug: If a `SELECT` was done with a unique key from a primary index, and the search matched to a delete-marked record, `InnoDB` could erroneously return the `NEXT` record.
- Fixed a bug introduced in 3.23.53: `LOCK TABLES ... READ LOCAL` should not set row locks on the rows read. This caused deadlocks and lock wait timeouts in `mysqldump`.
- Fixed a bug: If an index contains some column twice, and that column is updated, the table becomes corrupt. From now on `InnoDB` prevents creation of such indexes.

## D.4.28. Changes in MySQL/InnoDB-4.0.5, November 18, 2002

- `InnoDB` now supports also transaction isolation levels `READ COMMITTED` and `READ UNCOMMITTED`. `READ COMMITTED` more closely emulates Oracle and makes porting of applications from Oracle to MySQL easier.
- Deadlock resolution is now selective: we try to pick as victims transactions with less modified or inserted rows.
- `FOREIGN KEY` definitions are now aware of the `lower_case_table_names` setting in `my.cnf`.

- SHOW CREATE TABLE does not output the database name to a FOREIGN KEY definition if the referred table is in the same database as the table.
- InnoDB does a consistency check to most index pages before writing them to a data file.
- If you set `innodb_force_recovery > 0`, InnoDB tries to jump over corrupt index records and pages when doing SELECT \* FROM table. This helps in dumping.
- InnoDB now again uses asynchronous unbuffered I/O in Windows 2000 and XP; only unbuffered simulated async I/O in NT, 95/98/ME.
- Fixed a bug: the InnoDB range estimator greatly exaggerated the size of a short index range if the paths to the endpoints of the range in the index tree happened to branch in the root. This could cause unnecessary table scans in SQL queries. The fix is also backported to 3.23.54.
- Fixed a bug present in 3.23.52, 4.0.3, 4.0.4: InnoDB startup could take very long or even crash on some Windows 95/98/ME computers.
- Fixed a bug: the AUTO-INC lock was held to the end of the transaction if it was granted after a lock wait. This could cause unnecessary deadlocks.
- Fixed a bug: If SHOW INNODB STATUS, innodb\_monitor, or innodb\_lock\_monitor had to print several hundred transactions in one report, and the output became truncated, InnoDB would hang, printing to the error log many waits for a mutex created at `srv0srv.c`, line 1621.
- Fixed a bug: SHOW INNODB STATUS on Unix always reported average file read size as 0 bytes.
- Fixed a potential bug in 4.0.4: InnoDB now does ORDER BY ... DESC like MyISAM.
- Fixed a bug: DROP TABLE could cause crash or a hang if there was a rollback concurrently running on the table. The fix will be backported to 3.23 only if this appears a real problem for users.
- Fixed a bug: ORDER BY could fail if you had not created a primary key to a table, but had defined several indexes of which at least one was a UNIQUE index with all its columns declared as NOT NULL.
- Fixed a bug: a lock wait timeout in connection with ON DELETE CASCADE could cause corruption in indexes.
- Fixed a bug: If a SELECT was done with a unique key from a primary index, and the search matched to a delete-marked record, InnoDB could return the NEXT record.
- Outstanding bugs: in 4.0.4 two bugs were introduced to AUTO\_INCREMENT. REPLACE can cause the counter to be left 1 too low. A deadlock or a lock wait timeout can cause the same problem. These are fixed in 4.0.6.

## D.4.29. Changes in MySQL/InnoDB-3.23.53, October 9, 2002

- We again use unbuffered disk I/O to data files in Windows. Windows XP and Windows 2000 read performance seems to be very poor with normal I/O.
- Tuned range estimator so that index range scans are preferred over full index scans.
- Allow dropping and creating a table even if `innodb_force_recovery` is set. One can use this to drop a table which would cause a crash in rollback or purge, or if a failed table import causes a runaway rollback in recovery.

- Fixed a bug present in 3.23.52, 4.0.3, 4.0.4: **InnoDB** startup could take very long or even crash on some Windows 95/98/ME computers.
- Fixed a bug: fast shutdown (which is the default) sometimes was slowed down by purge and insert buffer merge.
- Fixed a bug: doing a big SELECT from a table where no rows were visible in a consistent read could cause a very long (> 600 seconds) semaphore wait in btr0cur.c line 310.
- Fixed a bug: the AUTO-INC lock was held to the end of the transaction if it was granted after a lock wait. This could cause unnecessary deadlocks.
- Fixed a bug: If you created a temporary table inside LOCK TABLES, and used that temporary table, that caused an assertion failure in ha\_innobase.cc.
- Fixed a bug: If SHOW INNODB STATUS, innodb\_monitor, or innodb\_lock\_monitor had to print several hundred transactions in one report, and the output became truncated, **InnoDB** would hang, printing to the error log many waits for a mutex created at srv0srv.c, line 1621.
- Fixed a bug: SHOW INNODB STATUS on Unix always reported average file read size as 0 bytes.

### D.4.30. Changes in MySQL/InnoDB-4.0.4, October 2, 2002

- We again use unbuffered disk I/O in Windows. Windows XP and Windows 2000 read performance seems to be very poor with normal I/O.
- Increased the maximum key length of **InnoDB** tables from 500 to 1024 bytes.
- Increased the table comment field in SHOW TABLE STATUS so that up to 16000 characters of foreign key definitions can be printed there.
- The auto-increment counter is no longer incremented if an insert of a row immediately fails in an error.
- Allow dropping and creating a table even if innodb\_force\_recovery is set. One can use this to drop a table which would cause a crash in rollback or purge, or if a failed table import causes a runaway rollback in recovery.
- Fixed a bug: Using ORDER BY primarykey DESC in 4.0.3 causes an assertion failure in btr0pcur.c, line 203.
- Fixed a bug: fast shutdown (which is the default) sometimes was slowed down by purge and insert buffer merge.
- Fixed a bug: doing a big SELECT from a table where no rows were visible in a consistent read could cause a very long (> 600 seconds) semaphore wait in btr0cur.c line 310.
- Fixed a bug: If the MySQL query cache was used, it did not get invalidated by a modification done by ON DELETE CASCADE or ...SET NULL.
- Fixed a bug: If you created a temporary table inside LOCK TABLES, and used that temporary table, that caused an assertion failure in ha\_innobd.cc.
- Fixed a bug: If you set innodb\_flush\_log\_at\_trx\_commit to 1, SHOW VARIABLES would show its value as 16 million.

### D.4.31. Changes in MySQL/InnoDB-4.0.3, August 28, 2002

- Removed unnecessary deadlocks when inserts have to wait for a locking read, update, or delete to release its next-key lock.
- The MySQL `HANDLER` SQL commands now work also for `InnoDB` type tables. `InnoDB` does the `HANDLER` reads always as consistent reads. `HANDLER` is a direct access path to read individual indexes of tables. In some cases, `HANDLER` can be used as a substitute of server-side cursors.
- Fixed a bug in 4.0.2: even a simple insert could crash the AIX version.
- Fixed a bug: If you used in a table name characters whose code is > 127, in `DROP TABLE InnoDB` could assert on line 155 of `pars0sym.c`.
- Compilation from source now provides a working version both on HP-UX-11 and HP-UX-10.20. The source of 4.0.2 worked only on 11, and the source of 3.23.52 only on 10.20.
- Fixed a bug: If compiled on 64-bit Solaris, `InnoDB` produced a bus error at startup.

### D.4.32. Changes in MySQL/InnoDB-3.23.52, August 16, 2002

- The feature set of 3.23 is frozen from this version on. New features go the 4.0 branch, and only bug-fixes are made to the 3.23 branch.
- Many CPU-bound join queries now run faster. On Windows also many other CPU-bound queries run faster.
- A new SQL command `SHOW INNODB STATUS` returns the output of the `InnoDB` Monitor to the client. The `InnoDB` Monitor now prints detailed information on the latest detected deadlock.
- `InnoDB` made the SQL query optimizer to avoid too much index-only range scans and choose full table scans instead. This is now fixed.
- `BEGIN` and `COMMIT` are now added in the binary log around transactions. The MySQL replication now respects transaction borders: a user no longer sees half transactions in replication slaves.
- A replication slave now prints in crash recovery the last master binary log position it was able to recover to.
- A new setting `innodb_flush_log_at_trx_commit=2` makes `InnoDB` to write the log to the operating system file cache at each commit. This is almost as fast as the setting `innodb_flush_log_at_trx_commit=0`, and the setting 2 also has the nice feature that in a crash where the operating system does not crash, no committed transaction is lost. If the operating system crashes or there is a power outage, then the setting 2 is no safer than the setting 0.
- Added checksum fields to log blocks.
- `SET FOREIGN_KEY_CHECKS=0` helps in importing tables in an arbitrary order which does not respect the foreign key rules.
- `SET UNIQUE_CHECKS=0` speeds up table imports into `InnoDB` if you have `UNIQUE` constraints on secondary indexes. This flag should be used only if you are certain that the input records contain no `UNIQUE` constraint violations.
- `SHOW TABLE STATUS` now lists also possible `ON DELETE CASCADE` or `ON DELETE SET NULL` in the comment field of the table.

- When CHECK TABLE is run on any [InnoDB](#) type table, it now checks also the adaptive hash index for all tables.
- If you defined ON DELETE CASCADE or SET NULL and updated the referenced key in the parent row, [InnoDB](#) deleted or updated the child row. This is now changed to conform to standard SQL: you get the error 'Cannot delete parent row'.
- Improved the auto-increment algorithm: now the first insert or SHOW TABLE STATUS initializes the auto-increment counter for the table. This removes almost all surprising deadlocks caused by SHOW TABLE STATUS.
- Aligned some buffers used in reading and writing to data files. This allows using unbuffered raw devices as data files in Linux.
- Fixed a bug: If you updated the primary key of a table so that only the case of characters changed, that could cause assertion failures, mostly in page0page.ic line 515.
- Fixed a bug: If you delete or update a row referenced in a foreign key constraint and the foreign key check has to wait for a lock, then the check may report an erroneous result. This affects also the ON DELETE... operation.
- Fixed a bug: A deadlock or a lock wait timeout error in [InnoDB](#) causes [InnoDB](#) to roll back the whole transaction, but MySQL could still write the earlier SQL statements to the binary log, even though [InnoDB](#) rolled them back. This could, for example, cause replicated databases to get out-of-sync.
- Fixed a bug: If the database happened to crash in the middle of a commit, then the recovery might leak tablespace pages.
- Fixed a bug: If you specified a non-latin1 character set in my.cnf, then, in contrary to what is stated in the manual, in a foreign key constraint a string type column had to have the same length specification in the referencing table and the referenced table.
- Fixed a bug: DROP TABLE or DROP DATABASE could fail if there simultaneously was a CREATE TABLE running.
- Fixed a bug: If you configured the buffer pool bigger than 2GB in a 32-bit computer, [InnoDB](#) would assert in buf0buf.ic line 214.
- Fixed a bug: on 64-bit computers updating rows which contained the SQL NULL in some column could cause the undo log and the ordinary log to become corrupt.
- Fixed a bug: innodb\_log\_monitor caused a hang if it suppressed lock prints for a page.
- Fixed a bug: in the HP-UX-10.20 version mutexes would leak and cause race conditions and crashes in any part of [InnoDB](#) code.
- Fixed a bug: If you ran in the AUTOCOMMIT mode, executed a SELECT, and immediately after that a RENAME TABLE, then RENAME would fail and MySQL would complain about error 1192.
- Fixed a bug: If compiled on 64-bit Solaris, [InnoDB](#) produced a bus error at startup.

### D.4.33. Changes in MySQL/InnoDB-4.0.2, July 10, 2002

- [InnoDB](#) is essentially the same as InnoDB-3.23.51.
- If no innodb\_data\_file\_path is specified, [InnoDB](#) at the database creation now creates a 10MB auto-

extending data file `ibdata1` to the `datadir` of MySQL. In 4.0.1 the file was 64MB and not auto-extending.

## D.4.34. Changes in MySQL/InnoDB-3.23.51, June 12, 2002

- Fixed a bug: a join could result in a segmentation fault in copying of a BLOB or TEXT column if some of the BLOB or TEXT columns in the table contained SQL NULL values.
- Fixed a bug: If you added self-referential foreign key constraints with ON DELETE CASCADE to tables and a row deletion caused InnoDB to attempt the deletion of the same row twice because of a cascading delete, then you got an assertion failure.
- Fixed a bug: If you use MySQL 'user-level locks' and close a connection, then InnoDB may assert in `ha_innbase.cc`, line 302.

## D.4.35. Changes in MySQL/InnoDB-3.23.50, April 23, 2002

- InnoDB now supports an auto-extending last data file. You do not need to preallocate the whole data file at the database startup.
- Made several changes to facilitate the use of the InnoDB Hot Backup tool. It is a separate non-free tool you can use to take online backups of your database without shutting down the server or setting any locks.
- If you want to run the InnoDB Hot Backup tool on an auto-extending data file you have to upgrade it to version `ibbackup-0.35`.
- The log scan phase in crash recovery now runs much faster.
- Starting from this server version, the hot backup tool truncates unused ends in the backup InnoDB data files.
- To allow the hot backup tool to work, on Windows we no longer use unbuffered I/O or native async I/O; instead we use the same simulated async I/O as on Unix.
- You can now define the ON DELETE CASCADE or ON DELETE SET NULL clause on foreign keys.
- FOREIGN KEY constraints now survive ALTER TABLE and CREATE INDEX.
- We suppress the FOREIGN KEY check if any of the column values in the foreign key or referenced key to be checked is the SQL NULL. This is compatible with Oracle, for example.
- SHOW CREATE TABLE now lists also foreign key constraints. Also mysqldump no longer forgets about foreign keys in table definitions.
- You can now add a new foreign key constraint with ALTER TABLE ... ADD CONSTRAINT FOREIGN KEY (...) REFERENCES ... (...).
- FOREIGN KEY definitions now allow backticks around table and column names.
- MySQL command SET TRANSACTION ISOLATION LEVEL ... has now the following effect on InnoDB tables: If a transaction is defined as SERIALIZABLE then InnoDB conceptually adds LOCK IN SHARE MODE to all consistent reads. If a transaction is defined to have any other isola-

tion level, then [InnoDB](#) obeys its default locking strategy which is REPEATABLE READ.

- `SHOW TABLE STATUS` no longer sets an x-lock at the end of an auto-increment index if the auto-increment counter has been initialized. This removes in almost all cases the surprising deadlocks caused by `SHOW TABLE STATUS`.
- Fixed a bug: in a `CREATE TABLE` statement the string 'foreign' followed by a non-space character confused the FOREIGN KEY parser and caused table creation to fail with errno 150.

## D.4.36. Changes in MySQL/InnoDB-3.23.49, February 17, 2002

- Fixed a bug: If you called `DROP DATABASE` for a database on which there simultaneously were running queries, the MySQL server could crash or hang. Crashes fixed, but a full fix has to wait some changes in the MySQL layer of code.
- Fixed a bug: on Windows one had to put the database name in lowercase for `DROP DATABASE` to work. Fixed in 3.23.49: case no longer matters on Windows. On Unix, the database name remains case sensitive.
- Fixed a bug: If one defined a non-latin1 character set as the default character set, then definition of foreign key constraints could fail in an assertion failure in `dict0crea.c`, reporting an internal error 17.

## D.4.37. Changes in MySQL/InnoDB-3.23.48, February 9, 2002

- Tuned the SQL optimizer to favor more often index searches over table scans.
- Fixed a performance problem when several large `SELECT` queries are run concurrently on a multi-processor Linux computer. Large CPU-bound `SELECT` queries now also generally run faster on all platforms.
- If MySQL binary logging is used, [InnoDB](#) now prints after crash recovery the latest MySQL binary log file name and the position in that file (= byte offset) [InnoDB](#) was able to recover to. This is useful, for example, when resynchronizing a master and a slave database in replication.
- Added better error messages to help in installation problems.
- One can now recover also MySQL temporary tables which have become orphaned inside the [InnoDB](#) tablespace.
- [InnoDB](#) now prevents a FOREIGN KEY declaration where the signedness is not the same in the referencing and referenced integer columns.
- Fixed a bug: calling `SHOW CREATE TABLE` or `SHOW TABLE STATUS` could cause memory corruption and make `mysqld` to crash. Especially at risk was `mysqldump`, because it calls frequently `SHOW CREATE TABLE`.
- Fixed a bug: If on Unix you did an `ALTER TABLE` to an [InnoDB](#) table and simultaneously did queries to it, `mysqld` could crash with an assertion failure in `row0row.c`, line 474.
- Fixed a bug: If inserts to several tables containing an auto-inc column were wrapped inside one `LOCK TABLES`, [InnoDB](#) asserted in `lock0lock.c`.
- In 3.23.47 we allowed several NULLS in a UNIQUE secondary index. But `CHECK TABLE` was not relaxed: it reports the table as corrupt. `CHECK TABLE` no longer complains in this situation.

- Fixed a bug: on Sparc and other high-endian processors SHOW VARIABLES showed innodb\_flush\_log\_at\_trx\_commit and other boolean-valued startup parameters always OFF even if they were switched on.
- Fixed a bug: If you ran mysqld-max-nt as a service on Windows NT/2000, the service shutdown did not always wait long enough for the InnoDB shutdown to finish.

### D.4.38. Changes in MySQL/InnoDB-3.23.47, December 28, 2001

- Recovery happens now faster, especially in a lightly loaded system, because background checkpointing has been made more frequent.
- InnoDB allows now several similar key values in a UNIQUE secondary index if those values contain SQL NULLs. Thus the convention is now the same as in MyISAM tables.
- InnoDB gives a better row count estimate for a table which contains BLOBs.
- In a FOREIGN KEY constraint InnoDB is now case-insensitive to column names, and in Windows also to table names.
- InnoDB allows a FOREIGN KEY column of CHAR type to refer to a column of VARCHAR type, and vice versa. MySQL silently changes the type of some columns between CHAR and VARCHAR, and these silent changes do not hinder FOREIGN KEY declaration any more.
- Recovery has been made more resilient to corruption of log files.
- Unnecessary statistics calculation has been removed from queries which generate a temporary table. Some ORDER BY and DISTINCT queries now run much faster.
- MySQL now knows that the table scan of an InnoDB table is done through the primary key. This saves a sort in some ORDER BY queries.
- The maximum key length of InnoDB tables is again restricted to 500 bytes. The MySQL interpreter is not able to handle longer keys.
- The default value of innodb\_lock\_wait\_timeout was changed from infinite to 50 seconds, the default value of innodb\_file\_io\_threads from 9 to 4.

### D.4.39. Changes in MySQL/InnoDB-4.0.1, December 23, 2001

- InnoDB is the same as in 3.23.47.
- In 4.0.0 the MySQL interpreter did not know the syntax LOCK IN SHARE MODE. This has been fixed.
- In 4.0.0 multiple-table delete did not work for transactional tables. This has been fixed.

### D.4.40. Changes in MySQL/InnoDB-3.23.46, November 30, 2001

- This is the same as 3.23.45.

## D.4.41. Changes in MySQL/InnoDB-3.23.45, November 23, 2001

- This is a bugfix release.
- In versions 3.23.42-.44 when creating a table on Windows, you have to use lowercase letters in the database name to be able to access the table. Fixed in 3.23.45.
- [InnoDB](#) now flushes stdout and stderr every 10 seconds: If these are redirected to files, the file contents can be better viewed with an editor.
- Fixed an assertion failure in .44, in `trx0trx.c`, line 178 when you drop a table which has the `.frm` file but does not exist inside [InnoDB](#).
- Fixed a bug in the insert buffer. The insert buffer tree could get into an inconsistent state, causing a crash, and also crashing the recovery. This bug could appear especially in large table imports or alterations.
- Fixed a bug in recovery: [InnoDB](#) could go into an infinite loop constantly printing a warning message that it cannot find free blocks from the buffer pool.
- Fixed a bug: when you created a temporary table of the [InnoDB](#) type, and then used `ALTER TABLE` to it, the MySQL server could crash.
- Prevented creation of MySQL system tables 'mysql.user', 'mysql.host', or 'mysql.db', in the [InnoDB](#) type.
- Fixed a bug which can cause an assertion failure in 3.23.44 in `srv0srv.c`, line 1728.

## D.4.42. Changes in MySQL/InnoDB-3.23.44, November 2, 2001

- You can define foreign key constraints on [InnoDB](#) tables. An example: `FOREIGN KEY (col1) REFERENCES table2(col2)`.
- You can create data files larger than 4GB in those filesystems that allow it.
- Improved [InnoDB](#) monitors, including a new `innodb_table_monitor` which allows you to print the contents of the [InnoDB](#) internal data dictionary.
- `DROP DATABASE` now works also for [InnoDB](#) tables.
- Accent characters in the default character set `latin1` are ordered according to the MySQL ordering.  
  
NOTE: If you are using `latin1` and have inserted characters whose code is  $> 127$  to an indexed `CHAR` column, you should run `CHECK TABLE` on your table when you upgrade to 3.23.43, and drop and reimport the table if `CHECK TABLE` reports an error!
- [InnoDB](#) calculates better table cardinality estimates.
- Change in deadlock resolution: in .43 a deadlock rolls back only the SQL statement, in .44 it rolls back the whole transaction.

- Deadlock, lock wait timeout, and foreign key constraint violations (no parent row, child rows exist) now return native MySQL error codes 1213, 1205, 1216, 1217, respectively.
- A new my.cnf parameter `innodb_thread_concurrency` helps in performance tuning in high concurrency environments.
- A new my.cnf option `innodb_force_recovery` helps you in dumping tables from a corrupted database.
- A new my.cnf option `innodb_fast_shutdown` speeds up shutdown. Normally `InnoDB` does a full purge and an insert buffer merge at shutdown.
- Raised maximum key length to 7000 bytes from a previous limit of 500 bytes.
- Fixed a bug in replication of auto-inc columns with multiline inserts.
- Fixed a bug when the case of letters changes in an update of an indexed secondary column.
- Fixed a hang when there are more than 24 data files.
- Fixed a crash when `MAX(col)` is selected from an empty table, and `col` is a not the first column in a multi-column index.
- Fixed a bug in purge which could cause crashes.

#### **D.4.43. Changes in MySQL/InnoDB-3.23.43, October 4, 2001**

- This is essentially the same as InnoDB-3.23.42.

#### **D.4.44. Changes in MySQL/InnoDB-3.23.42, September 9, 2001**

- Fixed a bug which corrupted the table if the primary key of a > 8000-byte row was updated.
- There are now 3 types of `InnoDB` Monitors: `innodb_monitor`, `innodb_lock_monitor`, and `innodb_tablespace_monitor`. `innodb_monitor` now prints also buffer pool hit rate and the total number of rows inserted, updated, deleted, read.
- Fixed a bug in `RENAME TABLE`.
- Fixed a bug in replication with an auto-increment column.

#### **D.4.45. Changes in MySQL/InnoDB-3.23.41, August 13, 2001**

- Support for < 4GB rows. The previous limit was 8000 bytes.
- Use the doublewrite file flush method.
- Raw disk partitions supported as data files.
- `InnoDB` Monitor.

- Several hang bugs fixed and an `ORDER BY` bug (“Sort aborted”) fixed.

## D.4.46. Changes in MySQL/InnoDB-3.23.40, July 16, 2001

- Only a few rare bugs fixed.

## D.4.47. Changes in MySQL/InnoDB-3.23.39, June 13, 2001

- `CHECK TABLE` now works for InnoDB tables.
- A new `my.cnf` parameter `innodb_unix_file_flush_method` introduced. It can be used to tune disk write performance.
- An auto-increment column now gets new values past the transaction mechanism. This saves CPU time and eliminates transaction deadlocks in new value assignment.
- Several bugfixes, most notably the rollback bug in 3.23.38.

## D.4.48. Changes in MySQL/InnoDB-3.23.38, May 12, 2001

- The new syntax `SELECT ... LOCK IN SHARE MODE` is introduced.
- InnoDB now calls `fsync()` after every disk write and calculates a checksum for every database page it writes or reads, which reveals disk defects.
- Several bugfixes.

## D.5. Changes in MySQL Cluster

Starting from 4.1.13 and 5.0.7, all Cluster changes are included in the MySQL Change History, and this manual section is no longer separately maintained.

### D.5.1. Changes in MySQL Cluster-5.0.7 (10 June 2005)

**Note:** Starting with version 5.0.8, changes for MySQL Cluster can be found in the combined MySQL Change History.

Functionality added or changed:

Bugs fixed:

- ([Bug#11019](http://bugs.mysql.com/11019) [http://bugs.mysql.com/11019]) `mgmapi start backup` in some cases returns wrong `backupid`
- ([Bug#10190](http://bugs.mysql.com/10190) [http://bugs.mysql.com/10190]) Backup from cluster with `NoOfReplica=1` is corrupt
- ([Bug#9246](http://bugs.mysql.com/9246) [http://bugs.mysql.com/9246]) Condition pushdown and left join, wrong result
- ([Bug#10956](http://bugs.mysql.com/10956) [http://bugs.mysql.com/10956]) More than 7 node restarts with `--initial` caused

cluster to fail.

- ([Bug#9945](http://bugs.mysql.com/9945) [<http://bugs.mysql.com/9945>]) `ALTER TABLE` caused server crash. (Linux/390)
- ([Bug#9826](http://bugs.mysql.com/9826) [<http://bugs.mysql.com/9826>]) ([Bug#10948](http://bugs.mysql.com/10948) [<http://bugs.mysql.com/10948>]) Schema change (`DROP TABLE`, `ALTER TABLE`) crashed HPUX and PPC32.
- ([Bug#10711](http://bugs.mysql.com/10711) [<http://bugs.mysql.com/10711>]) ([Bug#9363](http://bugs.mysql.com/9363) [<http://bugs.mysql.com/9363>]) ([Bug#8918](http://bugs.mysql.com/8918) [<http://bugs.mysql.com/8918>]) ([Bug#10058](http://bugs.mysql.com/10058) [<http://bugs.mysql.com/10058>]) ([Bug#9025](http://bugs.mysql.com/9025) [<http://bugs.mysql.com/9025>]) Cluster would time out and crash after first query; setting DataMemory to more than 2GB prevented cluster from starting; calling `ndb_select_count()` crashed the cluster. (64-bit Unix OSes)

## D.5.2. Changes in MySQL Cluster-5.0.6 (26 May 2005)

Functionality added or changed:

- Limit on number of metadata objects (number of tables, indexes and BLOBs) now increased to 20,320

Bugs fixed:

- The server would hang on successive calls to an `INSERT ... ON DUPLICATE KEY UPDATE` query. ([Bug#9725](http://bugs.mysql.com/9725) [<http://bugs.mysql.com/9725>])
- ([Bug#10193](http://bugs.mysql.com/10193) [<http://bugs.mysql.com/10193>]) Invalid DataDir in config causes ndbd segmentation fault
- ([Bug#10813](http://bugs.mysql.com/10813) [<http://bugs.mysql.com/10813>]) Build with SCI Transporter fails
- ([Bug#10831](http://bugs.mysql.com/10831) [<http://bugs.mysql.com/10831>]) ndb mgmd LogDestination maxfiles does not rotate logs properly

## D.5.3. Changes in MySQL Cluster-5.0.5 (Not released)

Functionality added or changed:

- Decreased IndexMemory Usage
- Parallel key lookup (read-multi-range) for queries like `SELECT * FROM t1 WHERE primary_key IN (1,2,3,4,5,6,7,8,9,10);`

Bugs fixed:

Patches merged from versions 4.1.11 and 4.1.12

- ([Bug#8315](http://bugs.mysql.com/8315) [<http://bugs.mysql.com/8315>]) NdbScanFilter cmp method only works for strings of exact word boundary length
- ([Bug#8103](http://bugs.mysql.com/8103) [<http://bugs.mysql.com/8103>]) Configuration handling error

- ([Bug#8035](http://bugs.mysql.com/8035) [http://bugs.mysql.com/8035]) mysqld signal 10 when ndbd is shutdown
- ([Bug#7631](http://bugs.mysql.com/7631) [http://bugs.mysql.com/7631]) NDB\$EVENT contains unreadable event and table names
- ([Bug#7628](http://bugs.mysql.com/7628) [http://bugs.mysql.com/7628]) Filtered event types are ignored
- ([Bug#7627](http://bugs.mysql.com/7627) [http://bugs.mysql.com/7627]) Drop Event operation fails
- ([Bug#7424](http://bugs.mysql.com/7424) [http://bugs.mysql.com/7424]) create index on datetime fails

## D.5.4. Changes in MySQL Cluster-5.0.4 (16 April 2005)

Functionality added or changed:

- Condition pushdown to storage engine now works for update and delete as well

Bugs fixed:

- ([Bug#9675](http://bugs.mysql.com/9675) [http://bugs.mysql.com/9675]) Auto-increment not working with INSERT..SELECT and NDB storage
- ([Bug#9517](http://bugs.mysql.com/9517) [http://bugs.mysql.com/9517]) Condition pushdown to storage engine does not work for update/delete
- ([Bug#9282](http://bugs.mysql.com/9282) [http://bugs.mysql.com/9282]) API Node Crashes/Reloads on 'DELETE FROM'
- ([Bug#9280](http://bugs.mysql.com/9280) [http://bugs.mysql.com/9280]) Memory leak in cluster when dependent sub-queries are used
- ([Bug#8585](http://bugs.mysql.com/8585) [http://bugs.mysql.com/8585]) ndb\_cache2 fails on aix52

## D.5.5. Changes in MySQL Cluster-5.0.3 (23 March 2005: Beta)

Functionality added or changed:

- Condition pushdown to storage engine
- Query cache enabled for cluster

Bugs fixed:

- Patches merged from version 4.1.10

## D.5.6. Changes in MySQL Cluster-5.0.1 (27 July 2004)

Functionality added or changed:

- This was the first MySQL Cluster release in the 5.0 series. As nearly all attention was still focused

on getting 4.1 stable, it is not recommended to use MySQL 5.0.1 for MySQL Cluster.

Bugs fixed:

- N/A

## D.5.7. Changes in MySQL Cluster-4.1.13 (15 July 2005)

Functionality added or changed:

Bugs fixed:

- ([Bug#11132](http://bugs.mysql.com/11132) [<http://bugs.mysql.com/11132>]) Connections between data nodes and management nodes were not being closed following shutdown of `ndb_mgmd`.
- ([Bug#11050](http://bugs.mysql.com/11050) [<http://bugs.mysql.com/11050>]) `ndb_mgm> show` printed incorrectly after master data node failure.
- ([Bug#10956](http://bugs.mysql.com/10956) [<http://bugs.mysql.com/10956>]) More than 7 node restarts with `--initial` caused cluster to fail.
- ([Bug#9826](http://bugs.mysql.com/9826) [<http://bugs.mysql.com/9826>]) ([Bug#10948](http://bugs.mysql.com/10948) [<http://bugs.mysql.com/10948>]) Schema change (`DROP TABLE`, `ALTER TABLE`) crashed HP-UX and PPC32.
- ([Bug#9025](http://bugs.mysql.com/9025) [<http://bugs.mysql.com/9025>]) Data nodes failed to restart on 64-bit Solaris.
- ([Bug#11166](http://bugs.mysql.com/11166) [<http://bugs.mysql.com/11166>]) Insert records were incorrectly applied by `ndb_restore`, thus making restoration from backup inconsistent if the binlog contained inserts.
- ([Bug#8918](http://bugs.mysql.com/8918) [<http://bugs.mysql.com/8918>]) ([Bug#9363](http://bugs.mysql.com/9363) [<http://bugs.mysql.com/9363>]) ([Bug#10711](http://bugs.mysql.com/10711) [<http://bugs.mysql.com/10711>]) ([Bug#10058](http://bugs.mysql.com/10058) [<http://bugs.mysql.com/10058>]) ([Bug#9025](http://bugs.mysql.com/9025) [<http://bugs.mysql.com/9025>]) Cluster would time out and crash after first query; setting `DataMemory` to more than 2GB prevented cluster from starting; calling `ndb_select_count()` crashed the cluster. (64-bit Unix OSes)
- ([Bug#10190](http://bugs.mysql.com/10190) [<http://bugs.mysql.com/10190>]) When making a backup of a cluster where `NumberOfReplicas` was equal to 1, the backup's metadata was corrupted. (Linux)
- ([Bug#9945](http://bugs.mysql.com/9945) [<http://bugs.mysql.com/9945>]) `ALTER TABLE` caused server crash. (Linux/390)
- ([Bug#11133](http://bugs.mysql.com/11133) [<http://bugs.mysql.com/11133>]) A delete operation performed as part of a transaction caused an erroneous result.
- ([Bug#10294](http://bugs.mysql.com/10294) [<http://bugs.mysql.com/10294>]) Not allowing sufficient parallelism in cluster configuration (for example, `NoOfTransactions` too small) caused `ndb_restore` to fail without generating any error messages.
- ([Bug#11290](http://bugs.mysql.com/11290) [<http://bugs.mysql.com/11290>]) Setting `TransactionInactiveTimeout=0` did not result in an infinite timeout.

## D.5.8. Changes in MySQL Cluster-4.1.12 (13 May 2005)

Functionality added or changed:

Bugs fixed:

- ([Bug#10471](http://bugs.mysql.com/10471) [http://bugs.mysql.com/10471]) Backup can become inconsistent with certain combinations of multiple-row updates
- ([Bug#10287](http://bugs.mysql.com/10287) [http://bugs.mysql.com/10287]) `ndb_select_all "delimiter"` option non functional
- ([Bug#10142](http://bugs.mysql.com/10142) [http://bugs.mysql.com/10142]) Unhandled resource shortage in UNIQUE index code
- ([Bug#10029](http://bugs.mysql.com/10029) [http://bugs.mysql.com/10029]) crash in ordered index scan after db full
- ([Bug#10001](http://bugs.mysql.com/10001) [http://bugs.mysql.com/10001]) 2 NDB nodes get signal 6 (abort) in DBTC
- ([Bug#9969](http://bugs.mysql.com/9969) [http://bugs.mysql.com/9969]) 4012 - has misleading error message
- ([Bug#9960](http://bugs.mysql.com/9960) [http://bugs.mysql.com/9960]) START BACKUP reports failure albeit succeeding
- ([Bug#9924](http://bugs.mysql.com/9924) [http://bugs.mysql.com/9924]) ABORT BACKUP 1 crashes 4 node cluster
- ([Bug#9892](http://bugs.mysql.com/9892) [http://bugs.mysql.com/9892]) Index activation file during node recovery
- ([Bug#9891](http://bugs.mysql.com/9891) [http://bugs.mysql.com/9891]) Crash in DBACC (line 7004) during commit
- ([Bug#9865](http://bugs.mysql.com/9865) [http://bugs.mysql.com/9865]) SELECT does not function properly
- ([Bug#9839](http://bugs.mysql.com/9839) [http://bugs.mysql.com/9839]) Column with AUTOINC contains -1 Value on node stop
- ([Bug#9757](http://bugs.mysql.com/9757) [http://bugs.mysql.com/9757]) Uncompleted node failure after gracefully stopping node
- ([Bug#9749](http://bugs.mysql.com/9749) [http://bugs.mysql.com/9749]) Transactions causes deadlock in ACC
- ([Bug#9724](http://bugs.mysql.com/9724) [http://bugs.mysql.com/9724]) Node fails to start: Message: File has already been opened
- ([Bug#9691](http://bugs.mysql.com/9691) [http://bugs.mysql.com/9691]) UPDATE fails on attempt to update primary key
- ([Bug#9675](http://bugs.mysql.com/9675) [http://bugs.mysql.com/9675]) Auto-increment not working with INSERT..SELECT and NDB storage
- ([Bug#9318](http://bugs.mysql.com/9318) [http://bugs.mysql.com/9318]) drop database does not drop ndb tables
- ([Bug#9280](http://bugs.mysql.com/9280) [http://bugs.mysql.com/9280]) Memory leak in cluster when dependent sub-queries are used
- ([Bug#8928](http://bugs.mysql.com/8928) [http://bugs.mysql.com/8928]) create table with keys will shutdown the cluster
- Creating a table did not work for a cluster with 6 nodes. ([Bug#8928](http://bugs.mysql.com/8928) [http://bugs.mysql.com/8928]) Databases with 1, 2, 4, 8, ... ( $2^n$  nodes) did not have the problem. After a rolling upgrade, restart each node manually by restarting it with the `--initial` option. Otherwise, use dump and restore after an upgrade.

## D.5.9. Changes in MySQL Cluster-4.1.11 (01 April 2005)

Functionality added or changed:

Bugs fixed:

- ([Bug#9916](http://bugs.mysql.com/9916) [http://bugs.mysql.com/9916]) DbaccMain.cpp / DBACC (Line: 4876) / Pointer too large
- ([Bug#9435](http://bugs.mysql.com/9435) [http://bugs.mysql.com/9435]) TIMESTAMP columns don't update
- ([Bug#9052](http://bugs.mysql.com/9052) [http://bugs.mysql.com/9052]) Uninitialized data during unique index build, potential cluster crash
- ([Bug#8876](http://bugs.mysql.com/8876) [http://bugs.mysql.com/8876]) Timeout when committing aborted transaction after node failure
- ([Bug#8786](http://bugs.mysql.com/8786) [http://bugs.mysql.com/8786]) ndb\_autodiscover, drop index can fail, wait 2 minutes timeout
- ([Bug#8853](http://bugs.mysql.com/8853) [http://bugs.mysql.com/8853]) Transaction aborted after long time during node failure (4012)
- ([Bug#8753](http://bugs.mysql.com/8753) [http://bugs.mysql.com/8753]) Invalid schema object version after dropping index (crash fixed, currently retry required)
- ([Bug#8645](http://bugs.mysql.com/8645) [http://bugs.mysql.com/8645]) Assertion failure with multiple management servers
- ([Bug#8557](http://bugs.mysql.com/8557) [http://bugs.mysql.com/8557]) ndbd does not get same nodeid on restart
- ([Bug#8556](http://bugs.mysql.com/8556) [http://bugs.mysql.com/8556]) corrupt ndb\_mgm show printout for certain configurations
- ([Bug#8167](http://bugs.mysql.com/8167) [http://bugs.mysql.com/8167]) cluster shared memory and mysqld signal usage clash

## D.5.10. Changes in MySQL Cluster-4.1.10 (12 February 2005)

Bugs fixed:

- ([Bug#8284](http://bugs.mysql.com/8284) [http://bugs.mysql.com/8284]) Out of fragment memory in DBACC
- ([Bug#8262](http://bugs.mysql.com/8262) [http://bugs.mysql.com/8262]) Node crash due to bug in DBLQH
- ([Bug#8208](http://bugs.mysql.com/8208) [http://bugs.mysql.com/8208]) node restart fails on Aix 5.2
- ([Bug#8167](http://bugs.mysql.com/8167) [http://bugs.mysql.com/8167]) cluster shared memory and mysqld signal usage clash
- ([Bug#8101](http://bugs.mysql.com/8101) [http://bugs.mysql.com/8101]) unique index and error 4209 while selecting
- ([Bug#8070](http://bugs.mysql.com/8070) [http://bugs.mysql.com/8070]) ([Bug#7937](http://bugs.mysql.com/7937) [http://bugs.mysql.com/7937]) ([Bug#6716](http://bugs.mysql.com/6716) [http://bugs.mysql.com/6716]) various ndb\_restore core dumps on HP-UX
- ([Bug#8010](http://bugs.mysql.com/8010) [http://bugs.mysql.com/8010]) 4006 forces MySQL Node Restart
- ([Bug#7928](http://bugs.mysql.com/7928) [http://bugs.mysql.com/7928]) out of connection objects
- ([Bug#7898](http://bugs.mysql.com/7898) [http://bugs.mysql.com/7898]) mysqld crash with ndb (solaris)
- ([Bug#7864](http://bugs.mysql.com/7864) [http://bugs.mysql.com/7864]) Not possible to have more than 4.5G data memory

## D.5.11. Changes in MySQL Cluster-4.1.9 (13 January 2005)

Functionality added or changed:

- New implementation of shared memory transporter.
- Cluster automatically configures shared memory transporter if possible.
- Cluster prioritizes usage of transporters with shared memory and localhost TCP
- Added switches to control the above functions, `ndb-shm` and `ndb-optimized-node-selection`.

Bugs fixed:

- ([Bug#7805](http://bugs.mysql.com/7805) [http://bugs.mysql.com/7805]) config.ini parsing error
- ([Bug#7798](http://bugs.mysql.com/7798) [http://bugs.mysql.com/7798]) Running range scan after alter table in different thread causes node failure
- ([Bug#7761](http://bugs.mysql.com/7761) [http://bugs.mysql.com/7761]) Alter table does not autocommit
- ([Bug#7725](http://bugs.mysql.com/7725) [http://bugs.mysql.com/7725]) Indexed DATETIME Columns Return Random Results
- ([Bug#7660](http://bugs.mysql.com/7660) [http://bugs.mysql.com/7660]) START BACKUP does not increment BACKUP-ID (Big Endian machines)
- ([Bug#7593](http://bugs.mysql.com/7593) [http://bugs.mysql.com/7593]) Cannot Create A Large NDB Data Warehouse
- ([Bug#7480](http://bugs.mysql.com/7480) [http://bugs.mysql.com/7480]) Mysqld crash in ha\_ndbcluster using Query Browser
- ([Bug#7470](http://bugs.mysql.com/7470) [http://bugs.mysql.com/7470]) shared memory transporter does not connect
- ([Bug#7396](http://bugs.mysql.com/7396) [http://bugs.mysql.com/7396]) Primary Key not working in NDB Mysql Clustered table (solaris)
- ([Bug#7379](http://bugs.mysql.com/7379) [http://bugs.mysql.com/7379]) ndb restore fails to handle blobs and multiple databases
- ([Bug#7346](http://bugs.mysql.com/7346) [http://bugs.mysql.com/7346]) ndb\_restore enters infinite loop
- ([Bug#7340](http://bugs.mysql.com/7340) [http://bugs.mysql.com/7340]) Problem for inserting data into the Text field on utf8
- ([Bug#7124](http://bugs.mysql.com/7124) [http://bugs.mysql.com/7124]) ndb\_mgmd is aborted on startup when using SHM connection

## D.5.12. Changes in MySQL Cluster-4.1.8 (14 December 2004)

Functionality added or changed:

- Default port for `ndb_mgmd` was changed to 1186 (from 2200) as this port number was officially assigned to MySQL Cluster by IANA.
- New command in `ndb_mgm`, PURGE STALE SESSIONS, as a workaround for cases where nodes fail to allocate a node id even if it is free to use.
- New command in `ndb_mgm`, CONNECT.

- The `ndb` executables have been changed to make use of the regular MySQL command line option parsing features. See [Section 15.6.5, “Command Options for MySQL Cluster Processes”](#), for notes on changes.
- As bonus of the above you can now specify all command line options in `my.cnf` using the executable names as sections, that is, `[ndbd]`, `[ndb_mgmd]`, `[ndb_mgm]`, `[ndb_restore]`, and so forth.

```
[ndbd]
ndb-connectstring=myhost.domain.com:1234
[ndb_mgm]
ndb-connectstring=myhost.domain.com:1234
```

- Added use of section `[mysql_cluster]` in `my.cnf`. All cluster executables, including `mysqld`, parse this section. For example, this is a convenient place to put `ndb-connectstring` so that it need be specified only once.
- Added cluster log info events on allocation and deallocation of nodeid's.
- Added cluster log info events on connection refuse as a result of version mismatch.
- Extended connectstring syntax to allow for leaving the port number out. For example, `ndb-connectstring|connect-string=myhost1,myhost2,myhost3` is a valid connectstring and connect occurs on default port 1186.
- Clear text `ndb` error messages provided also for error codes that are mapped to corresponding `mysql` error codes, by executing `SHOW WARNINGS` after an error has occurred which relates to the `ndb` storage engine.
- Significant performance improvements done for read performance, especially for blobs.
- Added some variables for performance tuning, `ndb_force_send` and `ndb_use_exact_count`. Do `show variables like 'ndb%';` in `mysql` client for listing. Use `set` command to alter variables.
- Added variables to set some options, `ndb_use_transactions` and `ndb_autoincrement_prefetch_sz`.

Bugs fixed:

- ([Bug#7303](http://bugs.mysql.com/7303) [<http://bugs.mysql.com/7303>]) `ndb_mgm`: Trying to set `CLUSTERLOG` for a specific node id core dumps
- ([Bug#7193](http://bugs.mysql.com/7193) [<http://bugs.mysql.com/7193>]) `start backup` gives false error printout
- ([Bug#7153](http://bugs.mysql.com/7153) [<http://bugs.mysql.com/7153>]) Cluster nodes don't report error on endianness mismatch
- ([Bug#7152](http://bugs.mysql.com/7152) [<http://bugs.mysql.com/7152>]) `ndb_mgmd` segmentation fault on incorrect `HostName` in configuration
- ([Bug#7104](http://bugs.mysql.com/7104) [<http://bugs.mysql.com/7104>]) `clusterlog` filtering and level setting broken
- ([Bug#6995](http://bugs.mysql.com/6995) [<http://bugs.mysql.com/6995>]) `ndb_recover` on `varchar` fields results in changing case of data
- ([Bug#6919](http://bugs.mysql.com/6919) [<http://bugs.mysql.com/6919>]) all status only shows 2 nodes on a 8-node cluster
- ([Bug#6871](http://bugs.mysql.com/6871) [<http://bugs.mysql.com/6871>]) `DBD` execute failed: Got error 897 'Unknown error code'

from ndbcluster

- ([Bug#6794](http://bugs.mysql.com/6794) [http://bugs.mysql.com/6794]) Wrong outcome of update operation of ndb table
- ([Bug#6791](http://bugs.mysql.com/6791) [http://bugs.mysql.com/6791]) Segmentation fault when config.ini is not correctly set
- ([Bug#6775](http://bugs.mysql.com/6775) [http://bugs.mysql.com/6775]) failure in acc when running many mysql clients
- ([Bug#6696](http://bugs.mysql.com/6696) [http://bugs.mysql.com/6696]) ndb\_mgm command line options inconsistent with behavior
- ([Bug#6684](http://bugs.mysql.com/6684) [http://bugs.mysql.com/6684]) ndb\_restore doesn't give error messages if improper command given
- ([Bug#6677](http://bugs.mysql.com/6677) [http://bugs.mysql.com/6677]) ndb\_mgm can crash on "ALL CLUSTERLOG"
- ([Bug#6538](http://bugs.mysql.com/6538) [http://bugs.mysql.com/6538]) Error code returned when select max() on empty table with index
- ([Bug#6451](http://bugs.mysql.com/6451) [http://bugs.mysql.com/6451]) failing create table gives "ghost" tables which are impossible to remove
- ([Bug#6435](http://bugs.mysql.com/6435) [http://bugs.mysql.com/6435]) strange behavior of left join
- ([Bug#6426](http://bugs.mysql.com/6426) [http://bugs.mysql.com/6426]) update with long pk fails
- ([Bug#6398](http://bugs.mysql.com/6398) [http://bugs.mysql.com/6398]) update of primary key fails
- ([Bug#6354](http://bugs.mysql.com/6354) [http://bugs.mysql.com/6354]) mysql does not complain about --ndbcluster option when NDB is not compiled in
- ([Bug#6331](http://bugs.mysql.com/6331) [http://bugs.mysql.com/6331]) INSERT IGNORE .. SELECT breaks subsequent inserts
- ([Bug#6288](http://bugs.mysql.com/6288) [http://bugs.mysql.com/6288]) cluster nodes crash on data import
- ([Bug#6031](http://bugs.mysql.com/6031) [http://bugs.mysql.com/6031]) To drop database you have to execute DROP DATABASE command twice
- ([Bug#6020](http://bugs.mysql.com/6020) [http://bugs.mysql.com/6020]) LOCK TABLE + delete returns error 208
- ([Bug#6018](http://bugs.mysql.com/6018) [http://bugs.mysql.com/6018]) REPLACE does not work for BLOBs + NDB
- ([Bug#6016](http://bugs.mysql.com/6016) [http://bugs.mysql.com/6016]) Strange crash with blobs + different DATABASES
- ([Bug#5973](http://bugs.mysql.com/5973) [http://bugs.mysql.com/5973]) ndb table belonging to different database shows up in show tables
- ([Bug#5872](http://bugs.mysql.com/5872) [http://bugs.mysql.com/5872]) ALTER TABLE with blob from ndb table to myisam fails
- ([Bug#5844](http://bugs.mysql.com/5844) [http://bugs.mysql.com/5844]) Failing mysql-test-run leaves stray NDB processes behind
- ([Bug#5824](http://bugs.mysql.com/5824) [http://bugs.mysql.com/5824]) HELP text messed up in ndb\_mgm
- ([Bug#5786](http://bugs.mysql.com/5786) [http://bugs.mysql.com/5786]) Duplicate key error after restore
- ([Bug#5785](http://bugs.mysql.com/5785) [http://bugs.mysql.com/5785]) lock timeout during concurrent update
- ([Bug#5782](http://bugs.mysql.com/5782) [http://bugs.mysql.com/5782]) Unknown error when using LIMIT with ndb table

- ([Bug#5756](http://bugs.mysql.com/5756) [<http://bugs.mysql.com/5756>]) RESTART node from ndb\_mgm fails
- A few more not reported bugs fixed

### D.5.13. Changes in MySQL Cluster-4.1.7 (23 October 2004)

Functionality added or changed:

- Optimization 1: Improved performance on index scans. Measured 30% performance increase on query which do large amounts of index scans.
- Optimization 2: Improved performance on primary key lookups. Around double performance for autocommitted primary key lookups.
- Optimization 3: Improved performance when using blobs by avoiding usage of exclusive locks for blobs.

Bugs fixed:

- A few bugs fixed.

### D.5.14. Changes in MySQL Cluster-4.1.6 (10 October 2004)

Functionality added or changed:

- Limited character set support for storage engine NDBCLUSTER:

Char set	Collation
big5	big5_chinese_ci
	big5_bin
binary	binary
euckr	euckr_korean_ci
	euckr_bin
gb2312	gb2312_chinese_ci
	gb2312_bin
gbk	gbk_chinese_ci
	gbk_bin
latin1	latin1_swedish_ci
	latin1_bin
sjis	sjis_japanese_ci
	sjis_bin
tis620	tis620_bin
ucs2	ucs2_general_ci
	ucs2_bin
ujis	ujis_japanese_ci

	ujis_bin
utf8	utf8_general_ci
	utf8_bin

- The SCI Transporter has been brought up-to-date with all changes and now works and has been documented as well.
- Optimizations when several clients to a MySQL Server access ndb tables.
- Added more checks and warnings for erroneous and inappropriate cluster configurations.
- [SHOW TABLES](#) now directly shows ndb tables created on a different MySQL server, that is, without a prior table access.
- Enhanced support for starting MySQL Server independently of ndbd and ndb\_mgmd.
- Clear text ndb error messages provided by executing [SHOW WARNINGS](#) after an error has occurred which relates to the ndb storage engine.

Bugs fixed:

- Quite a few bugs fixed.

## D.5.15. Changes in MySQL Cluster-4.1.5 (16 September 2004)

Functionality added or changed:

- Many queries in MySQL Cluster are executed as range scans or full table scans. All queries that don't use a unique hash index or the primary hash index use this access method. In a distributed system it is crucial that batching is properly performed.

In previous versions, the batch size was fixed to 16 per data node. In this version it is configurable per MySQL Server. So for queries using lots of large scans it is appropriate to set this parameter rather large and for queries using many small scans only fetching a small amount of records it is appropriate to set it low.

The performance of queries can easily change as much as 40% based on how this variable is set.

In future versions more logic will be implemented for assessing the batch size on a per-query basis. Thus, the semantics of the new configuration variable [ScanBatchSize](#) are likely to change.

- The fixed size overhead of the ndbd process has been greatly decreased. This is also true for the overhead per operation record as well as overhead per table and index.

A number of new configuration variables have been introduced to enable configuration of system buffers. Configuration variables for specifying the numbers of tables, unique hash indexes, and ordered indexes have also been introduced.

New configuration variables: [MaxNoOfOrderedIndexes](#), [MaxNoOfUniqueHashIndexes](#)

Configuration variables no longer used: [MaxNoOfIndexes](#) (split into the two above).

- In previous versions `ALTER TABLE`, `TRUNCATE TABLE`, and `LOAD DATA` were performed as one big transaction. In this version, all of these statements are automatically separated into several distinct transactions.  
  
This removes the limitation that one could not change very large tables due to the `MaxNoOfConcurrentOperations` parameter.
- MySQL Cluster's online backup feature now backs up indexes so that both data and indexes are restored.
- In previous versions it was not possible to use `NULL` in indexes. This is now possible for all supported index types.
- Much work has been put onto making `AUTO_INCREMENT` features work as for other table handlers. Autoincrements as a partial key is still only supported by `MyISAM`.
- In earlier versions, `mysqld` would crash if the cluster wasn't started with the `--ndbcluster` option. Now `mysqld` handles cluster crashes and starts without crashing.
- The `-i` option for initial startup of `ndbd` has been removed. Initial startup still can be specified by using the `--initial` option. The reason for this is to ensure that it is clear what takes place when using `--initial`: this option completely removes all data from the disk and should only be used at initial start, in certain software upgrade cases, and in some cases as a workaround when nodes cannot be restarted successfully.
- The management client (`ndb_mgm`) now has additional commands and more information is printed for some commands such as `show`.
- In previous versions, the files were called `ndb_0..` when it wasn't possible to allocate a node ID when starting the node. To ensure that files are not so easily overwritten, these files are now named `ndb_pid..`, where `pid` is the process ID assigned by the OS.
- The default parameters have changed for `ndb_mgmd` and `ndbd`. In particular, they are now started as daemons by default. The `-n` option has been removed since it could cause confusion as to its meaning (nstart or nodaemon).
- In the configuration file, you can now use `[NDBD]` as an alias for `[DB]`, `[MYSQLD]` as an alias for `[API]`, and `[NDB_MGMD]` as an alias for `[MGM]`. **Note:** In fact, `[NDBD]`, `[MYSQLD]`, and `[NDB_MGMD]` are now the preferred designations, although the older ones will continue to be supported for some time to come in order to maintain backward compatibility.
- Many more checks for consistency in configuration have been introduced to in order to provide quicker feedback on configuration errors.
- In the connect string, it is now possible to use both `;` and `,` as the separator between entries. Thus, `"nodeid=2,host=localhost:2200"` is equivalent to `"nodeid=2;host=localhost:2200"`.  
  
In the configuration file, it is also possible to use `:` or `=` for assignment values. For example, `MaxNoOfOrderedIndexes : 128` and `MaxNoOfOrderedIndexes = 128` are equivalent expressions.
- The configuration variable names are now case insensitive, so `MaxNoOfOrderedIndexes : 128` is equivalent to `MAXNOOFORDEREDINDEXES = 128`.
- It is possible now to set the backup directory separately from the `FileSystemPath` by using the `BackupDir` configuration variable.

Log files and trace files can now be placed in any directory by setting the `DataDir` configuration variable.

`FileSystemPath` is no longer mandatory and defaults to `DataDir`.

- Queries involving tables from different databases are now supported.
- It is now possible to update the primary key.
- The performance of ordered indexes has been greatly improved, particularly the maintenance of indexes on updates, inserts and deletes.

Bugs fixed:

- Quite a few bugs fixed.

## D.5.16. Changes in MySQL Cluster-4.1.4 (31 August 2004)

Functionality added or changed:

- The names of the log files and trace files created by the `ndbd` and `ndb_mgmd` processes have changed.
- Support for the many `BLOB` data types was introduced in this version.

Bugs fixed:

- Quite a few bugs were fixed in the 4.1.4 release.

## D.5.17. Changes in MySQL Cluster-4.1.3 (28 June 2004)

Functionality added or changed:

- This was the first MySQL Cluster release so all functionality was new.

Bugs fixed:

- Various bugs fixed in the development process leading up to 4.1.3.

## D.6. MySQL Connector/ODBC (MyODBC) Change History

### D.6.1. Changes in MyODBC 3.51.13

Functionality added or changed:

- N/A

Bugs fixed:

- Using Connector/ODBC, with `SQLBindCol` and binding the length to the return value from `SQL_LEN_DATA_AT_EXEC` fails with a memory allocation error. ([Bug#20547](#) [<http://bugs.mysql.com/20547>])
- The `SQLDriverConnect()` ODBC method did not work with recent MyODBC releases. ([Bug#12393](#) [<http://bugs.mysql.com/12393>])

## D.6.2. Changes in MyODBC 3.51.12

Functionality added or changed:

- N/A

Bugs fixed:

- File DSNs could not be saved. ([Bug#12019](#) [<http://bugs.mysql.com/12019>])
- `SQLColumns()` returned no information for tables that had a column named using a reserved word. ([Bug#9539](#) [<http://bugs.mysql.com/9539>])

## D.6.3. Changes in MyODBC 3.51.11

Functionality added or changed: No changes.

Bugs fixed:

- `mysql_list_dbcolumns()` and `insert_fields()` were retrieving all rows from a table. Fixed the queries generated by these functions to return no rows. ([Bug#8198](#) [<http://bugs.mysql.com/8198>])
- `SQLGetTypeInfo()` returned `tinyblob` for `SQL_VARBINARY` and nothing for `SQL_BINARY`. Fixed to return `varbinary` for `SQL_VARBINARY`, `binary` for `SQL_BINARY`, and `longblob` for `SQL_LONGVARBINARY`. ([Bug#8138](#) [<http://bugs.mysql.com/8138>])

## D.7. MySQL Connector/NET Change History

### D.7.1. Version 5.0.1 (not yet released)

Functionality added or changed:

- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. ([Bug#19994](#) [<http://bugs.mysql.com/19994>])
- The `MySqlException` class is now derived from the `DbException` class. ([Bug#21874](#) [<http://bugs.mysql.com/21874>])

Bugs fixed:

- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first.` ([Bug#7248](http://bugs.mysql.com/7248) [<http://bugs.mysql.com/7248>])
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](http://bugs.mysql.com/21521) [<http://bugs.mysql.com/21521>])

## D.7.2. Version 5.0.0

This is a new Alpha development release, fixing recently discovered bugs.

**NOTE:** This Alpha release, as any other pre-production release, should not be installed on *production* level systems or systems with critical data. It is good practice to back up your data before installing any new version of software. Although MySQL has worked very hard to ensure a high level of quality, protect your data by making a backup as you would for any software beta release. Please refer to our bug database at <http://bugs.mysql.com/> for more details about the individual bugs fixed in this version.

Bugs fixed:

- `CommandText`: Question mark in comment line is being parsed as a parameter. ([Bug#6214](http://bugs.mysql.com/6214) [<http://bugs.mysql.com/6214>])

Functionality added or changed:

- Implemented Usage Advisor.
- Added Async query methods.
- Reimplemented `PacketReader/PacketWriter` support into `MySQLStream` class.
- Added internal implementation of SHA1 so we don't have to distribute the OpenNetCF on mobile devices.
- Added usage advisor warnings for requesting column values by the wrong type.
- Reworked connection string classes to be simpler and faster.
- Added procedure metadata caching.
- Added perfmon hooks for stored procedure cache hits and misses.
- Implemented `MySQLConnectionBuilder` class.
- Implemented `MySQLClientFactory` class.
- Implemented classes and interfaces for ADO.Net 2.0 support.
- Replaced use of `ICSharpCode` with .NET 2.0 internal deflate support.
- Refactored test suite to test all protocols in a single pass.
- Completely refactored how column values are handled to avoid boxing in some cases.

### D.7.3. Version 1.0.8 (not yet released)

Bugs fixed:

- You can now install the Connector/NET MSI package from the command line using the `/passive`, `/quiet`, `/q` options. ([Bug#19994](http://bugs.mysql.com/19994) [<http://bugs.mysql.com/19994>])
- Executing multiple queries as part of a transaction returns `There is already an openDataReader associated with this Connection which must be closed first`. ([Bug#7248](http://bugs.mysql.com/7248) [<http://bugs.mysql.com/7248>])
- Calling `MySqlCommandBuilder.DeriveParameters` for a stored procedure that has no parameters would cause an application crash. ([Bug#15077](http://bugs.mysql.com/15077) [<http://bugs.mysql.com/15077>])
- A `SELECT` query on a table with a date with a value of `'0000-00-00'` would hang the application. ([Bug#17736](http://bugs.mysql.com/17736) [<http://bugs.mysql.com/17736>])
- The `#` would not be accepted within column/table names, even though it was valid. ([Bug#21521](http://bugs.mysql.com/21521) [<http://bugs.mysql.com/21521>])
- Calling `Close` on a connection after calling a stored procedure would trigger a `NullReferenceException`. ([Bug#20581](http://bugs.mysql.com/20581) [<http://bugs.mysql.com/20581>])
- `IDataRecord.GetString` would raise `NullPointerException` for null values in returned rows. Method now throws `SqlNullValueException`. ([Bug#19294](http://bugs.mysql.com/19294) [<http://bugs.mysql.com/19294>])
- An exception would be raised when using an output parameter to a `System.String` value. ([Bug#17814](http://bugs.mysql.com/17814) [<http://bugs.mysql.com/17814>])
- The `DiscoverParameters` function would fail when a stored procedure used a `NUMERIC` parameter type. ([Bug#19515](http://bugs.mysql.com/19515) [<http://bugs.mysql.com/19515>])
- When running a query that included a date comparison, a `DateReader` error would be raised. ([Bug#19481](http://bugs.mysql.com/19481) [<http://bugs.mysql.com/19481>])
- Parameter substitution in queries where the order of parameters and table fields did not match would substitute incorrect values. ([Bug#19261](http://bugs.mysql.com/19261) [<http://bugs.mysql.com/19261>])
- When working with multiple threads, character set initialization would generate errors. ([Bug#17106](http://bugs.mysql.com/17106) [<http://bugs.mysql.com/17106>])
- When using an unsigned 64-bit integer in a stored procedure, the unsigned bit would be lost stored. ([Bug#16934](http://bugs.mysql.com/16934) [<http://bugs.mysql.com/16934>])
- The connection string parser did not allow single or double quotes in the password. ([Bug#16659](http://bugs.mysql.com/16659) [<http://bugs.mysql.com/16659>])
- The `CommandBuilder` ignored `Unsigned` flag at `Parameter` creation. ([Bug#17375](http://bugs.mysql.com/17375) [<http://bugs.mysql.com/17375>])
- `CHAR` type added to `MySqlDbType`. ([Bug#17749](http://bugs.mysql.com/17749) [<http://bugs.mysql.com/17749>])
- Unsigned data types were not properly supported. ([Bug#16788](http://bugs.mysql.com/16788) [<http://bugs.mysql.com/16788>])

Functionality added or changed:

- Stored procedures are now cached.
- The method for retrieving stored procedure metadata has been changed so that users without `SELECT` privileges on the `mysql.proc` table can use a stored procedure.

## D.7.4. Version 1.0.7

- Unsigned `tinyint` (NET byte) would lead to and incorrectly determined parameter type from the parameter value. (Bug#18570 [<http://bugs.mysql.com/18570>])
- The parameter collection object's `Add()` method added parameters to the list without first checking to see whether they already existed. Now it updates the value of the existing parameter object if it exists. (Bug#13927 [<http://bugs.mysql.com/13927>])
- A `#42000Query was empty` exception occurred when executing a query built with `MySQLCommandBuilder`, if the query string ended with a semicolon. (Bug#14631 [<http://bugs.mysql.com/14631>])
- Implemented the `MySQLCommandBuilder.DeriveParameters` method that is used to discover the parameters for a stored procedure. (Bug#13632 [<http://bugs.mysql.com/13632>])
- Added support for the `cp932` character set. (Bug#13806 [<http://bugs.mysql.com/13806>])
- Calling a stored procedure where a parameter contained special characters (such as `'@'`) would produce an exception. Note that `ANSI_QUOTES` had to be enabled to make this possible. (Bug#13753 [<http://bugs.mysql.com/13753>])
- A statement that contained multiple references to the same parameter could not be prepared. (Bug#13541 [<http://bugs.mysql.com/13541>])
- The `Ping()` method did not update the `State` property of the `Connection` object. (Bug#13658 [<http://bugs.mysql.com/13658>])

## D.7.5. Version 1.0.6

- The `nant` build sequence had problems. (Bug#12978 [<http://bugs.mysql.com/12978>])
- Serializing a parameter failed if the first value passed in was `NULL`. (Bug#13276 [<http://bugs.mysql.com/13276>])
- Field names that contained the following characters caused errors: `( ) % < > /` (Bug#13036 [<http://bugs.mysql.com/13036>])
- The MySQL Connector/NET 1.0.5 installer would not install alongside MySQL Connector/NET 1.0.4. (Bug#12835 [<http://bugs.mysql.com/12835>])
- MySQL Connector/NET 1.0.5 could not connect on Mono. (Bug#13345 [<http://bugs.mysql.com/13345>])

## D.7.6. Version 1.0.5

- With multiple hosts in the connection string, MySQL Connector/NET would not connect to the last

- host in the list. ([Bug#12628](http://bugs.mysql.com/12628) [<http://bugs.mysql.com/12628>])
- MySQL Connector/NET interpreted the new decimal data type as a byte array. ([Bug#11294](http://bugs.mysql.com/11294) [<http://bugs.mysql.com/11294>])
  - The `cp1250` character set was not supported. ([Bug#11621](http://bugs.mysql.com/11621) [<http://bugs.mysql.com/11621>])
  - Connection could fail when .NET thread pool had no available worker threads. ([Bug#10637](http://bugs.mysql.com/10637) [<http://bugs.mysql.com/10637>])
  - Decimal parameters caused syntax errors. ([Bug#11550](http://bugs.mysql.com/11550) [<http://bugs.mysql.com/11550>], [Bug#10486](http://bugs.mysql.com/10486) [<http://bugs.mysql.com/10486>], [Bug#10152](http://bugs.mysql.com/10152) [<http://bugs.mysql.com/10152>])
  - A call to a stored procedure caused an exception if the stored procedure had no parameters. ([Bug#11542](http://bugs.mysql.com/11542) [<http://bugs.mysql.com/11542>])
  - Certain malformed queries would trigger a `Connection must be valid and open` error message. ([Bug#11490](http://bugs.mysql.com/11490) [<http://bugs.mysql.com/11490>])
  - The `MySqlCommandBuilder` class could not handle queries that referenced tables in a database other than the default database. ([Bug#8382](http://bugs.mysql.com/8382) [<http://bugs.mysql.com/8382>])
  - MySQL Connector/NET could not work properly with certain regional settings. (WL#8228)
  - Trying to use a stored procedure when `Connection.Database` was not populated generated an exception. ([Bug#11450](http://bugs.mysql.com/11450) [<http://bugs.mysql.com/11450>])
  - Trying to read a `TIMESTAMP` column generated an exception. ([Bug#7951](http://bugs.mysql.com/7951) [<http://bugs.mysql.com/7951>])
  - Parameters were not recognized when they were separated by linefeeds. ([Bug#9722](http://bugs.mysql.com/9722) [<http://bugs.mysql.com/9722>])
  - Calling `MySqlConnection.clone` when a connection string had not yet been set on the original connection would generate an error. ([Bug#10281](http://bugs.mysql.com/10281) [<http://bugs.mysql.com/10281>])
  - Added support to call a stored function from MySQL Connector/NET. ([Bug#10644](http://bugs.mysql.com/10644) [<http://bugs.mysql.com/10644>])
  - MySQL Connector/NET could not connect to MySQL 4.1.14. ([Bug#12771](http://bugs.mysql.com/12771) [<http://bugs.mysql.com/12771>])
  - The `ConnectionString` property could not be set when a `MySqlConnection` object was added with the designer. ([Bug#12551](http://bugs.mysql.com/12551) [<http://bugs.mysql.com/12551>], [Bug#8724](http://bugs.mysql.com/8724) [<http://bugs.mysql.com/8724>])

### D.7.7. Version 1.0.4 1-20-05

- [Bug#7243](http://bugs.mysql.com/7243) [<http://bugs.mysql.com/7243>] calling prepare causing exception [fixed]
- Fixed another small problem with prepared statements
- [Bug#7258](http://bugs.mysql.com/7258) [<http://bugs.mysql.com/7258>] MySqlCommand.Connection returns an IDbConnection [fixed]
- [Bug#7345](http://bugs.mysql.com/7345) [<http://bugs.mysql.com/7345>] MySqlAdapter.Fill method throws Error message : Non-negative number required [fixed]

- [Bug#7478](http://bugs.mysql.com/7478) [http://bugs.mysql.com/7478] Clone method bug in MySqlCommand [fixed]
- [Bug#7612](http://bugs.mysql.com/7612) [http://bugs.mysql.com/7612] MySqlDataReader.GetString(index) returns non-Null value when field is Null [fixed]
- [Bug#7755](http://bugs.mysql.com/7755) [http://bugs.mysql.com/7755] MySqlReader.GetInt32 throws exception if column is unsigned [fixed]
- [Bug#7704](http://bugs.mysql.com/7704) [http://bugs.mysql.com/7704] GetBytes is working no more [fixed]
- [Bug#7724](http://bugs.mysql.com/7724) [http://bugs.mysql.com/7724] Quote character \222 not quoted in EscapeString [fixed]
- Fixed problem that causes named pipes to not work with some blob functionality
- Fixed problem with shared memory connections
- [Bug#7436](http://bugs.mysql.com/7436) [http://bugs.mysql.com/7436] Problem with Multiple resultsets... [fixed]
- Added or filled out several more topics in the API reference documentation

## D.7.8. Version 1.0.3-gamma 12-10-04

- Made MySQL the default named pipe name
- Now SHOW COLLATION is used upon connection to retrieve the full list of charset ids
- Fixed Invalid character set index: 200 ([Bug#6547](http://bugs.mysql.com/6547) [http://bugs.mysql.com/6547])
- Installer now includes options to install into GAC and create Start Menu items
- [Bug#6863](http://bugs.mysql.com/6863) [http://bugs.mysql.com/6863] - Int64 Support in MySqlCommand Parameters [fixed]
- Connections now do not have to give a database on the connection string
- [Bug#6770](http://bugs.mysql.com/6770) [http://bugs.mysql.com/6770] - MySqlDataReader.GetChar(int i) throws IndexOutOfRangeException Exception [fixed]
- Fixed problem where multiple resultsets having different numbers of columns would cause a problem
- [Bug#6983](http://bugs.mysql.com/6983) [http://bugs.mysql.com/6983] Exception stack trace lost when re-throwing exceptions [fixed]
- Fixed major problem with detecting null values when using prepared statements
- [Bug#6902](http://bugs.mysql.com/6902) [http://bugs.mysql.com/6902] Errors in parsing stored procedure parameters [fixed]
- [Bug#6668](http://bugs.mysql.com/6668) [http://bugs.mysql.com/6668] Integer "out" parameter from stored procedure returned as string [fixed]
- [Bug#7032](http://bugs.mysql.com/7032) [http://bugs.mysql.com/7032] MySqlDateTime in Datatables sorting by Text, not Date. [fixed]
- [Bug#7133](http://bugs.mysql.com/7133) [http://bugs.mysql.com/7133] Invalid query string when using inout parameters [fixed]
- [Bug#6831](http://bugs.mysql.com/6831) [http://bugs.mysql.com/6831] Test suite fails with MySQL 4.0 because of case sensitivity of table names [fixed]

- [Bug#7132](http://bugs.mysql.com/7132) [http://bugs.mysql.com/7132] Inserting DateTime causes System.InvalidCastException to be thrown [fixed]
- [Bug#6879](http://bugs.mysql.com/6879) [http://bugs.mysql.com/6879] InvalidCast when using DATE\_ADD-function [fixed]
- [Bug#6634](http://bugs.mysql.com/6634) [http://bugs.mysql.com/6634] An Open Connection has been Closed by the Host System [fixed]
- Added ServerThread property to MySqlConnection to expose server thread id
- Added Ping method to MySqlConnection
- Changed the name of the test suite to MySql.Data.Tests.dll

### D.7.9. Version 1.0.2-gamma 04-11-15

- Fixed problem with MySqlBinary where string values could not be used to update extended text columns
- Fixed Installation directory ignored using custom installation ([Bug#6329](http://bugs.mysql.com/6329) [http://bugs.mysql.com/6329])
- Fixed problem where setting command text leaves the command in a prepared state
- Fixed double type handling in MySqlParameter(string parameterName, object value) ([Bug#6428](http://bugs.mysql.com/6428) [http://bugs.mysql.com/6428])
- Fixed Zero date "0000-00-00" is returned wrong when filling Dataset ([Bug#6429](http://bugs.mysql.com/6429) [http://bugs.mysql.com/6429])
- Fixed problem where calling stored procedures might cause an "Illegal mix of collations" problem.
- Added charset connection string option
- Fixed #HY000 Illegal mix of collations (latin1\_swedish\_ci,IMPLICIT) and (utf8\_general\_ ([Bug#6322](http://bugs.mysql.com/6322) [http://bugs.mysql.com/6322])
- Added the TableEditor CS and VB sample
- Fixed Charset-map for UCS-2 ([Bug#6541](http://bugs.mysql.com/6541) [http://bugs.mysql.com/6541])
- Updated the installer to include the new samples
- Fixed Long inserts take very long time (Bu #5453)
- Fixed Objects not being disposed ([Bug#6649](http://bugs.mysql.com/6649) [http://bugs.mysql.com/6649])
- Provider is now using character set specified by server as default

### D.7.10. Version 1.0.1-beta2 04-10-27

- Fixed [Bug#5602](http://bugs.mysql.com/5602) [http://bugs.mysql.com/5602] Possible bug in MySqlParameter(string, object) constructor
- Fixed [Bug#5458](http://bugs.mysql.com/5458) [http://bugs.mysql.com/5458] Calling GetChars on a longtext column throws an ex-

ception

- Fixed [Bug#5474](http://bugs.mysql.com/5474) [http://bugs.mysql.com/5474] cannot run a stored procedure populating mysqlcommand.parameters
- Fixed [Bug#5469](http://bugs.mysql.com/5469) [http://bugs.mysql.com/5469] Setting DbType throws NullReferenceException
- Fixed problem where connector was not issuing a CMD\_QUIT before closing the socket
- Fixed [Bug#5392](http://bugs.mysql.com/5392) [http://bugs.mysql.com/5392] MySqlCommand sees "?" as parameters in string literals
- Fixed problem with ConnectionInternal where a key might be added more than once
- CP1252 is now used for Latin1 only when the server is 4.1.2 and later
- Fixed [Bug#5388](http://bugs.mysql.com/5388) [http://bugs.mysql.com/5388] DataReader reports all rows as NULL if one row is NULL
- Virtualized driver subsystem so future releases could easily support client or embedded server support
- Field buffers being reused to decrease memory allocations and increase speed
- Fixed problem where using old syntax while using the interfaces caused problems
- Using PacketWriter instead of Packet for writing to streams
- Refactored compression code into CompressedStream to clean up NativeDriver
- Added test case for resetting the command text on a prepared command
- Fixed problem where MySqlParameterCollection.Add() would throw unclear exception when given a null value ([Bug#5621](http://bugs.mysql.com/5621) [http://bugs.mysql.com/5621])
- Fixed constructor initialize problems in MySqlCommand() ([Bug#5613](http://bugs.mysql.com/5613) [http://bugs.mysql.com/5613])
- Fixed Parsing the ';' char ([Bug#5876](http://bugs.mysql.com/5876) [http://bugs.mysql.com/5876])
- Fixed missing Reference in DbType setter ([Bug#5897](http://bugs.mysql.com/5897) [http://bugs.mysql.com/5897])
- Fixed System.OverflowException when using YEAR datatype ([Bug#6036](http://bugs.mysql.com/6036) [http://bugs.mysql.com/6036])
- Added Aggregate function test (wasn't really a bug)
- Fixed serializing of floating point parameters (double, numeric, single, decimal) ([Bug#5900](http://bugs.mysql.com/5900) [http://bugs.mysql.com/5900])
- IsNullable error ([Bug#5796](http://bugs.mysql.com/5796) [http://bugs.mysql.com/5796])
- Fixed problem where connection lifetime on the connect string was not being respected
- Fixed problem where Min Pool Size was not being respected
- Fixed MySqlDataReader and 'show tables from ...' behavior ([Bug#5256](http://bugs.mysql.com/5256) [http://bugs.mysql.com/5256])
- Implemented SequentialAccess

- Fixed MySqlDateTime sets IsZero property on all subseq.records after first zero found ([Bug#6006](http://bugs.mysql.com/6006) [<http://bugs.mysql.com/6006>])
- Fixed Can't display Chinese correctly ([Bug#5288](http://bugs.mysql.com/5288) [<http://bugs.mysql.com/5288>])
- Fixed Russian character support as well
- Fixed Method TokenizeSql() uses only a limited set of valid characters for parameters ([Bug#6217](http://bugs.mysql.com/6217) [<http://bugs.mysql.com/6217>])
- Fixed NET Connector source missing resx files ([Bug#6216](http://bugs.mysql.com/6216) [<http://bugs.mysql.com/6216>])
- Fixed DBNull Values causing problems with retrieving/updating queries. ([Bug#5798](http://bugs.mysql.com/5798) [<http://bugs.mysql.com/5798>])
- Fixed Yet Another "object reference not set to an instance of an object" ([Bug#5496](http://bugs.mysql.com/5496) [<http://bugs.mysql.com/5496>])
- Fixed problem in PacketReader where it could try to allocate the wrong buffer size in EnsureCapacity
- Fixed GetBoolean returns wrong values ([Bug#6227](http://bugs.mysql.com/6227) [<http://bugs.mysql.com/6227>])
- Fixed IndexOutOfBounds when reading BLOB with DataReader with GetString(index) ([Bug#6230](http://bugs.mysql.com/6230) [<http://bugs.mysql.com/6230>])

### D.7.11. Version 1.0.0 04-09-01

- Fixed BUG# 3889 Thai encoding not correctly supported
- Updated many of the test cases
- Fixed problem with using compression
- Bumped version number to 1.0.0 for beta 1 release
- Added COPYING.rtf file for use in installer
- Removed all of the XML comment warnings (I'll clean them up better later)
- Removed some last references to ByteFX

### D.7.12. Version 0.9.0 04-08-30

- Added test fixture for prepared statements
- All type classes now implement a SerializeBinary method for sending their data to a PacketWriter
- Added PacketWriter class that will enable future low-memory large object handling
- Fixed many small bugs in running prepared statements and stored procedures
- Changed command so that an exception will not be throw in executing a stored procedure with parameters in old syntax mode

- SingleRow behavior now working right even with limit
- GetBytes now only works on binary columns
- Logger now truncates long sql commands so blob columns don't blow out our log
- host and database now have a default value of "" unless otherwise set
- FIXED BUG# 5214 Connection Timeout seems to be ignored
- Added test case for bug# 5051: GetSchema not working correctly
- Fixed problem where GetSchema would return false for IsUnique when the column is key
- MySqlDataReader GetXXX methods now using the field level MySqlValue object and not performing conversions
- FIXED BUG# 5097: DataReader returning NULL for time column
- Added test case for LOAD DATA LOCAL INFILE
- Added replacetext custom nant task
- Added CommandBuilderTest fixture
- Added Last One Wins feature to CommandBuilder
- Fixed persist security info case problem
- Fixed GetBool so that 1, true, "true", and "yes" all count as trueWL# 2024 Make parameter mark configurable
- Added the "old syntax" connection string parameter to allow use of @ parameter marker
- Fixed [Bug#4658](http://bugs.mysql.com/4658) [http://bugs.mysql.com/4658] MySqlCommandBuilder
- Fixed [Bug#4864](http://bugs.mysql.com/4864) [http://bugs.mysql.com/4864] ByteFX.MySqlClient caches passwords if 'Persist Security Info' is false
- Updated license banner in all source files to include FLOSS exception
- Added new .Types namespace and implementations for most current MySql types
- Added MySqlField41 as a subclass of MySqlField
- Changed many classes to now use the new .Types types
- Changed type enum int to Int32, short to Int16, and bigint to Int64
- Added dummy types UInt16, UInt32, and UInt64 to allow an unsigned parameter to be made
- Connections are now reset when they are pulled from the connection pool
- Refactored auth code in driver so it can be used for both auth and reset
- Added UserReset test in PoolingTests.cs
- Connections are now reset using COM\_CHANGE\_USER when pulled from the pool
- Implemented SingleResultSet behavior

- Implemented support of unicode
- Added char set mappings for utf-8 and ucs-2
- fixed [Bug#4520](http://bugs.mysql.com/4520) [http://bugs.mysql.com/4520] time fields overflow using bytefx .net mysql driver
- Modified time test in data type test fixture to check for time spans where hours > 24
- Fixed [Bug#4505](http://bugs.mysql.com/4505) [http://bugs.mysql.com/4505] Wrong string with backslash escaping in Byte-Fx.Data.MySqlClient.MySqlParameter
- Added code to Parameter test case TestQuoting to test for backslashes
- Fixed [Bug#4486](http://bugs.mysql.com/4486) [http://bugs.mysql.com/4486] mysqlcommandbuilder fails with multi-word column names
- Fixed bug in TokenizeSql where underscore would terminate character capture in parameter name
- Added test case for spaces in column names
- Fixed bug# 4324 - MySqlDataReader.GetBytes don't works correctly
- Added GetBytes() test case to DataReader test fixture
- Now reading all server variables in InternalConnection.Configure into Hashtable
- Now using string[] for index map in CharSetMap
- Added CRInSQL test case for carriage returns in SQL
- setting maxPacketSize to default value in Driver.ctor
- Fixed [Bug#4442](http://bugs.mysql.com/4442) [http://bugs.mysql.com/4442] - Setting MySqlDbType on a parameter doesn't set generic type
- Removed obsolete data types Long and LongLong
- Fixed bug# 4071 - Overflow exception thrown when using "use pipe" on connection string
- Changed "use pipe" keyword to "pipe name" or just "pipe"
- Allow reading multiple resultsets from a single query
- Added flags attribute to ServerStatusFlags enum
- Changed name of ServerStatus enum to ServerStatusFlags
- Fixed [Bug#4386](http://bugs.mysql.com/4386) [http://bugs.mysql.com/4386] - Inserted data row doesn't update properly
- Fixed [Bug#4074](http://bugs.mysql.com/4074) [http://bugs.mysql.com/4074] - Error processing show create table
- Change Packet.ReadLenInteger to ReadPackedLong and added packet.ReadPackedInteger that always reads integers packed with 2,3,4
- Added syntax.cs test fixture to test various SQL syntax bugs
- Fixed bug# 4149 Improper handling of time values. Now time value of 00:00:00 is not treated as null.
- Moved all test suite files into TestSuite folder

- Fixed bug where null column would move the result packet pointer backward
- Added new nant build script
- Fixed [Bug#3917](http://bugs.mysql.com/3917) [http://bugs.mysql.com/3917] - clear tablename so it will be regen'ed properly during the next GenerateSchema.
- Fixed [Bug#3915](http://bugs.mysql.com/3915) [http://bugs.mysql.com/3915] - GetValues was always returning zero and was also always trying to copy all fields rather than respecting the size of the array passed in.
- Implemented shared memory access protocol
- Implemented prepared statements for MySQL 4.1
- Implemented stored procedures for MySQL 5.0
- Renamed MySqlInternalConnection to InternalConnection
- SQL is now parsed as chars, fixes problems with other languages
- Added logging and allow batch connection string options
- Fixed [Bug#3888](http://bugs.mysql.com/3888) [http://bugs.mysql.com/3888] - RowUpdating event not set when setting the DataAdapter property
- Fixed bug in char set mapping
- Implemented 4.1 authentication
- Improved open/auth code in driver
- Improved how connection bits are set during connection
- Database name is now passed to server during initial handshake
- Changed namespace for client to MySql.Data.MySqlClient
- Changed assembly name of client to MySql.Data.dll
- Changed license text in all source files to GPL
- Added the MySqlClient.build Nant file
- Removed the mono batch files
- Moved some of the unused files into notused folder so nant build file can use wildcards
- Implemented shared memory accesss
- Major revamp in code structure
- Prepared statements now working for MySql 4.1.1 and later
- Finished implementing auth for 4.0, 4.1.0, and 4.1.1
- Changed namespace from MySQL.Data.MySQLClient back to MySql.Data.MySqlClient
- Fixed bug in CharSetMapping where it was trying to use text names as ints
- Changed namespace to MySQL.Data.MySQLClient

- Integrated auth changes from UC2004
- Fixed bug where calling any of the GetXXX methods on a datareader before or after reading data would not throw the appropriate exception (thanks Luca Morelli <morelli.luca@iol.it>)
- Added TimeSpan code in parameter.cs to properly serialize a timespan object to mysql time format (thanks Gianluca Colombo <g.colombo@alfi.it>)
- Added TimeStamp to parameter serialization code. Prevented DataAdapter updates from working right (thanks Michael King)
- Fixed a misspelling in MySqlHelper.cs (thanks Patrick Kristiansen)

### D.7.13. Version 0.76

- Driver now using charset number given in handshake to create encoding
- Changed command editor to point to MySqlConnection.Design
- Fixed bug in Version.isAtLeast
- Changed DBConnectionString to support changes done to MySqlConnectionString
- Removed SqlCommandEditor and DataAdapterPreviewDialog
- Using new long return values in many places
- Integrated new CompressedStream class
- Changed ConnectionString and added attributes to allow it to be used in MySqlConnection.Design
- Changed packet.cs to support newer lengths in ReadLenInteger
- changed other classes to use new properties and fields of MySqlConnectionString
- ConnectionInternal is now using PING to see whether the server is alive
- Moved toolbox bitmaps into resource/
- Changed field.cs to allow values to come directly from row buffer
- Changed to use the new driver.Send syntax
- Using a new packet queueing system
- started work handling the "broken" compression packet handling
- Fixed bug in StreamCreator where failure to connect to a host would continue to loop infinitely (thanks Kevin Casella)
- Improved connectstring handling
- Moved designers into Pro product
- Removed some old commented out code from command.cs
- Fixed a problem with compression

- Fixed connection object where an exception throw prior to the connection opening would not leave the connection in the connecting state (thanks Chris Cline )
- Added GUID support
- Fixed sequence out of order bug (thanks Mark Reay)

## D.7.14. Version 0.75

- Enum values now supported as parameter values (thanks Philipp Sumi)
- Year datatype now supported
- fixed compression
- Fixed bug where a parameter with a TimeSpan as the value would not serialize properly
- Fixed bug where default ctor would not set default connection string values
- Added some XML comments to some members
- Work to fix/improve compression handling
- Improved ConnectionString handling so that it better matches the standard set by SqlConnection.
- A MySqlConnection is now thrown if a username is not included in the connection string
- Localhost is now used as the default if not specified on the connection string
- An exception is now thrown if an attempt is made to set the connection string while the connection is open
- Small changes to ConnectionString docs
- Removed MultiHostStream and MySqlStream. Replaced it with Common/StreamCreator
- Added support for Use Pipe connection string value
- Added Platform class for easier access to platform utility functions
- Fixed small pooling bug where new connection was not getting created after IsAlive fails
- Added Platform.cs and StreamCreator.cs
- Fixed Field.cs to properly handle 4.1 style timestamps
- Changed Common.Version to Common.DBVersion to avoid name conflict
- Fixed field.cs so that text columns return the right field type (thanks beni27@gmx.net)
- Added MySqlConnection class to provide some reference for error codes (thanks Geert Veenstra)

## D.7.15. Version 0.74

- Added Unix socket support (thanks Mohammad DAMT [md@mt.web.id])

- only calling Thread.Sleep when no data is available
- improved escaping of quote characters in parameter data
- removed misleading comments from parameter.cs
- fixed pooling bug
- same pooling bug fixed again!! ;-)
- Fixed ConnectionString editor dialog (thanks marco p (pomarc))
- UserId now supported in connection strings (thanks Jeff Neeley)
- Attempting to create a parameter that is not input throws an exception (thanks Ryan Gregg)
- Added much documentation
- checked in new MultiHostStream capability. Big thanks to Dan Guisinger for this. he originally submitted the code and idea of supporting multiple machines on the connect string.
- Added alot of documentation. Still alot to do.
- Fixed speed issue with 0.73
- changed to Thread.Sleep(0) in MySqlDataStream to help optimize the case where it doesn't need to wait (thanks Todd German)
- Prepopulating the idlepools to MinPoolSize
- Fixed MySqlPool deadlock condition as well as stupid bug where CreateNewPooledConnection was not ever adding new connections to the pool. Also fixed MySqlStream.ReadBytes and ReadByte to not use TicksPerSecond which does not appear to always be right. (thanks Matthew J. Peddlesden)
- Fix for precision and scale (thanks Matthew J. Peddlesden)
- Added Thread.Sleep(1) to stream reading methods to be more cpu friendly (thanks Sean McGinnis)
- Fixed problem where ExecuteReader would sometime return null (thanks Lloyd Dupont )
- Fixed major bug with null field handling (thanks Naucki)
- enclosed queries for max\_allowed\_packet and charset inside try catch (and set defaults)
- fixed problem where socket was not getting closed properly (thanks Steve!)
- Fixed problem where ExecuteNonQuery was not always returning the right value
- Fixed InternalConnection to not use @@session.max\_allowed\_packet but use @@max\_allowed\_packet. (Thanks Miguel)
- Added many new XML doc lines
- Fixed sql parsing to not send empty queries (thanks Rory)
- Fixed problem where the reader was not unpeeking the packet on close
- Fixed problem where user variables were not being handled (thanks Sami Vaaraniemi)
- Fixed loop checking in the MySqlPool (thanks Steve M. Brown)

- Fixed ParameterCollection.Add method to match SqlClient (thanks Joshua Mouch)
- Fixed ConnectionString parsing to handle no and yes for boolean and not lowercase values (thanks Naucki)
- Added InternalConnection class, changes to pooling
- Implemented Persist Security Info
- Added security.cs and version.cs to project
- Fixed DateTime handling in Parameter.cs (thanks Burkhard Perens-Golomb)
- Fixed parameter serialization where some types would throw a cast exception
- Fixed DataReader to convert all returned values to prevent casting errors (thanks Keith Murray)
- Added code to Command.ExecuteReader to return null if the initial SQL command throws an exception (thanks Burkhard Perens-Golomb)
- Fixed ExecuteScalar bug introduced with restructure
- Restructure to allow for LOCAL DATA INFILE and better sequencing of packets
- Fixed several bugs related to restructure.
- Early work done to support more secure passwords in Mysql 4.1. Old passwords in 4.1 not supported yet
- Parameters appearing after system parameters are now handled correctly (Adam M. (adammil))
- strings can now be assigned directly to blob fields (Adam M.)
- Fixed float parameters (thanks Pent)
- Improved Parameter ctor and ParameterCollection.Add methods to better match SqlClient (thx Joshua Mouch )
- Corrected Connection.CreateCommand to return a MySqlCommand type
- Fixed connection string designer dialog box problem (thanks Abraham Guyt)
- Fixed problem with sending commands not always reading the response packet (thanks Joshua Mouch )
- Fixed parameter serialization where some blobs types were not being handled (thanks Sean McGinnis )
- Removed spurious MessageBox.show from DataReader code (thanks Joshua Mouch )
- Fixed a nasty bug in the split sql code (thanks everyone! :-) )

## D.7.16. Version 0.71

- Fixed bug in MySqlStream where too much data could attempt to be read (thanks Peter Belbin)
- Implemented HasRows (thanks Nash Pherson)

- Fixed bug where tables with more than 252 columns cause an exception ( thanks Joshua Kessler )
- Fixed bug where SQL statements ending in ; would cause a problem ( thanks Shane Krueger )
- Fixed bug in driver where error messages were getting truncated by 1 character (thanks Shane Krueger)
- Made MySqlConnection serializable (thanks Mathias Hasselmann)

## D.7.17. Version 0.70

- Updated some of the character code pages to be more accurate
- Fixed problem where readers could be opened on connections that had readers open
- Release of 0.70
- Moved test to separate assembly MySqlConnectionTests
- Fixed stupid problem in driver with sequence out of order (Thanks Peter Belbin)
- Added some pipe tests
- Increased default max pool size to 50
- Compiles with Mono 0-24
- Fixed connection and data reader dispose problems
- Added String datatype handling to parameter serialization
- Fixed sequence problem in driver that occurred after thrown exception (thanks Burkhard Perken-Golomb)
- Added support for CommandBehavior.SingleRow to DataReader
- Fixed command sql processing so quotes are better handled (thanks Theo Spears)
- Fixed parsing of double, single, and decimal values to account for non-English separators. You still have to use the right syntax if you using hard coded sql, but if you use parameters the code will convert floating point types to use '.' appropriately internal both into the server and out. [ Thanks anonymous ]
- Added MySqlStream class to simplify timeOuts and driver coding.
- Fixed DataReader so that it is closed properly when the associated connection is closed. [thanks smishra]
- Made client more SqlConnection compliant so that DataReaders have to be closed before the connection can be used to run another command
- Improved DBNull.Value handling in the fields
- Added several unit tests
- Fixed MySqlConnection so that the base class is actually called :-o

- Improved driver coding
- Fixed bug where NextResult was returning false on the last resultset
- Added more tests for MySQL
- Improved casting problems by equating unsigned 32bit values to Int64 and unsigned 16bit values to Int32, and so forth.
- Added new ctor for MySqlParameter for (name, type, size, srccol)
- Fixed bug in MySqlDataReader where it didn't check for null fieldlist before returning field count
- Started adding MySqlClient unit tests (added MySqlClient/Tests folder and some test cases)
- Fixed some things in Connection String handling
- Moved INIT\_DB to MySqlPool. I may move it again, this is in preparation of the conference.
- Fixed bug inside CommandBuilder that prevented inserts from happening properly
- Reworked some of the internals so that all three execute methods of Command worked properly
- Fixed many small bugs found during benchmarking
- The first cut of ConnectionPooling is working. "min pool size" and "max pool size" are respected.
- Work to enable multiple resultsets to be returned
- Character sets are handled much more intelligently now. The driver queries MySQL at startup for the default character set. That character set is then used for conversions if that code page can be loaded. If not, then the default code page for the current OS is used.
- Added code to save the inferred type in the name,value ctor of Parameter
- Also, inferred type if value of null parameter is changed using Value property
- Converted all files to use proper Camel case. MySQL is now MySql in all files. PostgreSQL is now Pg-Sql
- Added attribute to PgSql code to prevent designer from trying to show
- Added MySQLDbType property to Parameter object and added proper conversion code to convert from DbType to MySQLDbType)
- Removed unused ObjectToString method from MySQLParameter.cs
- Fixed Add(..) method in ParameterCollection so that it doesn't use Add(name, value) instead.
- Fixed IndexOf and Contains in ParameterCollection to be aware that parameter names are now stored without @
- Fixed Command.ConvertSQLToBytes so it only allows characters that can be in MySQL variable names
- Fixed DataReader and Field so that blob fields read their data from Field.cs and GetBytes works right
- Added simple query builder editor to CommandText property of MySQLCommand

- Fixed CommandBuilder and Parameter serialization to account for Parameters not storing @ in their names
- Removed MySQLFieldType enum from Field.cs. Now using MySQLDbType enum
- Added Designer attribute to several classes to prevent designer view when using VS.Net
- Fixed Initial catalog typo in ConnectionString designer
- Removed 3 parameter ctor for MySQLParameter that conflicted with (name, type, value)
- changed MySQLParameter so paramName is now stored without leading @ (this fixed null inserts when using designer)
- Changed TypeConverter for MySQLParameter to use the ctor with all properties

### **D.7.18. Version 0.68**

- Fixed sequence issue in driver
- Added DbParametersEditor to make parameter editing more like SqlClient
- Fixed Command class so that parameters can be edited using the designer
- Update connection string designer to support Use Compression flag
- Fixed string encoding so that European characters like ä will work correctly
- Creating base classes to aid in building new data providers
- Added support for UID key in connection string
- Field, parameter, command now using DBNull.Value instead of null
- CommandBuilder using DBNull.Value
- CommandBuilder now builds insert command correctly when an auto\_insert field is not present
- Field now uses typeof keyword to return System.Types (performance)

### **D.7.19. Version 0.65**

- MySQLCommandBuilder now implemented
- Transaction support now implemented (not all table types support this)
- GetSchemaTable fixed to not use xsd (for Mono)
- Driver is now Mono-compatible!!
- TIME data type now supported
- More work to improve Timestamp data type handling
- Changed signatures of all classes to match corresponding SqlClient classes

## D.7.20. Version 0.60

- Protocol compression using SharpZipLib ([www.icsharpcode.net](http://www.icsharpcode.net))
- Named pipes on Windows now working properly
- Work done to improve Timestamp data type handling
- Implemented IEnumerable on DataReader so DataGrid would work

## D.7.21. Version 0.50

- Speed increased dramatically by removing bugging network sync code
- Driver no longer buffers rows of data (more ADO.Net compliant)
- Conversion bugs related to TIMESTAMP and DATETIME fields fixed

## D.8. MySQL Connector/J Change History

### D.8.1. Changes in MySQL Connector/J 5.0.3 (26 July 2006)

- Fixed `Statement.cancel()` causes `NullPointerException` if underlying connection has been closed due to server failure. ([Bug#20650](http://bugs.mysql.com/20650) [<http://bugs.mysql.com/20650>])
- Added configuration option `noAccessToProcedureBodies` which will cause the driver to create basic parameter metadata for `CallableStatements` when the user does not have access to procedure bodies via `SHOW CREATE PROCEDURE` or selecting from `mysql.proc` instead of throwing an exception. The default value for this option is `false`

### D.8.2. Changes in MySQL Connector/J 5.0.2-beta (11 July 2006)

- Fixed can't use `XAConnection` for local transactions when no global transaction is in progress. ([Bug#17401](http://bugs.mysql.com/17401) [<http://bugs.mysql.com/17401>])
- Fixed driver fails on non-ASCII platforms. The driver was assuming that the platform character set would be a superset of MySQL's `latin1` when doing the handshake for authentication, and when reading error messages. We now use Cp1252 for all strings sent to the server during the handshake phase, and a hard-coded mapping of the `language` system variable to the character set that is used for error messages. ([Bug#18086](http://bugs.mysql.com/18086) [<http://bugs.mysql.com/18086>])
- Fixed `ConnectionProperties` (and thus some subclasses) are not serializable, even though some J2EE containers expect them to be. ([Bug#19169](http://bugs.mysql.com/19169) [<http://bugs.mysql.com/19169>])
- Fixed `MysqlValidConnectionChecker` for JBoss doesn't work with `MySQLXADataSourcees`. ([Bug#20242](http://bugs.mysql.com/20242) [<http://bugs.mysql.com/20242>])
- Better caching of character set converters (per-connection) to remove a bottleneck for multibyte character sets.

- Added connection/datasource property `pinGlobalTxToPhysicalConnection` (defaults to `false`). When set to `true`, when using `XAConnections`, the driver ensures that operations on a given XID are always routed to the same physical connection. This allows the `XAConnection` to support `XA START ... JOIN` after `XA END` has been called, and is also a workaround for transaction managers that don't maintain thread affinity for a global transaction (most either always maintain thread affinity, or have it as a configuration option).
- `MysqlXaConnection.recover(int flags)` now allows combinations of `XARE-source.TMSTARTRSCAN` and `TMENDRSCAN`. To simulate the “scanning” nature of the interface, we return all prepared XIDs for `TMSTARTRSCAN`, and no new XIDs for calls with `TMNOFLAGS`, or `TMENDRSCAN` when not in combination with `TMSTARTRSCAN`. This change was made for API compliance, as well as integration with IBM WebSphere's transaction manager.

### D.8.3. Changes in MySQL Connector/J 5.0.1-beta (Not Released)

Not released due to a packaging error

### D.8.4. Changes in MySQL Connector/J 5.0.0-beta (22 December 2005)

- `XADataSource` implemented (ported from 3.2 branch which won't be released as a product). Use `com.mysql.jdbc.jdbc2.optional.MysqlXADataSource` as your datasource class name in your application server to utilize XA transactions in MySQL-5.0.10 and newer.
- `PreparedStatement.setString()` didn't work correctly when `sql_mode` on server contained `NO_BACKSLASH_ESCAPES` and no characters that needed escaping were present in the string.
- Attempt detection of the MySQL type `BINARY` (it's an alias, so this isn't always reliable), and use the `java.sql.Types.BINARY` type mapping for it.
- Moved `-bin-g.jar` file into separate `debug` subdirectory to avoid confusion.
- Don't allow `.setAutoCommit(true)`, or `.commit()` or `.rollback()` on an XA-managed connection as per the JDBC specification.
- If the connection `useTimezone` is set to `true`, then also respect time zone conversions in escape-processed string literals (for example, `"{ts ...}"` and `"{t ...}"`).
- Return original column name for `RSMD.getColumnNames()` if the column was aliased, alias name for `.getColumnLabel()` (if aliased), and original table name for `.getTableName()`. Note this only works for MySQL-4.1 and newer, as older servers don't make this information available to clients.
- Setting `useJDBCCompliantTimezoneShift=true` (it's not the default) causes the driver to use GMT for *all* `TIMESTAMP/DATETIME` time zones, and the current VM time zone for any other type that refers to time zones. This feature can not be used when `useTimezone=true` to convert between server and client time zones.
- Add one level of indirection of internal representation of `CallableStatement` parameter metadata to avoid class not found issues on JDK-1.3 for `ParameterMetadata` interface (which doesn't exist prior to JDBC-3.0).

- Added unit tests for `XADatasource`, as well as friendlier exceptions for XA failures compared to the "stock" `XAException` (which has no messages).
- Idle timeouts cause `XAConnections` to whine about rolling themselves back. ([Bug#14729](http://bugs.mysql.com/14729) [<http://bugs.mysql.com/14729>])
- Added support for Connector/MXJ integration via url subprotocol `jdbc:mysql:mxj://....`
- Moved all `SQLException` constructor usage to a factory in `SQLException` (ground-work for JDBC-4.0 `SQLState`-based exception classes).
- Removed Java5-specific calls to `BigDecimal` constructor (when result set value is `' '`, `(int)0` was being used as an argument indirectly via method return value. This signature doesn't exist prior to Java5.)
- Added service-provider entry to `META-INF/services/java.sql.Driver` for JDBC-4.0 support.
- Return "[VAR]BINARY" for `RSMD.getColumnTypeName()` when that is actually the type, and it can be distinguished (MySQL-4.1 and newer).
- When fix for [Bug#14562](http://bugs.mysql.com/14562) [<http://bugs.mysql.com/14562>] was merged from 3.1.12, added functionality for `CallableStatement`'s parameter metadata to return correct information for `.getParameterClassName()`.
- Fuller synchronization of `Connection` to avoid deadlocks when using multithreaded frameworks that multithread a single connection (usually not recommended, but the JDBC spec allows it anyways), part of fix to [Bug#14972](http://bugs.mysql.com/14972) [<http://bugs.mysql.com/14972>]).
- Implementation of `Statement.cancel()` and `Statement.setQueryTimeout()`. Both require MySQL-5.0.0 or newer server, require a separate connection to issue the `KILL QUERY` statement, and in the case of `setQueryTimeout()` creates an additional thread to handle the timeout functionality.

Note: Failures to cancel the statement for `setQueryTimeout()` may manifest themselves as `RuntimeExceptions` rather than failing silently, as there is currently no way to unblock the thread that is executing the query being cancelled due to timeout expiration and have it throw the exception instead.

## D.8.5. Changes in MySQL Connector/J 3.1.14 (not yet released)

- Fixed updatable result set throws `ClassCastException` when there is row data and `moveToInsertRow()` is called. (Fixes [Bug#20479](http://bugs.mysql.com/20479) [<http://bugs.mysql.com/20479>])
- Fixed Updatable result set that contains a BIT column fails when server-side prepared statements are used. (Fixes [Bug#20485](http://bugs.mysql.com/20485) [<http://bugs.mysql.com/20485>])
- Fixed memory leak with `profileSQL=true`. (Fixes [Bug#16987](http://bugs.mysql.com/16987) [<http://bugs.mysql.com/16987>])
- Connection fails to localhost when using timeout and IPv6 is configured. (Fixes [Bug#19726](http://bugs.mysql.com/19726) [<http://bugs.mysql.com/19726>])
- Fixed `NullPointerException` in `MysqlDataSourceFactory` due to Reference containing `RefAddr`s with null content. (Fixes [Bug#16791](http://bugs.mysql.com/16791) [<http://bugs.mysql.com/16791>])

- Fixed `ResultSet.getShort()` for `UNSIGNED TINYINT` returns incorrect values when using server-side prepared statements. (Fixes [Bug#20306](http://bugs.mysql.com/20306) [<http://bugs.mysql.com/20306>])
- Fixed can't pool server-side prepared statements, exception raised when re-using them. (Fixes [Bug#20687](http://bugs.mysql.com/20687) [<http://bugs.mysql.com/20687>])
- Fixed [Bug#21062](http://bugs.mysql.com/21062) [<http://bugs.mysql.com/21062>] - `ResultSet.getSomeInteger()` doesn't work for `BIT(>1)`.
- Fixed [Bug#18880](http://bugs.mysql.com/18880) [<http://bugs.mysql.com/18880>] - `ResultSet.getFloatFromString()` can't retrieve values near `Float.MIN/MAX_VALUE`.
- Fixed [Bug#20888](http://bugs.mysql.com/20888) [<http://bugs.mysql.com/20888>] - escape of quotes in client-side prepared statements parsing not respected. Patch covers more than bug report, including `NO_BACKSLASH_ESCAPES` being set, and stacked quote characters forms of escaping (i.e. " or """).
- Fixed [Bug#19993](http://bugs.mysql.com/19993) [<http://bugs.mysql.com/19993>] - `ReplicationDriver` does not always round-robin load balance depending on URL used for slaves list.

## D.8.6. Changes in MySQL Connector/J 3.1.13 (26 May 2006)

- `INOUT` parameter does not store `IN` value. ([Bug#15464](http://bugs.mysql.com/15464) [<http://bugs.mysql.com/15464>])
- Exception thrown for new decimal type when using updatable result sets. ([Bug#14609](http://bugs.mysql.com/14609) [<http://bugs.mysql.com/14609>])
- No "dos" character set in MySQL > 4.1.0. ([Bug#15544](http://bugs.mysql.com/15544) [<http://bugs.mysql.com/15544>])
- `PreparedStatement.setObject()` serializes `BigInteger` as object, rather than sending as numeric value (and is thus not complementary to `.getObject()` on an `UNSIGNED LONG` type). ([Bug#15383](http://bugs.mysql.com/15383) [<http://bugs.mysql.com/15383>])
- `ResultSet.getShort()` for `UNSIGNED TINYINT` returned wrong values. ([Bug#11874](http://bugs.mysql.com/11874) [<http://bugs.mysql.com/11874>])
- `lib-nodist` directory missing from package breaks out-of-box build. ([Bug#15676](http://bugs.mysql.com/15676) [<http://bugs.mysql.com/15676>])
- `DBMD.getColumns()` returns wrong type for `BIT`. ([Bug#15854](http://bugs.mysql.com/15854) [<http://bugs.mysql.com/15854>])
- Fixed issue where driver was unable to initialize character set mapping tables. Removed reliance on `.properties` files to hold this information, as it turns out to be too problematic to code around class loader hierarchies that change depending on how an application is deployed. Moved information back into the `CharsetMapping` class. ([Bug#14938](http://bugs.mysql.com/14938) [<http://bugs.mysql.com/14938>])
- Fixed updatable result set doesn't return `AUTO_INCREMENT` values for `insertRow()` when multiple column primary keys are used. (the driver was checking for the existence of single-column primary keys and an autoincrement value > 0 instead of a straightforward `isAutoIncrement()` check). ([Bug#16841](http://bugs.mysql.com/16841) [<http://bugs.mysql.com/16841>])
- Fixed `Statement.getGeneratedKeys()` throws `NullPointerException` when no query has been processed. ([Bug#17099](http://bugs.mysql.com/17099) [<http://bugs.mysql.com/17099>])
- Fixed driver trying to call methods that don't exist on older and newer versions of Log4j. The fix is not trying to auto-detect presence of log4j, too many different incompatible versions out there in the wild to do this reliably. ([Bug#13469](http://bugs.mysql.com/13469) [<http://bugs.mysql.com/13469>])

If you relied on autodetection before, you will need to add "logger=com.mysql.jdbc.log.Log4JLogger" to your JDBC URL to enable Log4J usage, or alternatively use the new "CommonsLogger" class to take care of this.

- Added support for Apache Commons logging, use "com.mysql.jdbc.log.CommonsLogger" as the value for the "logger" configuration property.
- LogFactory now prepends "com.mysql.jdbc.log" to log class name if it can't be found as-specified. This allows you to use "short names" for the built-in log factories, for example "logger=CommonsLogger" instead of "logger=com.mysql.jdbc.log.CommonsLogger".
- Fixed issue with `ReplicationConnection` incorrectly copying state, doesn't transfer connection context correctly when transitioning between the same read-only states. ([Bug#15570](http://bugs.mysql.com/15570) [<http://bugs.mysql.com/15570>])
- Fixed issue where server-side prepared statements don't cause truncation exceptions to be thrown when truncation happens. ([Bug#18041](http://bugs.mysql.com/18041) [<http://bugs.mysql.com/18041>])
- Added performance feature, re-writing of batched executes for `Statement.executeBatch()` (for all DML statements) and `PreparedStatement.executeBatch()` (for INSERTs with VALUE clauses only). Enable by using "rewriteBatchedStatements=true" in your JDBC URL.
- Fixed `CallableStatement.registerOutParameter()` not working when some parameters pre-populated. Still waiting for feedback from JDBC experts group to determine what correct parameter count from `getMetaData()` should be, however. ([Bug#17898](http://bugs.mysql.com/17898) [<http://bugs.mysql.com/17898>])
- Fixed calling `clearParameters()` on a closed prepared statement causes NPE. ([Bug#17587](http://bugs.mysql.com/17587) [<http://bugs.mysql.com/17587>])
- Map "latin1" on MySQL server to CP1252 for MySQL > 4.1.0.
- Added additional accessor and mutator methods on `ConnectionProperties` so that `DataSource` users can use same naming as regular URL properties.
- Fixed data truncation and `getWarnings()` only returns last warning in set. ([Bug#18740](http://bugs.mysql.com/18740) [<http://bugs.mysql.com/18740>])
- Improved performance of retrieving `BigDecimal`, `Time`, `Timestamp` and `Date` values from server-side prepared statements by creating fewer short-lived instances of `Strings` when the native type is not an exact match for the requested type. Fixes [Bug#18496](http://bugs.mysql.com/18496) [<http://bugs.mysql.com/18496>] for `BigDecimals`.
- Fixed aliased column names where length of name > 251 are corrupted. ([Bug#18554](http://bugs.mysql.com/18554) [<http://bugs.mysql.com/18554>])
- Fixed `ResultSet.wasNull()` not always reset correctly for booleans when done via conversion for server-side prepared statements. ([Bug#17450](http://bugs.mysql.com/17450) [<http://bugs.mysql.com/17450>])
- Fixed invalid classname returned for `ResultSetMetaData.getColumnClassName()` for `BIGINT` type. ([Bug#19282](http://bugs.mysql.com/19282) [<http://bugs.mysql.com/19282>])
- Fixed case where driver wasn't reading server status correctly when fetching server-side prepared statement rows, which in some cases could cause warning counts to be off, or multiple result sets to not be read off the wire.
- Driver now aware of fix for `BIT` type metadata that went into MySQL-5.0.21 for server not reporting length consistently ([Bug#13601](http://bugs.mysql.com/13601) [<http://bugs.mysql.com/13601>]).

- Fixed `PreparedStatement.setObject(int, Object, int)` doesn't respect scale of `BigDecimal`s. (Bug#19615 [<http://bugs.mysql.com/19615>])
- Fixed `ResultSet.wasNull()` returns incorrect value when extracting native string from server-side prepared statement generated result set. (Bug#19282 [<http://bugs.mysql.com/19282>])

## D.8.7. Changes in MySQL Connector/J 3.1.12 (30 November 2005)

- Fixed client-side prepared statement bug with embedded `?` characters inside quoted identifiers (it was recognized as a placeholder, when it was not).
- Don't allow `executeBatch()` for `CallableStatements` with registered `OUT/INOUT` parameters (JDBC compliance).
- Fall back to platform-encoding for `URLDecoder.decode()` when parsing driver URL properties if the platform doesn't have a two-argument version of this method.
- Java type conversion may be incorrect for `MEDIUMINT`. (Bug#14562 [<http://bugs.mysql.com/14562>])
- Added configuration property `useGmtMillisForDatetimes` which when set to `true` causes `ResultSet.getDate()`, `ResultSet.getTimestamp()` to return correct millis-since GMT when `ResultSet.getTime()` is called on the return value (currently default is `false` for legacy behavior).
- Fixed `DatabaseMetaData.stores*Identifiers()`:
  - If `lower_case_table_names=0` (on server):
    - `storesLowerCaseIdentifiers()` returns `false`
    - `storesLowerCaseQuotedIdentifiers()` returns `false`
    - `storesMixedCaseIdentifiers()` returns `true`
    - `storesMixedCaseQuotedIdentifiers()` returns `true`
    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`
  - If `lower_case_table_names=1` (on server):
    - `storesLowerCaseIdentifiers()` returns `true`
    - `storesLowerCaseQuotedIdentifiers()` returns `true`
    - `storesMixedCaseIdentifiers()` returns `false`
    - `storesMixedCaseQuotedIdentifiers()` returns `false`
    - `storesUpperCaseIdentifiers()` returns `false`
    - `storesUpperCaseQuotedIdentifiers()` returns `true`
- `DatabaseMetaData.getColumns()` doesn't return `TABLE_NAME` correctly. (Bug#14815)

[<http://bugs.mysql.com/14815>])

- Escape processor replaces quote character in quoted string with string delimiter. (Bug#14909 [<http://bugs.mysql.com/14909>])
- OpenOffice expects `DBMD.supportsIntegrityEnhancementFacility()` to return `true` if foreign keys are supported by the datasource, even though this method also covers support for check constraints, which MySQL *doesn't* have. Setting the configuration property `overrideSupportsIntegrityEnhancementFacility` to `true` causes the driver to return `true` for this method. (Bug#12975 [<http://bugs.mysql.com/12975>])
- Added `com.mysql.jdbc.testsuite.url.default` system property to set default JDBC url for testsuite (to speed up bug resolution when I'm working in Eclipse).
- Unable to initialize character set mapping tables (due to J2EE classloader differences). (Bug#14938 [<http://bugs.mysql.com/14938>])
- Deadlock while closing server-side prepared statements from multiple threads sharing one connection. (Bug#14972 [<http://bugs.mysql.com/14972>])
- `logSlowQueries` should give better info. (Bug#12230 [<http://bugs.mysql.com/12230>])
- Extraneous sleep on `autoReconnect`. (Bug#13775 [<http://bugs.mysql.com/13775>])
- Driver incorrectly closes streams passed as arguments to `PreparedStatement`. Reverts to legacy behavior by setting the JDBC configuration property `autoClosePstmtStreams` to `true` (also included in the 3-0-Compat configuration “bundle”). (Bug#15024 [<http://bugs.mysql.com/15024>])
- `maxQuerySizeToLog` is not respected. Added logging of bound values for `execute()` phase of server-side prepared statements when `profileSQL=true` as well. (Bug#13048 [<http://bugs.mysql.com/13048>])
- Usage advisor complains about unreferenced columns, even though they've been referenced. (Bug#15065 [<http://bugs.mysql.com/15065>])
- Don't increase timeout for failover/reconnect. (Bug#6577 [<http://bugs.mysql.com/6577>])
- Process escape tokens in `Connection.prepareStatement(...)`. (Bug#15141 [<http://bugs.mysql.com/15141>]) You can disable this behavior by setting the JDBC URL configuration property `processEscapeCodesForPrepStmts` to `false`.
- Reconnect during middle of `executeBatch()` should not occur if `autoReconnect` is enabled. (Bug#13255 [<http://bugs.mysql.com/13255>])

## D.8.8. Changes in MySQL Connector/J 3.1.11-stable (07 October 2005)

- Spurious `!` on console when character encoding is `utf8`. (Bug#11629 [<http://bugs.mysql.com/11629>])
- Fixed statements generated for testcases missing `;` for “plain” statements.
- Incorrect generation of testcase scripts for server-side prepared statements. (Bug#11663 [<http://bugs.mysql.com/11663>])

- Fixed regression caused by fix for [Bug#11552](http://bugs.mysql.com/11552) [http://bugs.mysql.com/11552] that caused driver to return incorrect values for unsigned integers when those integers were within the range of the positive signed type.
- Moved source code to Subversion repository.
- Escape tokenizer doesn't respect stacked single quotes for escapes. ([Bug#11797](http://bugs.mysql.com/11797) [http://bugs.mysql.com/11797])
- `GEOMETRY` type not recognized when using server-side prepared statements.
- `ReplicationConnection` won't switch to slave, throws “Catalog can't be null” exception. ([Bug#11879](http://bugs.mysql.com/11879) [http://bugs.mysql.com/11879])
- Properties shared between master and slave with replication connection. ([Bug#12218](http://bugs.mysql.com/12218) [http://bugs.mysql.com/12218])
- `Statement.getWarnings()` fails with NPE if statement has been closed. ([Bug#10630](http://bugs.mysql.com/10630) [http://bugs.mysql.com/10630])
- Only get `char[]` from SQL in `PreparedStatement.ParseInfo()` when needed.
- Geometry types not handled with server-side prepared statements. ([Bug#12104](http://bugs.mysql.com/12104) [http://bugs.mysql.com/12104])
- `StringUtils.getBytes()` doesn't work when using multi-byte character encodings and a length in `characters` is specified. ([Bug#11614](http://bugs.mysql.com/11614) [http://bugs.mysql.com/11614])
- `Pstmt.setObject(..., Types.BOOLEAN)` throws exception. ([Bug#11798](http://bugs.mysql.com/11798) [http://bugs.mysql.com/11798])
- `maxPerformance.properties` mis-spells “elideSetAutoCommits”. ([Bug#11976](http://bugs.mysql.com/11976) [http://bugs.mysql.com/11976])
- `DBMD.storesLower/Mixed/UpperIdentifiers()` reports incorrect values for servers deployed on Windows. ([Bug#11575](http://bugs.mysql.com/11575) [http://bugs.mysql.com/11575])
- `ResultSet.moveToCurrentRow()` fails to work when preceded by a call to `ResultSet.moveToInsertRow()`. ([Bug#11190](http://bugs.mysql.com/11190) [http://bugs.mysql.com/11190])
- `VARBINARY` data corrupted when using server-side prepared statements and `.setBytes()`. ([Bug#11115](http://bugs.mysql.com/11115) [http://bugs.mysql.com/11115])
- `explainSlowQueries` hangs with server-side prepared statements. ([Bug#12229](http://bugs.mysql.com/12229) [http://bugs.mysql.com/12229])
- Escape processor didn't honor strings demarcated with double quotes. ([Bug#11498](http://bugs.mysql.com/11498) [http://bugs.mysql.com/11498])
- Lifted restriction of changing streaming parameters with server-side prepared statements. As long as `all` streaming parameters were set before execution, `.clearParameters()` does not have to be called. (due to limitation of client/server protocol, prepared statements can not reset *individual* stream data on the server side).
- Reworked `Field` class, `*Buffer`, and `MysqlIO` to be aware of field lengths > `Integer.MAX_VALUE`.
- Updated `DBMD.supportsCorrelatedQueries()` to return `true` for versions > 4.1, `supportsGroupByUnrelated()` to return `true` and `getResultSetHoldability()` to re-

turn `HOLD_CURSORS_OVER_COMMIT`.

- Handling of catalog argument in `DatabaseMetaData.getIndexInfo()`, which also means changes to the following methods in `DatabaseMetaData`: ([Bug#12541](http://bugs.mysql.com/12541) [<http://bugs.mysql.com/12541>])
  - `getBestRowIdentifier()`
  - `getColumns()`
  - `getCrossReference()`
  - `getExportedKeys()`
  - `getImportedKeys()`
  - `getIndexInfo()`
  - `getPrimaryKeys()`
  - `getProcedures()` (and thus indirectly `getProcedureColumns()`)
  - `getTables()`

The `catalog` argument in all of these methods now behaves in the following way:

- Specifying `NULL` means that catalog will not be used to filter the results (thus all databases will be searched), unless you've set `nullCatalogMeansCurrent=true` in your JDBC URL properties.
- Specifying `" "` means “current” catalog, even though this isn't quite JDBC spec compliant, it's there for legacy users.
- Specifying a catalog works as stated in the API docs.
- Made `Connection.clientPrepare()` available from “wrapped” connections in the `jdbc2.optional` package (connections built by `ConnectionPoolDataSource` instances).
- Added `Connection.isMasterConnection()` for clients to be able to determine if a multi-host master/slave connection is connected to the first host in the list.
- Tokenizer for `=` in URL properties was causing `sessionVariables=...` to be parameterized incorrectly. ([Bug#12753](http://bugs.mysql.com/12753) [<http://bugs.mysql.com/12753>])
- Foreign key information that is quoted is parsed incorrectly when `DatabaseMetaData` methods use that information. ([Bug#11781](http://bugs.mysql.com/11781) [<http://bugs.mysql.com/11781>])
- The `sendBlobChunkSize` property is now clamped to `max_allowed_packet` with consideration of stream buffer size and packet headers to avoid `PacketTooBigExceptions` when `max_allowed_packet` is similar in size to the default `sendBlobChunkSize` which is 1M.
- `CallableStatement.clearParameters()` now clears resources associated with `INOUT/OUTPUT` parameters as well as `INPUT` parameters.
- `Connection.prepareCall()` is database name case-sensitive (on Windows systems). ([Bug#12417](http://bugs.mysql.com/12417) [<http://bugs.mysql.com/12417>])
- `cp1251` incorrectly mapped to `win1251` for servers newer than 4.0.x. ([Bug#12752](http://bugs.mysql.com/12752) [<http://bugs.mysql.com/12752>])

- `java.sql.Types.OTHER` returned for `BINARY` and `VARBINARY` columns when using `DatabaseMetaData.getColumns()`. (Bug#12970 [http://bugs.mysql.com/12970])
- `ServerPreparedStatement.getBinding()` now checks if the statement is closed before attempting to reference the list of parameter bindings, to avoid throwing a `NullPointerException`.
- `ResultSetMetaData` from `Statement.getGeneratedKeys()` caused a `NullPointerException` to be thrown whenever a method that required a connection reference was called. (Bug#13277 [http://bugs.mysql.com/13277])
- Backport of `Field` class, `ResultSetMetaData.getColumnClassName()`, and `ResultSet.getObject(int)` changes from 5.0 branch to fix behavior surrounding `VARCHAR BINARY/VARBINARY` and related types.
- Fixed `NullPointerException` when converting `catalog` parameter in many `DatabaseMetaDataMethods` to `byte[]`s (for the result set) when the parameter is `null`. (`null` isn't technically allowed by the JDBC specification, but we've historically allowed it).
- Backport of `VAR[BINARY|CHAR] [BINARY]` types detection from 5.0 branch.
- Read response in `MysqlIO.sendFileToServer()`, even if the local file can't be opened, otherwise next query issued will fail, because it's reading the response to the empty `LOAD DATA INFILE` packet sent to the server.
- Workaround for Bug#13374 [http://bugs.mysql.com/13374]: `ResultSet.getStatement()` on closed result set returns `NULL` (as per JDBC 4.0 spec, but not backward-compatible). Set the connection property `retainStatementAfterResultSetClose` to `true` to be able to retrieve a `ResultSet`'s statement after the `ResultSet` has been closed via `.getStatement()` (the default is `false`, to be JDBC-compliant and to reduce the chance that code using JDBC leaks `Statement` instances).
- URL configuration parameters don't allow `'&'` or `'='` in their values. The JDBC driver now parses configuration parameters as if they are encoded using the application/x-www-form-urlencoded format as specified by `java.net.URLDecoder` (<http://java.sun.com/j2se/1.5.0/docs/api/java/net/URLDecoder.html>). (Bug#13453 [http://bugs.mysql.com/13453])  
  
If the `'%'` character is present in a configuration property, it must now be represented as `%25`, which is the encoded form of `'%'` when using application/x-www-form-urlencoded encoding.
- The configuration property `sessionVariables` now allows you to specify variables that start with the `'@'` sign.
- When `gatherPerfMetrics` is enabled for servers older than 4.1.0, a `NullPointerException` is thrown from the constructor of `ResultSet` if the query doesn't use any tables. (Bug#13043 [http://bugs.mysql.com/13043])

## D.8.9. Changes in MySQL Connector/J 3.1.10-stable (23 June 2005)

- Fixed connecting without a database specified raised an exception in `MysqlIO.changeDatabaseTo()`.
- Initial implementation of `ParameterMetadata` for `PreparedStatement.getParameterMetadata()`. Only works fully for `CallableStatements`, as current

server-side prepared statements return every parameter as a `VARCHAR` type.

## D.8.10. Changes in MySQL Connector/J 3.1.9-stable (22 June 2005)

- Overhaul of character set configuration, everything now lives in a properties file.
- Driver now correctly uses CP932 if available on the server for Windows-31J, CP932 and MS932 java encoding names, otherwise it resorts to SJIS, which is only a close approximation. Currently only MySQL-5.0.3 and newer (and MySQL-4.1.12 or .13, depending on when the character set gets backported) can reliably support any variant of CP932.
- `com.mysql.jdbc.PreparedStatement.ParseInfo` does unnecessary call to `toCharArray()`. (Bug#9064 [<http://bugs.mysql.com/9064>])
- Memory leak in `ServerPreparedStatement` if `serverPrepare()` fails. (Bug#10144 [<http://bugs.mysql.com/10144>])
- Actually write manifest file to correct place so it ends up in the binary jar file.
- Added `createDatabaseIfNotExist` property (default is `false`), which will cause the driver to ask the server to create the database specified in the URL if it doesn't exist. You must have the appropriate privileges for database creation for this to work.
- Unsigned `SMALLINT` treated as signed for `ResultSet.getInt()`, fixed all cases for `UNSIGNED` integer values and server-side prepared statements, as well as `ResultSet.getObject()` for `UNSIGNED TINYINT`. (Bug#10156 [<http://bugs.mysql.com/10156>])
- Double quotes not recognized when parsing client-side prepared statements. (Bug#10155 [<http://bugs.mysql.com/10155>])
- Made `enableStreamingResults()` visible on `com.mysql.jdbc.jdbc2.optional.StatementWrapper`.
- Made `ServerPreparedStatement.asSql()` work correctly so auto-explain functionality would work with server-side prepared statements.
- Made JDBC2-compliant wrappers public in order to allow access to vendor extensions.
- Cleaned up logging of profiler events, moved code to dump a profiler event as a string to `com.mysql.jdbc.log.LogUtils` so that third parties can use it.
- `DatabaseMetaData.supportsMultipleOpenResults()` now returns `true`. The driver has supported this for some time, DBMD just missed that fact.
- Driver doesn't support `{?=CALL(...)}` for calling stored functions. This involved adding support for function retrieval to `DatabaseMetaData.getProcedures()` and `getProcedureColumns()` as well. (Bug#10310 [<http://bugs.mysql.com/10310>])
- `SQLException` thrown when retrieving `YEAR(2)` with `ResultSet.getString()`. The driver will now always treat `YEAR` types as `java.sql.Date` and return the correct values for `getString()`. Alternatively, the `yearIsDateType` connection property can be set to `false` and the values will be treated as `SHORTs`. (Bug#10485 [<http://bugs.mysql.com/10485>])
- The datatype returned for `TINYINT(1)` columns when `tinyIntIsBit=true` (the default) can be switched between `Types.BOOLEAN` and `Types.BIT` using the new configuration property

`transformedBitIsBoolean`, which defaults to `false`. If set to `false` (the default), `DatabaseMetaData.getColumns()` and `ResultSetMetaData.getColumnType()` will return `Types.BOOLEAN` for `TINYINT(1)` columns. If `true`, `Types.BOOLEAN` will be returned instead. Regardless of this configuration property, if `tinyIntIsBit` is enabled, columns with the type `TINYINT(1)` will be returned as `java.lang.Boolean` instances from `ResultSet.getObject(...)`, and `ResultSetMetaData.getColumnClassName()` will return `java.lang.Boolean`.

- `SQLException` is thrown when using property `characterSetResults` with `cp932` or `eu-cjpm`. ([Bug#10496](http://bugs.mysql.com/10496) [<http://bugs.mysql.com/10496>])
- Reorganized directory layout. Sources now are in `src` folder. Don't pollute parent directory when building, now output goes to `./build`, distribution goes to `./dist`.
- Added support/bug hunting feature that generates `.sql` test scripts to `STDERR` when `autoGenerateTestcaseScript` is set to `true`.
- 0-length streams not sent to server when using server-side prepared statements. ([Bug#10850](http://bugs.mysql.com/10850) [<http://bugs.mysql.com/10850>])
- Setting `cachePrepStmts=true` now causes the `Connection` to also cache the check the driver performs to determine if a prepared statement can be server-side or not, as well as caches server-side prepared statements for the lifetime of a connection. As before, the `prepStmtCacheSize` parameter controls the size of these caches.
- Try to handle `OutOfMemoryErrors` more gracefully. Although not much can be done, they will in most cases close the connection they happened on so that further operations don't run into a connection in some unknown state. When an OOM has happened, any further operations on the connection will fail with a "Connection closed" exception that will also list the OOM exception as the reason for the implicit connection close event.
- Don't send `COM_RESET_STMT` for each execution of a server-side prepared statement if it isn't required.
- Driver detects if you're running MySQL-5.0.7 or later, and does not scan for `LIMIT ?[,?]` in statements being prepared, as the server supports those types of queries now.
- `VARBINARY` data corrupted when using server-side prepared statements and `ResultSet.getBytes()`. ([Bug#11115](http://bugs.mysql.com/11115) [<http://bugs.mysql.com/11115>])
- `Connection.setCatalog()` is now aware of the `useLocalSessionState` configuration property, which when set to `true` will prevent the driver from sending `USE ...` to the server if the requested catalog is the same as the current catalog.
- Added the following configuration bundles, use one or many via the `useConfigs` configuration property:
  - `maxPerformance` — maximum performance without being reckless
  - `solarisMaxPerformance` — maximum performance for Solaris, avoids syscalls where it can
  - `3-0-Compat` — Compatibility with Connector/J 3.0.x functionality
- Added `maintainTimeStats` configuration property (defaults to `true`), which tells the driver whether or not to keep track of the last query time and the last successful packet sent to the server's time. If set to `false`, removes two syscalls per query.
- `autoReconnect` ping causes exception on connection startup. ([Bug#11259](http://bugs.mysql.com/11259))

[<http://bugs.mysql.com/11259>])

- Connector/J dumping query into `SQLException` twice. ([Bug#11360](#) [<http://bugs.mysql.com/11360>])
- Fixed `PreparedStatement.setClob()` not accepting `null` as a parameter.
- Production package doesn't include JBoss integration classes. ([Bug#11411](#) [<http://bugs.mysql.com/11411>])
- Removed nonsensical “costly type conversion” warnings when using usage advisor.

## D.8.11. Changes in MySQL Connector/J 3.1.8-stable (14 April 2005)

- Fixed `DatabaseMetaData.getTables()` returning views when they were not asked for as one of the requested table types.
- Added support for new precision-math `DECIMAL` type in MySQL 5.0.3 and up.
- Fixed `ResultSet.getTime()` on a `NULL` value for server-side prepared statements throws NPE.
- Made `Connection.ping()` a public method.
- `DATE_FORMAT()` queries returned as `BLOBs` from `getObject()`. ([Bug#8868](#) [<http://bugs.mysql.com/8868>])
- `ServerPreparedStatements` now correctly “stream” `BLOB/CLOB` data to the server. You can configure the threshold chunk size using the JDBC URL property `blobSendChunkSize` (the default is 1MB).
- `BlobFromLocator` now uses correct identifier quoting when generating prepared statements.
- Server-side session variables can be preset at connection time by passing them as a comma-delimited list for the connection property `sessionVariables`.
- Fixed regression in `ping()` for users using `autoReconnect=true`.
- `PreparedStatement.addBatch()` doesn't work with server-side prepared statements and streaming `BINARY` data. ([Bug#9040](#) [<http://bugs.mysql.com/9040>])
- `DBMD.supportsMixedCase*Identifiers()` returns wrong value on servers running on case-sensitive filesystems. ([Bug#8800](#) [<http://bugs.mysql.com/8800>])
- Cannot use `UTF-8` for `characterSetResults` configuration property. ([Bug#9206](#) [<http://bugs.mysql.com/9206>])
- A continuation of [Bug#8868](#) [<http://bugs.mysql.com/8868>], where functions used in queries that should return non-string types when resolved by temporary tables suddenly become opaque binary strings (work-around for server limitation). Also fixed fields with type of `CHAR(n) CHARACTER SET BINARY` to return correct/matching classes for `RSMD.getColumnClassName()` and `ResultSet.getObject()`. ([Bug#9236](#) [<http://bugs.mysql.com/9236>])
- `DBMD.supportsResultSetConcurrency()` not returning `true` for forward-only/read-only result sets (we obviously support this). ([Bug#8792](#) [<http://bugs.mysql.com/8792>])

- `DATA_TYPE` column from `DBMD.getBestRowIdentifier()` causes `ArrayIndexOutOfBoundsException` when accessed (and in fact, didn't return any value). (Bug#8803 [http://bugs.mysql.com/8803])
- Check for empty strings ( ' ') when converting `CHAR/VARCHAR` column data to numbers, throw exception if `emptyStringsConvertToZero` configuration property is set to `false` (for backward-compatibility with 3.0, it is now set to `true` by default, but will most likely default to `false` in 3.2).
- `PreparedStatement.getMetaData()` inserts blank row in database under certain conditions when not using server-side prepared statements. (Bug#9320 [http://bugs.mysql.com/9320])
- `Connection.canHandleAsPreparedStatement()` now makes “best effort” to distinguish `LIMIT` clauses with placeholders in them from ones without in order to have fewer false positives when generating work-arounds for statements the server cannot currently handle as server-side prepared statements.
- Fixed `build.xml` to not compile `log4j` logging if `log4j` not available.
- Added support for the c3p0 connection pool's (<http://c3p0.sf.net/>) validation/connection checker interface which uses the lightweight `COM_PING` call to the server if available. To use it, configure your c3p0 connection pool's `connectionTesterClassName` property to use `com.mysql.jdbc.integration.c3p0.MysqlConnectionTester`.
- Better detection of `LIMIT` inside/outside of quoted strings so that the driver can more correctly determine whether a prepared statement can be prepared on the server or not.
- Stored procedures with same name in different databases confuse the driver when it tries to determine parameter counts/types. (Bug#9319 [http://bugs.mysql.com/9319])
- Added finalizers to `ResultSet` and `Statement` implementations to be JDBC spec-compliant, which requires that if not explicitly closed, these resources should be closed upon garbage collection.
- Stored procedures with `DECIMAL` parameters with storage specifications that contained ' , ' in them would fail. (Bug#9682 [http://bugs.mysql.com/9682])
- `PreparedStatement.setObject(int, Object, int type, int scale)` now uses scale value for `BigDecimal` instances.
- `Statement.getMoreResults()` could throw NPE when existing result set was `.close()`d. (Bug#9704 [http://bugs.mysql.com/9704])
- The performance metrics feature now gathers information about number of tables referenced in a `SELECT`.
- The logging system is now automatically configured. If the value has been set by the user, via the URL property `logger` or the system property `com.mysql.jdbc.logger`, then use that, otherwise, autodetect it using the following steps:
  1. Log4j, if it's available,
  2. Then JDK1.4 logging,
  3. Then fallback to our `STDERR` logging.
- `DBMD.getTables()` shouldn't return tables if views are asked for, even if the database version doesn't support views. (Bug#9778 [http://bugs.mysql.com/9778])
- Fixed driver not returning `true` for `-1` when `ResultSet.getBoolean()` was called on result

sets returned from server-side prepared statements.

- Added a `Manifest.MF` file with implementation information to the `.jar` file.
- More tests in `Field.isOpaqueBinary()` to distinguish opaque binary (that is, fields with type `CHAR(n)` and `CHARACTER SET BINARY`) from output of various scalar and aggregate functions that return strings.
- Should accept `null` for catalog (meaning use current) in DBMD methods, even though it's not JDBC-compliant for legacy's sake. Disable by setting connection property `nullCatalogMeansCurrent` to `false` (which will be the default value in C/J 3.2.x). ([Bug#9917](http://bugs.mysql.com/9917) [<http://bugs.mysql.com/9917>])
- Should accept `null` for name patterns in DBMD (meaning '%'), even though it isn't JDBC compliant, for legacy's sake. Disable by setting connection property `nullNamePatternMatchesAll` to `false` (which will be the default value in C/J 3.2.x). ([Bug#9769](http://bugs.mysql.com/9769) [<http://bugs.mysql.com/9769>])

## D.8.12. Changes in MySQL Connector/J 3.1.7-stable (18 February 2005)

- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. ([Bug#7686](http://bugs.mysql.com/7686) [<http://bugs.mysql.com/7686>])
- Timestamps converted incorrectly to strings with server-side prepared statements and updatable result sets. ([Bug#7715](http://bugs.mysql.com/7715) [<http://bugs.mysql.com/7715>])
- Detect new `sql_mode` variable in string form (it used to be integer) and adjust quoting method for strings appropriately.
- Added `holdResultsOpenOverStatementClose` property (default is `false`), that keeps result sets open over `statement.close()` or new execution on same statement (suggested by Kevin Burton).
- Infinite recursion when “falling back” to master in failover configuration. ([Bug#7952](http://bugs.mysql.com/7952) [<http://bugs.mysql.com/7952>])
- Disable multi-statements (if enabled) for MySQL-4.1 versions prior to version 4.1.10 if the query cache is enabled, as the server returns wrong results in this configuration.
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly.
- Removed `dontUnpackBinaryResults` functionality, the driver now always stores results from server-side prepared statements as is from the server and unpacks them on demand.
- Emulated locators corrupt binary data when using server-side prepared statements. ([Bug#8096](http://bugs.mysql.com/8096) [<http://bugs.mysql.com/8096>])
- Fixed synchronization issue with `ServerPreparedStatement.serverPrepare()` that could cause deadlocks/crashes if connection was shared between threads.
- By default, the driver now scans SQL you are preparing via all variants of `Connection.prepareStatement()` to determine if it is a supported type of statement to prepare on the server side, and if it is not supported by the server, it instead prepares it as a client-side emulated prepared statement. You can disable this by passing `emulateUnsupportedPstmts=false` in your JDBC URL. ([Bug#4718](http://bugs.mysql.com/4718) [<http://bugs.mysql.com/4718>])

- Remove `_binary` introducer from parameters used as in/out parameters in `CallableStatement`.
- Always return `byte[]`s for output parameters registered as `*BINARY`.
- Send correct value for “boolean” `true` to server for `PreparedStatement.setObject(n, "true", Types.BIT)`.
- Fixed bug with `Connection` not caching statements from `prepareStatement()` when the statement wasn't a server-side prepared statement.
- Choose correct “direction” to apply time adjustments when both client and server are in GMT time zone when using `ResultSet.get(..., cal)` and `PreparedStatement.set(..., cal)`.
- Added `dontTrackOpenResources` option (default is `false`, to be JDBC compliant), which helps with memory use for non-well-behaved apps (that is, applications that don't close `Statement` objects when they should).
- `ResultSet.getString()` doesn't maintain format stored on server, bug fix only enabled when `noDatetimeStringSync` property is set to `true` (the default is `false`). (Bug#8428 [http://bugs.mysql.com/8428])
- Fixed NPE in `ResultSet.realClose()` when using usage advisor and result set was already closed.
- `PreparedStatements` not creating streaming result sets. (Bug#8487 [http://bugs.mysql.com/8487])
- Don't pass `NULL` to `String.valueOf()` in `ResultSet.getNativeConvertToString()`, as it stringifies it (that is, returns `null`), which is not correct for the method in question.
- `ResultSet.getBigDecimal()` throws exception when rounding would need to occur to set scale. The driver now chooses a rounding mode of “half up” if non-rounding `BigDecimal.setScale()` fails. (Bug#8424 [http://bugs.mysql.com/8424])
- Added `useLocalSessionState` configuration property, when set to `true` the JDBC driver trusts that the application is well-behaved and only sets autocommit and transaction isolation levels using the methods provided on `java.sql.Connection`, and therefore can manipulate these values in many cases without incurring round-trips to the database server.
- Added `enableStreamingResults()` to `Statement` for connection pool implementations that check `Statement.setFetchSize()` for specification-compliant values. Call `Statement.setFetchSize(>=0)` to disable the streaming results for that statement.
- Added support for `BIT` type in MySQL-5.0.3. The driver will treat `BIT(1-8)` as the JDBC standard `BIT` type (which maps to `java.lang.Boolean`), as the server does not currently send enough information to determine the size of a bitfield when `< 9` bits are declared. `BIT(>9)` will be treated as `VARBINARY`, and will return `byte[]` when `getObject()` is called.

### D.8.13. Changes in MySQL Connector/J 3.1.6-stable (23 December 2004)

- Fixed hang on `SocketInputStream.read()` with `Statement.setMaxRows()` and multiple result sets when driver has to truncate result set directly, rather than tacking a `LIMIT n` on the

end of it.

- `DBMD.getProcedures()` doesn't respect catalog parameter. ([Bug#7026](http://bugs.mysql.com/7026) [<http://bugs.mysql.com/7026>])

## D.8.14. Changes in MySQL Connector/J 3.1.5-gamma (02 December 2004)

- Fix comparisons made between string constants and dynamic strings that are converted with either `toUpperCase()` or `toLowerCase()` to use `Locale.ENGLISH`, as some locales “override” case rules for English. Also use `StringUtils.indexOfIgnoreCase()` instead of `.toUpperCase().indexOf()`, avoids creating a very short-lived transient `String` instance.
- Server-side prepared statements did not honor `zeroDateTimeBehavior` property, and would cause class-cast exceptions when using `ResultSet.getObject()`, as the all-zero string was always returned. ([Bug#5235](http://bugs.mysql.com/5235) [<http://bugs.mysql.com/5235>])
- Fixed batched updates with server prepared statements weren't looking if the types had changed for a given batched set of parameters compared to the previous set, causing the server to return the error “Wrong arguments to mysql\_stmt\_execute()”.
- Handle case when string representation of timestamp contains trailing ‘.’ with no numbers following it.
- Inefficient detection of pre-existing string instances in `ResultSet.getNativeString()`. ([Bug#5706](http://bugs.mysql.com/5706) [<http://bugs.mysql.com/5706>])
- Don't throw exceptions for `Connection.releaseSavepoint()`.
- Use a per-session `Calendar` instance by default when decoding dates from `ServerPreparedStatements` (set to old, less performant behavior by setting property `dynamicCalendars=true`).
- Added experimental configuration property `dontUnpackBinaryResults`, which delays unpacking binary result set values until they're asked for, and only creates object instances for non-numerical values (it is set to `false` by default). For some usecase/jvm combinations, this is friendlier on the garbage collector.
- `UNSIGNED BIGINT` unpacked incorrectly from server-side prepared statement result sets. ([Bug#5729](http://bugs.mysql.com/5729) [<http://bugs.mysql.com/5729>])
- `ServerSidePreparedStatement` allocating short-lived objects unnecessarily. ([Bug#6225](http://bugs.mysql.com/6225) [<http://bugs.mysql.com/6225>])
- Removed unwanted new `Throwable()` in `ResultSet` constructor due to bad merge (caused a new object instance that was never used for every result set created). Found while profiling for [Bug#6359](http://bugs.mysql.com/6359) [<http://bugs.mysql.com/6359>].
- Fixed too-early creation of `StringBuffer` in `EscapeProcessor.escapeSQL()`, also return `String` when escaping not needed (to avoid unnecessary object allocations). Found while profiling for [Bug#6359](http://bugs.mysql.com/6359) [<http://bugs.mysql.com/6359>].
- Use null-safe-equals for key comparisons in updatable result sets.
- `SUM()` on `DECIMAL` with server-side prepared statement ignores scale if zero-padding is needed (this ends up being due to conversion to `DOUBLE` by server, which when converted to a string to

- parse into `BigDecimal`, loses all “padding” zeros). ([Bug#6537](http://bugs.mysql.com/6537) [<http://bugs.mysql.com/6537>])
- Use `DatabaseMetaData.getIdentiferQuoteString()` when building DBMD queries.
- Use 1MB packet for sending file for `LOAD DATA LOCAL INFILE` if that is < `max_allowed_packet` on server.
- `ResultSetMetaData.getColumnDisplaySize()` returns incorrect values for multi-byte charsets. ([Bug#6399](http://bugs.mysql.com/6399) [<http://bugs.mysql.com/6399>])
- Make auto-deserialization of `java.lang.Objects` stored in `BLOB` columns configurable via `autoDeserialize` property (defaults to `false`).
- Re-work `Field.isOpaqueBinary()` to detect `CHAR(n) CHARACTER SET BINARY` to support fixed-length binary fields for `ResultSet.getObject()`.
- Use our own implementation of buffered input streams to get around blocking behavior of `java.io.BufferedReader`. Disable this with `useReadAheadInput=false`.
- Failing to connect to the server when one of the addresses for the given host name is IPV6 (which the server does not yet bind on). The driver now loops through *all* IP addresses for a given host, and stops on the first one that `accepts()` a `socket.connect()`. ([Bug#6348](http://bugs.mysql.com/6348) [<http://bugs.mysql.com/6348>])

## D.8.15. Changes in MySQL Connector/J 3.1.4-beta (04 September 2004)

- Connector/J 3.1.3 beta does not handle integers correctly (caused by changes to support unsigned reads in `Buffer.readInt()` -> `Buffer.readShort()`). ([Bug#4510](http://bugs.mysql.com/4510) [<http://bugs.mysql.com/4510>])
- Added support in `DatabaseMetaData.getTables()` and `getTableTypes()` for views, which are now available in MySQL server 5.0.x.
- `ServerPreparedStatement.execute*()` sometimes threw `ArrayIndexOutOfBoundsException` when unpacking field metadata. ([Bug#4642](http://bugs.mysql.com/4642) [<http://bugs.mysql.com/4642>])
- Optimized integer number parsing, enable “old” slower integer parsing using JDK classes via `useFastIntParsing=false` property.
- Added `useOnlyServerErrorMessages` property, which causes message text in exceptions generated by the server to only contain the text sent by the server (as opposed to the `SQLState`'s “standard” description, followed by the server's error message). This property is set to `true` by default.
- `ResultSet.isNull()` does not work for primitives if a previous `null` was returned. ([Bug#4689](http://bugs.mysql.com/4689) [<http://bugs.mysql.com/4689>])
- Track packet sequence numbers if `enablePacketDebug=true`, and throw an exception if packets received out-of-order.
- `ResultSet.getObject()` returns wrong type for strings when using prepared statements. ([Bug#4482](http://bugs.mysql.com/4482) [<http://bugs.mysql.com/4482>])
- Calling `MysqlPooledConnection.close()` twice (even though an application error), caused NPE. Fixed.

- `ServerPreparedStatement`s dealing with return of `DECIMAL` type don't work. (Bug#5012 [<http://bugs.mysql.com/5012>])
- `ResultSet.getObject()` doesn't return type `Boolean` for pseudo-bit types from prepared statements on 4.1.x (shortcut for avoiding extra type conversion when using binary-encoded result sets obscured test in `getObject()` for "pseudo" bit type). (Bug#5032 [<http://bugs.mysql.com/5032>])
- You can now use URLs in `LOAD DATA LOCAL INFILE` statements, and the driver will use Java's built-in handlers for retrieving the data and sending it to the server. This feature is not enabled by default, you must set the `allowUrlInLocalInfile` connection property to `true`.
- The driver is more strict about truncation of numerics on `ResultSet.get*()`, and will throw an `SQLException` when truncation is detected. You can disable this by setting `jdbcCompliant-Truncation` to `false` (it is enabled by default, as this functionality is required for JDBC compliance).
- Added three ways to deal with all-zero datetimes when reading them from a `ResultSet: exception` (the default), which throws an `SQLException` with an `SQLState` of `S1009`; `convertToNull`, which returns `NULL` instead of the date; and `round`, which rounds the date to the nearest closest value which is `'0001-01-01'`.
- Fixed `ServerPreparedStatement` to read prepared statement metadata off the wire, even though it's currently a placeholder instead of using `MysqlIO.clearInputStream()` which didn't work at various times because data wasn't available to read from the server yet. This fixes sporadic errors users were having with `ServerPreparedStatements` throwing `ArrayIndexOutOfBoundsException`s.
- Use `com.mysql.jdbc.Message`'s classloader when loading resource bundle, should fix sporadic issues when the caller's classloader can't locate the resource bundle.

## D.8.16. Changes in MySQL Connector/J 3.1.3-beta (07 July 2004)

- Mangle output parameter names for `CallableStatements` so they will not clash with user variable names.
- Added support for `INOUT` parameters in `CallableStatements`.
- Null bitmask sent for server-side prepared statements was incorrect. (Bug#4119 [<http://bugs.mysql.com/4119>])
- Use SQL Standard SQL states by default, unless `useSqlStateCodes` property is set to `false`.
- Added packet debugging code (see the `enablePacketDebug` property documentation).
- Added constants for MySQL error numbers (publicly accessible, see `com.mysql.jdbc.MysqlErrorNumbers`), and the ability to generate the mappings of vendor error codes to `SQLStates` that the driver uses (for documentation purposes).
- Externalized more messages (on-going effort).
- Error in retrieval of `mediumint` column with prepared statements and binary protocol. (Bug#4311 [<http://bugs.mysql.com/4311>])
- Support new time zone variables in MySQL-4.1.3 when `useTimezone=true`.

- Support for unsigned numerics as return types from prepared statements. This also causes a change in `ResultSet.getObject()` for the `bigint unsigned` type, which used to return `BigDecimal` instances, it now returns instances of `java.lang.BigInteger`.

## D.8.17. Changes in MySQL Connector/J 3.1.2-alpha (09 June 2004)

- Fixed stored procedure parameter parsing info when size was specified for a parameter (for example, `char()`, `varchar()`).
- Enabled callable statement caching via `cacheCallableStmts` property.
- Fixed case when no output parameters specified for a stored procedure caused a bogus query to be issued to retrieve out parameters, leading to a syntax error from the server.
- Fixed case when no parameters could cause a `NullPointerException` in `CallableStatement.setOutputParameters()`.
- Removed wrapping of exceptions in `MysqlIO.changeUser()`.
- Fixed sending of split packets for large queries, enabled nio ability to send large packets as well.
- Added `.toString()` functionality to `ServerPreparedStatement`, which should help if you're trying to debug a query that is a prepared statement (it shows SQL as the server would process).
- Added `gatherPerformanceMetrics` property, along with properties to control when/where this info gets logged (see docs for more info).
- `ServerPreparedStatements` weren't actually de-allocating server-side resources when `.close()` was called.
- Added `logSlowQueries` property, along with `slowQueriesThresholdMillis` property to control when a query should be considered "slow."
- Correctly map output parameters to position given in `prepareCall()` versus. order implied during `registerOutParameter()`. ([Bug#3146](http://bugs.mysql.com/3146) [<http://bugs.mysql.com/3146>])
- Correctly detect initial character set for servers  $\geq 4.1.0$ .
- Cleaned up detection of server properties.
- Support placeholder for parameter metadata for server  $\geq 4.1.2$ .
- `getProcedures()` does not return any procedures in result set. ([Bug#3539](http://bugs.mysql.com/3539) [<http://bugs.mysql.com/3539>])
- `getProcedureColumns()` doesn't work with wildcards for procedure name. ([Bug#3540](http://bugs.mysql.com/3540) [<http://bugs.mysql.com/3540>])
- `DBMD.getSQLStateType()` returns incorrect value. ([Bug#3520](http://bugs.mysql.com/3520) [<http://bugs.mysql.com/3520>])
- Added `connectionCollation` property to cause driver to issue `set collation_connection=...` query on connection init if default collation for given charset is not appropriate.

- Fixed `DatabaseMetaData.getProcedures()` when run on MySQL-5.0.0 (output of `SHOW PROCEDURE STATUS` changed between 5.0.0 and 5.0.1).
- `getWarnings()` returns `SQLWarning` instead of `DataTruncation`. (Bug#3804 [<http://bugs.mysql.com/3804>])
- Don't enable server-side prepared statements for server version 5.0.0 or 5.0.1, as they aren't compatible with the '4.1.2+' style that the driver uses (the driver expects information to come back that isn't there, so it hangs).

## D.8.18. Changes in MySQL Connector/J 3.1.1-alpha (14 February 2004)

- Fixed bug with `UpdatableResultSets` not using client-side prepared statements.
- Fixed character encoding issues when converting bytes to ASCII when MySQL doesn't provide the character set, and the JVM is set to a multi-byte encoding (usually affecting retrieval of numeric values).
- Unpack “unknown” data types from server prepared statements as `Strings`.
- Implemented long data (Blobs, Clobs, InputStreams, Readers) for server prepared statements.
- Implemented `Statement.getWarnings()` for MySQL-4.1 and newer (using `SHOW WARNINGS`).
- Default result set type changed to `TYPE_FORWARD_ONLY` (JDBC compliance).
- Centralized setting of result set type and concurrency.
- Refactored how connection properties are set and exposed as `DriverPropertyInfo` as well as `Connection` and `DataSource` properties.
- Support for NIO. Use `useNIO=true` on platforms that support NIO.
- Support for transaction savepoints (MySQL  $\geq$  4.0.14 or 4.1.1).
- Support for `mysql_change_user()`. See the `changeUser()` method in `com.mysql.jdbc.Connection`.
- Reduced number of methods called in average query to be more efficient.
- Prepared `Statements` will be re-prepared on auto-reconnect. Any errors encountered are postponed until first attempt to re-execute the re-prepared statement.
- Ensure that warnings are cleared before executing queries on prepared statements, as-per JDBC spec (now that we support warnings).
- Support “old” `profileSql` capitalization in `ConnectionProperties`. This property is deprecated, you should use `profileSQL` if possible.
- Optimized `Buffer.readLenByteArray()` to return shared empty byte array when length is 0.
- Allow contents of `PreparedStatement.setBlob()` to be retained between calls to `.execute*()`.

- Deal with 0-length tokens in `EscapeProcessor` (caused by callable statement escape syntax).
- Check for closed connection on delete/update/insert row operations in `UpdatableResultSet`.
- Fix support for table aliases when checking for all primary keys in `UpdatableResultSet`.
- Removed `useFastDates` connection property.
- Correctly initialize datasource properties from JNDI Refs, including explicitly specified URLs.
- `DatabaseMetaData` now reports `supportsStoredProcedures()` for MySQL versions  $\geq 5.0.0$
- Fixed stack overflow in `Connection.prepareCall()` (bad merge).
- Fixed `IllegalAccessError` to `Calendar.getTimeInMillis()` in `DateTimeValue` (for JDK  $< 1.4$ ).
- `DatabaseMetaData.getColumns()` is not returning correct column ordinal info for non-'%' column name patterns. (Bug#1673 [http://bugs.mysql.com/1673])
- Merged fix of datatype mapping from MySQL type `FLOAT` to `java.sql.Types.REAL` from 3.0 branch.
- Detect collation of column for `RSMD.isCaseSensitive()`.
- Fixed sending of queries larger than 16M.
- Added named and indexed input/output parameter support to `CallableStatement`. MySQL-5.0.x or newer.
- Fixed `NullPointerException` in `ServerPreparedStatement.setTimestamp()`, as well as year and month discrepancies in `ServerPreparedStatement.setTimestamp()`, `setDate()`.
- Added ability to have multiple database/JVM targets for compliance and regression/unit tests in `build.xml`.
- Fixed NPE and year/month bad conversions when accessing some datetime functionality in `ServerPreparedStatements` and their resultant result sets.
- Display where/why a connection was implicitly closed (to aid debugging).
- `CommunicationsException` implemented, that tries to determine why communications was lost with a server, and displays possible reasons when `.getMessage()` is called.
- `NULL` values for numeric types in binary encoded result sets causing `NullPointerExceptions`. (Bug#2359 [http://bugs.mysql.com/2359])
- Implemented `Connection.prepareCall()`, and `DatabaseMetaData.getProcedures()` and `getProcedureColumns()`.
- Reset `long binary` parameters in `ServerPreparedStatement` when `clearParameters()` is called, by sending `COM_RESET_STMT` to the server.
- Merged prepared statement caching, and `.getMetaData()` support from 3.0 branch.
- Fixed off-by-1900 error in some cases for years in `TimeUtil.fastDate/TimeCreate()` when unpacking results from server-side prepared statements.

- Fixed charset conversion issue in `getTables()`. ([Bug#2502](http://bugs.mysql.com/2502) [<http://bugs.mysql.com/2502>])
- Implemented multiple result sets returned from a statement or stored procedure.
- Server-side prepared statements were not returning datatype `YEAR` correctly. ([Bug#2606](http://bugs.mysql.com/2606) [<http://bugs.mysql.com/2606>])
- Enabled streaming of result sets from server-side prepared statements.
- Class-cast exception when using scrolling result sets and server-side prepared statements. ([Bug#2623](http://bugs.mysql.com/2623) [<http://bugs.mysql.com/2623>])
- Merged unbuffered input code from 3.0.
- Fixed `ConnectionProperties` that weren't properly exposed via accessors, cleaned up `ConnectionProperties` code.
- `NULL` fields were not being encoded correctly in all cases in server-side prepared statements. ([Bug#2671](http://bugs.mysql.com/2671) [<http://bugs.mysql.com/2671>])
- Fixed rare buffer underflow when writing numbers into buffers for sending prepared statement execution requests.
- Use DocBook version of docs for shipped versions of drivers.

### D.8.19. Changes in MySQL Connector/J 3.1.0-alpha (18 February 2003)

- Added `requireSSL` property.
- Added `useServerPrepStmts` property (default `false`). The driver will use server-side prepared statements when the server version supports them (4.1 and newer) when this property is set to `true`. It is currently set to `false` by default until all bind/fetch functionality has been implemented. Currently only DML prepared statements are implemented for 4.1 server-side prepared statements.
- Track open `Statements`, close all when `Connection.close()` is called (JDBC compliance).

### D.8.20. Changes in MySQL Connector/J 3.0.17-ga (23 June 2005)

- `Timestamp/Time` conversion goes in the wrong “direction” when `useTimeZone=true` and server time zone differs from client time zone. ([Bug#5874](http://bugs.mysql.com/5874) [<http://bugs.mysql.com/5874>])
- `DatabaseMetaData.getIndexInfo()` ignored `unique` parameter. ([Bug#7081](http://bugs.mysql.com/7081) [<http://bugs.mysql.com/7081>])
- Support new protocol type `MYSQL_TYPE_VARCHAR`.
- Added `useOldUTF8Behavior` configuration property, which causes JDBC driver to act like it did with MySQL-4.0.x and earlier when the character encoding is `utf-8` when connected to MySQL-4.1 or newer.

- Statements created from a pooled connection were returning physical connection instead of logical connection when `getConnection()` was called. (Bug#7316 [<http://bugs.mysql.com/7316>])
- `PreparedStatement` don't encode Big5 (and other multi-byte) character sets correctly in static SQL strings. (Bug#7033 [<http://bugs.mysql.com/7033>])
- Connections starting up failed-over (due to down master) never retry master. (Bug#6966 [<http://bugs.mysql.com/6966>])
- `PreparedStatement.fixDecimalExponent()` adding extra +, making number unparseable by MySQL server. (Bug#7061 [<http://bugs.mysql.com/7061>])
- Timestamp key column data needed `_binary` stripped for `UpdatableResultSet.refreshRow()`. (Bug#7686 [<http://bugs.mysql.com/7686>])
- Backported SQLState codes mapping from Connector/J 3.1, enable with `useSqlStateCodes=true` as a connection property, it defaults to `false` in this release, so that we don't break legacy applications (it defaults to `true` starting with Connector/J 3.1).
- `PreparedStatement.fixDecimalExponent()` adding extra +, making number unparseable by MySQL server. (Bug#7601 [<http://bugs.mysql.com/7601>])
- Escape sequence `{fn convert(..., type)}` now supports ODBC-style types that are prepended by `SQL_`.
- Fixed duplicated code in `configureClientCharset()` that prevented `useOldUTF8Behavior=true` from working properly.
- Handle streaming result sets with more than 2 billion rows properly by fixing wraparound of row number counter.
- `MS932`, `SHIFT_JIS`, and `Windows_31J` not recognized as aliases for `sjis`. (Bug#7607 [<http://bugs.mysql.com/7607>])
- Adding `CP943` to aliases for `sjis`. (Bug#6549 [<http://bugs.mysql.com/6549>], fixed while fixing Bug#7607 [<http://bugs.mysql.com/7607>])
- Which requires hex escaping of binary data when using multi-byte charsets with prepared statements. (Bug#8064 [<http://bugs.mysql.com/8064>])
- `NON_UNIQUE` column from `DBMD.getIndexInfo()` returned inverted value. (Bug#8812 [<http://bugs.mysql.com/8812>])
- Workaround for server Bug#9098 [<http://bugs.mysql.com/9098>]: Default values of `CURRENT_*` for `DATE`, `TIME`, `DATETIME`, and `TIMESTAMP` columns can't be distinguished from `string` values, so `UpdatableResultSet.moveToInsertRow()` generates bad SQL for inserting default values.
- `EUCKR` charset is sent as `SET NAMES euc_kr` which MySQL-4.1 and newer doesn't understand. (Bug#8629 [<http://bugs.mysql.com/8629>])
- `DatabaseMetaData.supportsSelectForUpdate()` returns correct value based on server version.
- Use hex escapes for `PreparedStatement.setBytes()` for double-byte charsets including "aliases" `Windows-31J`, `CP934`, `MS932`.
- Added support for the `EUC_JP_Solaris` character encoding, which maps to a MySQL encoding of `eucjpms` (backported from 3.1 branch). This only works on servers that support `eucjpms`,

namely 5.0.3 or later.

## D.8.21. Changes in MySQL Connector/J 3.0.16-ga (15 November 2004)

- Re-issue character set configuration commands when re-using pooled connections and/or `Connection.changeUser()` when connected to MySQL-4.1 or newer.
- Fixed `ResultSetMetaData.isReadOnly()` to detect non-writable columns when connected to MySQL-4.1 or newer, based on existence of “original” table and column names.
- `ResultSet.updateByte()` when on insert row throws `ArrayOutOfBoundsException`. (Bug#5664 [<http://bugs.mysql.com/5664>])
- Fixed `DatabaseMetaData.getTypes()` returning incorrect (this is, non-negative) scale for the `NUMERIC` type.
- Off-by-one bug in `Buffer.readString(string)`. (Bug#5664 [<http://bugs.mysql.com/5664>])
- Made `TINYINT(1)` -> `BIT/Boolean` conversion configurable via `tinyIntIsBit` property (default `true` to be JDBC compliant out of the box).
- Only set `character_set_results` during connection establishment if server version  $\geq$  4.1.1.
- Fixed regression where `useUnbufferedInput` was defaulting to `false`.
- `ResultSet.getTimestamp()` on a column with `TIME` in it fails. (Bug#5664 [<http://bugs.mysql.com/5664>])

## D.8.22. Changes in MySQL Connector/J 3.0.15-production (04 September 2004)

- `StringUtils.escapeEasternUnicodeByteStream` was still broken for GBK. (Bug#4010 [<http://bugs.mysql.com/4010>])
- Failover for `autoReconnect` not using port numbers for any hosts, and not retrying all hosts. (**Warning:** This required a change to the `SocketFactory.connect()` method signature, which is now `public Socket connect(String host, int portNumber, Properties props)`; therefore, any third-party socket factories will have to be changed to support this signature. (Bug#4334 [<http://bugs.mysql.com/4334>])
- Logical connections created by `MysqlConnectionPoolDataSource` will now issue a `rollback()` when they are closed and sent back to the pool. If your application server/connection pool already does this for you, you can set the `rollbackOnPooledClose` property to `false` to avoid the overhead of an extra `rollback()`.
- Removed redundant calls to `checkRowPos()` in `ResultSet`.
- `DOUBLE` mapped twice in `DBMD.getTypeInfo()`. (Bug#4742 [<http://bugs.mysql.com/4742>])
- Added FLOSS license exemption.
- Calling `.close()` twice on a `PooledConnection` causes NPE. (Bug#4808)

[<http://bugs.mysql.com/4808>])

- `DBMD.getColumns()` returns incorrect JDBC type for unsigned columns. This affects type mappings for all numeric types in the `RSMD.getColumnType()` and `RSMD.getColumnTypeNames()` methods as well, to ensure that “like” types from `DBMD.getColumns()` match up with what `RSMD.getColumnType()` and `getColumnTypeNames()` return. (Bug#4138 [<http://bugs.mysql.com/4138>], Bug#4860 [<http://bugs.mysql.com/4860>])
- “Production” is now “GA” (General Availability) in naming scheme of distributions.
- `RSMD.getPrecision()` returning 0 for non-numeric types (should return max length in chars for non-binary types, max length in bytes for binary types). This fix also fixes mapping of `RSMD.getColumnType()` and `RSMD.getColumnTypeName()` for the BLOB types based on the length sent from the server (the server doesn’t distinguish between TINYBLOB, BLOB, MEDIUMBLOB or LONGBLOB at the network protocol level). (Bug#4880 [<http://bugs.mysql.com/4880>])
- `ResultSet` should release `Field[]` instance in `.close()`. (Bug#5022 [<http://bugs.mysql.com/5022>])
- `ResultSet.getMetaData()` should not return incorrectly initialized metadata if the result set has been closed, but should instead throw an `SQLException`. Also fixed for `getRow()` and `getWarnings()` and traversal methods by calling `checkClosed()` before operating on instance-level fields that are nullified during `.close()`. (Bug#5069 [<http://bugs.mysql.com/5069>])
- Parse new time zone variables from 4.1.x servers.
- Use `_binary` introducer for `PreparedStatement.setBytes()` and `set*Stream()` when connected to MySQL-4.1.x or newer to avoid misinterpretation during character conversion.

### D.8.23. Changes in MySQL Connector/J 3.0.14-production (28 May 2004)

- Fixed URL parsing error.

### D.8.24. Changes in MySQL Connector/J 3.0.13-production (27 May 2004)

- Using a `MySQLDataSource` without server name fails. (Bug#3848 [<http://bugs.mysql.com/3848>])
- `No Database Selected` when using `MysqlConnectionPoolDataSource`. (Bug#3920 [<http://bugs.mysql.com/3920>])
- `PreparedStatement.getGeneratedKeys()` method returns only 1 result for batched insertions. (Bug#3873 [<http://bugs.mysql.com/3873>])

### D.8.25. Changes in MySQL Connector/J 3.0.12-production (18 May 2004)

- Add unsigned attribute to `DatabaseMetaData.getColumns()` output in the `TYPE_NAME`

column.

- Added `failOverReadOnly` property, to allow end-user to configure state of connection (read-only/writable) when failed over.
- Backported “change user” and “reset server state” functionality from 3.1 branch, to allow clients of `MysqlConnectionPoolDataSource` to reset server state on `getConnection()` on a pooled connection.
- Don't escape SJIS/GBK/BIG5 when using MySQL-4.1 or newer.
- Allow `url` parameter for `MysqlDataSource` and `MysqlConnectionPool DataSource` so that passing of other properties is possible from inside appservers.
- Map duplicate key and foreign key errors to `SQLState` of `23000`.
- Backport documentation tooling from 3.1 branch.
- Return creating statement for `ResultSets` created by `getGeneratedKeys()`. (Bug#2957 [http://bugs.mysql.com/2957])
- Allow `java.util.Date` to be sent in as parameter to `PreparedStatement.setObject()`, converting it to a `Timestamp` to maintain full precision. (Bug#103 [http://bugs.mysql.com/103]).
- Don't truncate `BLOB` or `CLOB` values when using `setBytes()` and/or `setBinary/CharacterStream()`. (Bug#2670 [http://bugs.mysql.com/2670]).
- Dynamically configure character set mappings for field-level character sets on MySQL-4.1.0 and newer using `SHOW COLLATION` when connecting.
- Map `binary` character set to `US-ASCII` to support `DATETIME` charset recognition for servers  $\geq$  4.1.2.
- Use `SET character_set_results` during initialization to allow any charset to be returned to the driver for result sets.
- Use `charsetnr` returned during connect to encode queries before issuing `SET NAMES` on MySQL  $\geq$  4.1.0.
- Add helper methods to `ResultSetMetaData` (`getColumnCharacterEncoding()` and `getColumnCharacterSet()`) to allow end-users to see what charset the driver thinks it should be using for the column.
- Only set `character_set_results` for MySQL  $\geq$  4.1.0.
- `StringUtils.escapeSJISByteStream()` not covering all eastern double-byte charsets correctly. (Bug#3511 [http://bugs.mysql.com/3511])
- Renamed `StringUtils.escapeSJISByteStream()` to more appropriate `escapeEasternUnicodeByteStream()`.
- Not specifying database in URL caused `MalformedURLException` exception. (Bug#3554 [http://bugs.mysql.com/3554])
- Auto-convert MySQL encoding names to Java encoding names if used for `characterEncoding` property.
- Added encoding names that are recognized on some JVMs to fix case where they were reverse-

mapped to MySQL encoding names incorrectly.

- Use `junit.textui.TestRunner` for all unit tests (to allow them to be run from the command line outside of Ant or Eclipse).
- `UpdatableResultSet` not picking up default values for `moveToInsertRow()`. (Bug#3557 [http://bugs.mysql.com/3557])
- Inconsistent reporting of data type. The server still doesn't return all types for \*BLOBs \*TEXT correctly, so the driver won't return those correctly. (Bug#3570 [http://bugs.mysql.com/3570])
- `DBMD.getSQLStateType()` returns incorrect value. (Bug#3520 [http://bugs.mysql.com/3520])
- Fixed regression in `PreparedStatement.setString()` and eastern character encodings.
- Made `StringRegressionTest` 4.1-unicode aware.

## D.8.26. Changes in MySQL Connector/J 3.0.11-stable (19 February 2004)

- Trigger a `SET NAMES utf8` when encoding is forced to `utf8` or `utf-8` via the `characterEncoding` property. Previously, only the Java-style encoding name of `utf-8` would trigger this.
- `AutoReconnect` time was growing faster than exponentially. (Bug#2447 [http://bugs.mysql.com/2447])
- Fixed failover always going to last host in list. (Bug#2578 [http://bugs.mysql.com/2578])
- Added `useUnbufferedInput` parameter, and now use it by default (due to JVM issue <http://developer.java.sun.com/developer/bugParade/bugs/4401235.html>)
- Detect `on/off` or `1, 2, 3` form of `lower_case_table_names` value on server.
- Return `java.lang.Integer` for `TINYINT` and `SMALLINT` types from `ResultSetMetaData.getColumnClassName()`. (Bug#2852 [http://bugs.mysql.com/2852])
- Return `java.lang.Double` for `FLOAT` type from `ResultSetMetaData.getColumnClassName()`. (Bug#2855 [http://bugs.mysql.com/2855])
- Return `[B` instead of `java.lang.Object` for `BINARY`, `VARBINARY` and `LONGVARBINARY` types from `ResultSetMetaData.getColumnClassName()` (JDBC compliance).
- Issue connection events on all instances created from a `ConnectionPoolDataSource`.

## D.8.27. Changes in MySQL Connector/J 3.0.10-stable (13 January 2004)

- Don't count quoted IDs when inside a 'string' in `PreparedStatement` parsing. (Bug#1511 [http://bugs.mysql.com/1511])
- “Friendlier” exception message for `PacketTooLargeException`. (Bug#1534 [http://bugs.mysql.com/1534])

- Backported fix for aliased tables and `UpdatableResultSets` in `checkUpdatability()` method from 3.1 branch.
- Fix for `ArrayIndexOutOfBoundsException` exception when using `Statement.setMaxRows()`. (Bug#1695 [http://bugs.mysql.com/1695])
- Barge blobs and split packets not being read correctly. (Bug#1576 [http://bugs.mysql.com/1576])
- Fixed regression of `Statement.getGeneratedKeys()` and `REPLACE` statements.
- Subsequent call to `ResultSet.updateFoo()` causes NPE if result set is not updatable. (Bug#1630 [http://bugs.mysql.com/1630])
- Fix for 4.1.1-style authentication with no password.
- Foreign Keys column sequence is not consistent in `DatabaseMetaData.getImported/Exported/CrossReference()`. (Bug#1731 [http://bugs.mysql.com/1731])
- `DatabaseMetaData.getSystemFunction()` returning bad function `VResultsSion`. (Bug#1775 [http://bugs.mysql.com/1775])
- Cross-database updatable result sets are not checked for updatability correctly. (Bug#1592 [http://bugs.mysql.com/1592])
- `DatabaseMetaData.getColumns()` should return `Types.LONGVARCHAR` for MySQL `LONGTEXT` type.
- `ResultSet.getObject()` on `TINYINT` and `SMALLINT` columns should return Java type `Integer`. (Bug#1913 [http://bugs.mysql.com/1913])
- Added `alwaysClearStream` connection property, which causes the driver to always empty any remaining data on the input stream before each query.
- Added more descriptive error message `Server Configuration Denies Access to DataSource`, as well as retrieval of message from server.
- Autoreconnect code didn't set catalog upon reconnect if it had been changed.
- Implement `ResultSet.updateClob()`.
- `ResultSetMetaData.isCaseSensitive()` returned wrong value for `CHAR/VARCHAR` columns.
- Connection property `maxRows` not honored. (Bug#1933 [http://bugs.mysql.com/1933])
- Statements being created too many times in `DBMD.extractForeignKeyFromCreateTable()`. (Bug#1925 [http://bugs.mysql.com/1925])
- Support escape sequence `{fn convert ... }`. (Bug#1914 [http://bugs.mysql.com/1914])
- `ArrayIndexOutOfBoundsException` when parameter number == number of parameters + 1. (Bug#1958 [http://bugs.mysql.com/1958])
- `ResultSet.findColumn()` should use first matching column name when there are duplicate column names in `SELECT` query (JDBC-compliance). (Bug#2006 [http://bugs.mysql.com/2006])
- Removed static synchronization bottleneck from `PreparedStatement.setTimestamp()`.

- Removed static synchronization bottleneck from instance factory method of `SingleByteCharsetConverter`.
- Enable caching of the parsing stage of prepared statements via the `cachePrepStmts`, `prepStmtCacheSize`, and `prepStmtCacheSqlLimit` properties (disabled by default).
- Speed up parsing of `PreparedStatement`s, try to use one-pass whenever possible.
- Fixed security exception when used in Applets (applets can't read the system property `file.encoding` which is needed for `LOAD DATA LOCAL INFILE`).
- Use constants for `SQLStates`.
- Map charset `ko18_ru` to `ko18r` when connected to MySQL-4.1.0 or newer.
- Ensure that `Buffer.writeString()` saves room for the `\0`.
- Fixed exception `Unknown character set 'danish'` on connect with JDK-1.4.0
- Fixed mappings in `SQLException` to report deadlocks with `SQLStates` of `41000`.
- `maxRows` property would affect internal statements, so check it for all statement creation internal to the driver, and set to 0 when it is not.

## D.8.28. Changes in MySQL Connector/J 3.0.9-stable (07 October 2003)

- Faster date handling code in `ResultSet` and `PreparedStatement` (no longer uses `Date` methods that synchronize on static calendars).
- Fixed test for end of buffer in `Buffer.readString()`.
- Fixed `ResultSet.previous()` behavior to move current position to before result set when on first row of result set. ([Bug#496](http://bugs.mysql.com/496) [<http://bugs.mysql.com/496>])
- Fixed `Statement` and `PreparedStatement` issuing bogus queries when `setMaxRows()` had been used and a `LIMIT` clause was present in the query.
- `refreshRow` didn't work when primary key values contained values that needed to be escaped (they ended up being doubly escaped). ([Bug#661](http://bugs.mysql.com/661) [<http://bugs.mysql.com/661>])
- Support `InnoDB` constraint names when extracting foreign key information in `DatabaseMetaData` (implementing ideas from Parwinder Sekhon). ([Bug#517](http://bugs.mysql.com/517) [<http://bugs.mysql.com/517>], [Bug#664](http://bugs.mysql.com/664) [<http://bugs.mysql.com/664>])
- Backported 4.1 protocol changes from 3.1 branch (server-side SQL states, new field information, larger client capability flags, connect-with-database, and so forth).
- Fix `UpdatableResultSet` to return values for `getXXX()` when on insert row. ([Bug#675](http://bugs.mysql.com/675) [<http://bugs.mysql.com/675>])
- The `insertRow` in an `UpdatableResultSet` is now loaded with the default column values when `moveToInsertRow()` is called. ([Bug#688](http://bugs.mysql.com/688) [<http://bugs.mysql.com/688>])
- `DatabaseMetaData.getColumns()` wasn't returning `NULL` for default values that are specified as `NULL`.

- Change default statement type/concurrency to `TYPE_FORWARD_ONLY` and `CONCUR_READ_ONLY` (spec compliance).
- Don't try and reset isolation level on reconnect if MySQL doesn't support them.
- Don't wrap `SQLExceptions` in `RowDataDynamic`.
- Don't change timestamp TZ twice if `useTimezone==true`. (Bug#774 [http://bugs.mysql.com/774])
- Fixed regression in large split-packet handling. (Bug#848 [http://bugs.mysql.com/848])
- Better diagnostic error messages in exceptions for “streaming” result sets.
- Issue exception on `ResultSet.getXXX()` on empty result set (wasn't caught in some cases).
- Don't hide messages from exceptions thrown in I/O layers.
- Don't fire connection closed events when closing pooled connections, or on `PooledConnection.getConnection()` with already open connections. (Bug#884 [http://bugs.mysql.com/884])
- Clip +/- INF (to smallest and largest representative values for the type in MySQL) and NaN (to 0) for `setDouble/setFloat()`, and issue a warning on the statement when the server does not support +/- INF or NaN.
- Double-escaping of `'\'` when charset is SJIS or GBK and `'\'` appears in non-escaped input. (Bug#879 [http://bugs.mysql.com/879])
- When emptying input stream of unused rows for “streaming” result sets, have the current thread `yield()` every 100 rows in order to not monopolize CPU time.
- `DatabaseMetaData.getColumns()` getting confused about the keyword “set” in character columns. (Bug#1099 [http://bugs.mysql.com/1099])
- Fixed deadlock issue with `Statement.setMaxRows()`.
- Fixed `CLOB.truncate()`. (Bug#1130 [http://bugs.mysql.com/1130])
- Optimized `CLOB.setCharacterStream()`. (Bug#1131 [http://bugs.mysql.com/1131])
- Made `databaseName`, `portNumber`, and `serverName` optional parameters for `MySQLDataSourceFactory`. (Bug#1246 [http://bugs.mysql.com/1246])
- `ResultSet.get/setString` mashing char 127. (Bug#1247 [http://bugs.mysql.com/1247])
- Backported authentication changes for 4.1.1 and newer from 3.1 branch.
- Added `com.mysql.jdbc.util.BaseBugReport` to help creation of testcases for bug reports.
- Added property to “clobber” streaming results, by setting the `clobberStreamingResults` property to `true` (the default is `false`). This will cause a “streaming” `ResultSet` to be automatically closed, and any outstanding data still streaming from the server to be discarded if another query is executed before all the data has been read from the server.

## D.8.29. Changes in MySQL Connector/J 3.0.8-stable (23 May 2003)

- Allow bogus URLs in `Driver.getPropertyInfo()`.
- Return list of generated keys when using multi-value `INSERTS` with `Statement.getGeneratedKeys()`.
- Use JVM charset with filenames and `LOAD DATA [LOCAL] INFILE`.
- Fix infinite loop with `Connection.cleanup()`.
- Changed Ant target `compile-core` to `compile-driver`, and made testsuite compilation a separate target.
- Fixed result set not getting set for `Statement.executeUpdate()`, which affected `getGeneratedKeys()` and `getUpdateCount()` in some cases.
- Unicode character `0xFFFF` in a string would cause the driver to throw an `ArrayOutOfBoundsException`. ([Bug#378](http://bugs.mysql.com/378) [<http://bugs.mysql.com/378>]).
- Return correct number of generated keys when using `REPLACE` statements.
- Fix problem detecting server character set in some cases.
- Fix row data decoding error when using *very* large packets.
- Optimized row data decoding.
- Issue exception when operating on an already closed prepared statement.
- Fixed SJIS encoding bug, thanks to Naoto Sato.
- Optimized usage of `EscapeProcessor`.
- Allow multiple calls to `Statement.close()`.

### D.8.30. Changes in MySQL Connector/J 3.0.7-stable (08 April 2003)

- Fixed `MysqlPooledConnection.close()` calling wrong event type.
- Fixed `StringIndexOutOfBoundsException` in `PreparedStatement.setClob()`.
- 4.1 Column Metadata fixes.
- Remove synchronization from `Driver.connect()` and `Driver.acceptsUrl()`.
- `IOExceptions` during a transaction now cause the `Connection` to be closed.
- Fixed missing conversion for `YEAR` type in `ResultSetMetaData.getColumnTypeName()`.
- Don't pick up indexes that start with `pri` as primary keys for `DBMD.getPrimaryKeys()`.
- Throw `SQLExceptions` when trying to do operations on a forcefully closed `Connection` (that is, when a communication link failure occurs).
- You can now toggle profiling on/off using `Connection.setProfileSql(boolean)`.
- Fixed charset issues with database metadata (charset was not getting set correctly).

- Updatable `ResultSets` can now be created for aliased tables/columns when connected to MySQL-4.1 or newer.
- Fixed `LOAD DATA LOCAL INFILE` bug when file > `max_allowed_packet`.
- Fixed escaping of 0x5c ('\\') character for GBK and Big5 charsets.
- Fixed `ResultSet.getTimestamp()` when underlying field is of type `DATE`.
- Ensure that packet size from `alignPacketSize()` does not exceed `max_allowed_packet` (JVM bug)
- Don't reset `Connection.isReadOnly()` when `autoReconnecting`.

### D.8.31. Changes in MySQL Connector/J 3.0.6-stable (18 February 2003)

- Fixed `ResultSetMetaData` to return "" when catalog not known. Fixes `NullPointerExceptions` with Sun's `CachedRowSet`.
- Fixed `DBMD.getTypeInfo()` and `DBMD.getColumns()` returning different value for precision in `TEXT` and `BLOB` types.
- Allow ignoring of warning for “non transactional tables” during rollback (compliance/usability) by setting `ignoreNonTxTables` property to `true`.
- Fixed `SQLExceptions` getting swallowed on initial connect.
- Fixed `Statement.setMaxRows()` to stop sending `LIMIT` type queries when not needed (performance).
- Clean up `Statement` query/method mismatch tests (that is, `INSERT` not allowed with `.executeQuery()`).
- More checks added in `ResultSet` traversal method to catch when in closed state.
- Fixed `ResultSetMetaData.isWritable()` to return correct value.
- Add “window” of different `NULL` sorting behavior to `DBMD.nullsAreSortedAtStart` (4.0.2 to 4.0.10, true; otherwise, no).
- Implemented `Blob.setBytes()`. You still need to pass the resultant `Blob` back into an updatable `ResultSet` or `PreparedStatement` to persist the changes, because MySQL does not support “locators”.
- Backported 4.1 charset field info changes from Connector/J 3.1.

### D.8.32. Changes in MySQL Connector/J 3.0.5-gamma (22 January 2003)

- Fixed `Buffer.fastSkipLenString()` causing `ArrayIndexOutOfBoundsException` exceptions with some queries when unpacking fields.

- Implemented an empty `TypeMap` for `Connection.getTypeMap()` so that some third-party apps work with MySQL (IBM WebSphere 5.0 Connection pool).
- Added missing `LONGTEXT` type to `DBMD.getColumns()`.
- Retrieve `TX_ISOLATION` from database for `Connection.getTransactionIsolation()` when the MySQL version supports it, instead of an instance variable.
- Quote table names in `DatabaseMetaData.getColumns()`, `getPrimaryKeys()`, `getIndexInfo()`, `getBestRowIdentifier()`.
- Greatly reduce memory required for `setBinaryStream()` in `PreparedStatement`.
- Fixed `ResultSet.isBeforeFirst()` for empty result sets.
- Added update options for foreign key metadata.

### D.8.33. Changes in MySQL Connector/J 3.0.4-gamma (06 January 2003)

- Added quoted identifiers to database names for `Connection.setCatalog`.
- Added support for quoted identifiers in `PreparedStatement` parser.
- Streamlined character conversion and `byte[]` handling in `PreparedStatement` for `setByte()`.
- Reduce memory footprint of `PreparedStatement` by sharing outbound packet with `MysqlIO`.
- Added `strictUpdates` property to allow control of amount of checking for “correctness” of updatable result sets. Set this to `false` if you want faster updatable result sets and you know that you create them from `SELECT` statements on tables with primary keys and that you have selected all primary keys in your query.
- Added support for 4.0.8-style large packets.
- Fixed `PreparedStatement.executeBatch()` parameter overwriting.

### D.8.34. Changes in MySQL Connector/J 3.0.3-dev (17 December 2002)

- Changed `charsToByte` in `SingleByteCharConverter` to be non-static.
- Changed `SingleByteCharConverter` to use lazy initialization of each converter.
- Fixed charset handling in `Fields.java`.
- Implemented `Connection.nativeSQL()`.
- More robust escape tokenizer: Recognize `--` comments, and allow nested escape sequences (see `testsuite.EscapeProcessingTest`).

- `DBMD.getImported/ExportedKeys()` now handles multiple foreign keys per table.
- Fixed `ResultSetMetaData.getPrecision()` returning incorrect values for some floating-point types.
- Fixed `ResultSetMetaData.getColumnTypeName()` returning `BLOB` for `TEXT` and `TEXT` for `BLOB` types.
- Fixed `Buffer.isLastDataPacket()` for 4.1 and newer servers.
- Added `CLIENT_LONG_FLAG` to be able to get more column flags (`isAutoIncrement()` being the most important).
- Because of above, implemented `ResultSetMetaData.isAutoIncrement()` to use `Field.isAutoIncrement()`.
- Honor `lower_case_table_names` when enabled in the server when doing table name comparisons in `DatabaseMetaData` methods.
- Some MySQL-4.1 protocol support (extended field info from selects).
- Use non-aliased table/column names and database names to fully qualify tables and columns in `UpdatableResultSet` (requires MySQL-4.1 or newer).
- Allow user to alter behavior of `Statement/PreparedStatement.executeBatch()` via `continueBatchOnError` property (defaults to `true`).
- Check for connection closed in more `Connection` methods (`createStatement`, `prepareStatement`, `setTransactionIsolation`, `setAutoCommit`).
- More robust implementation of updatable result sets. Checks that *all* primary keys of the table have been selected.
- `LOAD DATA LOCAL INFILE ...` now works, if your server is configured to allow it. Can be turned off with the `allowLoadLocalInfile` property (see the `README`).
- Substitute `' ? '` for unknown character conversions in single-byte character sets instead of `'\0'`.
- `NamedPipeSocketFactory` now works (only intended for Windows), see `README` for instructions.

## D.8.35. Changes in MySQL Connector/J 3.0.2-dev (08 November 2002)

- Fixed issue with updatable result sets and `PreparedStatements` not working.
- Fixed `ResultSet.setFetchDirection(FETCH_UNKNOWN)`.
- Fixed issue when calling `Statement.setFetchSize()` when using arbitrary values.
- Fixed incorrect conversion in `ResultSet.getLong()`.
- Implemented `ResultSet.updateBlob()`.
- Removed duplicate code from `UpdatableResultSet` (it can be inherited from `ResultSet`, the extra code for each method to handle updatability I thought might someday be necessary has not

been needed).

- Fixed `UnsupportedEncodingException` thrown when “forcing” a character encoding via properties.
- Fixed various non-ASCII character encoding issues.
- Added driver property `useHostsInPrivileges`. Defaults to true. Affects whether or not `@hostname` will be used in `DBMD.getColumn/TablePrivileges`.
- All `DBMD` result set columns describing schemas now return `NULL` to be more compliant with the behavior of other JDBC drivers for other database systems (MySQL does not support schemas).
- Added SSL support. See [README](#) for information on how to use it.
- Properly restore connection properties when `autoReconnecting` or failing-over, including `autoCommit` state, and isolation level.
- Use `SHOW CREATE TABLE` when possible for determining foreign key information for `DatabaseMetaData`. Also allows cascade options for `DELETE` information to be returned.
- Escape `0x5c` character in strings for the SJIS charset.
- Fixed start position off-by-1 error in `Clob.getSubString()`.
- Implemented `Clob.truncate()`.
- Implemented `Clob.setString()`.
- Implemented `Clob.setAsciiStream()`.
- Implemented `Clob.setCharacterStream()`.
- Added `com.mysql.jdbc.MinisAdmin` class, which allows you to send `shutdown` command to MySQL server. This is intended to be used when “embedding” Java and MySQL server together in an end-user application.
- Added `connectTimeout` parameter that allows users of JDK-1.4 and newer to specify a maximum time to wait to establish a connection.
- Failover and `autoReconnect` work only when the connection is in an `autoCommit(false)` state, in order to stay transaction-safe.
- Added `queriesBeforeRetryMaster` property that specifies how many queries to issue when failed over before attempting to reconnect to the master (defaults to 50).
- Fixed `DBMD.supportsResultSetConcurrency()` so that it returns true for `ResultSet.TYPE_SCROLL_INSENSITIVE` and `ResultSet.CONCUR_READ_ONLY` or `ResultSet.CONCUR_UPDATABLE`.
- Fixed `ResultSet.isLast()` for empty result sets (should return `false`).
- `PreparedStatement` now honors stream lengths in `setBinary/Ascii/Character Stream()` unless you set the connection property `useStreamLengthsInPrepStmts` to `false`.
- Removed some not-needed temporary object creation by smarter use of `Strings` in `EscapeProcessor`, `Connection` and `DatabaseMetaData` classes.

## D.8.36. Changes in MySQL Connector/J 3.0.1-dev (21 September 2002)

- Fixed `ResultSet.getRow()` off-by-one bug.
- Fixed `RowDataStatic.getAt()` off-by-one bug.
- Added limited `Clob` functionality (`ResultSet.getClob()`, `PreparedStatement.setClob()`, `PreparedStatement.setObject(Clob)`).
- Added `socketTimeout` parameter to URL.
- `Connection.isClosed()` no longer “pings” the server.
- `Connection.close()` issues `rollback()` when `getAutoCommit()` is `false`.
- Added `paranoid` parameter, which sanitizes error messages by removing “sensitive” information from them (such as hostnames, ports, or usernames), as well as clearing “sensitive” data structures when possible.
- Fixed `ResultSetMetaData.isSigned()` for `TINYINT` and `BIGINT`.
- Charsets now automatically detected. Optimized code for single-byte character set conversion.
- Implemented `ResultSet.getCharacterStream()`.
- Added `LOCAL TEMPORARY` to table types in `DatabaseMetaData.getTableTypes()`.
- Massive code clean-up to follow Java coding conventions (the time had come).

## D.8.37. Changes in MySQL Connector/J 3.0.0-dev (31 July 2002)

- **!!! LICENSE CHANGE !!!** The driver is now GPL. If you need non-GPL licenses, please contact me <mark@mysql.com>.
- JDBC-3.0 functionality including `Statement/PreparedStatement.getGeneratedKeys()` and `ResultSet.getURL()`.
- Performance enhancements: Driver is now 50–100% faster in most situations, and creates fewer temporary objects.
- Repackaging: New driver name is `com.mysql.jdbc.Driver`, old name still works, though (the driver is now provided by MySQL-AB).
- Better checking for closed connections in `Statement` and `PreparedStatement`.
- Support for streaming (row-by-row) result sets (see [README](#)) Thanks to Doron.
- Support for large packets (new addition to MySQL-4.0 protocol), see [README](#) for more information.
- JDBC Compliance: Passes all tests besides stored procedure tests.
- Fix and sort primary key names in `DBMetaData` (SF bugs 582086 and 582086).

- Float types now reported as `java.sql.Types.FLOAT` (SF bug 579573).
- `ResultSet.getTimestamp()` now works for `DATE` types (SF bug 559134).
- `ResultSet.getDate/Time/Timestamp` now recognizes all forms of invalid values that have been set to all zeros by MySQL (SF bug 586058).
- Testsuite now uses Junit (which you can get from <http://www.junit.org>).
- The driver now only works with JDK-1.2 or newer.
- Added multi-host failover support (see [README](#)).
- General source-code cleanup.
- Overall speed improvements via controlling transient object creation in `MysqlIO` class when reading packets.
- Performance improvements in string handling and field metadata creation (lazily instantiated) contributed by Alex Twisleton-Wykeham-Fiennes.

### D.8.38. Changes in MySQL Connector/J 2.0.14 (16 May 2002)

- More code cleanup.
- `PreparedStatement` now releases resources on `.close()`. (SF bug 553268)
- Quoted identifiers not used if server version does not support them. Also, if server started with `--ansi` or `--sql-mode=ANSI_QUOTES`, `"` will be used as an identifier quote character, otherwise `'` will be used.
- `ResultSet.getDouble()` now uses code built into JDK to be more precise (but slower).
- `LogicalHandle.isClosed()` calls through to physical connection.
- Added SQL profiling (to `STDERR`). Set `profileSql=true` in your JDBC URL. See [README](#) for more information.
- Fixed typo for `relaxAutoCommit` parameter.

### D.8.39. Changes in MySQL Connector/J 2.0.13 (24 April 2002)

- More code cleanup.
- Fixed unicode chars being read incorrectly. (SF bug 541088)
- Faster blob escaping for `PrepStmt`.
- Added `set/getPortNumber()` to `DataSource(s)`. (SF bug 548167)
- Added `setURL()` to `MySQLXADataSource`. (SF bug 546019)
- `PreparedStatement.toString()` fixed. (SF bug 534026)
- `ResultSetMetaData.getColumnClassName()` now implemented.

- Rudimentary version of `Statement.getGeneratedKeys()` from JDBC-3.0 now implemented (you need to be using JDK-1.4 for this to work, I believe).
- `DBMetaData.getIndexInfo()` - bad PAGES fixed. (SF BUG 542201)

## D.8.40. Changes in MySQL Connector/J 2.0.12 (07 April 2002)

- General code cleanup.
- Added `getIdleFor()` method to `Connection` and `MysqlLogicalHandle`.
- Relaxed synchronization in all classes, should fix 520615 and 520393.
- Added `getTable/columnPrivileges()` to `DBMD` (fixes 484502).
- Added new types to `getTypeInfo()`, fixed existing types thanks to Al Davis and Kid Kalanon.
- Added support for `BIT` types (51870) to `PreparedStatement`.
- Fixed `getRow()` bug (527165) in `ResultSet`.
- Fixes for `ResultSet` updatability in `PreparedStatement`.
- Fixed time zone off-by-1-hour bug in `PreparedStatement` (538286, 528785).
- `ResultSet`: Fixed updatability (values being set to `null` if not updated).
- `DataSources` - fixed `setUrl` bug (511614, 525565), wrong datasource class name (532816, 528767).
- Added identifier quoting to all `DatabaseMetaData` methods that need them (should fix 518108).
- Added support for `YEAR` type (533556).
- `ResultSet.insertRow()` should now detect `auto_increment` fields in most cases and use that value in the new row. This detection will not work in multi-valued keys, however, due to the fact that the MySQL protocol does not return this information.
- `ResultSet.refreshRow()` implemented.
- Fixed `testsuite.Traversal afterLast()` bug, thanks to Igor Lastric.

## D.8.41. Changes in MySQL Connector/J 2.0.11 (27 January 2002)

- Fixed missing `DELETE_RULE` value in `DBMD.getImported/ExportedKeys()` and `getCrossReference()`.
- Full synchronization of `Statement.java`.
- More changes to fix `Unexpected end of input stream` errors when reading `BLOB` values. This should be the last fix.

## D.8.42. Changes in MySQL Connector/J 2.0.10 (24 January 2002)

- Fixed spurious `Unexpected end of input stream` errors in `MysqlIO` (bug 507456).
- Fixed null-pointer-exceptions when using `MysqlConnectionPoolDataSource` with WebSphere 4 (bug 505839).

## D.8.43. Changes in MySQL Connector/J 2.0.9 (13 January 2002)

- `Ant` build was corrupting included `jar` files, fixed (bug 487669).
- Fixed extra memory allocation in `MysqlIO.readPacket()` (bug 488663).
- Implementation of `DatabaseMetaData.getExported/ImportedKeys()` and `getCrossReference()`.
- Full synchronization on methods modifying instance and class-shared references, driver should be entirely thread-safe now (please let me know if you have problems).
- `DataSource` implementations moved to `org.gjt.mm.mysql.jdbc2.optional` package, and (initial) implementations of `PooledConnectionDataSource` and `XADataSource` are in place (thanks to Todd Wolff for the implementation and testing of `PooledConnectionDataSource` with IBM WebSphere 4).
- Added detection of network connection being closed when reading packets (thanks to Todd Lizambri).
- Fixed quoting error with escape processor (bug 486265).
- Report batch update support through `DatabaseMetaData` (bug 495101).
- Fixed off-by-one-hour error in `PreparedStatement.setTimestamp()` (bug 491577).
- Removed concatenation support from driver (the `||` operator), as older versions of VisualAge seem to be the only thing that use it, and it conflicts with the logical `||` operator. You will need to start `mysqld` with the `--ansi` flag to use the `||` operator as concatenation (bug 491680).
- Fixed casting bug in `PreparedStatement` (bug 488663).

## D.8.44. Changes in MySQL Connector/J 2.0.8 (25 November 2001)

- Batch updates now supported (thanks to some inspiration from Daniel Rall).
- `XADataSource/ConnectionPoolDataSource` code (experimental)
- `PreparedStatement.setAnyNumericType()` now handles positive exponents correctly (adds `+` so MySQL can understand it).
- `DatabaseMetaData.getPrimaryKeys()` and `getBestRowIdentifier()` are now

more robust in identifying primary keys (matches regardless of case or abbreviation/full spelling of `Primary Key` in `Key_type` column).

## D.8.45. Changes in MySQL Connector/J 2.0.7 (24 October 2001)

- `PreparedStatement.setCharacterStream()` now implemented
- Fixed dangling socket problem when in high availability (`autoReconnect=true`) mode, and finalizer for `Connection` will close any dangling sockets on GC.
- Fixed `ResultSetMetaData.getPrecision()` returning one less than actual on newer versions of MySQL.
- `ResultSet.getBlob()` now returns `null` if column value was `null`.
- Character sets read from database if `useUnicode=true` and `characterEncoding` is not set. (thanks to Dmitry Vereshchagin)
- Initial transaction isolation level read from database (if available). (thanks to Dmitry Vereshchagin)
- Fixed `DatabaseMetaData.supportsTransactions()`, and `supportsTransactionIsolationLevel()` and `getTypeInfo()` `SQL_DATETIME_SUB` and `SQL_DATA_TYPE` fields not being readable.
- Fixed `PreparedStatement` generating SQL that would end up with syntax errors for some queries.
- Fixed `ResultSet.isAfterLast()` always returning `false`.
- Fixed time zone issue in `PreparedStatement.setTimestamp()`. (thanks to Erik Olofsson)
- Capitalize type names when `capitalizeTypeNames=true` is passed in URL or properties (for WebObjects). (thanks to Anjo Krank)
- Updatable result sets now correctly handle `NULL` values in fields.
- `PreparedStatement.setDouble()` now uses full-precision doubles (reverting a fix made earlier to truncate them).
- `PreparedStatement.setBoolean()` will use 1/0 for values if your MySQL version is 3.21.23 or higher.

## D.8.46. Changes in MySQL Connector/J 2.0.6 (16 June 2001)

- Fixed `PreparedStatement` parameter checking.
- Fixed case-sensitive column names in `ResultSet.java`.

## D.8.47. Changes in MySQL Connector/J 2.0.5 (13 June 2001)

- Fixed `ResultSet.getBlob()` `ArrayIndex` out-of-bounds.

- Fixed `ResultSetMetaData.getColumnTypeName()` for `TEXT/BLOB`.
- Fixed `ArrayIndexOutOfBoundsException` when sending large `BLOB` queries. (Max size packet was not being set)
- Added `ISOLATION` level support to `Connection.setIsolationLevel()`
- Fixed NPE on `PreparedStatement.executeUpdate()` when all columns have not been set.
- Fixed data parsing of `TIMESTAMP` values with 2-digit years.
- Added `Byte` to `PreparedStatement.setObject()`.
- `ResultSet.getBoolean()` now recognizes `-1` as `true`.
- `ResultSet` has `+/-Inf/inf` support.
- `ResultSet.insertRow()` works now, even if not all columns are set (they will be set to `NULL`).
- `DatabaseMetaData.getCrossReference()` no longer `ArrayIndexOOB`.
- `getObject()` on `ResultSet` correctly does `TINYINT->Byte` and `SMALLINT->Short`.

## D.8.48. Changes in MySQL Connector/J 2.0.3 (03 December 2000)

- Implemented `getBigDecimal()` without scale component for JDBC2.
- Fixed composite key problem with updatable result sets.
- Added detection of `-/+INF` for doubles.
- Faster ASCII string operations.
- Fixed incorrect detection of `MAX_ALLOWED_PACKET`, so sending large blobs should work now.
- Fixed off-by-one error in `java.sql.Blob` implementation code.
- Added `ultraDevHack` URL parameter, set to `true` to allow (broken) Macromedia UltraDev to use the driver.

## D.8.49. Changes in MySQL Connector/J 2.0.1 (06 April 2000)

- Fixed `RSMD.isWritable()` returning wrong value. Thanks to Moritz Maass.
- Cleaned up exception handling when driver connects.
- Columns that are of type `TEXT` now return as `Strings` when you use `getObject()`.
- `DatabaseMetaData.getPrimaryKeys()` now works correctly with respect to `key_seq`. Thanks to Brian Slesinsky.
- No escape processing is done on `PreparedStatements` anymore per JDBC spec.

- Fixed many JDBC-2.0 traversal, positioning bugs, especially with respect to empty result sets. Thanks to Ron Smits, Nick Brook, Cessar Garcia and Carlos Martinez.
- Fixed some issues with updatability support in [ResultSet](#) when using multiple primary keys.

### **D.8.50. Changes in MySQL Connector/J 2.0.0pre5 (21 February 2000)**

- Fixed Bad Handshake problem.

### **D.8.51. Changes in MySQL Connector/J 2.0.0pre4 (10 January 2000)**

- Fixes to [ResultSet](#) for [insertRow\(\)](#) - Thanks to Cesar Garcia
- Fix to Driver to recognize JDBC-2.0 by loading a JDBC-2.0 class, instead of relying on JDK version numbers. Thanks to John Baker.
- Fixed [ResultSet](#) to return correct row numbers
- [Statement.updateCount\(\)](#) now returns rows matched, instead of rows actually updated, which is more SQL-92 like.

10-29-99

- [Statement/PreparedStatement.getMoreResults\(\)](#) bug fixed. Thanks to Noel J. Bergman.
- Added [Short](#) as a type to [PreparedStatement.setObject\(\)](#). Thanks to Jeff Crowder
- Driver now automatically configures maximum/preferred packet sizes by querying server.
- Autoreconnect code uses fast ping command if server supports it.
- Fixed various bugs with respect to packet sizing when reading from the server and when alloc'ing to write to the server.

### **D.8.52. Changes in MySQL Connector/J 2.0.0pre (17 August 1999)**

- Now compiles under JDK-1.2. The driver supports both JDK-1.1 and JDK-1.2 at the same time through a core set of classes. The driver will load the appropriate interface classes at runtime by figuring out which JVM version you are using.
- Fixes for result sets with all nulls in the first row. (Pointed out by Tim Endres)
- Fixes to column numbers in [SQLExceptions](#) in [ResultSet](#) (Thanks to Blas Rodriguez Somoza)
- The database no longer needs to be specified to connect. (Thanks to Christian Motschke)

### D.8.53. Changes in MySQL Connector/J 1.2b (04 July 1999)

- Better Documentation (in progress), in doc/mm.doc/book1.html
- DBMD now allows null for a column name pattern (not in spec), which it changes to '%'
- DBMD now has correct types/lengths for getXXX().
- ResultSet.getDate(), getTime(), and getTimestamp() fixes. (contributed by Alan Wilken)
- EscapeProcessor now handles \{ \} and { or } inside quotes correctly. (thanks to Alik for some ideas on how to fix it)
- Fixes to properties handling in Connection. (contributed by Juho Tikkala)
- ResultSet.getObject() now returns null for NULL columns in the table, rather than bombing out. (thanks to Ben Grosman)
- ResultSet.getObject() now returns Strings for types from MySQL that it doesn't know about. (Suggested by Chris Perdue)
- Removed DataInput/Output streams, not needed, 1/2 number of method calls per IO operation.
- Use default character encoding if one is not specified. This is a work-around for broken JVMs, because according to spec, EVERY JVM must support "ISO8859\_1", but they don't.
- Fixed Connection to use the platform character encoding instead of "ISO8859\_1" if one isn't explicitly set. This fixes problems people were having loading the character- converter classes that didn't always exist (JVM bug). (thanks to Fritz Elfert for pointing out this problem)
- Changed MySQLIO to re-use packets where possible to reduce memory usage.
- Fixed escape-processor bugs pertaining to { } inside quotes.

### D.8.54. Changes in MySQL Connector/J 1.2a (14 April 1999)

- Fixed character-set support for non-Javasoft JVMs (thanks to many people for pointing it out)
- Fixed ResultSet.getBoolean() to recognize 'y' & 'n' as well as '1' & '0' as boolean flags. (thanks to Tim Pizey)
- Fixed ResultSet.getTimestamp() to give better performance. (thanks to Richard Swift)
- Fixed getByte() for numeric types. (thanks to Ray Bellis)
- Fixed DatabaseMetaData.getTypeInfo() for DATE type. (thanks to Paul Johnston)
- Fixed EscapeProcessor for "fn" calls. (thanks to Piyush Shah at locomotive.org)
- Fixed EscapeProcessor to not do extraneous work if there are no escape codes. (thanks to Ryan Gustafson)
- Fixed Driver to parse URLs of the form "jdbc:mysql://host:port" (thanks to Richard Lobb)

### D.8.55. Changes in MySQL Connector/J 1.1i (24 March 1999)

- Fixed Timestamps for PreparedStatements
- Fixed null pointer exceptions in RSMD and RS
- Re-compiled with jikes for valid class files (thanks ms!)

### **D.8.56. Changes in MySQL Connector/J 1.1h (08 March 1999)**

- Fixed escape processor to deal with unmatched { and } (thanks to Craig Coles)
- Fixed escape processor to create more portable (between DATETIME and TIMESTAMP types) representations so that it will work with BETWEEN clauses. (thanks to Craig Longman)
- MysqlIO.quit() now closes the socket connection. Before, after many failed connections some OS's would run out of file descriptors. (thanks to Michael Brinkman)
- Fixed NullPointerException in Driver.getPropertyInfo. (thanks to Dave Potts)
- Fixes to MysqlDefs to allow all \*text fields to be retrieved as Strings. (thanks to Chris at Leverage)
- Fixed setDouble in PreparedStatement for large numbers to avoid sending scientific notation to the database. (thanks to J.S. Ferguson)
- Fixed getScale() and getPrecision() in RSMD. (contrib'd by James Klicman)
- Fixed getObject() when field was DECIMAL or NUMERIC (thanks to Bert Hobbs)
- DBMD.getTables() bombed when passed a null table-name pattern. Fixed. (thanks to Richard Lobb)
- Added check for "client not authorized" errors during connect. (thanks to Hannes Wallnoefer)

### **D.8.57. Changes in MySQL Connector/J 1.1g (19 February 1999)**

- Result set rows are now byte arrays. Blobs and Unicode work bidirectionally now. The useUnicode and encoding options are implemented now.
- Fixes to PreparedStatement to send binary set by setXXXStream to be sent untouched to the MySQL server.
- Fixes to getDriverPropertyInfo().

### **D.8.58. Changes in MySQL Connector/J 1.1f (31 December 1998)**

- Changed all ResultSet fields to Strings, this should allow Unicode to work, but your JVM must be able to convert between the character sets. This should also make reading data from the server be a bit quicker, because there is now no conversion from StringBuffer to String.
- Changed PreparedStatement.streamToString() to be more efficient (code from Uwe Schaefer).

- URL parsing is more robust (throws SQL exceptions on errors rather than NullPointerExceptions)
- PreparedStatement now can convert Strings to Time/Date values via setObject() (code from Robert Currey).
- IO no longer hangs in Buffer.readInt(), that bug was introduced in 1.1d when changing to all byte-arrays for result sets. (Pointed out by Samo Login)

### **D.8.59. Changes in MySQL Connector/J 1.1b (03 November 1998)**

- Fixes to DatabaseMetaData to allow both IBM VA and J-Builder to work. Let me know how it goes. (thanks to Jac Kersing)
- Fix to ResultSet.getBoolean() for NULL strings (thanks to Barry Lagerweij)
- Beginning of code cleanup, and formatting. Getting ready to branch this off to a parallel JDBC-2.0 source tree.
- Added "final" modifier to critical sections in MySQLIO and Buffer to allow compiler to inline methods for speed.

9-29-98

- If object references passed to setXXX() in PreparedStatement are null, setNull() is automatically called for you. (Thanks for the suggestion goes to Erik Ostrom)
- setObject() in PreparedStatement will now attempt to write a serialized representation of the object to the database for objects of Types.OTHER and objects of unknown type.
- Util now has a static method readObject() which given a ResultSet and a column index will re-instantiate an object serialized in the above manner.

### **D.8.60. Changes in MySQL Connector/J 1.1 (02 September 1998)**

- Got rid of "ugly hack" in MySQLIO.nextRow(). Rather than catch an exception, Buffer.isLastDataPacket() was fixed.
- Connection.getCatalog() and Connection.setCatalog() should work now.
- Statement.setMaxRows() works, as well as setting by property maxRows. Statement.setMaxRows() overrides maxRows set via properties or url parameters.
- Automatic re-connection is available. Because it has to "ping" the database before each query, it is turned off by default. To use it, pass in "autoReconnect=true" in the connection URL. You may also change the number of reconnect tries, and the initial timeout value via "maxReconnects=n" (default 3) and "initialTimeout=n" (seconds, default 2) parameters. The timeout is an exponential backoff type of timeout; for example, if you have initial timeout of 2 seconds, and maxReconnects of 3, then the driver will timeout 2 seconds, 4 seconds, then 16 seconds between each re-connection attempt.

## D.8.61. Changes in MySQL Connector/J 1.0 (24 August 1998)

- Fixed handling of blob data in Buffer.java
- Fixed bug with authentication packet being sized too small.
- The JDBC Driver is now under the LPGL

8-14-98

- Fixed Buffer.readLenString() to correctly read data for BLOBS.
- Fixed PreparedStatement.toString() to correctly read data for BLOBS.
- Fixed PreparedStatement.setDate() to not add a day. (above fixes thanks to Vincent Partington)
- Added URL parameter parsing (?user=... and so forth).

## D.8.62. Changes in MySQL Connector/J 0.9d (04 August 1998)

- Big news! New package name. Tim Endres from ICE Engineering is starting a new source tree for GNU GPL'd Java software. He's graciously given me the org.gjt.mm package directory to use, so now the driver is in the org.gjt.mm.mysql package scheme. I'm "legal" now. Look for more information on Tim's project soon.
- Now using dynamically sized packets to reduce memory usage when sending commands to the DB.
- Small fixes to getTypeInfo() for parameters, and so forth.
- DatabaseMetaData is now fully implemented. Let me know if these drivers work with the various IDEs out there. I've heard that they're working with JBuilder right now.
- Added JavaDoc documentation to the package.
- Package now available in .zip or .tar.gz.

## D.8.63. Changes in MySQL Connector/J 0.9 (28 July 1998)

- Implemented getTypeInfo(). Connection.rollback() now throws an SQLException per the JDBC spec.
- Added PreparedStatement that supports all JDBC API methods for PreparedStatement including InputStreams. Please check this out and let me know if anything is broken.
- Fixed a bug in ResultSet that would break some queries that only returned 1 row.
- Fixed bugs in DatabaseMetaData.getTables(), DatabaseMetaData.getColumns() and DatabaseMetaData.getCatalogs().
- Added functionality to Statement that allows executeUpdate() to store values for IDs that are auto-

matically generated for AUTO\_INCREMENT fields. Basically, after an executeUpdate(), look at the SQLWarnings for warnings like "LAST\_INSERTED\_ID = 'some number', COMMAND = 'your SQL query'". If you are using AUTO\_INCREMENT fields in your tables and are executing a lot of executeUpdate(s) on one Statement, be sure to clearWarnings() every so often to save memory.

### D.8.64. Changes in MySQL Connector/J 0.8 (06 July 1998)

- Split MysqlIO and Buffer to separate classes. Some ClassLoaders gave an IllegalAccessException error for some fields in those two classes. Now mm.mysql works in applets and all classloaders. Thanks to Joe Ennis <jce@mail.boone.com> for pointing out the problem and working on a fix with me.

### D.8.65. Changes in MySQL Connector/J 0.7 (01 July 1998)

- Fixed DatabaseMetadata problems in getColumnns() and bug in switch statement in the Field constructor. Thanks to Costin Manolache <costin@tdiinc.com> for pointing these out.

### D.8.66. Changes in MySQL Connector/J 0.6 (21 May 1998)

- Incorporated efficiency changes from Richard Swift <Richard.Swift@kanatek.ca> in [MysqlIO.java](#) and [ResultSet.java](#):
- We're now 15% faster than gwe's driver.
- Started working on [DatabaseMetaData](#).
- The following methods are implemented:
  - [getTables\(\)](#)
  - [getTableTypes\(\)](#)
  - [getColumnns](#)
  - [getCatalogs\(\)](#)

---

## Appendix E. Porting to Other Systems

This appendix helps you port MySQL to other operating systems. Do check the list of currently supported operating systems first. See [Section 2.1.1, “Operating Systems Supported by MySQL”](#). If you have created a new port of MySQL, please let us know so that we can list it here and on our Web site (<http://www.mysql.com/>), recommending it to other users.

Note: If you create a new port of MySQL, you are free to copy and distribute it under the GPL license, but it does not make you a copyright holder of MySQL.

A working POSIX thread library is needed for the server. On Solaris 2.5 we use Sun PThreads (the native thread support in 2.4 and earlier versions is not good enough), on Linux we use LinuxThreads by Xavier Leroy, <[Xavier.Leroy@inria.fr](mailto:Xavier.Leroy@inria.fr)>.

The hard part of porting to a new Unix variant without good native thread support is probably to port MIT-pthreads. See [mit-pthreads/README](#) and Programming POSIX Threads (<http://www.humanfactor.com/pthreads/>).

Up to MySQL 4.0.2, the MySQL distribution included a patched version of Chris Provenzano's Pthreads from MIT (see the MIT Pthreads Web page at <http://www.mit.edu/afs/sipb/project/pthreads/> and a programming introduction at [http://www.mit.edu:8001/people/proven/IAP\\_2000/](http://www.mit.edu:8001/people/proven/IAP_2000/)). These can be used for some operating systems that do not have POSIX threads. See [Section 2.9.5, “MIT-pthreads Notes”](#).

It is also possible to use another user level thread package named FSU Pthreads (see <http://moss.csc.ncsu.edu/~mueller/pthreads/>). This implementation is being used for the SCO port.

See the `thr_lock.c` and `thr_alarm.c` programs in the `mysys` directory for some tests/examples of these problems.

Both the server and the client need a working C++ compiler. We use `gcc` on many platforms. Other compilers that are known to work are SPARCworks, Sun Forte, Irix `cc`, HP-UX `aCC`, IBM AIX `xlC_r`, Intel `ecc/icc` and Compaq `cxx`).

To compile only the client use `./configure --without-server`.

There is currently no support for only compiling the server, nor is it likely to be added unless someone has a good reason for it.

If you want/need to change any `Makefile` or the configure script you also need GNU Automake and Autoconf. See [Section 2.9.3, “Installing from the Development Source Tree”](#).

All steps needed to remake everything from the most basic files.

```
/bin/rm */.deps/*.P
/bin/rm -f config.cache
aclocal
autoheader
aclocal
automake
autoconf
./configure --with-debug=full --prefix='your installation directory'

# The makefiles generated above need GNU make 3.75 or newer.
# (called gmake below)
gmake clean all install init-db
```

If you run into problems with a new port, you may have to do some debugging of MySQL! See [Section E.1, “Debugging a MySQL Server”](#).

**Note:** Before you start debugging `mysqld`, first get the test programs `mysys/thr_alarm` and

`mysys/thr_lock` to work. This ensures that your thread installation has even a remote chance to work!

## E.1. Debugging a MySQL Server

If you are using some functionality that is very new in MySQL, you can try to run `mysqld` with the `--skip-new` (which disables all new, potentially unsafe functionality) or with `--safe-mode` which disables a lot of optimization that may cause problems. See [Section A.4.2, “What to Do If MySQL Keeps Crashing”](#).

If `mysqld` doesn't want to start, you should verify that you don't have any `my.cnf` files that interfere with your setup! You can check your `my.cnf` arguments with `mysqld --print-defaults` and avoid using them by starting with `mysqld --no-defaults ...`.

If `mysqld` starts to eat up CPU or memory or if it “hangs,” you can use `mysqladmin processlist status` to find out if someone is executing a query that takes a long time. It may be a good idea to run `mysqladmin -i10 processlist status` in some window if you are experiencing performance problems or problems when new clients can't connect.

The command `mysqladmin debug` dumps some information about locks in use, used memory and query usage to the MySQL log file. This may help solve some problems. This command also provides some useful information even if you haven't compiled MySQL for debugging!

If the problem is that some tables are getting slower and slower you should try to optimize the table with `OPTIMIZE TABLE` or `myisamchk`. See [Chapter 5, Database Administration](#). You should also check the slow queries with `EXPLAIN`.

You should also read the OS-specific section in this manual for problems that may be unique to your environment. See [Section 2.13, “Operating System-Specific Notes”](#).

### E.1.1. Compiling MySQL for Debugging

If you have some very specific problem, you can always try to debug MySQL. To do this you must configure MySQL with the `--with-debug` or the `--with-debug=full` option. You can check whether MySQL was compiled with debugging by doing: `mysqld --help`. If the `--debug` flag is listed with the options then you have debugging enabled. `mysqladmin ver` also lists the `mysqld` version as `mysql ... --debug` in this case.

If you are using `gcc` or `egcs`, the recommended `configure` line is:

```
CC=gcc CFLAGS="-O2" CXX=gcc CXXFLAGS="-O2 -felide-constructors \  
-fno-exceptions -fno-rtti" ./configure --prefix=/usr/local/mysql \  
--with-debug --with-extra-charsets=complex
```

This avoids problems with the `libstdc++` library and with C++ exceptions (many compilers have problems with C++ exceptions in threaded code) and compile a MySQL version with support for all character sets.

If you suspect a memory overrun error, you can configure MySQL with `--with-debug=full`, which installs a memory allocation (`SAFEMALLOC`) checker. However, running with `SAFEMALLOC` is quite slow, so if you get performance problems you should start `mysqld` with the `--skip-safemalloc` option. This disables the memory overrun checks for each call to `malloc()` and `free()`.

If `mysqld` stops crashing when you compile it with `--with-debug`, you probably have found a compiler bug or a timing bug within MySQL. In this case, you can try to add `-g` to the `CFLAGS` and `CXXFLAGS` variables above and not use `--with-debug`. If `mysqld` dies, you can at least attach to it with `gdb` or use `gdb` on the core file to find out what happened.

When you configure MySQL for debugging you automatically enable a lot of extra safety check functions that monitor the health of `mysqld`. If they find something “unexpected,” an entry is written to `stderr`, which `mysqld_safe` directs to the error log! This also means that if you are having some unexpected problems with MySQL and are using a source distribution, the first thing you should do is to configure MySQL for debugging! (The second thing is to send mail to a MySQL mailing list and ask for help. See [Section 1.7.1, “MySQL Mailing Lists”](#). If you believe that you have found a bug, please use the instructions at [Section 1.8, “How to Report Bugs or Problems”](#)).

In the Windows MySQL distribution, `mysqld.exe` is by default compiled with support for trace files.

## E.1.2. Creating Trace Files

If the `mysqld` server doesn't start or if you can cause it to crash quickly, you can try to create a trace file to find the problem.

To do this, you must have a `mysqld` that has been compiled with debugging support. You can check this by executing `mysqld -V`. If the version number ends with `-debug`, it's compiled with support for trace files. (On Windows, the debugging server is named `mysqld-debug` rather than `mysqld` as of MySQL 4.1.)

Start the `mysqld` server with a trace log in `/tmp/mysqld.trace` on Unix or `C:\mysqld.trace` on Windows:

```
shell> mysqld --debug
```

On Windows, you should also use the `--standalone` flag to not start `mysqld` as a service. In a console window, use this command:

```
C:\> mysqld-debug --debug --standalone
```

After this, you can use the `mysql.exe` command-line tool in a second console window to reproduce the problem. You can stop the `mysqld` server with `mysqladmin shutdown`.

Note that the trace file become **very big**! If you want to generate a smaller trace file, you can use debugging options something like this:

```
mysqld --debug=d,info,error,query,general,where:0,/tmp/mysqld.trace
```

This only prints information with the most interesting tags to the trace file.

If you make a bug report about this, please only send the lines from the trace file to the appropriate mailing list where something seems to go wrong! If you can't locate the wrong place, you can ftp the trace file, together with a full bug report, to <ftp://ftp.mysql.com/pub/mysql/upload/> so that a MySQL developer can take a look at it.

The trace file is made with the **DEBUG** package by Fred Fish. See [Section E.3, “The DEBUG Package”](#).

## E.1.3. Debugging `mysqld` under `gdb`

On most systems you can also start `mysqld` from `gdb` to get more information if `mysqld` crashes.

With some older `gdb` versions on Linux you must use `run --one-thread` if you want to be able to debug `mysqld` threads. In this case, you can only have one thread active at a time. We recommend you to upgrade to `gdb 5.1` ASAP as thread debugging works much better with this version!

NTPL threads (the new thread library on Linux) may cause problems while running `mysqld` under `gdb`. Some symptoms are:

- `mysqld` hangs during startup (before it writes `ready for connections`).
- `mysqld` crashes during a `pthread_mutex_lock()` or `pthread_mutex_unlock()` call.

In this case, you should set the following environment variable in the shell before starting `gdb`:

```
LD_ASSUME_KERNEL=2.4.1
export LD_ASSUME_KERNEL
```

When running `mysqld` under `gdb`, you should disable the stack trace with `--skip-stack-trace` to be able to catch segfaults within `gdb`.

In MySQL 4.0.14 and above you should use the `--gdb` option to `mysqld`. This installs an interrupt handler for `SIGINT` (needed to stop `mysqld` with `^C` to set breakpoints) and disable stack tracing and core file handling.

It's very hard to debug MySQL under `gdb` if you do a lot of new connections the whole time as `gdb` doesn't free the memory for old threads. You can avoid this problem by starting `mysqld` with `-thread_cache_size='max_connections+1'`. In most cases just using `-thread_cache_size=5` helps a lot!

If you want to get a core dump on Linux if `mysqld` dies with a `SIGSEGV` signal, you can start `mysqld` with the `--core-file` option. This core file can be used to make a backtrace that may help you find out why `mysqld` died:

```
shell> gdb mysqld core
gdb> backtrace full
gdb> quit
```

See [Section A.4.2, “What to Do If MySQL Keeps Crashing”](#).

If you are using `gdb` 4.17.x or above on Linux, you should install a `.gdb` file, with the following information, in your current directory:

```
set print sevenbit off
handle SIGUSR1 nostop noprint
handle SIGUSR2 nostop noprint
handle SIGWAITING nostop noprint
handle SIGLWP nostop noprint
handle SIGPIPE nostop
handle SIGALRM nostop
handle SIGHUP nostop
handle SIGTERM nostop noprint
```

If you have problems debugging threads with `gdb`, you should download `gdb` 5.x and try this instead. The new `gdb` version has very improved thread handling!

Here is an example how to debug `mysqld`:

```
shell> gdb /usr/local/libexec/mysqld
gdb> run
...
backtrace full # Do this when mysqld crashes
```

Include the above output in a bug report, which you can file using the instructions in [Section 1.8, “How to Report Bugs or Problems”](#).

If `mysqld` hangs you can try to use some system tools like `strace` or `/usr/proc/bin/pstack` to examine where `mysqld` has hung.

```
strace /tmp/log libexec/mysqld
```

If you are using the Perl [DBI](#) interface, you can turn on debugging information by using the `trace` method or by setting the `DBI_TRACE` environment variable.

## E.1.4. Using a Stack Trace

On some operating systems, the error log contains a stack trace if `mysqld` dies unexpectedly. You can use this to find out where (and maybe why) `mysqld` died. See [Section 5.11.1, “The Error Log”](#). To get a stack trace, you must not compile `mysqld` with the `-fomit-frame-pointer` option to gcc. See [Section E.1.1, “Compiling MySQL for Debugging”](#).

If the error file contains something like the following:

```
mysqld got signal 11;
The manual section 'Debugging a MySQL server' tells you how to use a
stack trace and/or the core file to produce a readable backtrace that may
help in finding out why mysqld died
Attempting backtrace. You can use the following information to find out
where mysqld died.  If you see no messages after this, something went
terribly wrong...
stack range sanity check, ok, backtrace follows
0x40077552
0x81281a0
0x8128f47
0x8127be0
0x8127995
0x8104947
0x80ff28f
0x810131b
0x80ee4bc
0x80c3c91
0x80c6b43
0x80c1fd9
0x80c1686
```

you can find where `mysqld` died by doing the following:

1. Copy the preceding numbers to a file, for example `mysqld.stack`.
2. Make a symbol file for the `mysqld` server:

```
nm -n libexec/mysqld > /tmp/mysqld.sym
```

Note that most MySQL binary distributions (except for the "debug" packages, where this information is included inside of the binaries themselves) ship with the above file, named `mysqld.sym.gz`. In this case, you can simply unpack it by doing:

```
gunzip < bin/mysqld.sym.gz > /tmp/mysqld.sym
```

3. Execute `resolve_stack_dump -s /tmp/mysqld.sym -n mysqld.stack`.

This prints out where `mysqld` died. If this doesn't help you find out why `mysqld` died, you should make a bug report and include the output from the above command with the bug report.

Note however that in most cases it does not help us to just have a stack trace to find the reason for the problem. To be able to locate the bug or provide a workaround, we would in most cases need to know the query that killed `mysqld` and preferably a test case so that we can repeat the problem! See [Section 1.8, “How to Report Bugs or Problems”](#).

## E.1.5. Using Server Logs to Find Causes of Errors in `mysqld`

Note that before starting `mysqld` with `--log` you should check all your tables with `myisamchk`. See [Chapter 5, Database Administration](#).

If `mysqld` dies or hangs, you should start `mysqld` with `--log`. When `mysqld` dies again, you can examine the end of the log file for the query that killed `mysqld`.

If you are using `--log` without a file name, the log is stored in the database directory as `host_name.log`. In most cases it is the last query in the log file that killed `mysqld`, but if possible you should verify this by restarting `mysqld` and executing the found query from the `mysql` command-line tools. If this works, you should also test all complicated queries that didn't complete.

You can also try the command `EXPLAIN` on all `SELECT` statements that takes a long time to ensure that `mysqld` is using indexes properly. See [Section 7.2.1, "Optimizing Queries with EXPLAIN"](#).

You can find the queries that take a long time to execute by starting `mysqld` with `--log-slow-queries`. See [Section 5.11.5, "The Slow Query Log"](#).

If you find the text `mysqld restarted` in the error log file (normally named `hostname.err`) you probably have found a query that causes `mysqld` to fail. If this happens, you should check all your tables with `myisamchk` (see [Chapter 5, Database Administration](#)), and test the queries in the MySQL log files to see whether one fails. If you find such a query, try first upgrading to the newest MySQL version. If this doesn't help and you can't find anything in the `mysql` mail archive, you should report the bug to a MySQL mailing list. The mailing lists are described at <http://lists.mysql.com/>, which also has links to online list archives.

If you have started `mysqld` with `myisam-recover`, MySQL automatically checks and tries to repair `MyISAM` tables if they are marked as 'not closed properly' or 'crashed'. If this happens, MySQL writes an entry in the `hostname.err` file `'Warning: Checking table ...'` which is followed by `Warning: Repairing table` if the table needs to be repaired. If you get a lot of these errors, without `mysqld` having died unexpectedly just before, then something is wrong and needs to be investigated further. See [Section 5.2.1, "Command Options"](#).

It is not a good sign if `mysqld` did die unexpectedly, but in this case, you should not investigate the `Checking table...` messages, but instead try to find out why `mysqld` died.

## E.1.6. Making a Test Case If You Experience Table Corruption

If you get corrupted tables or if `mysqld` always fails after some update commands, you can test whether this bug is reproducible by doing the following:

- Take down the MySQL daemon (with `mysqladmin shutdown`).
- Make a backup of the tables (to guard against the very unlikely case that the repair does something bad).
- Check all tables with `myisamchk -s database/*.MYI`. Repair any wrong tables with `myisamchk -r database/table.MYI`.
- Make a second backup of the tables.
- Remove (or move away) any old log files from the MySQL data directory if you need more space.
- Start `mysqld` with `--log-bin`. See [Section 5.11.4, "The Binary Log"](#). If you want to find a query that crashes `mysqld`, you should use `--log --log-bin`.
- When you have gotten a crashed table, stop the `mysqld server`.

- Restore the backup.
- Restart the `mysqld` server **without** `--log-bin`
- Re-execute the commands with `mysqlbinlog update-log-file | mysql`. The update log is saved in the MySQL database directory with the name `hostname-bin.#`.
- If the tables are corrupted again or you can get `mysqld` to die with the above command, you have found a reproducible bug that should be easy to fix! FTP the tables and the binary log to <ftp://ftp.mysql.com/pub/mysql/upload/> and report it in our bugs database using the instructions given in [Section 1.8, “How to Report Bugs or Problems”](#). (Please note that the `/pub/mysql/upload/` FTP directory is not listable, so you'll not see what you've uploaded in your FTP client.) If you are a support customer, you can use the MySQL Customer Support Center <https://support.mysql.com/> to alert the MySQL team about the problem and have it fixed as soon as possible.

You can also use the script `mysql_find_rows` to just execute some of the update statements if you want to narrow down the problem.

## E.2. Debugging a MySQL Client

To be able to debug a MySQL client with the integrated debug package, you should configure MySQL with `--with-debug` or `--with-debug=full`. See [Section 2.9.2, “Typical configure Options”](#).

Before running a client, you should set the `MYSQL_DEBUG` environment variable:

```
shell> MYSQL_DEBUG=d:t:0,/tmp/client.trace
shell> export MYSQL_DEBUG
```

This causes clients to generate a trace file in `/tmp/client.trace`.

If you have problems with your own client code, you should attempt to connect to the server and run your query using a client that is known to work. Do this by running `mysql` in debugging mode (assuming that you have compiled MySQL with debugging on):

```
shell> mysql --debug=d:t:0,/tmp/client.trace
```

This provides useful information in case you mail a bug report. See [Section 1.8, “How to Report Bugs or Problems”](#).

If your client crashes at some 'legal' looking code, you should check that your `mysql.h` include file matches your MySQL library file. A very common mistake is to use an old `mysql.h` file from an old MySQL installation with new MySQL library.

## E.3. The DBUG Package

The MySQL server and most MySQL clients are compiled with the DBUG package originally created by Fred Fish. When you have configured MySQL for debugging, this package makes it possible to get a trace file of what the program is debugging. See [Section E.1.2, “Creating Trace Files”](#).

This section summarizes the argument values that you can specify in debug options on the command line for MySQL programs that have been built with debugging support. For more information about programming with the DBUG package, see the DBUG manual in the `dbug` directory of MySQL source distributions. It's best to use a recent distribution for MySQL 5.0 to get the most updated DBUG manual.

You use the debug package by invoking a program with the `--debug="..."` or the `-#...` option.

Most MySQL programs have a default debug string that is used if you don't specify an option to `--debug`. The default trace file is usually `/tmp/program_name.trace` on Unix and `\program_name.trace` on Windows.

The debug control string is a sequence of colon-separated fields as follows:

```
<field_1>:<field_2>:...:<field_N>
```

Each field consists of a mandatory flag character followed by an optional `' , '` and comma-separated list of modifiers:

```
flag[,modifier,modifier,...,modifier]
```

The currently recognized flag characters are:

Flag	Description
<code>d</code>	Enable output from <code>DEBUG_&lt;N&gt;</code> macros for the current state. May be followed by a list of keywords which selects output only for the <code>DEBUG</code> macros with that keyword. An empty list of keywords implies output for all macros.
<code>D</code>	Delay after each debugger output line. The argument is the number of tenths of seconds to delay, subject to machine capabilities. For example, <code>--D,20</code> specifies a delay of two seconds.
<code>f</code>	Limit debugging, tracing, and profiling to the list of named functions. Note that a null list disables all functions. The appropriate <code>d</code> or <code>t</code> flags must still be given; this flag only limits their actions if they are enabled.
<code>F</code>	Identify the source file name for each line of debug or trace output.
<code>i</code>	Identify the process with the PID or thread ID for each line of debug or trace output.
<code>g</code>	Enable profiling. Create a file called <code>debugmon.out</code> containing information that can be used to profile the program. May be followed by a list of keywords that select profiling only for the functions in that list. A null list implies that all functions are considered.
<code>L</code>	Identify the source file line number for each line of debug or trace output.
<code>n</code>	Print the current function nesting depth for each line of debug or trace output.
<code>N</code>	Number each line of debug output.
<code>o</code>	Redirect the debugger output stream to the specified file. The default output is <code>stderr</code> .
<code>O</code>	Like <code>o</code> , but the file is really flushed between each write. When needed, the file is closed and reopened between each write.
<code>p</code>	Limit debugger actions to specified processes. A process must be identified with the <code>DEBUG_PROCESS</code> macro and match one in the list for debugger actions to occur.
<code>P</code>	Print the current process name for each line of debug or trace output.
<code>r</code>	When pushing a new state, do not inherit the previous state's function nesting level. Useful when the output is to start at the left margin.
<code>S</code>	Do function <code>_sanity(_file_,_line_)</code> at each debugged function until <code>_sanity()</code> returns something that differs from 0. (Mostly used with <code>safemalloc</code> to find memory leaks)
<code>t</code>	Enable function call/exit trace lines. May be followed by a list (containing only one modifier) giving a numeric maximum trace level, beyond which no output occurs for either debugging or tracing macros. The default is a compile time option.

Some examples of debug control strings that might appear on a shell command line (the `--#` is typically used to introduce a control string to an application program) are:

```

-#d:t
-#d:f,main,subr1:F:L:t,20
-#d,input,output,files:n
-#d:t:i:O,\\mysqld.trace

```

In MySQL, common tags to print (with the `d` option) are `enter`, `exit`, `error`, `warning`, `info`, and `loop`.

## E.4. Comments about RTS Threads

I have tried to use the RTS thread packages with MySQL but stumbled on the following problems:

They use old versions of many POSIX calls and it is very tedious to make wrappers for all functions. I am inclined to think that it would be easier to change the thread libraries to the newest POSIX specification.

Some wrappers are currently written. See `mysys/my_pthread.c` for more info.

At least the following should be changed:

`pthread_get_specific` should use one argument. `sigwait` should take two arguments. A lot of functions (at least `pthread_cond_wait`, `pthread_cond_timedwait()`) should return the error code on error. Now they return -1 and set `errno`.

Another problem is that user-level threads use the `ALRM` signal and this aborts a lot of functions (`read`, `write`, `open`...). MySQL should do a retry on interrupt on all of these but it is not that easy to verify it.

The biggest unsolved problem is the following:

To get thread-level alarms I changed `mysys/thr_alarm.c` to wait between alarms with `pthread_cond_timedwait()`, but this aborts with error `EINTR`. I tried to debug the thread library as to why this happens, but couldn't find any easy solution.

If someone wants to try MySQL with RTS threads I suggest the following:

- Change functions MySQL uses from the thread library to POSIX. This shouldn't take that long.
- Compile all libraries with the `-DHAVE_rts_threads`.
- Compile `thr_alarm`.
- If there are some small differences in the implementation, they may be fixed by changing `my_pthread.h` and `my_pthread.c`.
- Run `thr_alarm`. If it runs without any “warning,” “error,” or aborted messages, you are on the right track. Here is a successful run on Solaris:

```

Main thread: 1
Thread 0 (5) started
Thread: 5 Waiting
process_alarm
Thread 1 (6) started
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 1 (1) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 2 (2) sec

```

```
Thread: 6 Simulation of no alarm needed
Thread: 6 Slept for 0 (3) sec
Thread: 6 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 4 (4) sec
Thread: 6 Waiting
process_alarm
thread_alarm
Thread: 5 Slept for 10 (10) sec
Thread: 5 Waiting
process_alarm
process_alarm
thread_alarm
Thread: 6 Slept for 5 (5) sec
Thread: 6 Waiting
process_alarm
process_alarm
...
thread_alarm
Thread: 5 Slept for 0 (1) sec
end
```

## E.5. Differences Between Thread Packages

MySQL is very dependent on the thread package used. So when choosing a good platform for MySQL, the thread package is very important.

There are at least three types of thread packages:

- User threads in a single process. Thread switching is managed with alarms and the threads library manages all non-thread-safe functions with locks. Read, write and select operations are usually managed with a thread-specific select that switches to another thread if the running threads have to wait for data. If the user thread packages are integrated in the standard libs (FreeBSD and BSDI threads) the thread package requires less overhead than thread packages that have to map all unsafe calls (MIT-pthreads, FSU Pthreads and RTS threads). In some environments (for example, SCO), all system calls are thread-safe so the mapping can be done very easily (FSU Pthreads on SCO). Downside: All mapped calls take a little time and it's quite tricky to be able to handle all situations. There are usually also some system calls that are not handled by the thread package (like MIT-pthreads and sockets). Thread scheduling isn't always optimal.
- User threads in separate processes. Thread switching is done by the kernel and all data are shared between threads. The thread package manages the standard thread calls to allow sharing data between threads. LinuxThreads is using this method. Downside: Lots of processes. Thread creating is slow. If one thread dies the rest are usually left hanging and you must kill them all before restarting. Thread switching is somewhat expensive.
- Kernel threads. Thread switching is handled by the thread library or the kernel and is very fast. Everything is done in one process, but on some systems, `ps` may show the different threads. If one thread aborts, the whole process aborts. Most system calls are thread-safe and should require very little overhead. Solaris, HP-UX, AIX and OSF/1 have kernel threads.

In some systems kernel threads are managed by integrating user level threads in the system libraries. In such cases, the thread switching can only be done by the thread library and the kernel isn't really “thread aware.”

---

## Appendix F. Environment Variables

This appendix lists all the environment variables that are used directly or indirectly by MySQL. Most of these can also be found in other places in this manual.

Note that any options on the command line take precedence over values specified in option files and environment variables, and values in option files take precedence over values in environment variables.

In many cases, it is preferable to use an option file instead of environment variables to modify the behavior of MySQL. See [Section 4.3.2, “Using Option Files”](#).

Variable	Description
CXX	The name of your C++ compiler (for running <code>configure</code> ).
CC	The name of your C compiler (for running <code>configure</code> ).
CFLAGS	Flags for your C compiler (for running <code>configure</code> ).
CXXFLAGS	Flags for your C++ compiler (for running <code>configure</code> ).
DBI_USER	The default username for Perl DBI.
DBI_TRACE	Trace options for Perl DBI.
HOME	The default path for the <code>mysql</code> history file is <code>\$HOME/.mysql_history</code> .
LD_RUN_PATH	Used to specify the location of <code>libmysqlclient.so</code> .
MYSQL_DEBUG	Debug trace options when debugging.
MYSQL_GROUP_SUFFIX	Option group suffix value (like specifying <code>-defaults-group-suffix</code> ).
MYSQL_HISTFILE	The path to the <code>mysql</code> history file. If this variable is set, its value overrides the default for <code>\$HOME/.mysql_history</code> .
MYSQL_HOME	The path to the directory in which the server-specific <code>my.cnf</code> file resides (as of MySQL 5.0.3).
MYSQL_HOST	The default hostname used by the <code>mysql</code> command-line client.
MYSQL_PS1	The command prompt to use in the <code>mysql</code> command-line client.
MYSQL_PWD	The default password when connecting to <code>mysqld</code> . Note that using this is insecure. See <a href="#">Section 5.8.6, “Keeping Your Password Secure”</a> .
MYSQL_TCP_PORT	The default TCP/IP port number.
MYSQL_UNIX_PORT	The default Unix socket filename; used for connections to <code>localhost</code> .
PATH	Used by the shell to find MySQL programs.
TMPDIR	The directory where temporary files are created.
TZ	This should be set to your local time zone. See <a href="#">Section A.4.6, “Time Zone Problems”</a> .
UMASK_DIR	The user-directory creation mask when creating directories. Note that this is <b>ANDed</b> with <code>UMASK</code> .
UMASK	The user-file creation mask when creating files.
USER	The default username on Windows and NetWare used when connecting to <code>mysqld</code> .

---

# Appendix G. Regular Expressions

A regular expression is a powerful way of specifying a pattern for a complex search.

MySQL uses Henry Spencer's implementation of regular expressions, which is aimed at conformance with POSIX 1003.2. See [Appendix C, Credits](#). MySQL uses the extended version to support pattern-matching operations performed with the `REGEXP` operator in SQL statements. See [Section 3.3.4.7, "Pattern Matching"](#), and [Section 12.3.1, "String Comparison Functions"](#).

This appendix is a summary, with examples, of the special characters and constructs that can be used in MySQL for `REGEXP` operations. It does not contain all the details that can be found in Henry Spencer's `regex(7)` manual page. That manual page is included in MySQL source distributions, in the `regex.7` file under the `regex` directory.

A regular expression describes a set of strings. The simplest regular expression is one that has no special characters in it. For example, the regular expression `hello` matches `hello` and nothing else.

Non-trivial regular expressions use certain special constructs so that they can match more than one string. For example, the regular expression `hello|word` matches either the string `hello` or the string `word`.

As a more complex example, the regular expression `B[an]*s` matches any of the strings `Bananas`, `Baaaaas`, `Bs`, and any other string starting with a `B`, ending with an `s`, and containing any number of `a` or `n` characters in between.

A regular expression for the `REGEXP` operator may use any of the following special characters and constructs:

- `^`

Match the beginning of a string.

```
mysql> SELECT 'fo\nfo' REGEXP '^fo$';      -> 0
mysql> SELECT 'fofo' REGEXP '^fo';        -> 1
```

- `$`

Match the end of a string.

```
mysql> SELECT 'fo\no' REGEXP '^fo\no$';    -> 1
mysql> SELECT 'fo\no' REGEXP '^fo$';       -> 0
```

- `.`

Match any character (including carriage return and newline).

```
mysql> SELECT 'fofo' REGEXP '^f.*$';       -> 1
mysql> SELECT 'fo\r\nfo' REGEXP '^f.*$';   -> 1
```

- `a*`

Match any sequence of zero or more `a` characters.

```
mysql> SELECT 'Ban' REGEXP '^Ba*n';        -> 1
mysql> SELECT 'Baaan' REGEXP '^Ba*n';     -> 1
mysql> SELECT 'Bn' REGEXP '^Ba*n';        -> 1
```

- `a+`

Match any sequence of one or more `a` characters.

```
mysql> SELECT 'Ban' REGEXP '^Ba+n';      -> 1
mysql> SELECT 'Bn' REGEXP '^Ba+n';      -> 0
```

- `a?`

Match either zero or one `a` character.

```
mysql> SELECT 'Bn' REGEXP '^Ba?n';      -> 1
mysql> SELECT 'Ban' REGEXP '^Ba?n';     -> 1
mysql> SELECT 'Baan' REGEXP '^Ba?n';    -> 0
```

- `de|abc`

Match either of the sequences `de` or `abc`.

```
mysql> SELECT 'pi' REGEXP 'pi|apa';     -> 1
mysql> SELECT 'axe' REGEXP 'pi|apa';    -> 0
mysql> SELECT 'apa' REGEXP 'pi|apa';    -> 1
mysql> SELECT 'apa' REGEXP '^(pi|apa)$'; -> 1
mysql> SELECT 'pi' REGEXP '^(pi|apa)$'; -> 1
mysql> SELECT 'pix' REGEXP '^(pi|apa)$'; -> 0
```

- `(abc)*`

Match zero or more instances of the sequence `abc`.

```
mysql> SELECT 'pi' REGEXP '^(pi)*$';    -> 1
mysql> SELECT 'pip' REGEXP '^(pi)*$';   -> 0
mysql> SELECT 'pipi' REGEXP '^(pi)*$';  -> 1
```

- `{1}, {2, 3}`

`{n}` or `{m, n}` notation provides a more general way of writing regular expressions that match many occurrences of the previous atom (or “piece”) of the pattern. `m` and `n` are integers.

- `a*`

Can be written as `a{0, }`.

- `a+`

Can be written as `a{1, }`.

- `a?`

Can be written as `a{0, 1}`.

To be more precise, `a{n}` matches exactly `n` instances of `a`. `a{n, }` matches `n` or more instances of `a`. `a{m, n}` matches `m` through `n` instances of `a`, inclusive.

`m` and `n` must be in the range from 0 to `RE_DUP_MAX` (default 255), inclusive. If both `m` and `n` are given, `m` must be less than or equal to `n`.

```
mysql> SELECT 'abcde' REGEXP 'a[bcd]{2}e'; -> 0
mysql> SELECT 'abcde' REGEXP 'a[bcd]{3}e'; -> 1
mysql> SELECT 'abcde' REGEXP 'a[bcd]{1,10}e'; -> 1
```

- `[a-dX], [^a-dX]`

Matches any character that is (or is not, if `^` is used) either `a`, `b`, `c`, `d` or `X`. A `-` character between two other characters forms a range that matches all characters from the first character to the second. For example, `[0-9]` matches any decimal digit. To include a literal `]` character, it must immediately follow the opening bracket `[`. To include a literal `-` character, it must be written first or last. Any character that does not have a defined special meaning inside a `[ ]` pair matches only itself.

```
mysql> SELECT 'aXbc' REGEXP '[a-dXYZ]';           -> 1
mysql> SELECT 'aXbc' REGEXP '^[a-dXYZ]$';       -> 0
mysql> SELECT 'aXbc' REGEXP '^a-dXYZ+$';       -> 1
mysql> SELECT 'aXbc' REGEXP '^[^a-dXYZ]+$';    -> 0
mysql> SELECT 'gheis' REGEXP '^[^a-dXYZ]+$';   -> 1
mysql> SELECT 'gheisa' REGEXP '^a-dXYZ+$';     -> 0
```

- `[.characters.]`

Within a bracket expression (written using `[` and `]`), matches the sequence of characters of that collating element. `characters` is either a single character or a character name like `newline`. You can find the full list of character names in the `regexp/cname.h` file.

```
mysql> SELECT '~' REGEXP '[[.~.]]';             -> 1
mysql> SELECT '~' REGEXP '[[.tilde.]]';        -> 1
```

- `[=character_class=]`

Within a bracket expression (written using `[` and `]`), `[=character_class=]` represents an equivalence class. It matches all characters with the same collation value, including itself. For example, if `o` and `(+)` are the members of an equivalence class, then `[=o=]`, `[=(+)=]`, and `[o(+)]` are all synonymous. An equivalence class may not be used as an endpoint of a range.

- `[:character_class:]`

Within a bracket expression (written using `[` and `]`), `[:character_class:]` represents a character class that matches all characters belonging to that class. The following table lists the standard class names. These names stand for the character classes defined in the `ctype(3)` manual page. A particular locale may provide other class names. A character class may not be used as an endpoint of a range.

<code>alnum</code>	Alphanumeric characters
<code>alpha</code>	Alphabetic characters
<code>blank</code>	Whitespace characters
<code>cntrl</code>	Control characters
<code>digit</code>	Digit characters
<code>graph</code>	Graphic characters
<code>lower</code>	Lowercase alphabetic characters
<code>print</code>	Graphic or space characters
<code>punct</code>	Punctuation characters
<code>space</code>	Space, tab, newline, and carriage return
<code>upper</code>	Uppercase alphabetic characters
<code>xdigit</code>	Hexadecimal digit characters

```
mysql> SELECT 'justalnums' REGEXP '[:alnum:]+'; -> 1
mysql> SELECT '!!!' REGEXP '[:alnum:]+';      -> 0
```

- `[[:<:]], [[:>:]]`

These markers stand for word boundaries. They match the beginning and end of words, respectively. A word is a sequence of word characters that is not preceded by or followed by word characters. A word character is an alphanumeric character in the `alnum` class or an underscore (`_`).

```
mysql> SELECT 'a word a' REGEXP '[:<:]word[:>:]'; -> 1
mysql> SELECT 'a xword a' REGEXP '[:<:]word[:>:]'; -> 0
```

To use a literal instance of a special character in a regular expression, precede it by two backslash (`\`) characters. The MySQL parser interprets one of the backslashes, and the regular expression library interprets the other. For example, to match the string `1+2` that contains the special `+` character, only the last of the following regular expressions is the correct one:

```
mysql> SELECT '1+2' REGEXP '1+2'; -> 0
mysql> SELECT '1+2' REGEXP '1\+2'; -> 0
mysql> SELECT '1+2' REGEXP '1\\+2'; -> 1
```

---

# Appendix H. Limits in MySQL

This Appendix lists current limits in MySQL 4.1.

## H.1. Limits of Joins

In MySQL 4.1, the maximum number of tables that can be referenced in a single join is 61. This also applies to the number of tables that can be referenced in the definition of a view.

---

# Appendix I. Feature Restrictions

The discussion here describes restrictions that apply to the use of MySQL features such as subqueries.

## I.1. Restrictions on Subqueries

- Known bug to be fixed later: If you compare a `NULL` value to a subquery using `ALL`, `ANY`, or `SOME`, and the subquery returns an empty result, the comparison might evaluate to the non-standard result of `NULL` rather than to `TRUE` or `FALSE`. This is to be fixed in MySQL 5.1.
- A subquery's outer statement can be any one of: `SELECT`, `INSERT`, `UPDATE`, `DELETE`, `SET`, or `DO`.
- Subquery optimization for `IN` is not as effective as for the `=` operator or for `IN(value_list)` constructs.

A typical case for poor `IN` subquery performance is when the subquery returns a small number of rows but the outer query returns a large number of rows to be compared to the subquery result.

The problem is that, for a statement that uses an `IN` subquery, the optimizer rewrites it as a correlated subquery. Consider the following statement that uses an uncorrelated subquery:

```
SELECT ... FROM t1 WHERE t1.a IN (SELECT b FROM t2);
```

The optimizer rewrites the statement to a correlated subquery:

```
SELECT ... FROM t1 WHERE EXISTS (SELECT 1 FROM t2 WHERE t2.b = t1.a);
```

If the inner and outer queries return  $M$  and  $N$  rows, respectively, the execution time becomes on the order of  $O(M \times N)$ , rather than  $O(M+N)$  as it would be for an uncorrelated subquery.

An implication is that an `IN` subquery can be much slower than a query written using an `IN(value_list)` construct that lists the same values that the subquery would return.

- In general, you cannot modify a table and select from the same table in a subquery. For example, this limitation applies to statements of the following forms:

```
DELETE FROM t WHERE ... (SELECT ... FROM t ...);  
UPDATE t ... WHERE col = (SELECT ... FROM t ...);  
{INSERT|REPLACE} INTO t (SELECT ... FROM t ...);
```

Exception: The preceding prohibition does not apply if you are using a subquery for the modified table in the `FROM` clause. Example:

```
UPDATE t ... WHERE col = (SELECT (SELECT ... FROM t...) AS _t ...);
```

Here the prohibition does not apply because a subquery in the `FROM` clause is materialized as a temporary table, so the relevant rows in `t` have already been selected by the time the update to `t` takes place.

- Row comparison operations are only partially supported:
  - For `expr IN (subquery)`, `expr` can be an  $n$ -tuple (specified via row constructor syntax) and the subquery can return rows of  $n$ -tuples.

- For `expr op {ALL|ANY|SOME} (subquery)`, `expr` must be a scalar value and the subquery must be a column subquery; it cannot return multiple-column rows.

In other words, for a subquery that returns rows of  $n$ -tuples, this is supported:

```
(val_1, ..., val_n) IN (subquery)
```

But this is not supported:

```
(val_1, ..., val_n) op {ALL|ANY|SOME} (subquery)
```

The reason for supporting row comparisons for `IN` but not for the others is that `IN` is implemented by rewriting it as a sequence of `=` comparisons and `AND` operations. This approach cannot be used for `ALL`, `ANY`, or `SOME`.

- Row constructors are not well optimized. The following two expressions are equivalent, but only the second can be optimized:

```
(col1, col2, ...) = (val1, val2, ...)
col1 = val1 AND col2 = val2 AND ...
```

- Subqueries in the `FROM` clause cannot be correlated subqueries. They are materialized (executed to produce a result set) before evaluating the outer query, so they cannot be evaluated per row of the outer query.
- The optimizer is more mature for joins than for subqueries, so in many cases a statement that uses a subquery can be executed more efficiently if you rewrite it as a join.

An exception occurs for the case where an `IN` subquery can be rewritten as a `SELECT DISTINCT` join. Example:

```
SELECT col FROM t1 WHERE id_col IN (SELECT id_col2 FROM t2 WHERE condition);
```

That statement can be rewritten as follows:

```
SELECT DISTINCT col FROM t1, t2 WHERE t1.id_col = t2.id_col AND condition;
```

But in this case, the join requires an extra `DISTINCT` operation and is not more efficient than the subquery.

- Possible future optimization: MySQL does not rewrite the join order for subquery evaluation. In some cases, a subquery could be executed more efficiently if MySQL rewrote it as a join. This would give the optimizer a chance to choose between more execution plans. For example, it could decide whether to read one table or the other first.

Example:

```
SELECT a FROM outer_table AS ot
WHERE a IN (SELECT a FROM inner_table AS it WHERE ot.b = it.b);
```

For that query, MySQL always scans `outer_table` first and then executes the subquery on `inner_table` for each row. If `outer_table` has a lot of rows and `inner_table` has few rows, the query probably will not be as fast as it could be.

The preceding query could be rewritten like this:

```
SELECT a FROM outer_table AS ot, inner_table AS it
```

```
WHERE ot.a = it.a AND ot.b = it.b;
```

In this case, we can scan the small table (`inner_table`) and look up rows in `outer_table`, which will be fast if there is an index on `(ot.a,ot.b)`.

- Possible future optimization: A correlated subquery is evaluated for each row of the outer query. A better approach is that if the outer row values do not change from the previous row, do not evaluate the subquery again. Instead, use its previous result.
- Possible future optimization: A subquery in the `FROM` clause is evaluated by materializing the result into a temporary table, and this table does not use indexes. This does not allow the use of indexes in comparison with other tables in the query, although that might be useful.
- Possible future optimization: If a subquery in the `FROM` clause resembles a view to which the merge algorithm can be applied, rewrite the query and apply the merge algorithm so that indexes can be used. The following statement contains such a subquery:

```
SELECT * FROM (SELECT * FROM t1 WHERE t1.t1_col) AS _t1, t2 WHERE t2.t2_col;
```

The statement can be rewritten as a join like this:

```
SELECT * FROM t1, t2 WHERE t1.t1_col AND t2.t2_col;
```

This type of rewriting would provide two benefits:

- It avoids the use of a temporary table for which no indexes can be used. In the rewritten query, the optimizer can use indexes on `t1`.
- It gives the optimizer more freedom to choose between different execution plans. For example, rewriting the query as a join allows the optimizer to use `t1` or `t2` first.
- Possible future optimization: For `IN`, `= ANY`, `<> ANY`, `= ALL`, and `<> ALL` with non-correlated subqueries, use an in-memory hash for a result result or a temporary table with an index for larger results. Example:

```
SELECT a FROM big_table AS bt
WHERE non_key_field IN (SELECT non_key_field FROM table WHERE condition)
```

In this case, we could create a temporary table:

```
CREATE TABLE t (key (non_key_field))
(SELECT non_key_field FROM table WHERE condition)
```

Then, for each row in `big_table`, do a key lookup in `t` based on `bt.non_key_field`.

---

# Appendix J. GNU General Public License

Version 2, June 1991

Copyright © 1989, 1991 Free Software Foundation, Inc.  
59 Temple Place - Suite 330, Boston, MA 02111-1307, USA  
Everyone is permitted to copy and distribute verbatim copies  
of this license document, but changing it is not allowed.

## Preamble

The licenses for most software are designed to take away your freedom to share and change it. By contrast, the GNU General Public License is intended to guarantee your freedom to share and change free software---to make sure the software is free for all its users. This General Public License applies to most of the Free Software Foundation's software and to any other program whose authors commit to using it. (Some other Free Software Foundation software is covered by the GNU Library General Public License instead.) You can apply it to your programs, too.

When we speak of free software, we are referring to freedom, not price. Our General Public Licenses are designed to make sure that you have the freedom to distribute copies of free software (and charge for this service if you wish), that you receive source code or can get it if you want it, that you can change the software or use pieces of it in new free programs; and that you know you can do these things.

To protect your rights, we need to make restrictions that forbid anyone to deny you these rights or to ask you to surrender the rights. These restrictions translate to certain responsibilities for you if you distribute copies of the software, or if you modify it.

For example, if you distribute copies of such a program, whether gratis or for a fee, you must give the recipients all the rights that you have. You must make sure that they, too, receive or can get the source code. And you must show them these terms so they know their rights.

We protect your rights with two steps: (1) copyright the software, and (2) offer you this license which gives you legal permission to copy, distribute and/or modify the software.

Also, for each author's protection and ours, we want to make certain that everyone understands that there is no warranty for this free software. If the software is modified by someone else and passed on, we want its recipients to know that what they have is not the original, so that any problems introduced by others will not reflect on the original authors' reputations.

Finally, any free program is threatened constantly by software patents. We wish to avoid the danger that redistributors of a free program will individually obtain patent licenses, in effect making the program proprietary. To prevent this, we have made it clear that any patent must be licensed for everyone's free use or not licensed at all.

The precise terms and conditions for copying, distribution and modification follow.

## GNU GENERAL PUBLIC LICENSE TERMS AND CONDITIONS FOR COPYING, DISTRIBUTION AND MODIFICATION

1. This License applies to any program or other work which contains a notice placed by the copyright holder saying it may be distributed under the terms of this General Public License. The ``Program'', below, refers to any such program or work, and a ``work based on the Program'' means either the Program or any derivative work under copyright law: that is to say, a work containing the Program or a portion of it, either verbatim or with modifications and/or translated into another language. (Hereinafter, translation is included without limitation in the term ``modification".) Each licensee is

addressed as ``you''.

Activities other than copying, distribution and modification are not covered by this License; they are outside its scope. The act of running the Program is not restricted, and the output from the Program is covered only if its contents constitute a work based on the Program (independent of having been made by running the Program). Whether that is true depends on what the Program does.

2. You may copy and distribute verbatim copies of the Program's source code as you receive it, in any medium, provided that you conspicuously and appropriately publish on each copy an appropriate copyright notice and disclaimer of warranty; keep intact all the notices that refer to this License and to the absence of any warranty; and give any other recipients of the Program a copy of this License along with the Program.

You may charge a fee for the physical act of transferring a copy, and you may at your option offer warranty protection in exchange for a fee.

3. You may modify your copy or copies of the Program or any portion of it, thus forming a work based on the Program, and copy and distribute such modifications or work under the terms of Section 1 above, provided that you also meet all of these conditions:
  - a. You must cause the modified files to carry prominent notices stating that you changed the files and the date of any change.
  - b. You must cause any work that you distribute or publish, that in whole or in part contains or is derived from the Program or any part thereof, to be licensed as a whole at no charge to all third parties under the terms of this License.
  - c. If the modified program normally reads commands interactively when run, you must cause it, when started running for such interactive use in the most ordinary way, to print or display an announcement including an appropriate copyright notice and a notice that there is no warranty (or else, saying that you provide a warranty) and that users may redistribute the program under these conditions, and telling the user how to view a copy of this License. (Exception: if the Program itself is interactive but does not normally print such an announcement, your work based on the Program is not required to print an announcement.)

These requirements apply to the modified work as a whole. If identifiable sections of that work are not derived from the Program, and can be reasonably considered independent and separate works in themselves, then this License, and its terms, do not apply to those sections when you distribute them as separate works. But when you distribute the same sections as part of a whole which is a work based on the Program, the distribution of the whole must be on the terms of this License, whose permissions for other licensees extend to the entire whole, and thus to each and every part regardless of who wrote it.

Thus, it is not the intent of this section to claim rights or contest your rights to work written entirely by you; rather, the intent is to exercise the right to control the distribution of derivative or collective works based on the Program.

In addition, mere aggregation of another work not based on the Program with the Program (or with a work based on the Program) on a volume of a storage or distribution medium does not bring the other work under the scope of this License.

4. You may copy and distribute the Program (or a work based on it, under Section 2) in object code or executable form under the terms of Sections 1 and 2 above provided that you also do one of the following:
  - a. Accompany it with the complete corresponding machine-readable source code, which must be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,

- b. Accompany it with a written offer, valid for at least three years, to give any third-party, for a charge no more than your cost of physically performing source distribution, a complete machine-readable copy of the corresponding source code, to be distributed under the terms of Sections 1 and 2 above on a medium customarily used for software interchange; or,
- c. Accompany it with the information you received as to the offer to distribute corresponding source code. (This alternative is allowed only for noncommercial distribution and only if you received the program in object code or executable form with such an offer, in accord with Subsection b above.)

The source code for a work means the preferred form of the work for making modifications to it. For an executable work, complete source code means all the source code for all modules it contains, plus any associated interface definition files, plus the scripts used to control compilation and installation of the executable. However, as a special exception, the source code distributed need not include anything that is normally distributed (in either source or binary form) with the major components (compiler, kernel, and so on) of the operating system on which the executable runs, unless that component itself accompanies the executable.

If distribution of executable or object code is made by offering access to copy from a designated place, then offering equivalent access to copy the source code from the same place counts as distribution of the source code, even though third parties are not compelled to copy the source along with the object code.

- 5. You may not copy, modify, sublicense, or distribute the Program except as expressly provided under this License. Any attempt otherwise to copy, modify, sublicense or distribute the Program is void, and will automatically terminate your rights under this License. However, parties who have received copies, or rights, from you under this License will not have their licenses terminated so long as such parties remain in full compliance.
- 6. You are not required to accept this License, since you have not signed it. However, nothing else grants you permission to modify or distribute the Program or its derivative works. These actions are prohibited by law if you do not accept this License. Therefore, by modifying or distributing the Program (or any work based on the Program), you indicate your acceptance of this License to do so, and all its terms and conditions for copying, distributing or modifying the Program or works based on it.
- 7. Each time you redistribute the Program (or any work based on the Program), the recipient automatically receives a license from the original licensor to copy, distribute or modify the Program subject to these terms and conditions. You may not impose any further restrictions on the recipients' exercise of the rights granted herein. You are not responsible for enforcing compliance by third parties to this License.
- 8. If, as a consequence of a court judgment or allegation of patent infringement or for any other reason (not limited to patent issues), conditions are imposed on you (whether by court order, agreement or otherwise) that contradict the conditions of this License, they do not excuse you from the conditions of this License. If you cannot distribute so as to satisfy simultaneously your obligations under this License and any other pertinent obligations, then as a consequence you may not distribute the Program at all. For example, if a patent license would not permit royalty-free redistribution of the Program by all those who receive copies directly or indirectly through you, then the only way you could satisfy both it and this License would be to refrain entirely from distribution of the Program.

If any portion of this section is held invalid or unenforceable under any particular circumstance, the balance of the section is intended to apply and the section as a whole is intended to apply in other circumstances.

It is not the purpose of this section to induce you to infringe any patents or other property right claims or to contest validity of any such claims; this section has the sole purpose of protecting the

integrity of the free software distribution system, which is implemented by public license practices. Many people have made generous contributions to the wide range of software distributed through that system in reliance on consistent application of that system; it is up to the author/donor to decide if he or she is willing to distribute software through any other system and a licensee cannot impose that choice.

This section is intended to make thoroughly clear what is believed to be a consequence of the rest of this License.

9. If the distribution and/or use of the Program is restricted in certain countries either by patents or by copyrighted interfaces, the original copyright holder who places the Program under this License may add an explicit geographical distribution limitation excluding those countries, so that distribution is permitted only in or among countries not thus excluded. In such case, this License incorporates the limitation as if written in the body of this License.
10. The Free Software Foundation may publish revised and/or new versions of the General Public License from time to time. Such new versions will be similar in spirit to the present version, but may differ in detail to address new problems or concerns.

Each version is given a distinguishing version number. If the Program specifies a version number of this License which applies to it and ``any later version'', you have the option of following the terms and conditions either of that version or of any later version published by the Free Software Foundation. If the Program does not specify a version number of this License, you may choose any version ever published by the Free Software Foundation.

11. If you wish to incorporate parts of the Program into other free programs whose distribution conditions are different, write to the author to ask for permission. For software which is copyrighted by the Free Software Foundation, write to the Free Software Foundation; we sometimes make exceptions for this. Our decision will be guided by the two goals of preserving the free status of all derivatives of our free software and of promoting the sharing and reuse of software generally.

#### NO WARRANTY

12. BECAUSE THE PROGRAM IS LICENSED FREE OF CHARGE, THERE IS NO WARRANTY FOR THE PROGRAM, TO THE EXTENT PERMITTED BY APPLICABLE LAW. EXCEPT WHEN OTHERWISE STATED IN WRITING THE COPYRIGHT HOLDERS AND/OR OTHER PARTIES PROVIDE THE PROGRAM ``AS IS'' WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING, BUT NOT LIMITED TO, THE IMPLIED WARRANTIES OF MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE. THE ENTIRE RISK AS TO THE QUALITY AND PERFORMANCE OF THE PROGRAM IS WITH YOU. SHOULD THE PROGRAM PROVE DEFECTIVE, YOU ASSUME THE COST OF ALL NECESSARY SERVICING, REPAIR OR CORRECTION.
13. IN NO EVENT UNLESS REQUIRED BY APPLICABLE LAW OR AGREED TO IN WRITING WILL ANY COPYRIGHT HOLDER, OR ANY OTHER PARTY WHO MAY MODIFY AND/OR REDISTRIBUTE THE PROGRAM AS PERMITTED ABOVE, BE LIABLE TO YOU FOR DAMAGES, INCLUDING ANY GENERAL, SPECIAL, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF THE USE OR INABILITY TO USE THE PROGRAM (INCLUDING BUT NOT LIMITED TO LOSS OF DATA OR DATA BEING RENDERED INACCURATE OR LOSSES SUSTAINED BY YOU OR THIRD PARTIES OR A FAILURE OF THE PROGRAM TO OPERATE WITH ANY OTHER PROGRAMS), EVEN IF SUCH HOLDER OR OTHER PARTY HAS BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

END OF TERMS AND CONDITIONS

**How to Apply These Terms to Your New Programs**

If you develop a new program, and you want it to be of the greatest possible use to the public, the best way to achieve this is to make it free software which everyone can redistribute and change under these terms.

To do so, attach the following notices to the program. It is safest to attach them to the start of each source file to most effectively convey the exclusion of warranty; and each file should have at least the ``copyright" line and a pointer to where the full notice is found.

```
one line to give the program's name and a brief idea of what it does.
Copyright (C) yyyy name of author

This program is free software; you can redistribute it and/or modify
it under the terms of the GNU General Public License as published by
the Free Software Foundation; either version 2 of the License, or
(at your option) any later version.

This program is distributed in the hope that it will be useful,
but WITHOUT ANY WARRANTY; without even the implied warranty of
MERCHANTABILITY or FITNESS FOR A PARTICULAR PURPOSE. See the
GNU General Public License for more details.

You should have received a copy of the GNU General Public License
along with this program; if not, write to the Free Software
Foundation, Inc., 59 Temple Place - Suite 330, Boston, MA 02111-1307, USA.
```

Also add information on how to contact you by electronic and paper mail.

If the program is interactive, make it output a short notice like this when it starts in an interactive mode:

```
Gnomovision version 69, Copyright (C) 19yy name of author
Gnomovision comes with ABSOLUTELY NO WARRANTY; for details type `show w'.
This is free software, and you are welcome to redistribute it
under certain conditions; type `show c' for details.
```

The hypothetical commands 'show w' and 'show c' should show the appropriate parts of the General Public License. Of course, the commands you use may be called something other than 'show w' and 'show c'; they could even be mouse-clicks or menu items---whatever suits your program.

You should also get your employer (if you work as a programmer) or your school, if any, to sign a ``copyright disclaimer" for the program, if necessary. Here is a sample; alter the names:

```
Yoyodyne, Inc., hereby disclaims all copyright interest in the program
`Gnomovision' (which makes passes at compilers) written by James Hacker.

signature of Ty Coon, 1 April 1989
Ty Coon, President of Vice
```

This General Public License does not permit incorporating your program into proprietary programs. If your program is a subroutine library, you may consider it more useful to permit linking proprietary applications with the library. If this is what you want to do, use the GNU Library General Public License instead of this License.

---

# Appendix K. MySQL FLOSS License Exception

The MySQL AB Exception for Free/Libre and Open Source Software-only Applications Using MySQL Client Libraries (the "FLOSS Exception").

*Version 0.5, 30 August 2006*

## Exception Intent

We want specified Free/Libre and Open Source Software ("FLOSS") applications to be able to use specified GPL-licensed MySQL client libraries (the "Program") despite the fact that not all FLOSS licenses are compatible with version 2 of the GNU General Public License (the "GPL").

## Legal Terms and Conditions

As a special exception to the terms and conditions of version 2.0 of the GPL:

1. You are free to distribute a Derivative Work that is formed entirely from the Program and one or more works (each, a "FLOSS Work") licensed under one or more of the licenses listed below in section 1, as long as:
  - a. You obey the GPL in all respects for the Program and the Derivative Work, except for identifiable sections of the Derivative Work which are not derived from the Program, and which can reasonably be considered independent and separate works in themselves,
  - b. all identifiable sections of the Derivative Work which are not derived from the Program, and which can reasonably be considered independent and separate works in themselves,
    - i. are distributed subject to one of the FLOSS licenses listed below, and
    - ii. the object code or executable form of those sections are accompanied by the complete corresponding machine-readable source code for those sections on the same medium and under the same FLOSS license as the corresponding object code or executable forms of those sections, and
  - c. any works which are aggregated with the Program or with a Derivative Work on a volume of a storage or distribution medium in accordance with the GPL, can reasonably be considered independent and separate works in themselves which are not derivatives of either the Program, a Derivative Work or a FLOSS Work.

If the above conditions are not met, then the Program may only be copied, modified, distributed or used under the terms and conditions of the GPL or another valid licensing option from MySQL AB.

## 2. FLOSS License List

License name	Version(s)/Copyright Date
Academic Free License	2.0
Apache Software License	1.0/1.1/2.0
Apple Public Source License	2.0
Artistic license	From Perl 5.8.0
BSD license	"July 22 1999"
Common Public License	1.0
GNU Library or "Lesser" General Public License (LGPL)	2.0/2.1
Jabber Open Source License	1.0

MIT license	—
Mozilla Public License (MPL)	1.0/1.1
Open Software License	2.0
OpenSSL license (with original SSLeay license)	"2003" ("1998")
PHP License	3.0
Python license (CNRI Python License)	—
Python Software Foundation License	2.1.1
Sleepycat License	"1999"
University of Illinois/NCSA Open Source License	—
W3C License	"2001"
X11 License	"2001"
Zlib/libpng License	—
Zope Public License	2.0

Due to the many variants of some of the above licenses, we require that any version follow the 2003 version of the Free Software Foundation's Free Software Definition (<http://www.gnu.org/philosophy/free-sw.html>) or version 1.9 of the Open Source Definition by the Open Source Initiative (<http://www.opensource.org/docs/definition.php>).

3. Definitions

- a. Terms used, but not defined, herein shall have the meaning provided in the GPL.
- b. Derivative Work means a derivative work under copyright law.

4. **Applicability:** This FLOSS Exception applies to all Programs that contain a notice placed by MySQL AB saying that the Program may be distributed under the terms of this FLOSS Exception. If you create or distribute a work which is a Derivative Work of both the Program and any other work licensed under the GPL, then this FLOSS Exception is not available for that work; thus, you must remove the FLOSS Exception notice from that work and comply with the GPL in all respects, including by retaining all GPL notices. You may choose to redistribute a copy of the Program exclusively under the terms of the GPL by removing the FLOSS Exception notice from that copy of the Program, provided that the copy has never been modified by you or any third party.

**Appendix A. Qualified Libraries and Packages**

The following is a non-exhaustive list of libraries and packages which are covered by the FLOSS License Exception. Please note that this appendix is provided merely as an additional service to specific FLOSS projects wishing to simplify licensing information for their users. Compliance with one of the licenses noted under the "FLOSS license list" section remains a prerequisite.

Package Name	Qualifying License and Version
Apache Portable Runtime (APR)	Apache Software License

	2.0
